Abstract

This document provides information about installing OpenShift Container Platform and details about some configuration processes.

Table of Contents

CHAPTER 1. INSTALLATION OVERVIEW	71
1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW	71
1.1.1. About OpenShift Container Platform installation	71
1.1.1.1. About the installation program	71
1.1.1.2. About Red Hat Enterprise Linux CoreOS (RHCOS)	72
1.1.1.3. Glossary of common terms for OpenShift Container Platform installing	72
1.1.1.4. Installation process	74
The installation process with the Assisted Installer	75
The installation process with Agent-based infrastructure	75
The installation process with installer-provisioned infrastructure	75
The installation process with user-provisioned infrastructure	76
Installation process details	76
1.1.1.5. Verifying node state after installation	78
Installation scope	79
1.1.1.6. OpenShift Local overview	79
1.1.2. Supported platforms for OpenShift Container Platform clusters	80
1.2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS	81
1.2.1. Selecting a cluster installation type	82
1.2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?	82
1.2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?	83
1.2.1.3. Do you want to use existing components in your cluster?	83
1.2.1.4. Do you need extra security for your cluster?	84
1.2.2. Preparing your cluster for users after installation	84
1.2.3. Preparing your cluster for workloads	85
1.2.4. Supported installation methods for different platforms	85
1.3. CLUSTER CAPABILITIES	90
1.3.1. Selecting cluster capabilities	90
1.3.2. Optional cluster capabilities in OpenShift Container Platform 4.14	92
1.3.2.1. Bare-metal capability	93
Purpose	93
1.3.2.2. Build capability	93
Purpose	93
1.3.2.3. Cluster storage capability	93
Purpose	93
Notes	94
1.3.2.4. Console capability	94
Purpose	94
1.3.2.5. CSI snapshot controller capability	94
Purpose	94
1.3.2.6. DeploymentConfig capability	94
Purpose	94
1.3.2.7. Insights capability	94
Purpose	94
Notes	95
1.3.2.8. Machine API capability	95
Purpose	95
1.3.2.9. Marketplace capability	95
Purpose	95
1.3.2.10. Node Tuning capability	96
Purpose	96

1.3.2.11. OpenShift samples capability	96
Purpose	96
1.3.2.12. Cluster Image Registry capability	96
Purpose	96
Project	97
1.3.3. Additional resources	97
1.4. SUPPORT FOR FIPS CRYPTOGRAPHY	97
1.4.1. FIPS validation in OpenShift Container Platform	98
1.4.2. FIPS support in components that the cluster uses	99
1.4.2.1. etcd	99
1.4.2.2. Storage	99
1.4.2.3. Runtimes	99
1.4.3. Installing a cluster in FIPS mode	99
CHAPTER 2. DISCONNECTED INSTALLATION MIRRORING	101
2.1. ABOUT DISCONNECTED INSTALLATION MIRRORING	101
2.1.1. Creating a mirror registry	101
2.1.2. Mirroring images for a disconnected installation	101
2.2. CREATING A MIRROR REGISTRY WITH MIRROR REGISTRY FOR RED HAT OPENSIFT	101
2.2.1. Prerequisites	101
2.2.2. Mirror registry for Red Hat OpenShift introduction	102
2.2.2.1. Mirror registry for Red Hat OpenShift limitations	102
2.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift	103
2.2.4. Updating mirror registry for Red Hat OpenShift from a local host	104
2.2.5. Mirroring on a remote host with mirror registry for Red Hat OpenShift	105
2.2.6. Updating mirror registry for Red Hat OpenShift from a remote host	106
2.2.7. Replacing mirror registry for Red Hat OpenShift SSL/TLS certificates	107
2.2.8. Uninstalling the mirror registry for Red Hat OpenShift	108
2.2.9. Mirror registry for Red Hat OpenShift flags	108
2.2.10. Mirror registry for Red Hat OpenShift release notes	110
2.2.10.1. Mirror registry for Red Hat OpenShift 2.0 release notes	110
2.2.10.1.1. Mirror registry for Red Hat OpenShift 2.0.1	110
2.2.10.1.2. Mirror registry for Red Hat OpenShift 2.0.0	110
2.2.10.1.2.1. New features	110
2.2.10.2. Mirror registry for Red Hat OpenShift 1.3 release notes	111
2.2.10.2.1. Mirror registry for Red Hat OpenShift 1.3.11	111
2.2.10.2.2. Mirror registry for Red Hat OpenShift 1.3.10	111
2.2.10.2.3. Mirror registry for Red Hat OpenShift 1.3.9	111
2.2.10.2.4. Mirror registry for Red Hat OpenShift 1.3.8	111
2.2.10.2.5. Mirror registry for Red Hat OpenShift 1.3.7	111
2.2.10.2.6. Mirror registry for Red Hat OpenShift 1.3.6	112
2.2.10.2.7. Mirror registry for Red Hat OpenShift 1.3.5	112
2.2.10.2.8. Mirror registry for Red Hat OpenShift 1.3.4	112
2.2.10.2.9. Mirror registry for Red Hat OpenShift 1.3.3	112
2.2.10.2.10. Mirror registry for Red Hat OpenShift 1.3.2	112
2.2.10.2.11. Mirror registry for Red Hat OpenShift 1.3.1	112
2.2.10.2.12. Mirror registry for Red Hat OpenShift 1.3.0	113
2.2.10.2.12.1. New features	113
2.2.10.2.12.2. Bug fixes	113
2.2.10.3. Mirror registry for Red Hat OpenShift 1.2 release notes	113
2.2.10.3.1. Mirror registry for Red Hat OpenShift 1.2.9	114
2.2.10.3.2. Mirror registry for Red Hat OpenShift 1.2.8	114
2.2.10.3.3. Mirror registry for Red Hat OpenShift 1.2.7	114

2.2.10.3.3.1. Bug fixes	114
2.2.10.3.4. Mirror registry for Red Hat OpenShift 1.2.6	114
2.2.10.3.4.1. New features	114
2.2.10.3.5. Mirror registry for Red Hat OpenShift 1.2.5	114
2.2.10.3.6. Mirror registry for Red Hat OpenShift 1.2.4	115
2.2.10.3.7. Mirror registry for Red Hat OpenShift 1.2.3	115
2.2.10.3.8. Mirror registry for Red Hat OpenShift 1.2.2	115
2.2.10.3.9. Mirror registry for Red Hat OpenShift 1.2.1	115
2.2.10.3.10. Mirror registry for Red Hat OpenShift 1.2.0	115
2.2.10.3.10.1. Bug fixes	115
2.2.10.4. Mirror registry for Red Hat OpenShift 1.1 release notes	115
2.2.10.4.1. Mirror registry for Red Hat OpenShift 1.1.0	115
2.2.10.4.1.1. New features	116
2.2.10.4.1.2. Bug fixes	116
2.2.11. Troubleshooting mirror registry for Red Hat OpenShift	116
2.2.12. Additional resources	117
2.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION	117
2.3.1. Prerequisites	117
2.3.2. About the mirror registry	117
2.3.3. Preparing your mirror host	118
2.3.3.1. Installing the OpenShift CLI by downloading the binary	118
Installing the OpenShift CLI on Linux	119
Installing the OpenShift CLI on Windows	119
Installing the OpenShift CLI on macOS	120
2.3.4. Configuring credentials that allow images to be mirrored	120
2.3.5. Mirroring the OpenShift Container Platform image repository	122
2.3.6. The Cluster Samples Operator in a disconnected environment	126
2.3.6.1. Cluster Samples Operator assistance for mirroring	126
2.3.7. Mirroring Operator catalogs for use with disconnected clusters	127
2.3.7.1. Prerequisites	127
2.3.7.2. Extracting and mirroring catalog contents	128
2.3.7.2.1. Mirroring catalog contents to registries on the same network	128
2.3.7.2.2. Mirroring catalog contents to airgapped registries	129
2.3.7.3. Generated manifests	132
2.3.7.4. Postinstallation requirements	133
2.3.8. Next steps	133
2.3.9. Additional resources	133
2.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUGIN	133
2.4.1. About the oc-mirror plugin	134
2.4.2. oc-mirror compatibility and support	134
2.4.3. About the mirror registry	135
2.4.4. Prerequisites	136
2.4.5. Preparing your mirror hosts	136
2.4.5.1. Installing the oc-mirror OpenShift CLI plugin	136
2.4.5.2. Configuring credentials that allow images to be mirrored	137
2.4.6. Creating the image set configuration	140
2.4.7. Mirroring an image set to a mirror registry	142
2.4.7.1. Mirroring an image set in a partially disconnected environment	142
2.4.7.1.1. Mirroring from mirror to mirror	142
2.4.7.2. Mirroring an image set in a fully disconnected environment	143
2.4.7.2.1. Mirroring from mirror to disk	144
2.4.7.2.2. Mirroring from disk to mirror	145
2.4.8. Configuring your cluster to use the resources generated by oc-mirror	146

2.4.9. Keeping your mirror registry content updated	147
2.4.9.1. About updating your mirror registry content	147
Adding new and updated images	147
Pruning images	148
2.4.9.2. Updating your mirror registry content	148
2.4.10. Performing a dry run	149
2.4.11. Including local OCI Operator catalogs	150
2.4.12. Image set configuration parameters	153
2.4.13. Image set configuration examples	159
Use case: Including the shortest OpenShift Container Platform update path	159
Use case: Including all versions of OpenShift Container Platform from a minimum to the latest version for multi-architecture releases	159
Use case: Including Operator versions from a minimum to the latest	160
Use case: Including the Nutanix CSI Operator	161
Use case: Including the default Operator channel	161
Use case: Including an entire catalog (all versions)	162
Use case: Including an entire catalog (channel heads only)	162
Use case: Including arbitrary images and helm charts	162
Use case: Including the upgrade path for EUS releases	163
2.4.14. Command reference for oc-mirror	164
2.4.15. Additional resources	165
CHAPTER 3. INSTALLING ON ALIBABA	166
3.1. PREPARING TO INSTALL ON ALIBABA CLOUD	166
3.1.1. Prerequisites	166
3.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud	166
3.1.3. Registering and Configuring Alibaba Cloud Domain	166
3.1.4. Supported Alibaba regions	167
3.1.5. Next steps	167
3.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES	167
3.2.1. Creating the required RAM user	167
3.2.2. Configuring the Cloud Credential Operator utility	172
3.2.3. Next steps	173
3.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD	173
3.3.1. Prerequisites	174
3.3.2. Internet access for OpenShift Container Platform	174
3.3.3. Generating a key pair for cluster node SSH access	174
3.3.4. Obtaining the installation program	176
3.3.5. Creating the installation configuration file	177
3.3.6. Generating the required installation manifests	179
3.3.7. Creating credentials for OpenShift Container Platform components with the ccoctl tool	179
3.3.8. Deploying the cluster	181
3.3.9. Installing the OpenShift CLI by downloading the binary	183
Installing the OpenShift CLI on Linux	183
Installing the OpenShift CLI on Windows	184
Installing the OpenShift CLI on macOS	184
3.3.10. Logging in to the cluster by using the CLI	185
3.3.11. Logging in to the cluster by using the web console	185
3.3.12. Telemetry access for OpenShift Container Platform	186
3.3.13. Next steps	186
3.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS	186
3.4.1. Prerequisites	187
3.4.2. Internet access for OpenShift Container Platform	187

3.4.3. Generating a key pair for cluster node SSH access	188
3.4.4. Obtaining the installation program	189
3.4.4.1. Creating the installation configuration file	190
3.4.4.2. Generating the required installation manifests	192
3.4.4.3. Creating credentials for OpenShift Container Platform components with the ccoctl tool	192
3.4.4.4. Sample customized install-config.yaml file for Alibaba Cloud	195
3.4.4.5. Configuring the cluster-wide proxy during installation	196
3.4.5. Deploying the cluster	198
3.4.6. Installing the OpenShift CLI by downloading the binary	199
Installing the OpenShift CLI on Linux	199
Installing the OpenShift CLI on Windows	200
Installing the OpenShift CLI on macOS	200
3.4.7. Logging in to the cluster by using the CLI	201
3.4.8. Logging in to the cluster by using the web console	201
3.4.9. Telemetry access for OpenShift Container Platform	202
3.4.10. Next steps	202
3.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS	203
3.5.1. Prerequisites	203
3.5.2. Internet access for OpenShift Container Platform	203
3.5.3. Generating a key pair for cluster node SSH access	204
3.5.4. Obtaining the installation program	206
3.5.5. Network configuration phases	206
3.5.5.1. Creating the installation configuration file	207
3.5.5.2. Generating the required installation manifests	208
3.5.5.3. Sample customized install-config.yaml file for Alibaba Cloud	209
3.5.5.4. Configuring the cluster-wide proxy during installation	211
3.5.6. Cluster Network Operator configuration	212
3.5.6.1. Cluster Network Operator configuration object	213
defaultNetwork object configuration	213
Configuration for the OpenShift SDN network plugin	214
Configuration for the OVN-Kubernetes network plugin	215
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	220
3.5.7. Specifying advanced network configuration	220
3.5.8. Configuring hybrid networking with OVN-Kubernetes	221
3.5.9. Deploying the cluster	223
3.5.10. Installing the OpenShift CLI by downloading the binary	224
Installing the OpenShift CLI on Linux	224
Installing the OpenShift CLI on Windows	225
Installing the OpenShift CLI on macOS	225
3.5.11. Logging in to the cluster by using the CLI	226
3.5.12. Logging in to the cluster by using the web console	226
3.5.13. Telemetry access for OpenShift Container Platform	227
3.5.14. Next steps	228
3.6. INSTALLING A CLUSTER ON ALIBABA CLOUD INTO AN EXISTING VPC	228
3.6.1. Prerequisites	228
3.6.2. Using a custom VPC	229
3.6.2.1. Requirements for using your VPC	229
3.6.2.2. VPC validation	229
3.6.2.3. Division of permissions	229
3.6.2.4. Isolation between clusters	229
3.6.3. Internet access for OpenShift Container Platform	230
3.6.4. Generating a key pair for cluster node SSH access	230
3.6.5. Obtaining the installation program	232

3.6.5.1. Creating the installation configuration file	233
3.6.5.2. Sample customized install-config.yaml file for Alibaba Cloud	235
3.6.5.3. Generating the required installation manifests	236
3.6.5.4. Configuring the Cloud Credential Operator utility	236
3.6.5.5. Creating credentials for OpenShift Container Platform components with the ccoctl tool	237
3.6.6. Deploying the cluster	240
3.6.7. Installing the OpenShift CLI by downloading the binary	241
Installing the OpenShift CLI on Linux	242
Installing the OpenShift CLI on Windows	242
Installing the OpenShift CLI on macOS	243
3.6.8. Logging in to the cluster by using the CLI	243
3.6.9. Logging in to the cluster by using the web console	244
3.6.10. Telemetry access for OpenShift Container Platform	244
3.6.11. Next steps	245
3.7. INSTALLATION CONFIGURATION PARAMETERS FOR ALIBABA CLOUD	245
3.7.1. Available installation configuration parameters for Alibaba Cloud	245
3.7.1.1. Required configuration parameters	245
3.7.1.2. Network configuration parameters	247
3.7.1.3. Optional configuration parameters	249
3.7.1.4. Additional Alibaba Cloud configuration parameters	255
3.8. UNINSTALLING A CLUSTER ON ALIBABA CLOUD	259
3.8.1. Removing a cluster that uses installer-provisioned infrastructure	259
CHAPTER 4. INSTALLING ON AWS	261
4.1. PREPARING TO INSTALL ON AWS	261
4.1.1. Prerequisites	261
4.1.2. Requirements for installing OpenShift Container Platform on AWS	261
4.1.3. Choosing a method to install OpenShift Container Platform on AWS	261
4.1.3.1. Installing a cluster on a single node	261
4.1.3.2. Installing a cluster on installer-provisioned infrastructure	261
4.1.3.3. Installing a cluster on user-provisioned infrastructure	262
4.1.4. Next steps	262
4.2. CONFIGURING AN AWS ACCOUNT	262
4.2.1. Configuring Route 53	263
4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53	263
4.2.2. AWS account limits	264
4.2.3. Required AWS permissions for the IAM user	266
4.2.4. Creating an IAM user	275
4.2.5. IAM Policies and AWS authentication	275
4.2.5.1. Default permissions for IAM instance profiles	276
4.2.5.2. Specifying an existing IAM role	277
4.2.5.3. Using AWS IAM Analyzer to create policy templates	278
4.2.6. Supported AWS Marketplace regions	279
4.2.7. Supported AWS regions	279
4.2.7.1. AWS public regions	280
4.2.7.2. AWS GovCloud regions	281
4.2.7.3. AWS SC2S and C2S secret regions	281
4.2.7.4. AWS China regions	281
4.2.8. Next steps	281
4.3. INSTALLING A CLUSTER QUICKLY ON AWS	281
4.3.1. Prerequisites	281
4.3.2. Internet access for OpenShift Container Platform	282
4.3.3. Generating a key pair for cluster node SSH access	282

4.3.4. Obtaining the installation program	284
4.3.5. Deploying the cluster	285
4.3.6. Installing the OpenShift CLI by downloading the binary	287
Installing the OpenShift CLI on Linux	288
Installing the OpenShift CLI on Windows	288
Installing the OpenShift CLI on macOS	289
4.3.7. Logging in to the cluster by using the CLI	289
4.3.8. Logging in to the cluster by using the web console	290
4.3.9. Telemetry access for OpenShift Container Platform	291
4.3.10. Next steps	291
4.4. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS	291
4.4.1. Prerequisites	291
4.4.2. Internet access for OpenShift Container Platform	292
4.4.3. Generating a key pair for cluster node SSH access	292
4.4.4. Obtaining an AWS Marketplace image	294
4.4.5. Obtaining the installation program	295
4.4.6. Creating the installation configuration file	296
4.4.6.1. Minimum resource requirements for cluster installation	297
4.4.6.2. Tested instance types for AWS	298
4.4.6.3. Tested instance types for AWS on 64-bit ARM infrastructures	299
4.4.6.4. Sample customized install-config.yaml file for AWS	300
4.4.6.5. Configuring the cluster-wide proxy during installation	302
4.4.7. Installing the OpenShift CLI by downloading the binary	304
Installing the OpenShift CLI on Linux	304
Installing the OpenShift CLI on Windows	305
Installing the OpenShift CLI on macOS	305
4.4.8. Alternatives to storing administrator-level secrets in the kube-system project	306
4.4.8.1. Manually creating long-term credentials	306
4.4.8.2. Configuring an AWS cluster to use short-term credentials	308
4.4.8.2.1. Configuring the Cloud Credential Operator utility	308
4.4.8.2.2. Creating AWS resources with the Cloud Credential Operator utility	311
4.4.8.2.2.1. Creating AWS resources with a single command	312
4.4.8.2.2.2. Creating AWS resources individually	314
4.4.8.2.3. Incorporating the Cloud Credential Operator utility manifests	316
4.4.9. Deploying the cluster	317
4.4.10. Logging in to the cluster by using the CLI	319
4.4.11. Logging in to the cluster by using the web console	319
4.4.12. Telemetry access for OpenShift Container Platform	320
4.4.13. Next steps	321
4.5. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS	321
4.5.1. Prerequisites	321
4.5.2. Internet access for OpenShift Container Platform	321
4.5.3. Generating a key pair for cluster node SSH access	322
4.5.4. Obtaining the installation program	324
4.5.5. Network configuration phases	324
4.5.6. Creating the installation configuration file	325
4.5.6.1. Minimum resource requirements for cluster installation	327
4.5.6.2. Tested instance types for AWS	328
4.5.6.3. Tested instance types for AWS on 64-bit ARM infrastructures	328
4.5.6.4. Sample customized install-config.yaml file for AWS	329
4.5.6.5. Configuring the cluster-wide proxy during installation	332
4.5.7. Installing the OpenShift CLI by downloading the binary	333
Installing the OpenShift CLI on Linux	333

Installing the OpenShift CLI on Windows	334
Installing the OpenShift CLI on macOS	334
4.5.8. Alternatives to storing administrator-level secrets in the kube-system project	335
4.5.8.1. Manually creating long-term credentials	335
4.5.8.2. Configuring an AWS cluster to use short-term credentials	337
4.5.8.2.1. Configuring the Cloud Credential Operator utility	337
4.5.8.2.2. Creating AWS resources with the Cloud Credential Operator utility	341
4.5.8.2.2.1. Creating AWS resources with a single command	341
4.5.8.2.2.2. Creating AWS resources individually	343
4.5.8.2.3. Incorporating the Cloud Credential Operator utility manifests	346
4.5.9. Cluster Network Operator configuration	346
4.5.9.1. Cluster Network Operator configuration object	347
defaultNetwork object configuration	347
Configuration for the OpenShift SDN network plugin	348
Configuration for the OVN-Kubernetes network plugin	349
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	354
4.5.10. Specifying advanced network configuration	354
4.5.11. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster	355
4.5.12. Configuring hybrid networking with OVN-Kubernetes	357
4.5.13. Deploying the cluster	358
4.5.14. Logging in to the cluster by using the CLI	360
4.5.15. Logging in to the cluster by using the web console	360
4.5.16. Telemetry access for OpenShift Container Platform	361
4.5.17. Next steps	362
4.6. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK	362
4.6.1. Prerequisites	362
4.6.2. About installations in restricted networks	363
4.6.2.1. Additional limits	363
4.6.3. About using a custom VPC	363
4.6.3.1. Requirements for using your VPC	363
Option 1: Create VPC endpoints	365
Option 2: Create a proxy without VPC endpoints	365
Option 3: Create a proxy with VPC endpoints	365
4.6.3.2. VPC validation	366
4.6.3.3. Division of permissions	367
4.6.3.4. Isolation between clusters	367
4.6.4. Internet access for OpenShift Container Platform	367
4.6.5. Generating a key pair for cluster node SSH access	368
4.6.6. Creating the installation configuration file	369
4.6.6.1. Minimum resource requirements for cluster installation	372
4.6.6.2. Sample customized install-config.yaml file for AWS	373
4.6.6.3. Configuring the cluster-wide proxy during installation	376
4.6.7. Installing the OpenShift CLI by downloading the binary	378
Installing the OpenShift CLI on Linux	378
Installing the OpenShift CLI on Windows	379
Installing the OpenShift CLI on macOS	379
4.6.8. Alternatives to storing administrator-level secrets in the kube-system project	380
4.6.8.1. Manually creating long-term credentials	380
4.6.8.2. Configuring an AWS cluster to use short-term credentials	382
4.6.8.2.1. Configuring the Cloud Credential Operator utility	382
4.6.8.2.2. Creating AWS resources with the Cloud Credential Operator utility	385
4.6.8.2.2.1. Creating AWS resources with a single command	386
4.6.8.2.2.2. Creating AWS resources individually	388

4.6.8.2.3. Incorporating the Cloud Credential Operator utility manifests	390
4.6.9. Deploying the cluster	391
4.6.10. Logging in to the cluster by using the CLI	393
4.6.11. Disabling the default OperatorHub catalog sources	393
4.6.12. Telemetry access for OpenShift Container Platform	394
4.6.13. Next steps	394
4.7. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC	394
4.7.1. Prerequisites	394
4.7.2. About using a custom VPC	395
4.7.2.1. Requirements for using your VPC	395
Option 1: Create VPC endpoints	397
Option 2: Create a proxy without VPC endpoints	397
Option 3: Create a proxy with VPC endpoints	397
4.7.2.2. VPC validation	398
4.7.2.3. Division of permissions	399
4.7.2.4. Isolation between clusters	399
4.7.2.5. AWS security groups	399
4.7.2.6. Modifying trust policy when installing into a shared VPC	400
4.7.3. Internet access for OpenShift Container Platform	400
4.7.4. Generating a key pair for cluster node SSH access	401
4.7.5. Obtaining the installation program	403
4.7.6. Creating the installation configuration file	403
4.7.6.1. Minimum resource requirements for cluster installation	405
4.7.6.2. Tested instance types for AWS	406
4.7.6.3. Tested instance types for AWS on 64-bit ARM infrastructures	407
4.7.6.4. Sample customized install-config.yaml file for AWS	407
4.7.6.5. Configuring the cluster-wide proxy during installation	410
4.7.6.6. Applying existing AWS security groups to the cluster	412
4.7.7. Installing the OpenShift CLI by downloading the binary	413
Installing the OpenShift CLI on Linux	413
Installing the OpenShift CLI on Windows	414
Installing the OpenShift CLI on macOS	414
4.7.8. Alternatives to storing administrator-level secrets in the kube-system project	415
4.7.8.1. Manually creating long-term credentials	415
4.7.8.2. Configuring an AWS cluster to use short-term credentials	417
4.7.8.2.1. Configuring the Cloud Credential Operator utility	417
4.7.8.2.2. Creating AWS resources with the Cloud Credential Operator utility	420
4.7.8.2.2.1. Creating AWS resources with a single command	421
4.7.8.2.2.2. Creating AWS resources individually	423
4.7.8.2.3. Incorporating the Cloud Credential Operator utility manifests	425
4.7.9. Deploying the cluster	426
4.7.10. Logging in to the cluster by using the CLI	428
4.7.11. Logging in to the cluster by using the web console	428
4.7.12. Telemetry access for OpenShift Container Platform	429
4.7.13. Next steps	430
4.8. INSTALLING A PRIVATE CLUSTER ON AWS	430
4.8.1. Prerequisites	430
4.8.2. Private clusters	430
4.8.2.1. Private clusters in AWS	431
4.8.2.1.1. Limitations	431
4.8.3. About using a custom VPC	432
4.8.3.1. Requirements for using your VPC	432
Option 1: Create VPC endpoints	433

Option 2: Create a proxy without VPC endpoints	433
Option 3: Create a proxy with VPC endpoints	433
4.8.3.2. VPC validation	435
4.8.3.3. Division of permissions	435
4.8.3.4. Isolation between clusters	435
4.8.3.5. AWS security groups	436
4.8.4. Internet access for OpenShift Container Platform	436
4.8.5. Generating a key pair for cluster node SSH access	436
4.8.6. Obtaining the installation program	438
4.8.7. Manually creating the installation configuration file	439
4.8.7.1. Minimum resource requirements for cluster installation	440
4.8.7.2. Tested instance types for AWS	441
4.8.7.3. Tested instance types for AWS on 64-bit ARM infrastructures	442
4.8.7.4. Sample customized install-config.yaml file for AWS	442
4.8.7.5. Configuring the cluster-wide proxy during installation	445
4.8.7.6. Applying existing AWS security groups to the cluster	447
4.8.8. Installing the OpenShift CLI by downloading the binary	448
Installing the OpenShift CLI on Linux	448
Installing the OpenShift CLI on Windows	449
Installing the OpenShift CLI on macOS	449
4.8.9. Alternatives to storing administrator-level secrets in the kube-system project	450
4.8.9.1. Manually creating long-term credentials	450
4.8.9.2. Configuring an AWS cluster to use short-term credentials	452
4.8.9.2.1. Configuring the Cloud Credential Operator utility	452
4.8.9.2.2. Creating AWS resources with the Cloud Credential Operator utility	455
4.8.9.2.2.1. Creating AWS resources with a single command	456
4.8.9.2.2.2. Creating AWS resources individually	458
4.8.9.2.3. Incorporating the Cloud Credential Operator utility manifests	460
4.8.10. Deploying the cluster	461
4.8.11. Logging in to the cluster by using the CLI	463
4.8.12. Logging in to the cluster by using the web console	463
4.8.13. Telemetry access for OpenShift Container Platform	464
4.8.14. Next steps	465
4.9. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION	465
4.9.1. Prerequisites	465
4.9.2. AWS government regions	465
4.9.3. Installation requirements	465
4.9.4. Private clusters	466
4.9.4.1. Private clusters in AWS	466
4.9.4.1.1. Limitations	467
4.9.5. About using a custom VPC	467
4.9.5.1. Requirements for using your VPC	467
Option 1: Create VPC endpoints	468
Option 2: Create a proxy without VPC endpoints	468
Option 3: Create a proxy with VPC endpoints	469
4.9.5.2. VPC validation	470
4.9.5.3. Division of permissions	471
4.9.5.4. Isolation between clusters	471
4.9.5.5. AWS security groups	471
4.9.6. Internet access for OpenShift Container Platform	471
4.9.7. Generating a key pair for cluster node SSH access	472
4.9.8. Obtaining an AWS Marketplace image	474
4.9.9. Obtaining the installation program	474

4.9.10. Manually creating the installation configuration file	475
4.9.10.1. Minimum resource requirements for cluster installation	476
4.9.10.2. Tested instance types for AWS	477
4.9.10.3. Tested instance types for AWS on 64-bit ARM infrastructures	478
4.9.10.4. Sample customized install-config.yaml file for AWS	478
4.9.10.5. Configuring the cluster-wide proxy during installation	481
4.9.10.6. Applying existing AWS security groups to the cluster	483
4.9.11. Installing the OpenShift CLI by downloading the binary	484
Installing the OpenShift CLI on Linux	484
Installing the OpenShift CLI on Windows	485
Installing the OpenShift CLI on macOS	485
4.9.12. Alternatives to storing administrator-level secrets in the kube-system project	486
4.9.12.1. Manually creating long-term credentials	486
4.9.12.2. Configuring an AWS cluster to use short-term credentials	488
4.9.12.2.1. Configuring the Cloud Credential Operator utility	488
4.9.12.2.2. Creating AWS resources with the Cloud Credential Operator utility	492
4.9.12.2.2.1. Creating AWS resources with a single command	492
4.9.12.2.2.2. Creating AWS resources individually	494
4.9.12.2.3. Incorporating the Cloud Credential Operator utility manifests	497
4.9.13. Deploying the cluster	497
4.9.14. Logging in to the cluster by using the CLI	499
4.9.15. Logging in to the cluster by using the web console	500
4.9.16. Telemetry access for OpenShift Container Platform	500
4.9.17. Next steps	501
4.10. INSTALLING A CLUSTER ON AWS INTO A SECRET OR TOP SECRET REGION	501
4.10.1. Prerequisites	501
4.10.2. AWS secret regions	501
4.10.3. Installation requirements	502
4.10.4. Private clusters	502
4.10.4.1. Private clusters in AWS	503
4.10.4.1.1. Limitations	503
4.10.5. About using a custom VPC	504
4.10.5.1. Requirements for using your VPC	504
Option 1: Create VPC endpoints	505
Option 2: Create a proxy without VPC endpoints	505
Option 3: Create a proxy with VPC endpoints	505
4.10.5.2. VPC validation	507
4.10.5.3. Division of permissions	507
4.10.5.4. Isolation between clusters	508
4.10.5.5. AWS security groups	508
4.10.6. Internet access for OpenShift Container Platform	508
4.10.7. Uploading a custom RHCOS AMI in AWS	509
4.10.8. Generating a key pair for cluster node SSH access	511
4.10.9. Obtaining the installation program	513
4.10.10. Manually creating the installation configuration file	513
4.10.10.1. Tested instance types for AWS	514
4.10.10.2. Sample customized install-config.yaml file for AWS	515
4.10.10.3. Configuring the cluster-wide proxy during installation	518
4.10.10.4. Applying existing AWS security groups to the cluster	520
4.10.11. Installing the OpenShift CLI by downloading the binary	521
Installing the OpenShift CLI on Linux	521
Installing the OpenShift CLI on Windows	522
Installing the OpenShift CLI on macOS	522

4.10.12. Alternatives to storing administrator-level secrets in the kube-system project	523
4.10.12.1. Manually creating long-term credentials	523
4.10.12.2. Configuring an AWS cluster to use short-term credentials	525
4.10.12.2.1. Configuring the Cloud Credential Operator utility	525
4.10.12.2.2. Creating AWS resources with the Cloud Credential Operator utility	528
4.10.12.2.2.1. Creating AWS resources with a single command	528
4.10.12.2.2.2. Creating AWS resources individually	530
4.10.12.2.3. Incorporating the Cloud Credential Operator utility manifests	533
4.10.13. Deploying the cluster	534
4.10.14. Logging in to the cluster by using the CLI	535
4.10.15. Logging in to the cluster by using the web console	536
4.10.16. Telemetry access for OpenShift Container Platform	537
4.10.17. Next steps	537
4.11. INSTALLING A CLUSTER ON AWS CHINA	537
4.11.1. Prerequisites	538
4.11.2. Installation requirements	538
4.11.3. Internet access for OpenShift Container Platform	538
4.11.4. Private clusters	539
4.11.4.1. Private clusters in AWS	539
4.11.4.1.1. Limitations	540
4.11.5. About using a custom VPC	540
4.11.5.1. Requirements for using your VPC	540
Option 1: Create VPC endpoints	541
Option 2: Create a proxy without VPC endpoints	542
Option 3: Create a proxy with VPC endpoints	542
4.11.5.2. VPC validation	543
4.11.5.3. Division of permissions	544
4.11.5.4. Isolation between clusters	544
4.11.5.5. AWS security groups	544
4.11.6. Generating a key pair for cluster node SSH access	544
4.11.7. Uploading a custom RHCOS AMI in AWS	546
4.11.8. Obtaining the installation program	548
4.11.9. Manually creating the installation configuration file	549
4.11.9.1. Sample customized install-config.yaml file for AWS	550
4.11.9.2. Minimum resource requirements for cluster installation	553
4.11.9.3. Tested instance types for AWS	554
4.11.9.4. Tested instance types for AWS on 64-bit ARM infrastructures	555
4.11.9.5. Configuring the cluster-wide proxy during installation	555
4.11.9.6. Applying existing AWS security groups to the cluster	557
4.11.10. Installing the OpenShift CLI by downloading the binary	558
Installing the OpenShift CLI on Linux	558
Installing the OpenShift CLI on Windows	559
Installing the OpenShift CLI on macOS	559
4.11.11. Alternatives to storing administrator-level secrets in the kube-system project	560
4.11.11.1. Manually creating long-term credentials	560
4.11.11.2. Configuring an AWS cluster to use short-term credentials	562
4.11.11.2.1. Configuring the Cloud Credential Operator utility	563
4.11.11.2.2. Creating AWS resources with the Cloud Credential Operator utility	566
4.11.11.2.2.1. Creating AWS resources with a single command	566
4.11.11.2.2.2. Creating AWS resources individually	568
4.11.11.2.3. Incorporating the Cloud Credential Operator utility manifests	571
4.11.12. Deploying the cluster	571
4.11.13. Logging in to the cluster by using the CLI	573

4.11.14. Logging in to the cluster by using the web console	574
4.11.15. Telemetry access for OpenShift Container Platform	574
4.11.16. Next steps	575
4.12. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES	575
4.12.1. Prerequisites	575
4.12.2. Internet access for OpenShift Container Platform	576
4.12.3. Requirements for a cluster with user-provisioned infrastructure	576
4.12.3.1. Required machines for cluster installation	576
4.12.3.2. Minimum resource requirements for cluster installation	577
4.12.3.3. Tested instance types for AWS	578
4.12.3.4. Tested instance types for AWS on 64-bit ARM infrastructures	579
4.12.3.5. Certificate signing requests management	579
4.12.4. Required AWS infrastructure components	580
4.12.4.1. Other infrastructure components	580
Option 1: Create VPC endpoints	580
Option 2: Create a proxy without VPC endpoints	581
Option 3: Create a proxy with VPC endpoints	581
4.12.4.2. Cluster machines	588
4.12.4.3. Required AWS permissions for the IAM user	588
4.12.5. Obtaining an AWS Marketplace image	597
4.12.6. Obtaining the installation program	597
4.12.7. Generating a key pair for cluster node SSH access	598
4.12.8. Creating the installation files for AWS	600
4.12.8.1. Optional: Creating a separate /var partition	600
4.12.8.2. Creating the installation configuration file	602
4.12.8.3. Configuring the cluster-wide proxy during installation	604
4.12.8.4. Creating the Kubernetes manifest and Ignition config files	606
4.12.9. Extracting the infrastructure name	608
4.12.10. Creating a VPC in AWS	609
4.12.10.1. CloudFormation template for the VPC	611
4.12.11. Creating networking and load balancing components in AWS	616
4.12.11.1. CloudFormation template for the network and load balancers	620
4.12.12. Creating security group and roles in AWS	628
4.12.12.1. CloudFormation template for security objects	631
4.12.13. Accessing RHCOS AMIs with stream metadata	642
4.12.14. RHCOS AMIs for the AWS infrastructure	642
4.12.14.1. AWS regions without a published RHCOS AMI	645
4.12.14.2. Uploading a custom RHCOS AMI in AWS	646
4.12.15. Creating the bootstrap node in AWS	648
4.12.15.1. CloudFormation template for the bootstrap machine	653
4.12.16. Creating the control plane machines in AWS	657
4.12.16.1. CloudFormation template for control plane machines	661
4.12.17. Creating the worker nodes in AWS	667
4.12.17.1. CloudFormation template for worker machines	670
4.12.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	673
4.12.19. Installing the OpenShift CLI by downloading the binary	674
Installing the OpenShift CLI on Linux	674
Installing the OpenShift CLI on Windows	675
Installing the OpenShift CLI on macOS	675
4.12.20. Logging in to the cluster by using the CLI	676
4.12.21. Approving the certificate signing requests for your machines	676
4.12.22. Initial Operator configuration	679

4.12.22.1. Image registry storage configuration	680
4.12.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure	680
4.12.22.1.2. Configuring storage for the image registry in non-production clusters	681
4.12.23. Deleting the bootstrap resources	682
4.12.24. Creating the Ingress DNS Records	682
4.12.25. Completing an AWS installation on user-provisioned infrastructure	685
4.12.26. Logging in to the cluster by using the web console	686
4.12.27. Telemetry access for OpenShift Container Platform	687
4.12.28. Additional resources	687
4.12.29. Next steps	687
4.13. INSTALLING A CLUSTER ON AWS WITH WORKER NODES ON AWS LOCAL ZONES	687
4.13.1. Prerequisites	688
4.13.2. Cluster limitations in AWS Local Zones	689
4.13.3. Internet access for OpenShift Container Platform	690
4.13.4. Obtaining an AWS Marketplace image	690
4.13.5. Installing the OpenShift CLI by downloading the binary	691
Installing the OpenShift CLI on Linux	691
Installing the OpenShift CLI on Windows	691
Installing the OpenShift CLI on macOS	692
4.13.6. Preparing for the installation	693
4.13.6.1. Obtaining the installation program	693
4.13.6.2. Generating a key pair for cluster node SSH access	693
4.13.6.3. Creating the installation files for AWS	695
4.13.6.4. Minimum resource requirements for cluster installation	695
4.13.6.5. Tested instance types for AWS	696
4.13.6.6. Creating the installation configuration file	697
4.13.6.7. Edge compute pools and AWS Local Zones	698
4.13.7. Opting in to AWS Local Zones	701
4.13.8. Cluster installation options for an AWS Local Zones environment	702
4.13.9. Install a cluster quickly in AWS Local Zones	702
4.13.9.1. Modifying an installation configuration file to use AWS Local Zones	702
4.13.10. Installing a cluster in an existing VPC that has Local Zone subnets	704
4.13.10.1. Creating a VPC in AWS	704
4.13.10.2. Creating a subnet in AWS Local Zones	706
4.13.10.3. CloudFormation template for the VPC	708
4.13.10.4. AWS security groups	713
4.13.10.5. CloudFormation template for the subnet that uses AWS Local Zones	714
4.13.10.6. Modifying an installation configuration file to use AWS Local Zones subnets	715
4.13.11. Deploying the cluster	716
4.13.12. Logging in to the cluster by using the CLI	717
4.13.13. Logging in to the cluster by using the web console	718
4.13.14. Verifying nodes that were created with edge compute pool	719
4.13.15. Telemetry access for OpenShift Container Platform	720
4.13.16. Next steps	720
4.14. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	720
4.14.1. Prerequisites	720
4.14.2. About installations in restricted networks	721
4.14.2.1. Additional limits	722
4.14.3. Internet access for OpenShift Container Platform	722
4.14.4. Requirements for a cluster with user-provisioned infrastructure	722
4.14.4.1. Required machines for cluster installation	722
4.14.4.2. Minimum resource requirements for cluster installation	723

4.14.4.3. Tested instance types for AWS	724
4.14.4.4. Tested instance types for AWS on 64-bit ARM infrastructures	725
4.14.4.5. Certificate signing requests management	725
4.14.5. Required AWS infrastructure components	725
4.14.5.1. Other infrastructure components	726
Option 1: Create VPC endpoints	726
Option 2: Create a proxy without VPC endpoints	727
Option 3: Create a proxy with VPC endpoints	727
4.14.5.2. Cluster machines	734
4.14.5.3. Required AWS permissions for the IAM user	734
4.14.6. Generating a key pair for cluster node SSH access	742
4.14.7. Creating the installation files for AWS	744
4.14.7.1. Optional: Creating a separate /var partition	744
4.14.7.2. Creating the installation configuration file	747
4.14.7.3. Configuring the cluster-wide proxy during installation	749
4.14.7.4. Creating the Kubernetes manifest and Ignition config files	751
4.14.8. Extracting the infrastructure name	753
4.14.9. Creating a VPC in AWS	754
4.14.9.1. CloudFormation template for the VPC	756
4.14.10. Creating networking and load balancing components in AWS	761
4.14.10.1. CloudFormation template for the network and load balancers	765
4.14.11. Creating security group and roles in AWS	773
4.14.11.1. CloudFormation template for security objects	775
4.14.12. Accessing RHCOS AMIs with stream metadata	786
4.14.13. RHCOS AMIs for the AWS infrastructure	787
4.14.14. Creating the bootstrap node in AWS	790
4.14.14.1. CloudFormation template for the bootstrap machine	795
4.14.15. Creating the control plane machines in AWS	799
4.14.15.1. CloudFormation template for control plane machines	804
4.14.16. Creating the worker nodes in AWS	809
4.14.16.1. CloudFormation template for worker machines	812
4.14.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure	815
4.14.18. Logging in to the cluster by using the CLI	816
4.14.19. Approving the certificate signing requests for your machines	816
4.14.20. Initial Operator configuration	819
4.14.20.1. Disabling the default OperatorHub catalog sources	820
4.14.20.2. Image registry storage configuration	821
4.14.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure	821
4.14.20.2.2. Configuring storage for the image registry in non-production clusters	822
4.14.21. Deleting the bootstrap resources	822
4.14.22. Creating the Ingress DNS Records	823
4.14.23. Completing an AWS installation on user-provisioned infrastructure	825
4.14.24. Logging in to the cluster by using the web console	826
4.14.25. Telemetry access for OpenShift Container Platform	827
4.14.26. Additional resources	828
4.14.27. Next steps	828
4.15. INSTALLING A CLUSTER ON AWS WITH REMOTE WORKERS ON AWS OUTPOSTS	828
4.15.1. Prerequisites	829
4.15.2. About using a custom VPC	829
4.15.2.1. Requirements for using your VPC	829
Option 1: Create VPC endpoints	831
Option 2: Create a proxy without VPC endpoints	831
Option 3: Create a proxy with VPC endpoints	832

4.15.2.2. VPC validation	833
4.15.2.3. Division of permissions	834
4.15.2.4. Isolation between clusters	834
4.15.2.5. AWS security groups	834
4.15.3. Internet access for OpenShift Container Platform	834
4.15.4. Generating a key pair for cluster node SSH access	835
4.15.5. Obtaining the installation program	837
4.15.6. Minimum resource requirements for cluster installation	837
4.15.7. Identifying your AWS Outposts instance types	839
4.15.8. Creating the installation configuration file	839
4.15.8.1. Sample customized install-config.yaml file for AWS	841
4.15.8.2. Applying existing AWS security groups to the cluster	843
4.15.9. Generating manifest files	844
4.15.9.1. Modifying manifest files	845
4.15.10. Installing the OpenShift CLI by downloading the binary	846
Installing the OpenShift CLI on Linux	846
Installing the OpenShift CLI on Windows	847
Installing the OpenShift CLI on macOS	847
4.15.11. Alternatives to storing administrator-level secrets in the kube-system project	848
4.15.11.1. Manually creating long-term credentials	848
4.15.11.2. Configuring an AWS cluster to use short-term credentials	850
4.15.11.2.1. Configuring the Cloud Credential Operator utility	850
4.15.11.2.2. Creating AWS resources with the Cloud Credential Operator utility	853
4.15.11.2.2.1. Creating AWS resources with a single command	854
4.15.11.2.2.2. Creating AWS resources individually	855
4.15.11.2.3. Incorporating the Cloud Credential Operator utility manifests	858
4.15.12. Deploying the cluster	859
4.15.13. Logging in to the cluster by using the CLI	861
4.15.14. Logging in to the cluster by using the web console	861
4.15.15. Telemetry access for OpenShift Container Platform	862
4.15.16. Cluster Limitations	863
4.15.17. Next steps	863
4.16. INSTALLING A THREE-NODE CLUSTER ON AWS	863
4.16.1. Configuring a three-node cluster	864
4.16.2. Next steps	865
4.17. UNINSTALLING A CLUSTER ON AWS	865
4.17.1. Removing a cluster that uses installer-provisioned infrastructure	865
4.17.2. Deleting Amazon Web Services resources with the Cloud Credential Operator utility	866
4.17.3. Deleting a cluster with a configured AWS Local Zone infrastructure	867
4.18. INSTALLATION CONFIGURATION PARAMETERS FOR AWS	868
4.18.1. Available installation configuration parameters for AWS	868
4.18.1.1. Required configuration parameters	868
4.18.1.2. Network configuration parameters	870
4.18.1.3. Optional configuration parameters	872
4.18.1.4. Optional AWS configuration parameters	878
CHAPTER 5. INSTALLING ON AZURE	885
5.1. PREPARING TO INSTALL ON AZURE	885
5.1.1. Prerequisites	885
5.1.2. Requirements for installing OpenShift Container Platform on Azure	885
5.1.3. Choosing a method to install OpenShift Container Platform on Azure	885
5.1.3.1. Installing a cluster on installer-provisioned infrastructure	885
5.1.3.2. Installing a cluster on user-provisioned infrastructure	886

5.1.4. Next steps	886
5.2. CONFIGURING AN AZURE ACCOUNT	886
5.2.1. Azure account limits	886
5.2.2. Configuring a public DNS zone in Azure	889
5.2.3. Increasing Azure account limits	889
5.2.4. Recording the subscription and tenant IDs	890
5.2.5. Supported identities to access Azure resources	892
5.2.5.1. Required Azure roles	892
5.2.5.2. Required Azure permissions for installer-provisioned infrastructure	892
5.2.5.3. Using Azure managed identities	900
5.2.5.4. Creating a service principal	900
5.2.6. Supported Azure Marketplace regions	901
5.2.7. Supported Azure regions	902
Supported Azure public regions	902
Supported Azure Government regions	903
5.2.8. Next steps	903
5.3. ENABLING USER-MANAGED ENCRYPTION FOR AZURE	903
5.3.1. Preparing an Azure Disk Encryption Set	904
5.3.2. Next steps	906
5.4. INSTALLING A CLUSTER QUICKLY ON AZURE	906
5.4.1. Prerequisites	906
5.4.2. Internet access for OpenShift Container Platform	906
5.4.3. Generating a key pair for cluster node SSH access	907
5.4.4. Obtaining the installation program	908
5.4.5. Deploying the cluster	909
5.4.6. Installing the OpenShift CLI by downloading the binary	912
Installing the OpenShift CLI on Linux	912
Installing the OpenShift CLI on Windows	913
Installing the OpenShift CLI on macOS	913
5.4.7. Logging in to the cluster by using the CLI	914
5.4.8. Telemetry access for OpenShift Container Platform	914
5.4.9. Next steps	915
5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS	915
5.5.1. Prerequisites	915
5.5.2. Internet access for OpenShift Container Platform	915
5.5.3. Generating a key pair for cluster node SSH access	915
5.5.4. Using the Azure Marketplace offering	917
5.5.5. Obtaining the installation program	920
5.5.6. Creating the installation configuration file	920
5.5.6.1. Minimum resource requirements for cluster installation	923
5.5.6.2. Tested instance types for Azure	924
5.5.6.3. Tested instance types for Azure on 64-bit ARM infrastructures	925
5.5.6.4. Enabling trusted launch for Azure VMs	925
5.5.6.5. Enabling confidential VMs	926
5.5.6.6. Sample customized install-config.yaml file for Azure	927
5.5.6.7. Configuring the cluster-wide proxy during installation	930
5.5.7. Configuring user-defined tags for Azure	932
5.5.8. Querying user-defined tags for Azure	934
5.5.9. Installing the OpenShift CLI by downloading the binary	935
Installing the OpenShift CLI on Linux	935
Installing the OpenShift CLI on Windows	935
Installing the OpenShift CLI on macOS	936
5.5.10. Alternatives to storing administrator-level secrets in the kube-system project	936

5.5.10.1. Manually creating long-term credentials	937
5.5.10.2. Configuring an Azure cluster to use short-term credentials	939
5.5.10.2.1. Configuring the Cloud Credential Operator utility	939
5.5.10.2.2. Creating Azure resources with the Cloud Credential Operator utility	941
5.5.10.2.3. Incorporating the Cloud Credential Operator utility manifests	943
5.5.11. Deploying the cluster	944
5.5.12. Logging in to the cluster by using the CLI	946
5.5.13. Telemetry access for OpenShift Container Platform	946
5.5.14. Next steps	947
5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS	947
5.6.1. Prerequisites	947
5.6.2. Internet access for OpenShift Container Platform	947
5.6.3. Generating a key pair for cluster node SSH access	948
5.6.4. Obtaining the installation program	950
5.6.5. Creating the installation configuration file	950
5.6.5.1. Minimum resource requirements for cluster installation	953
5.6.5.2. Tested instance types for Azure	954
5.6.5.3. Tested instance types for Azure on 64-bit ARM infrastructures	955
5.6.5.4. Enabling trusted launch for Azure VMs	955
5.6.5.5. Enabling confidential VMs	956
5.6.5.6. Sample customized install-config.yaml file for Azure	957
5.6.5.7. Configuring the cluster-wide proxy during installation	960
5.6.6. Network configuration phases	962
5.6.7. Specifying advanced network configuration	962
5.6.8. Cluster Network Operator configuration	963
5.6.8.1. Cluster Network Operator configuration object	964
defaultNetwork object configuration	965
Configuration for the OpenShift SDN network plugin	965
Configuration for the OVN-Kubernetes network plugin	966
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	971
5.6.9. Configuring hybrid networking with OVN-Kubernetes	971
5.6.10. Installing the OpenShift CLI by downloading the binary	973
Installing the OpenShift CLI on Linux	973
Installing the OpenShift CLI on Windows	974
Installing the OpenShift CLI on macOS	974
5.6.11. Alternatives to storing administrator-level secrets in the kube-system project	975
5.6.11.1. Manually creating long-term credentials	975
5.6.11.2. Configuring an Azure cluster to use short-term credentials	977
5.6.11.2.1. Configuring the Cloud Credential Operator utility	977
5.6.11.2.2. Creating Azure resources with the Cloud Credential Operator utility	979
5.6.11.2.3. Incorporating the Cloud Credential Operator utility manifests	981
5.6.12. Deploying the cluster	983
5.6.13. Logging in to the cluster by using the CLI	984
5.6.14. Telemetry access for OpenShift Container Platform	985
5.6.15. Next steps	985
5.7. INSTALLING A CLUSTER ON AZURE INTO AN EXISTING VNET	985
5.7.1. Prerequisites	985
5.7.2. About reusing a VNet for your OpenShift Container Platform cluster	985
5.7.2.1. Requirements for using your VNet	986
5.7.2.1.1. Network security group requirements	987
5.7.2.2. Division of permissions	989
5.7.2.3. Isolation between clusters	989
5.7.3. Internet access for OpenShift Container Platform	989

5.7.4. Generating a key pair for cluster node SSH access	990
5.7.5. Obtaining the installation program	991
5.7.6. Creating the installation configuration file	992
5.7.6.1. Minimum resource requirements for cluster installation	995
5.7.6.2. Tested instance types for Azure	996
5.7.6.3. Tested instance types for Azure on 64-bit ARM infrastructures	996
5.7.6.4. Enabling trusted launch for Azure VMs	997
5.7.6.5. Enabling confidential VMs	998
5.7.6.6. Sample customized install-config.yaml file for Azure	999
5.7.6.7. Configuring the cluster-wide proxy during installation	1002
5.7.7. Installing the OpenShift CLI by downloading the binary	1004
Installing the OpenShift CLI on Linux	1004
Installing the OpenShift CLI on Windows	1004
Installing the OpenShift CLI on macOS	1005
5.7.8. Alternatives to storing administrator-level secrets in the kube-system project	1005
5.7.8.1. Manually creating long-term credentials	1006
5.7.8.2. Configuring an Azure cluster to use short-term credentials	1008
5.7.8.2.1. Configuring the Cloud Credential Operator utility	1008
5.7.8.2.2. Creating Azure resources with the Cloud Credential Operator utility	1010
5.7.8.2.3. Incorporating the Cloud Credential Operator utility manifests	1012
5.7.9. Deploying the cluster	1013
5.7.10. Telemetry access for OpenShift Container Platform	1015
5.7.11. Next steps	1015
5.8. INSTALLING A PRIVATE CLUSTER ON AZURE	1015
5.8.1. Prerequisites	1015
5.8.2. Private clusters	1016
5.8.2.1. Private clusters in Azure	1016
5.8.2.1.1. Limitations	1017
5.8.2.2. User-defined outbound routing	1017
Private cluster with network address translation	1017
Private cluster with Azure Firewall	1018
Private cluster with a proxy configuration	1018
Private cluster with no internet access	1018
5.8.3. About reusing a VNet for your OpenShift Container Platform cluster	1018
5.8.3.1. Requirements for using your VNet	1018
5.8.3.1.1. Network security group requirements	1019
5.8.3.2. Division of permissions	1021
5.8.3.3. Isolation between clusters	1022
5.8.4. Internet access for OpenShift Container Platform	1022
5.8.5. Generating a key pair for cluster node SSH access	1022
5.8.6. Obtaining the installation program	1024
5.8.7. Manually creating the installation configuration file	1025
5.8.7.1. Minimum resource requirements for cluster installation	1026
5.8.7.2. Tested instance types for Azure	1027
5.8.7.3. Tested instance types for Azure on 64-bit ARM infrastructures	1028
5.8.7.4. Enabling trusted launch for Azure VMs	1028
5.8.7.5. Enabling confidential VMs	1029
5.8.7.6. Sample customized install-config.yaml file for Azure	1030
5.8.7.7. Configuring the cluster-wide proxy during installation	1033
5.8.8. Installing the OpenShift CLI by downloading the binary	1035
Installing the OpenShift CLI on Linux	1035
Installing the OpenShift CLI on Windows	1036
Installing the OpenShift CLI on macOS	1036

5.8.9. Alternatives to storing administrator-level secrets in the kube-system project	1037
5.8.9.1. Manually creating long-term credentials	1037
5.8.9.2. Configuring an Azure cluster to use short-term credentials	1039
5.8.9.2.1. Configuring the Cloud Credential Operator utility	1039
5.8.9.2.2. Creating Azure resources with the Cloud Credential Operator utility	1041
5.8.9.2.3. Incorporating the Cloud Credential Operator utility manifests	1044
5.8.10. Deploying the cluster	1045
5.8.11. Logging in to the cluster by using the CLI	1047
5.8.12. Telemetry access for OpenShift Container Platform	1048
5.8.13. Next steps	1048
5.9. INSTALLING A CLUSTER ON AZURE INTO A GOVERNMENT REGION	1048
5.9.1. Prerequisites	1048
5.9.2. Azure government regions	1048
5.9.3. Private clusters	1049
5.9.3.1. Private clusters in Azure	1049
5.9.3.1.1. Limitations	1050
5.9.3.2. User-defined outbound routing	1050
5.9.4. About reusing a VNet for your OpenShift Container Platform cluster	1051
5.9.4.1. Requirements for using your VNet	1051
5.9.4.1.1. Network security group requirements	1052
5.9.4.2. Division of permissions	1054
5.9.4.3. Isolation between clusters	1054
5.9.5. Internet access for OpenShift Container Platform	1054
5.9.6. Generating a key pair for cluster node SSH access	1055
5.9.7. Obtaining the installation program	1056
5.9.8. Manually creating the installation configuration file	1057
5.9.8.1. Minimum resource requirements for cluster installation	1058
5.9.8.2. Tested instance types for Azure	1059
5.9.8.3. Enabling trusted launch for Azure VMs	1060
5.9.8.4. Enabling confidential VMs	1061
5.9.8.5. Sample customized install-config.yaml file for Azure	1062
5.9.8.6. Configuring the cluster-wide proxy during installation	1065
5.9.9. Deploying the cluster	1067
5.9.10. Installing the OpenShift CLI by downloading the binary	1069
Installing the OpenShift CLI on Linux	1069
Installing the OpenShift CLI on Windows	1070
Installing the OpenShift CLI on macOS	1071
5.9.11. Logging in to the cluster by using the CLI	1071
5.9.12. Telemetry access for OpenShift Container Platform	1072
5.9.13. Next steps	1072
5.10. INSTALLING A CLUSTER ON AZURE IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	1072
5.10.1. About installations in restricted networks	1073
5.10.1.1. Additional limits	1073
5.10.1.2. Internet access for OpenShift Container Platform	1074
5.10.2. Configuring your Azure project	1074
5.10.2.1. Azure account limits	1074
5.10.2.2. Configuring a public DNS zone in Azure	1077
5.10.2.3. Increasing Azure account limits	1077
5.10.2.4. Certificate signing requests management	1078
5.10.2.5. Required Azure roles	1078
5.10.2.6. Required Azure permissions for user-provisioned infrastructure	1079
5.10.2.7. Creating a service principal	1085

5.10.2.8. Supported Azure regions	1087
Supported Azure public regions	1087
Supported Azure Government regions	1089
5.10.3. Requirements for a cluster with user-provisioned infrastructure	1089
5.10.3.1. Required machines for cluster installation	1089
5.10.3.2. Minimum resource requirements for cluster installation	1090
5.10.3.3. Tested instance types for Azure	1091
5.10.3.4. Tested instance types for Azure on 64-bit ARM infrastructures	1092
5.10.4. Using the Azure Marketplace offering	1092
5.10.4.1. Obtaining the installation program	1094
5.10.4.2. Generating a key pair for cluster node SSH access	1095
5.10.5. Creating the installation files for Azure	1097
5.10.5.1. Optional: Creating a separate /var partition	1097
5.10.5.2. Creating the installation configuration file	1100
5.10.5.3. Configuring the cluster-wide proxy during installation	1103
5.10.5.4. Exporting common variables for ARM templates	1105
5.10.5.5. Creating the Kubernetes manifest and Ignition config files	1106
5.10.6. Creating the Azure resource group	1109
5.10.7. Uploading the RHCOS cluster image and bootstrap Ignition config file	1110
5.10.8. Example for creating DNS zones	1111
5.10.9. Creating a VNet in Azure	1112
5.10.9.1. ARM template for the VNet	1113
5.10.10. Deploying the RHCOS cluster image for the Azure infrastructure	1114
5.10.10.1. ARM template for image storage	1115
5.10.11. Networking requirements for user-provisioned infrastructure	1118
5.10.11.1. Network connectivity requirements	1118
5.10.12. Creating networking and load balancing components in Azure	1120
5.10.12.1. ARM template for the network and load balancers	1121
5.10.13. Creating the bootstrap machine in Azure	1125
5.10.13.1. ARM template for the bootstrap machine	1127
5.10.14. Creating the control plane machines in Azure	1130
5.10.14.1. ARM template for control plane machines	1131
5.10.15. Wait for bootstrap completion and remove bootstrap resources in Azure	1135
5.10.16. Creating additional worker machines in Azure	1136
5.10.16.1. ARM template for worker machines	1137
5.10.17. Installing the OpenShift CLI by downloading the binary	1141
Installing the OpenShift CLI on Linux	1141
Installing the OpenShift CLI on Windows	1142
Installing the OpenShift CLI on macOS	1142
5.10.18. Logging in to the cluster by using the CLI	1143
5.10.19. Approving the certificate signing requests for your machines	1143
5.10.20. Adding the Ingress DNS records	1146
5.10.21. Completing an Azure installation on user-provisioned infrastructure	1147
5.10.22. Telemetry access for OpenShift Container Platform	1148
5.11. INSTALLING A CLUSTER ON AZURE USING ARM TEMPLATES	1148
5.11.1. Prerequisites	1149
5.11.2. Internet access for OpenShift Container Platform	1149
5.11.3. Configuring your Azure project	1150
5.11.3.1. Azure account limits	1150
5.11.3.2. Configuring a public DNS zone in Azure	1153
5.11.3.3. Increasing Azure account limits	1153
5.11.3.4. Certificate signing requests management	1154
5.11.3.5. Recording the subscription and tenant IDs	1154

5.11.3.6. Supported identities to access Azure resources	1156
5.11.3.7. Required Azure permissions for user-provisioned infrastructure	1156
5.11.3.8. Using Azure managed identities	1162
5.11.3.9. Creating a service principal	1163
5.11.3.10. Supported Azure regions	1164
Supported Azure public regions	1164
Supported Azure Government regions	1165
5.11.4. Requirements for a cluster with user-provisioned infrastructure	1166
5.11.4.1. Required machines for cluster installation	1166
5.11.4.2. Minimum resource requirements for cluster installation	1166
5.11.4.3. Tested instance types for Azure	1168
5.11.4.4. Tested instance types for Azure on 64-bit ARM infrastructures	1168
5.11.5. Using the Azure Marketplace offering	1169
5.11.6. Obtaining the installation program	1171
5.11.7. Generating a key pair for cluster node SSH access	1172
5.11.8. Creating the installation files for Azure	1174
5.11.8.1. Optional: Creating a separate /var partition	1174
5.11.8.2. Creating the installation configuration file	1176
5.11.8.3. Configuring the cluster-wide proxy during installation	1179
5.11.8.4. Exporting common variables for ARM templates	1180
5.11.8.5. Creating the Kubernetes manifest and Ignition config files	1182
5.11.9. Creating the Azure resource group	1185
5.11.10. Uploading the RHCOS cluster image and bootstrap Ignition config file	1186
5.11.11. Example for creating DNS zones	1187
5.11.12. Creating a VNet in Azure	1188
5.11.12.1. ARM template for the VNet	1189
5.11.13. Deploying the RHCOS cluster image for the Azure infrastructure	1190
5.11.13.1. ARM template for image storage	1191
5.11.14. Networking requirements for user-provisioned infrastructure	1194
5.11.14.1. Network connectivity requirements	1194
5.11.15. Creating networking and load balancing components in Azure	1196
5.11.15.1. ARM template for the network and load balancers	1197
5.11.16. Creating the bootstrap machine in Azure	1201
5.11.16.1. ARM template for the bootstrap machine	1203
5.11.17. Creating the control plane machines in Azure	1206
5.11.17.1. ARM template for control plane machines	1207
5.11.18. Wait for bootstrap completion and remove bootstrap resources in Azure	1211
5.11.19. Creating additional worker machines in Azure	1212
5.11.19.1. ARM template for worker machines	1213
5.11.20. Installing the OpenShift CLI by downloading the binary	1217
Installing the OpenShift CLI on Linux	1217
Installing the OpenShift CLI on Windows	1218
Installing the OpenShift CLI on macOS	1218
5.11.21. Logging in to the cluster by using the CLI	1219
5.11.22. Approving the certificate signing requests for your machines	1219
5.11.23. Adding the Ingress DNS records	1222
5.11.24. Completing an Azure installation on user-provisioned infrastructure	1223
5.11.25. Telemetry access for OpenShift Container Platform	1224
5.12. INSTALLING A CLUSTER ON AZURE IN A RESTRICTED NETWORK	1224
5.12.1. Prerequisites	1225
5.12.2. About installations in restricted networks	1225
5.12.2.1. Additional limits	1226
5.12.2.2. User-defined outbound routing	1226

Restricted cluster with Azure Firewall	1226
5.12.3. About reusing a VNet for your OpenShift Container Platform cluster	1227
5.12.3.1. Requirements for using your VNet	1227
5.12.3.1.1. Network security group requirements	1228
5.12.3.2. Division of permissions	1230
5.12.3.3. Isolation between clusters	1230
5.12.4. Internet access for OpenShift Container Platform	1230
5.12.5. Generating a key pair for cluster node SSH access	1231
5.12.6. Creating the installation configuration file	1233
5.12.6.1. Minimum resource requirements for cluster installation	1236
5.12.6.2. Tested instance types for Azure	1237
5.12.6.3. Tested instance types for Azure on 64-bit ARM infrastructures	1238
5.12.6.4. Enabling trusted launch for Azure VMs	1238
5.12.6.5. Enabling confidential VMs	1239
5.12.6.6. Sample customized install-config.yaml file for Azure	1241
5.12.6.7. Configuring the cluster-wide proxy during installation	1244
5.12.7. Installing the OpenShift CLI by downloading the binary	1246
Installing the OpenShift CLI on Linux	1246
Installing the OpenShift CLI on Windows	1246
Installing the OpenShift CLI on macOS	1247
5.12.8. Alternatives to storing administrator-level secrets in the kube-system project	1247
5.12.8.1. Manually creating long-term credentials	1248
5.12.8.2. Configuring an Azure cluster to use short-term credentials	1250
5.12.8.2.1. Configuring the Cloud Credential Operator utility	1250
5.12.8.2.2. Creating Azure resources with the Cloud Credential Operator utility	1252
5.12.8.2.3. Incorporating the Cloud Credential Operator utility manifests	1254
5.12.9. Deploying the cluster	1255
5.12.10. Logging in to the cluster by using the CLI	1257
5.12.11. Telemetry access for OpenShift Container Platform	1257
5.12.12. Next steps	1258
5.13. INSTALLING A THREE-NODE CLUSTER ON AZURE	1258
5.13.1. Configuring a three-node cluster	1258
5.13.2. Next steps	1259
5.14. UNINSTALLING A CLUSTER ON AZURE	1259
5.14.1. Removing a cluster that uses installer-provisioned infrastructure	1259
5.14.2. Deleting Microsoft Azure resources with the Cloud Credential Operator utility	1260
5.15. INSTALLATION CONFIGURATION PARAMETERS FOR AZURE	1261
5.15.1. Available installation configuration parameters for Azure	1261
5.15.1.1. Required configuration parameters	1261
5.15.1.2. Network configuration parameters	1262
5.15.1.3. Optional configuration parameters	1264
5.15.1.4. Additional Azure configuration parameters	1270
CHAPTER 6. INSTALLING ON AZURE STACK HUB	1287
6.1. PREPARING TO INSTALL ON AZURE STACK HUB	1287
6.1.1. Prerequisites	1287
6.1.2. Requirements for installing OpenShift Container Platform on Azure Stack Hub	1287
6.1.3. Choosing a method to install OpenShift Container Platform on Azure Stack Hub	1287
6.1.3.1. Installing a cluster on installer-provisioned infrastructure	1287
6.1.3.2. Installing a cluster on user-provisioned infrastructure	1287
6.1.4. Next steps	1287
6.2. CONFIGURING AN AZURE STACK HUB ACCOUNT	1288
6.2.1. Azure Stack Hub account limits	1288

6.2.2. Configuring a DNS zone in Azure Stack Hub	1289
6.2.3. Required Azure Stack Hub roles	1290
6.2.4. Creating a service principal	1290
6.2.5. Next steps	1292
6.3. INSTALLING A CLUSTER ON AZURE STACK HUB WITH AN INSTALLER-PROVISIONED INFRASTRUCTURE	1293
6.3.1. Prerequisites	1293
6.3.2. Internet access for OpenShift Container Platform	1293
6.3.3. Generating a key pair for cluster node SSH access	1294
6.3.4. Uploading the RHCOS cluster image	1295
6.3.5. Obtaining the installation program	1296
6.3.6. Manually creating the installation configuration file	1297
6.3.6.1. Sample customized install-config.yaml file for Azure Stack Hub	1298
6.3.7. Manually manage cloud credentials	1300
6.3.8. Configuring the cluster to use an internal CA	1302
6.3.9. Deploying the cluster	1302
6.3.10. Installing the OpenShift CLI by downloading the binary	1304
Installing the OpenShift CLI on Linux	1304
Installing the OpenShift CLI on Windows	1305
Installing the OpenShift CLI on macOS	1305
6.3.11. Logging in to the cluster by using the CLI	1306
6.3.12. Logging in to the cluster by using the web console	1306
6.3.13. Telemetry access for OpenShift Container Platform	1307
6.3.14. Next steps	1307
6.4. INSTALLING A CLUSTER ON AZURE STACK HUB WITH NETWORK CUSTOMIZATIONS	1307
6.4.1. Prerequisites	1308
6.4.2. Internet access for OpenShift Container Platform	1308
6.4.3. Generating a key pair for cluster node SSH access	1308
6.4.4. Uploading the RHCOS cluster image	1310
6.4.5. Obtaining the installation program	1311
6.4.6. Manually creating the installation configuration file	1312
6.4.6.1. Sample customized install-config.yaml file for Azure Stack Hub	1313
6.4.7. Manually manage cloud credentials	1315
6.4.8. Configuring the cluster to use an internal CA	1317
6.4.9. Network configuration phases	1317
6.4.10. Specifying advanced network configuration	1318
6.4.11. Cluster Network Operator configuration	1319
6.4.11.1. Cluster Network Operator configuration object	1320
defaultNetwork object configuration	1320
Configuration for the OpenShift SDN network plugin	1321
Configuration for the OVN-Kubernetes network plugin	1322
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	1327
6.4.12. Configuring hybrid networking with OVN-Kubernetes	1327
6.4.13. Deploying the cluster	1329
6.4.14. Installing the OpenShift CLI by downloading the binary	1330
Installing the OpenShift CLI on Linux	1330
Installing the OpenShift CLI on Windows	1331
Installing the OpenShift CLI on macOS	1331
6.4.15. Logging in to the cluster by using the CLI	1332
6.4.16. Logging in to the cluster by using the web console	1333
6.4.17. Telemetry access for OpenShift Container Platform	1333
6.4.18. Next steps	1334
6.5. INSTALLING A CLUSTER ON AZURE STACK HUB USING ARM TEMPLATES	1334

6.5.1. Prerequisites	1334
6.5.2. Internet access for OpenShift Container Platform	1335
6.5.3. Configuring your Azure Stack Hub project	1335
6.5.3.1. Azure Stack Hub account limits	1335
6.5.3.2. Configuring a DNS zone in Azure Stack Hub	1337
6.5.3.3. Certificate signing requests management	1337
6.5.3.4. Required Azure Stack Hub roles	1337
6.5.3.5. Creating a service principal	1338
6.5.4. Obtaining the installation program	1340
6.5.5. Generating a key pair for cluster node SSH access	1341
6.5.6. Creating the installation files for Azure Stack Hub	1343
6.5.6.1. Manually creating the installation configuration file	1343
6.5.6.2. Sample customized install-config.yaml file for Azure Stack Hub	1345
6.5.6.3. Configuring the cluster-wide proxy during installation	1347
6.5.6.4. Exporting common variables for ARM templates	1348
6.5.6.5. Creating the Kubernetes manifest and Ignition config files	1349
6.5.6.6. Optional: Creating a separate /var partition	1354
6.5.7. Creating the Azure resource group	1356
6.5.8. Uploading the RHCOS cluster image and bootstrap Ignition config file	1357
6.5.9. Example for creating DNS zones	1358
6.5.10. Creating a VNet in Azure Stack Hub	1359
6.5.10.1. ARM template for the VNet	1360
6.5.11. Deploying the RHCOS cluster image for the Azure Stack Hub infrastructure	1360
6.5.11.1. ARM template for image storage	1361
6.5.12. Networking requirements for user-provisioned infrastructure	1361
6.5.12.1. Network connectivity requirements	1361
6.5.13. Creating networking and load balancing components in Azure Stack Hub	1362
6.5.13.1. ARM template for the network and load balancers	1364
6.5.14. Creating the bootstrap machine in Azure Stack Hub	1364
6.5.14.1. ARM template for the bootstrap machine	1365
6.5.15. Creating the control plane machines in Azure Stack Hub	1366
6.5.15.1. ARM template for control plane machines	1366
6.5.16. Wait for bootstrap completion and remove bootstrap resources in Azure Stack Hub	1367
6.5.17. Creating additional worker machines in Azure Stack Hub	1368
6.5.17.1. ARM template for worker machines	1369
6.5.18. Installing the OpenShift CLI by downloading the binary	1369
Installing the OpenShift CLI on Linux	1369
Installing the OpenShift CLI on Windows	1370
Installing the OpenShift CLI on macOS	1370
6.5.19. Logging in to the cluster by using the CLI	1371
6.5.20. Approving the certificate signing requests for your machines	1371
6.5.21. Adding the Ingress DNS records	1374
6.5.22. Completing an Azure Stack Hub installation on user-provisioned infrastructure	1375
6.6. INSTALLATION CONFIGURATION PARAMETERS FOR AZURE STACK HUB	1376
6.6.1. Available installation configuration parameters for Azure Stack Hub	1376
6.6.1.1. Required configuration parameters	1376
6.6.1.2. Network configuration parameters	1378
6.6.1.3. Optional configuration parameters	1380
6.6.1.4. Additional Azure Stack Hub configuration parameters	1386
6.7. UNINSTALLING A CLUSTER ON AZURE STACK HUB	1388
6.7.1. Removing a cluster that uses installer-provisioned infrastructure	1388
CHAPTER 7. INSTALLING ON GCP	1390

7.1. PREPARING TO INSTALL ON GCP	1390
7.1.1. Prerequisites	1390
7.1.2. Requirements for installing OpenShift Container Platform on GCP	1390
7.1.3. Choosing a method to install OpenShift Container Platform on GCP	1390
7.1.3.1. Installing a cluster on installer-provisioned infrastructure	1390
7.1.3.2. Installing a cluster on user-provisioned infrastructure	1391
7.1.4. Next steps	1391
7.2. CONFIGURING A GCP PROJECT	1391
7.2.1. Creating a GCP project	1391
7.2.2. Enabling API services in GCP	1392
7.2.3. Configuring DNS for GCP	1393
7.2.4. GCP account limits	1393
7.2.5. Creating a service account in GCP	1395
7.2.5.1. Required GCP roles	1396
7.2.5.2. Required GCP permissions for installer-provisioned infrastructure	1397
7.2.5.3. Required GCP permissions for shared VPC installations	1404
7.2.6. Supported GCP regions	1404
7.2.7. Next steps	1406
7.3. INSTALLING A CLUSTER QUICKLY ON GCP	1406
7.3.1. Prerequisites	1406
7.3.2. Internet access for OpenShift Container Platform	1406
7.3.3. Generating a key pair for cluster node SSH access	1407
7.3.4. Obtaining the installation program	1408
7.3.5. Deploying the cluster	1409
7.3.6. Installing the OpenShift CLI by downloading the binary	1412
Installing the OpenShift CLI on Linux	1412
Installing the OpenShift CLI on Windows	1413
Installing the OpenShift CLI on macOS	1413
7.3.7. Logging in to the cluster by using the CLI	1414
7.3.8. Telemetry access for OpenShift Container Platform	1414
7.3.9. Next steps	1415
7.4. INSTALLING A CLUSTER ON GCP WITH CUSTOMIZATIONS	1415
7.4.1. Prerequisites	1415
7.4.2. Internet access for OpenShift Container Platform	1415
7.4.3. Generating a key pair for cluster node SSH access	1415
7.4.4. Obtaining the installation program	1417
7.4.5. Creating the installation configuration file	1418
7.4.5.1. Minimum resource requirements for cluster installation	1420
7.4.5.2. Tested instance types for GCP	1421
7.4.5.3. Tested instance types for GCP on 64-bit ARM infrastructures	1422
7.4.5.4. Using custom machine types	1422
7.4.5.5. Enabling Shielded VMs	1422
7.4.5.6. Enabling Confidential VMs	1423
7.4.5.7. Sample customized install-config.yaml file for GCP	1424
7.4.5.8. Configuring the cluster-wide proxy during installation	1427
7.4.6. Managing user-defined labels and tags for GCP	1429
7.4.6.1. Configuring user-defined labels and tags for GCP	1431
7.4.6.2. Querying user-defined labels and tags for GCP	1432
7.4.7. Installing the OpenShift CLI by downloading the binary	1433
Installing the OpenShift CLI on Linux	1433
Installing the OpenShift CLI on Windows	1434
Installing the OpenShift CLI on macOS	1434
7.4.8. Alternatives to storing administrator-level secrets in the kube-system project	1435

7.4.8.1. Manually creating long-term credentials	1435
7.4.8.2. Configuring a GCP cluster to use short-term credentials	1437
7.4.8.2.1. Configuring the Cloud Credential Operator utility	1437
7.4.8.2.2. Creating GCP resources with the Cloud Credential Operator utility	1438
7.4.8.2.3. Incorporating the Cloud Credential Operator utility manifests	1440
7.4.9. Using the GCP Marketplace offering	1441
7.4.10. Deploying the cluster	1442
7.4.11. Logging in to the cluster by using the CLI	1443
7.4.12. Telemetry access for OpenShift Container Platform	1444
7.4.13. Next steps	1444
7.5. INSTALLING A CLUSTER ON GCP WITH NETWORK CUSTOMIZATIONS	1444
7.5.1. Prerequisites	1445
7.5.2. Internet access for OpenShift Container Platform	1445
7.5.3. Generating a key pair for cluster node SSH access	1445
7.5.4. Obtaining the installation program	1447
7.5.5. Creating the installation configuration file	1448
7.5.5.1. Minimum resource requirements for cluster installation	1449
7.5.5.2. Tested instance types for GCP	1451
7.5.5.3. Tested instance types for GCP on 64-bit ARM infrastructures	1451
7.5.5.4. Using custom machine types	1451
7.5.5.5. Enabling Shielded VMs	1452
7.5.5.6. Enabling Confidential VMs	1453
7.5.5.7. Sample customized install-config.yaml file for GCP	1454
7.5.5.8. Configuring the cluster-wide proxy during installation	1457
7.5.6. Installing the OpenShift CLI by downloading the binary	1459
Installing the OpenShift CLI on Linux	1459
Installing the OpenShift CLI on Windows	1459
Installing the OpenShift CLI on macOS	1460
7.5.7. Alternatives to storing administrator-level secrets in the kube-system project	1460
7.5.7.1. Manually creating long-term credentials	1461
7.5.7.2. Configuring a GCP cluster to use short-term credentials	1463
7.5.7.2.1. Configuring the Cloud Credential Operator utility	1463
7.5.7.2.2. Creating GCP resources with the Cloud Credential Operator utility	1464
7.5.7.2.3. Incorporating the Cloud Credential Operator utility manifests	1466
7.5.8. Network configuration phases	1467
7.5.9. Specifying advanced network configuration	1467
7.5.10. Cluster Network Operator configuration	1468
7.5.10.1. Cluster Network Operator configuration object	1469
defaultNetwork object configuration	1470
Configuration for the OpenShift SDN network plugin	1470
Configuration for the OVN-Kubernetes network plugin	1471
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	1476
7.5.11. Deploying the cluster	1476
7.5.12. Logging in to the cluster by using the CLI	1478
7.5.13. Telemetry access for OpenShift Container Platform	1478
7.5.14. Next steps	1479
7.6. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK	1479
7.6.1. Prerequisites	1479
7.6.2. About installations in restricted networks	1480
7.6.2.1. Additional limits	1480
7.6.3. Internet access for OpenShift Container Platform	1480
7.6.4. Generating a key pair for cluster node SSH access	1480
7.6.5. Creating the installation configuration file	1482

7.6.5.1. Minimum resource requirements for cluster installation	1485
7.6.5.2. Tested instance types for GCP	1486
7.6.5.3. Tested instance types for GCP on 64-bit ARM infrastructures	1487
7.6.5.4. Using custom machine types	1487
7.6.5.5. Enabling Shielded VMs	1487
7.6.5.6. Enabling Confidential VMs	1488
7.6.5.7. Sample customized install-config.yaml file for GCP	1489
7.6.5.8. Create an Ingress Controller with global access on GCP	1493
7.6.5.9. Configuring the cluster-wide proxy during installation	1494
7.6.6. Installing the OpenShift CLI by downloading the binary	1496
Installing the OpenShift CLI on Linux	1496
Installing the OpenShift CLI on Windows	1496
Installing the OpenShift CLI on macOS	1497
7.6.7. Alternatives to storing administrator-level secrets in the kube-system project	1497
7.6.7.1. Manually creating long-term credentials	1498
7.6.7.2. Configuring a GCP cluster to use short-term credentials	1500
7.6.7.2.1. Configuring the Cloud Credential Operator utility	1500
7.6.7.2.2. Creating GCP resources with the Cloud Credential Operator utility	1501
7.6.7.2.3. Incorporating the Cloud Credential Operator utility manifests	1503
7.6.8. Deploying the cluster	1504
7.6.9. Logging in to the cluster by using the CLI	1505
7.6.10. Disabling the default OperatorHub catalog sources	1506
7.6.11. Telemetry access for OpenShift Container Platform	1506
7.6.12. Next steps	1506
7.7. INSTALLING A CLUSTER ON GCP INTO AN EXISTING VPC	1507
7.7.1. Prerequisites	1507
7.7.2. About using a custom VPC	1507
7.7.2.1. Requirements for using your VPC	1507
7.7.2.2. VPC validation	1508
7.7.2.3. Division of permissions	1508
7.7.2.4. Isolation between clusters	1508
7.7.3. Internet access for OpenShift Container Platform	1508
7.7.4. Generating a key pair for cluster node SSH access	1509
7.7.5. Obtaining the installation program	1510
7.7.6. Creating the installation configuration file	1511
7.7.6.1. Minimum resource requirements for cluster installation	1513
7.7.6.2. Tested instance types for GCP	1514
7.7.6.3. Tested instance types for GCP on 64-bit ARM infrastructures	1515
7.7.6.4. Using custom machine types	1515
7.7.6.5. Enabling Shielded VMs	1515
7.7.6.6. Enabling Confidential VMs	1516
7.7.6.7. Sample customized install-config.yaml file for GCP	1517
7.7.6.8. Create an Ingress Controller with global access on GCP	1520
7.7.6.9. Configuring the cluster-wide proxy during installation	1521
7.7.7. Installing the OpenShift CLI by downloading the binary	1523
Installing the OpenShift CLI on Linux	1523
Installing the OpenShift CLI on Windows	1524
Installing the OpenShift CLI on macOS	1524
7.7.8. Alternatives to storing administrator-level secrets in the kube-system project	1525
7.7.8.1. Manually creating long-term credentials	1525
7.7.8.2. Configuring a GCP cluster to use short-term credentials	1527
7.7.8.2.1. Configuring the Cloud Credential Operator utility	1527
7.7.8.2.2. Creating GCP resources with the Cloud Credential Operator utility	1528

7.7.8.2.3. Incorporating the Cloud Credential Operator utility manifests	1530
7.7.9. Deploying the cluster	1531
7.7.10. Logging in to the cluster by using the CLI	1533
7.7.11. Telemetry access for OpenShift Container Platform	1533
7.7.12. Next steps	1534
7.8. INSTALLING A CLUSTER ON GCP INTO A SHARED VPC	1534
7.8.1. Prerequisites	1534
7.8.2. Internet access for OpenShift Container Platform	1534
7.8.3. Generating a key pair for cluster node SSH access	1535
7.8.4. Obtaining the installation program	1537
7.8.5. Creating the installation files for GCP	1537
7.8.5.1. Manually creating the installation configuration file	1538
7.8.5.2. Enabling Shielded VMs	1538
7.8.5.3. Enabling Confidential VMs	1539
7.8.5.4. Sample customized install-config.yaml file for shared VPC installation	1540
7.8.5.5. Configuring the cluster-wide proxy during installation	1542
7.8.6. Installing the OpenShift CLI by downloading the binary	1543
Installing the OpenShift CLI on Linux	1543
Installing the OpenShift CLI on Windows	1544
Installing the OpenShift CLI on macOS	1544
7.8.7. Alternatives to storing administrator-level secrets in the kube-system project	1545
7.8.7.1. Manually creating long-term credentials	1545
7.8.7.2. Configuring a GCP cluster to use short-term credentials	1547
7.8.7.2.1. Configuring the Cloud Credential Operator utility	1547
7.8.7.2.2. Creating GCP resources with the Cloud Credential Operator utility	1548
7.8.7.2.3. Incorporating the Cloud Credential Operator utility manifests	1550
7.8.8. Deploying the cluster	1551
7.8.9. Logging in to the cluster by using the CLI	1553
7.8.10. Telemetry access for OpenShift Container Platform	1553
7.8.11. Next steps	1554
7.9. INSTALLING A PRIVATE CLUSTER ON GCP	1554
7.9.1. Prerequisites	1554
7.9.2. Private clusters	1554
7.9.2.1. Private clusters in GCP	1555
7.9.2.1.1. Limitations	1555
7.9.3. About using a custom VPC	1556
7.9.3.1. Requirements for using your VPC	1556
7.9.3.2. Division of permissions	1557
7.9.3.3. Isolation between clusters	1557
7.9.4. Internet access for OpenShift Container Platform	1557
7.9.5. Generating a key pair for cluster node SSH access	1557
7.9.6. Obtaining the installation program	1559
7.9.7. Manually creating the installation configuration file	1560
7.9.7.1. Minimum resource requirements for cluster installation	1561
7.9.7.2. Tested instance types for GCP	1562
7.9.7.3. Tested instance types for GCP on 64-bit ARM infrastructures	1563
7.9.7.4. Using custom machine types	1563
7.9.7.5. Enabling Shielded VMs	1564
7.9.7.6. Enabling Confidential VMs	1564
7.9.7.7. Sample customized install-config.yaml file for GCP	1565
7.9.7.8. Create an Ingress Controller with global access on GCP	1569
7.9.7.9. Configuring the cluster-wide proxy during installation	1570
7.9.8. Installing the OpenShift CLI by downloading the binary	1572

Installing the OpenShift CLI on Linux	1572
Installing the OpenShift CLI on Windows	1572
Installing the OpenShift CLI on macOS	1573
7.9.9. Alternatives to storing administrator-level secrets in the kube-system project	1573
7.9.9.1. Manually creating long-term credentials	1574
7.9.9.2. Configuring a GCP cluster to use short-term credentials	1576
7.9.9.2.1. Configuring the Cloud Credential Operator utility	1576
7.9.9.2.2. Creating GCP resources with the Cloud Credential Operator utility	1577
7.9.9.2.3. Incorporating the Cloud Credential Operator utility manifests	1579
7.9.10. Deploying the cluster	1580
7.9.11. Logging in to the cluster by using the CLI	1581
7.9.12. Telemetry access for OpenShift Container Platform	1582
7.9.13. Next steps	1582
7.10. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN GCP BY USING DEPLOYMENT MANAGER TEMPLATES	1582
7.10.1. Prerequisites	1583
7.10.2. Certificate signing requests management	1583
7.10.3. Internet access for OpenShift Container Platform	1583
7.10.4. Configuring your GCP project	1584
7.10.4.1. Creating a GCP project	1584
7.10.4.2. Enabling API services in GCP	1584
7.10.4.3. Configuring DNS for GCP	1585
7.10.4.4. GCP account limits	1586
7.10.4.5. Creating a service account in GCP	1587
7.10.4.6. Required GCP roles	1588
7.10.4.7. Required GCP permissions for user-provisioned infrastructure	1589
7.10.4.8. Supported GCP regions	1597
7.10.4.9. Installing and configuring CLI tools for GCP	1598
7.10.5. Requirements for a cluster with user-provisioned infrastructure	1598
7.10.5.1. Required machines for cluster installation	1599
7.10.5.2. Minimum resource requirements for cluster installation	1599
7.10.5.3. Tested instance types for GCP	1600
7.10.5.4. Tested instance types for GCP on 64-bit ARM infrastructures	1601
7.10.5.5. Using custom machine types	1601
7.10.6. Creating the installation files for GCP	1601
7.10.6.1. Optional: Creating a separate /var partition	1601
7.10.6.2. Creating the installation configuration file	1604
7.10.6.3. Enabling Shielded VMs	1605
7.10.6.4. Enabling Confidential VMs	1606
7.10.6.5. Configuring the cluster-wide proxy during installation	1607
7.10.6.6. Creating the Kubernetes manifest and Ignition config files	1609
7.10.7. Exporting common variables	1611
7.10.7.1. Extracting the infrastructure name	1612
7.10.7.2. Exporting common variables for Deployment Manager templates	1612
7.10.8. Creating a VPC in GCP	1613
7.10.8.1. Deployment Manager template for the VPC	1614
7.10.9. Networking requirements for user-provisioned infrastructure	1615
7.10.9.1. Setting the cluster node hostnames through DHCP	1615
7.10.9.2. Network connectivity requirements	1615
7.10.10. Creating load balancers in GCP	1617
7.10.10.1. Deployment Manager template for the external load balancer	1619
7.10.10.2. Deployment Manager template for the internal load balancer	1619
7.10.11. Creating a private DNS zone in GCP	1621

7.10.11.1. Deployment Manager template for the private DNS	1622
7.10.12. Creating firewall rules in GCP	1623
7.10.12.1. Deployment Manager template for firewall rules	1624
7.10.13. Creating IAM roles in GCP	1626
7.10.13.1. Deployment Manager template for IAM roles	1628
7.10.14. Creating the RHCOS cluster image for the GCP infrastructure	1629
7.10.15. Creating the bootstrap machine in GCP	1629
7.10.15.1. Deployment Manager template for the bootstrap machine	1631
7.10.16. Creating the control plane machines in GCP	1633
7.10.16.1. Deployment Manager template for control plane machines	1635
7.10.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1637
7.10.18. Creating additional worker machines in GCP	1638
7.10.18.1. Deployment Manager template for worker machines	1640
7.10.19. Installing the OpenShift CLI by downloading the binary	1641
Installing the OpenShift CLI on Linux	1641
Installing the OpenShift CLI on Windows	1642
Installing the OpenShift CLI on macOS	1642
7.10.20. Logging in to the cluster by using the CLI	1643
7.10.21. Approving the certificate signing requests for your machines	1644
7.10.22. Optional: Adding the ingress DNS records	1646
7.10.23. Completing a GCP installation on user-provisioned infrastructure	1648
7.10.24. Telemetry access for OpenShift Container Platform	1650
7.10.25. Next steps	1650
7.11. INSTALLING A CLUSTER INTO A SHARED VPC ON GCP USING DEPLOYMENT MANAGER TEMPLATES	1651
7.11.1. Prerequisites	1651
7.11.2. Certificate signing requests management	1651
7.11.3. Internet access for OpenShift Container Platform	1652
7.11.4. Configuring the GCP project that hosts your cluster	1652
7.11.4.1. Creating a GCP project	1652
7.11.4.2. Enabling API services in GCP	1652
7.11.4.3. GCP account limits	1653
7.11.4.4. Creating a service account in GCP	1655
7.11.4.4.1. Required GCP roles	1655
7.11.4.5. Supported GCP regions	1657
7.11.4.6. Installing and configuring CLI tools for GCP	1658
7.11.5. Requirements for a cluster with user-provisioned infrastructure	1659
7.11.5.1. Required machines for cluster installation	1659
7.11.5.2. Minimum resource requirements for cluster installation	1659
7.11.5.3. Tested instance types for GCP	1660
7.11.5.4. Using custom machine types	1661
7.11.6. Configuring the GCP project that hosts your shared VPC network	1661
7.11.6.1. Configuring DNS for GCP	1662
7.11.6.2. Creating a VPC in GCP	1663
7.11.6.2.1. Deployment Manager template for the VPC	1665
7.11.7. Creating the installation files for GCP	1666
7.11.7.1. Manually creating the installation configuration file	1666
7.11.7.2. Enabling Shielded VMs	1667
7.11.7.3. Enabling Confidential VMs	1668
7.11.7.4. Sample customized install-config.yaml file for GCP	1669
7.11.7.5. Configuring the cluster-wide proxy during installation	1671
7.11.7.6. Creating the Kubernetes manifest and Ignition config files	1673
7.11.8. Exporting common variables	1676

7.11.8.1. Extracting the infrastructure name	1676
7.11.8.2. Exporting common variables for Deployment Manager templates	1676
7.11.9. Networking requirements for user-provisioned infrastructure	1677
7.11.9.1. Setting the cluster node hostnames through DHCP	1677
7.11.9.2. Network connectivity requirements	1678
7.11.10. Creating load balancers in GCP	1679
7.11.10.1. Deployment Manager template for the external load balancer	1681
7.11.10.2. Deployment Manager template for the internal load balancer	1682
7.11.11. Creating a private DNS zone in GCP	1683
7.11.11.1. Deployment Manager template for the private DNS	1685
7.11.12. Creating firewall rules in GCP	1685
7.11.12.1. Deployment Manager template for firewall rules	1686
7.11.13. Creating IAM roles in GCP	1689
7.11.13.1. Deployment Manager template for IAM roles	1691
7.11.14. Creating the RHCOS cluster image for the GCP infrastructure	1692
7.11.15. Creating the bootstrap machine in GCP	1692
7.11.15.1. Deployment Manager template for the bootstrap machine	1694
7.11.16. Creating the control plane machines in GCP	1696
7.11.16.1. Deployment Manager template for control plane machines	1698
7.11.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1700
7.11.18. Creating additional worker machines in GCP	1701
7.11.18.1. Deployment Manager template for worker machines	1703
7.11.19. Installing the OpenShift CLI by downloading the binary	1704
Installing the OpenShift CLI on Linux	1704
Installing the OpenShift CLI on Windows	1705
Installing the OpenShift CLI on macOS	1705
7.11.20. Logging in to the cluster by using the CLI	1706
7.11.21. Approving the certificate signing requests for your machines	1706
7.11.22. Adding the ingress DNS records	1709
7.11.23. Adding ingress firewall rules	1711
7.11.23.1. Creating cluster-wide firewall rules for a shared VPC in GCP	1711
7.11.24. Completing a GCP installation on user-provisioned infrastructure	1712
7.11.25. Telemetry access for OpenShift Container Platform	1715
7.11.26. Next steps	1715
7.12. INSTALLING A CLUSTER ON GCP IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE	1715
7.12.1. Prerequisites	1715
7.12.2. About installations in restricted networks	1716
7.12.2.1. Additional limits	1716
7.12.3. Internet access for OpenShift Container Platform	1716
7.12.4. Configuring your GCP project	1717
7.12.4.1. Creating a GCP project	1717
7.12.4.2. Enabling API services in GCP	1717
7.12.4.3. Configuring DNS for GCP	1718
7.12.4.4. GCP account limits	1719
7.12.4.5. Creating a service account in GCP	1720
7.12.4.6. Required GCP roles	1721
7.12.4.7. Required GCP permissions for user-provisioned infrastructure	1722
7.12.4.8. Supported GCP regions	1730
7.12.4.9. Installing and configuring CLI tools for GCP	1731
7.12.5. Requirements for a cluster with user-provisioned infrastructure	1731
7.12.5.1. Required machines for cluster installation	1732
7.12.5.2. Minimum resource requirements for cluster installation	1732

7.12.5.3. Tested instance types for GCP	1733
7.12.5.4. Using custom machine types	1734
7.12.6. Creating the installation files for GCP	1734
7.12.6.1. Optional: Creating a separate /var partition	1734
7.12.6.2. Creating the installation configuration file	1736
7.12.6.3. Enabling Shielded VMs	1739
7.12.6.4. Enabling Confidential VMs	1740
7.12.6.5. Configuring the cluster-wide proxy during installation	1741
7.12.6.6. Creating the Kubernetes manifest and Ignition config files	1742
7.12.7. Exporting common variables	1745
7.12.7.1. Extracting the infrastructure name	1745
7.12.7.2. Exporting common variables for Deployment Manager templates	1745
7.12.8. Creating a VPC in GCP	1746
7.12.8.1. Deployment Manager template for the VPC	1747
7.12.9. Networking requirements for user-provisioned infrastructure	1748
7.12.9.1. Setting the cluster node hostnames through DHCP	1748
7.12.9.2. Network connectivity requirements	1749
7.12.10. Creating load balancers in GCP	1750
7.12.10.1. Deployment Manager template for the external load balancer	1752
7.12.10.2. Deployment Manager template for the internal load balancer	1753
7.12.11. Creating a private DNS zone in GCP	1754
7.12.11.1. Deployment Manager template for the private DNS	1756
7.12.12. Creating firewall rules in GCP	1756
7.12.12.1. Deployment Manager template for firewall rules	1757
7.12.13. Creating IAM roles in GCP	1760
7.12.13.1. Deployment Manager template for IAM roles	1761
7.12.14. Creating the RHCOS cluster image for the GCP infrastructure	1762
7.12.15. Creating the bootstrap machine in GCP	1762
7.12.15.1. Deployment Manager template for the bootstrap machine	1765
7.12.16. Creating the control plane machines in GCP	1766
7.12.16.1. Deployment Manager template for control plane machines	1768
7.12.17. Wait for bootstrap completion and remove bootstrap resources in GCP	1770
7.12.18. Creating additional worker machines in GCP	1771
7.12.18.1. Deployment Manager template for worker machines	1773
7.12.19. Logging in to the cluster by using the CLI	1774
7.12.20. Disabling the default OperatorHub catalog sources	1775
7.12.21. Approving the certificate signing requests for your machines	1775
7.12.22. Optional: Adding the ingress DNS records	1778
7.12.23. Completing a GCP installation on user-provisioned infrastructure	1779
7.12.24. Telemetry access for OpenShift Container Platform	1782
7.12.25. Next steps	1782
7.13. INSTALLING A THREE-NODE CLUSTER ON GCP	1782
7.13.1. Configuring a three-node cluster	1782
7.13.2. Next steps	1783
7.14. INSTALLATION CONFIGURATION PARAMETERS FOR GCP	1784
7.14.1. Available installation configuration parameters for GCP	1784
7.14.1.1. Required configuration parameters	1784
7.14.1.2. Network configuration parameters	1785
7.14.1.3. Optional configuration parameters	1787
7.14.1.4. Additional Google Cloud Platform (GCP) configuration parameters	1793
7.15. UNINSTALLING A CLUSTER ON GCP	1825
7.15.1. Removing a cluster that uses installer-provisioned infrastructure	1825
7.15.2. Deleting Google Cloud Platform resources with the Cloud Credential Operator utility	1826

CHAPTER 8. INSTALLING ON IBM CLOUD	1828
8.1. PREPARING TO INSTALL ON IBM CLOUD	1828
8.1.1. Prerequisites	1828
8.1.2. Requirements for installing OpenShift Container Platform on IBM Cloud	1828
8.1.3. Choosing a method to install OpenShift Container Platform on IBM Cloud	1828
8.1.3.1. Installing a cluster on installer-provisioned infrastructure	1828
8.1.4. Next steps	1829
8.2. CONFIGURING AN IBM CLOUD ACCOUNT	1829
8.2.1. Prerequisites	1829
8.2.2. Quotas and limits on IBM Cloud	1829
Virtual Private Cloud (VPC)	1829
Application load balancer	1829
Floating IP address	1829
Virtual Server Instances (VSI)	1830
Block Storage Volumes	1830
8.2.3. Configuring DNS resolution	1830
8.2.3.1. Using IBM Cloud Internet Services for DNS resolution	1831
8.2.3.2. Using IBM Cloud DNS Services for DNS resolution	1832
8.2.4. IBM Cloud IAM Policies and API Key	1833
8.2.4.1. Required access policies	1833
8.2.4.2. Access policy assignment	1834
8.2.4.3. Creating an API key	1834
8.2.5. Supported IBM Cloud regions	1835
8.2.6. Next steps	1835
8.3. CONFIGURING IAM FOR IBM CLOUD	1835
8.3.1. Alternatives to storing administrator-level secrets in the kube-system project	1835
8.3.2. Configuring the Cloud Credential Operator utility	1836
8.3.3. Next steps	1837
8.3.4. Additional resources	1837
8.4. INSTALLING A CLUSTER ON IBM CLOUD WITH CUSTOMIZATIONS	1837
8.4.1. Prerequisites	1837
8.4.2. Internet access for OpenShift Container Platform	1838
8.4.3. Generating a key pair for cluster node SSH access	1838
8.4.4. Obtaining the installation program	1840
8.4.5. Exporting the API key	1841
8.4.6. Creating the installation configuration file	1841
8.4.6.1. Minimum resource requirements for cluster installation	1842
8.4.6.2. Sample customized install-config.yaml file for IBM Cloud	1843
8.4.6.3. Configuring the cluster-wide proxy during installation	1845
8.4.7. Manually creating IAM	1847
8.4.8. Deploying the cluster	1849
8.4.9. Installing the OpenShift CLI by downloading the binary	1850
Installing the OpenShift CLI on Linux	1851
Installing the OpenShift CLI on Windows	1851
Installing the OpenShift CLI on macOS	1852
8.4.10. Logging in to the cluster by using the CLI	1852
8.4.11. Telemetry access for OpenShift Container Platform	1853
8.4.12. Next steps	1853
8.5. INSTALLING A CLUSTER ON IBM CLOUD WITH NETWORK CUSTOMIZATIONS	1853
8.5.1. Prerequisites	1853
8.5.2. Internet access for OpenShift Container Platform	1854
8.5.3. Generating a key pair for cluster node SSH access	1854
8.5.4. Obtaining the installation program	1856

8.5.5. Exporting the API key	1857
8.5.6. Creating the installation configuration file	1857
8.5.6.1. Minimum resource requirements for cluster installation	1859
8.5.6.2. Sample customized install-config.yaml file for IBM Cloud	1859
8.5.6.3. Configuring the cluster-wide proxy during installation	1861
8.5.7. Manually creating IAM	1863
8.5.8. Network configuration phases	1865
8.5.9. Specifying advanced network configuration	1866
8.5.10. Cluster Network Operator configuration	1867
8.5.10.1. Cluster Network Operator configuration object	1868
defaultNetwork object configuration	1868
Configuration for the OpenShift SDN network plugin	1869
Configuration for the OVN-Kubernetes network plugin	1870
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	1875
8.5.11. Deploying the cluster	1875
8.5.12. Installing the OpenShift CLI by downloading the binary	1877
Installing the OpenShift CLI on Linux	1877
Installing the OpenShift CLI on Windows	1877
Installing the OpenShift CLI on macOS	1878
8.5.13. Logging in to the cluster by using the CLI	1878
8.5.14. Telemetry access for OpenShift Container Platform	1879
8.5.15. Next steps	1879
8.6. INSTALLING A CLUSTER ON IBM CLOUD INTO AN EXISTING VPC	1879
8.6.1. Prerequisites	1879
8.6.2. About using a custom VPC	1880
8.6.2.1. Requirements for using your VPC	1880
8.6.2.2. VPC validation	1880
8.6.2.3. Isolation between clusters	1881
8.6.3. Internet access for OpenShift Container Platform	1881
8.6.4. Generating a key pair for cluster node SSH access	1882
8.6.5. Obtaining the installation program	1883
8.6.6. Exporting the API key	1884
8.6.7. Creating the installation configuration file	1885
8.6.7.1. Minimum resource requirements for cluster installation	1886
8.6.7.2. Sample customized install-config.yaml file for IBM Cloud	1887
8.6.7.3. Configuring the cluster-wide proxy during installation	1889
8.6.8. Manually creating IAM	1891
8.6.9. Deploying the cluster	1893
8.6.10. Installing the OpenShift CLI by downloading the binary	1895
Installing the OpenShift CLI on Linux	1895
Installing the OpenShift CLI on Windows	1896
Installing the OpenShift CLI on macOS	1896
8.6.11. Logging in to the cluster by using the CLI	1897
8.6.12. Telemetry access for OpenShift Container Platform	1897
8.6.13. Next steps	1897
8.7. INSTALLING A PRIVATE CLUSTER ON IBM CLOUD	1898
8.7.1. Prerequisites	1898
8.7.2. Private clusters	1898
8.7.3. Private clusters in IBM Cloud	1899
8.7.3.1. Limitations	1899
8.7.4. About using a custom VPC	1899
8.7.4.1. Requirements for using your VPC	1899
8.7.4.2. VPC validation	1900

8.7.4.3. Isolation between clusters	1900
8.7.5. Internet access for OpenShift Container Platform	1901
8.7.6. Generating a key pair for cluster node SSH access	1901
8.7.7. Obtaining the installation program	1903
8.7.8. Exporting the API key	1904
8.7.9. Manually creating the installation configuration file	1904
8.7.9.1. Minimum resource requirements for cluster installation	1905
8.7.9.2. Sample customized install-config.yaml file for IBM Cloud	1906
8.7.9.3. Configuring the cluster-wide proxy during installation	1908
8.7.10. Manually creating IAM	1910
8.7.11. Deploying the cluster	1912
8.7.12. Installing the OpenShift CLI by downloading the binary	1914
Installing the OpenShift CLI on Linux	1914
Installing the OpenShift CLI on Windows	1915
Installing the OpenShift CLI on macOS	1915
8.7.13. Logging in to the cluster by using the CLI	1916
8.7.14. Telemetry access for OpenShift Container Platform	1916
8.7.15. Next steps	1916
8.8. INSTALLATION CONFIGURATION PARAMETERS FOR IBM CLOUD	1917
8.8.1. Available installation configuration parameters for IBM Cloud	1917
8.8.1.1. Required configuration parameters	1917
8.8.1.2. Network configuration parameters	1918
8.8.1.3. Optional configuration parameters	1920
8.8.1.4. Additional IBM Cloud configuration parameters	1925
8.9. UNINSTALLING A CLUSTER ON IBM CLOUD	1929
8.9.1. Removing a cluster that uses installer-provisioned infrastructure	1929
CHAPTER 9. INSTALLING ON NUTANIX	1931
9.1. PREPARING TO INSTALL ON NUTANIX	1931
9.1.1. Nutanix version requirements	1931
9.1.2. Environment requirements	1931
9.1.2.1. Required account privileges	1931
9.1.2.2. Cluster limits	1933
9.1.2.3. Cluster resources	1933
9.1.2.4. Networking requirements	1933
9.1.2.4.1. Required IP Addresses	1934
9.1.2.4.2. DNS records	1934
9.1.3. Configuring the Cloud Credential Operator utility	1934
9.2. INSTALLING A CLUSTER ON NUTANIX	1936
9.2.1. Prerequisites	1936
9.2.2. Internet access for OpenShift Container Platform	1937
9.2.3. Internet access for Prism Central	1937
9.2.4. Generating a key pair for cluster node SSH access	1937
9.2.5. Obtaining the installation program	1939
9.2.6. Adding Nutanix root CA certificates to your system trust	1940
9.2.7. Creating the installation configuration file	1940
9.2.7.1. Sample customized install-config.yaml file for Nutanix	1942
9.2.7.2. Configuring the cluster-wide proxy during installation	1945
9.2.8. Installing the OpenShift CLI by downloading the binary	1947
Installing the OpenShift CLI on Linux	1947
Installing the OpenShift CLI on Windows	1947
Installing the OpenShift CLI on macOS	1948
9.2.9. Configuring IAM for Nutanix	1948

9.2.10. Adding config map and secret resources required for Nutanix CCM	1951
9.2.11. Deploying the cluster	1952
9.2.12. Configuring the default storage container	1953
9.2.13. Telemetry access for OpenShift Container Platform	1954
9.2.14. Additional resources	1954
9.2.15. Next steps	1954
9.3. INSTALLING A CLUSTER ON NUTANIX IN A RESTRICTED NETWORK	1954
9.3.1. Prerequisites	1954
9.3.2. About installations in restricted networks	1955
9.3.2.1. Additional limits	1955
9.3.3. Generating a key pair for cluster node SSH access	1955
9.3.4. Adding Nutanix root CA certificates to your system trust	1957
9.3.5. Downloading the RHCOS cluster image	1957
9.3.6. Creating the installation configuration file	1958
9.3.6.1. Sample customized install-config.yaml file for Nutanix	1961
9.3.6.2. Configuring the cluster-wide proxy during installation	1964
9.3.7. Installing the OpenShift CLI by downloading the binary	1966
Installing the OpenShift CLI on Linux	1966
Installing the OpenShift CLI on Windows	1967
Installing the OpenShift CLI on macOS	1967
9.3.8. Configuring IAM for Nutanix	1968
9.3.9. Deploying the cluster	1970
9.3.10. Post installation	1972
9.3.10.1. Disabling the default OperatorHub catalog sources	1972
9.3.10.2. Installing the policy resources into the cluster	1972
9.3.10.3. Configuring the default storage container	1973
9.3.11. Telemetry access for OpenShift Container Platform	1973
9.3.12. Additional resources	1973
9.3.13. Next steps	1973
9.4. INSTALLING A THREE-NODE CLUSTER ON NUTANIX	1974
9.4.1. Configuring a three-node cluster	1974
9.4.2. Next steps	1974
9.5. UNINSTALLING A CLUSTER ON NUTANIX	1974
9.5.1. Removing a cluster that uses installer-provisioned infrastructure	1974
9.6. INSTALLATION CONFIGURATION PARAMETERS FOR NUTANIX	1975
9.6.1. Available installation configuration parameters for Nutanix	1975
9.6.1.1. Required configuration parameters	1975
9.6.1.2. Network configuration parameters	1977
9.6.1.3. Optional configuration parameters	1979
9.6.1.4. Additional Nutanix configuration parameters	1985
CHAPTER 10. INSTALLING ON BARE METAL	1990
10.1. PREPARING FOR BARE METAL CLUSTER INSTALLATION	1990
10.1.1. Prerequisites	1990
10.1.2. Planning a bare metal cluster for OpenShift Virtualization	1990
10.1.3. NIC partitioning for SR-IOV devices (Technology Preview)	1990
10.1.4. Choosing a method to install OpenShift Container Platform on bare metal	1991
10.1.4.1. Installing a cluster on installer-provisioned infrastructure	1992
10.1.4.2. Installing a cluster on user-provisioned infrastructure	1992
10.2. INSTALLING A USER-PROVISIONED CLUSTER ON BARE METAL	1992
10.2.1. Prerequisites	1993
10.2.2. Internet access for OpenShift Container Platform	1993
10.2.3. Requirements for a cluster with user-provisioned infrastructure	1993

10.2.3.1. Required machines for cluster installation	1994
10.2.3.2. Minimum resource requirements for cluster installation	1994
10.2.3.3. Certificate signing requests management	1995
10.2.3.4. Requirements for baremetal clusters on vSphere	1996
10.2.3.5. Networking requirements for user-provisioned infrastructure	1996
10.2.3.5.1. Setting the cluster node hostnames through DHCP	1997
10.2.3.5.2. Network connectivity requirements	1997
NTP configuration for user-provisioned infrastructure	1998
10.2.3.6. User-provisioned DNS requirements	1998
10.2.3.6.1. Example DNS configuration for user-provisioned clusters	2000
10.2.3.7. Load balancing requirements for user-provisioned infrastructure	2002
10.2.3.7.1. Example load balancer configuration for user-provisioned clusters	2004
10.2.4. Preparing the user-provisioned infrastructure	2006
10.2.5. Validating DNS resolution for user-provisioned infrastructure	2008
10.2.6. Generating a key pair for cluster node SSH access	2011
10.2.7. Obtaining the installation program	2012
10.2.8. Installing the OpenShift CLI by downloading the binary	2013
Installing the OpenShift CLI on Linux	2013
Installing the OpenShift CLI on Windows	2014
Installing the OpenShift CLI on macOS	2014
10.2.9. Manually creating the installation configuration file	2015
10.2.9.1. Sample install-config.yaml file for bare metal	2016
10.2.9.2. Configuring the cluster-wide proxy during installation	2018
10.2.9.3. Configuring a three-node cluster	2020
10.2.10. Creating the Kubernetes manifest and Ignition config files	2021
10.2.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2023
10.2.11.1. Installing RHCOS by using an ISO image	2024
10.2.11.2. Installing RHCOS by using PXE or iPXE booting	2027
10.2.11.3. Advanced RHCOS installation configuration	2032
10.2.11.3.1. Using advanced networking options for PXE and ISO installations	2032
10.2.11.3.2. Disk partitioning	2033
10.2.11.3.2.1. Creating a separate /var partition	2034
10.2.11.3.2.2. Retaining existing partitions	2036
10.2.11.3.3. Identifying Ignition configs	2037
10.2.11.3.4. Default console configuration	2037
10.2.11.3.5. Enabling the serial console for PXE and ISO installations	2038
10.2.11.3.6. Customizing a live RHCOS ISO or PXE install	2038
10.2.11.3.7. Customizing a live RHCOS ISO image	2039
10.2.11.3.7.1. Modifying a live install ISO image to enable the serial console	2039
10.2.11.3.7.2. Modifying a live install ISO image to use a custom certificate authority	2040
10.2.11.3.7.3. Modifying a live install ISO image with customized network settings	2041
10.2.11.3.8. Customizing a live RHCOS PXE environment	2042
10.2.11.3.8.1. Modifying a live install PXE environment to enable the serial console	2043
10.2.11.3.8.2. Modifying a live install PXE environment to use a custom certificate authority	2044
10.2.11.3.8.3. Modifying a live install PXE environment with customized network settings	2044
10.2.11.3.9. Advanced RHCOS installation reference	2046
10.2.11.3.9.1. Networking and bonding options for ISO installations	2046
Configuring DHCP or static IP addresses	2046
Configuring an IP address without a static hostname	2047
Specifying multiple network interfaces	2047
Configuring default gateway and route	2047
Disabling DHCP on a single interface	2047
Combining DHCP and static IP configurations	2048

Configuring VLANs on individual interfaces	2048
Providing multiple DNS servers	2048
Bonding multiple network interfaces to a single interface	2048
Bonding multiple SR-IOV network interfaces to a dual port NIC interface	2049
Using network teaming	2050
10.2.11.3.9.2. coreos-installer options for ISO and PXE installations	2050
10.2.11.3.9.3. coreos.inst boot options for ISO or PXE installations	2054
10.2.11.4. Enabling multipathing with kernel arguments on RHCOS	2056
10.2.12. Waiting for the bootstrap process to complete	2057
10.2.13. Logging in to the cluster by using the CLI	2058
10.2.14. Approving the certificate signing requests for your machines	2059
10.2.15. Initial Operator configuration	2062
10.2.15.1. Image registry removed during installation	2063
10.2.15.2. Image registry storage configuration	2063
10.2.15.2.1. Configuring registry storage for bare metal and other manual installations	2063
10.2.15.2.2. Configuring storage for the image registry in non-production clusters	2065
10.2.15.2.3. Configuring block registry storage for bare metal	2065
10.2.16. Completing installation on user-provisioned infrastructure	2066
10.2.17. Telemetry access for OpenShift Container Platform	2069
10.2.18. Next steps	2069
10.3. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER WITH NETWORK CUSTOMIZATIONS	2069
10.3.1. Prerequisites	2069
10.3.2. Internet access for OpenShift Container Platform	2070
10.3.3. Requirements for a cluster with user-provisioned infrastructure	2070
10.3.3.1. Required machines for cluster installation	2070
10.3.3.2. Minimum resource requirements for cluster installation	2071
10.3.3.3. Certificate signing requests management	2072
10.3.3.4. Networking requirements for user-provisioned infrastructure	2073
10.3.3.4.1. Setting the cluster node hostnames through DHCP	2073
10.3.3.4.2. Network connectivity requirements	2073
NTP configuration for user-provisioned infrastructure	2075
10.3.3.5. User-provisioned DNS requirements	2075
10.3.3.5.1. Example DNS configuration for user-provisioned clusters	2077
10.3.3.6. Load balancing requirements for user-provisioned infrastructure	2079
10.3.3.6.1. Example load balancer configuration for user-provisioned clusters	2081
10.3.4. Preparing the user-provisioned infrastructure	2083
10.3.5. Validating DNS resolution for user-provisioned infrastructure	2085
10.3.6. Generating a key pair for cluster node SSH access	2087
10.3.7. Obtaining the installation program	2089
10.3.8. Installing the OpenShift CLI by downloading the binary	2090
Installing the OpenShift CLI on Linux	2090
Installing the OpenShift CLI on Windows	2091
Installing the OpenShift CLI on macOS	2091
10.3.9. Manually creating the installation configuration file	2092
10.3.9.1. Sample install-config.yaml file for bare metal	2093
10.3.10. Network configuration phases	2095
10.3.11. Specifying advanced network configuration	2096
10.3.12. Cluster Network Operator configuration	2097
10.3.12.1. Cluster Network Operator configuration object	2098
defaultNetwork object configuration	2098
Configuration for the OpenShift SDN network plugin	2099
Configuration for the OVN-Kubernetes network plugin	2100

kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2105
10.3.13. Creating the Ignition config files	2105
10.3.14. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2106
10.3.14.1. Installing RHCOS by using an ISO image	2107
10.3.14.2. Installing RHCOS by using PXE or iPXE booting	2111
10.3.14.3. Advanced RHCOS installation configuration	2115
10.3.14.3.1. Using advanced networking options for PXE and ISO installations	2115
10.3.14.3.2. Disk partitioning	2116
10.3.14.3.2.1. Creating a separate /var partition	2117
10.3.14.3.2.2. Retaining existing partitions	2119
10.3.14.3.3. Identifying Ignition configs	2120
10.3.14.3.4. Default console configuration	2121
10.3.14.3.5. Enabling the serial console for PXE and ISO installations	2121
10.3.14.3.6. Customizing a live RHCOS ISO or PXE install	2122
10.3.14.3.7. Customizing a live RHCOS ISO image	2122
10.3.14.3.7.1. Modifying a live install ISO image to enable the serial console	2123
10.3.14.3.7.2. Modifying a live install ISO image to use a custom certificate authority	2124
10.3.14.3.7.3. Modifying a live install ISO image with customized network settings	2124
10.3.14.3.8. Customizing a live RHCOS PXE environment	2126
10.3.14.3.8.1. Modifying a live install PXE environment to enable the serial console	2126
10.3.14.3.8.2. Modifying a live install PXE environment to use a custom certificate authority	2127
10.3.14.3.8.3. Modifying a live install PXE environment with customized network settings	2128
10.3.14.3.9. Advanced RHCOS installation reference	2129
10.3.14.3.9.1. Networking and bonding options for ISO installations	2129
Configuring DHCP or static IP addresses	2130
Configuring an IP address without a static hostname	2130
Specifying multiple network interfaces	2131
Configuring default gateway and route	2131
Disabling DHCP on a single interface	2131
Combining DHCP and static IP configurations	2131
Configuring VLANs on individual interfaces	2131
Providing multiple DNS servers	2132
Bonding multiple network interfaces to a single interface	2132
Bonding multiple SR-IOV network interfaces to a dual port NIC interface	2132
Using network teaming	2133
10.3.14.3.9.2. coreos-installer options for ISO and PXE installations	2133
10.3.14.3.9.3. coreos.inst boot options for ISO or PXE installations	2138
10.3.14.4. Enabling multipathing with kernel arguments on RHCOS	2139
10.3.15. Waiting for the bootstrap process to complete	2141
10.3.16. Logging in to the cluster by using the CLI	2142
10.3.17. Approving the certificate signing requests for your machines	2143
10.3.18. Initial Operator configuration	2145
10.3.18.1. Image registry removed during installation	2146
10.3.18.2. Image registry storage configuration	2147
10.3.18.3. Configuring block registry storage for bare metal	2147
10.3.19. Completing installation on user-provisioned infrastructure	2148
10.3.20. Telemetry access for OpenShift Container Platform	2151
10.3.21. Next steps	2151
10.4. INSTALLING A USER-PROVISIONED BARE METAL CLUSTER ON A RESTRICTED NETWORK	2151
10.4.1. Prerequisites	2151
10.4.2. About installations in restricted networks	2152
10.4.2.1. Additional limits	2152
10.4.3. Internet access for OpenShift Container Platform	2152

10.4.4. Requirements for a cluster with user-provisioned infrastructure	2153
10.4.4.1. Required machines for cluster installation	2153
10.4.4.2. Minimum resource requirements for cluster installation	2153
10.4.4.3. Certificate signing requests management	2155
10.4.4.4. Networking requirements for user-provisioned infrastructure	2155
10.4.4.4.1. Setting the cluster node hostnames through DHCP	2155
10.4.4.4.2. Network connectivity requirements	2156
NTP configuration for user-provisioned infrastructure	2157
10.4.4.5. User-provisioned DNS requirements	2157
10.4.4.5.1. Example DNS configuration for user-provisioned clusters	2159
10.4.4.6. Load balancing requirements for user-provisioned infrastructure	2161
10.4.4.6.1. Example load balancer configuration for user-provisioned clusters	2163
10.4.5. Preparing the user-provisioned infrastructure	2165
10.4.6. Validating DNS resolution for user-provisioned infrastructure	2167
10.4.7. Generating a key pair for cluster node SSH access	2169
10.4.8. Manually creating the installation configuration file	2171
10.4.8.1. Sample install-config.yaml file for bare metal	2173
10.4.8.2. Configuring the cluster-wide proxy during installation	2176
10.4.8.3. Configuring a three-node cluster	2177
10.4.9. Creating the Kubernetes manifest and Ignition config files	2178
10.4.10. Configuring chrony time service	2180
10.4.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2181
10.4.11.1. Installing RHCOS by using an ISO image	2182
10.4.11.2. Installing RHCOS by using PXE or iPXE booting	2186
10.4.11.3. Advanced RHCOS installation configuration	2190
10.4.11.3.1. Using advanced networking options for PXE and ISO installations	2190
10.4.11.3.2. Disk partitioning	2191
10.4.11.3.2.1. Creating a separate /var partition	2192
10.4.11.3.2.2. Retaining existing partitions	2194
10.4.11.3.3. Identifying Ignition configs	2195
10.4.11.3.4. Default console configuration	2196
10.4.11.3.5. Enabling the serial console for PXE and ISO installations	2196
10.4.11.3.6. Customizing a live RHCOS ISO or PXE install	2197
10.4.11.3.7. Customizing a live RHCOS ISO image	2197
10.4.11.3.7.1. Modifying a live install ISO image to enable the serial console	2198
10.4.11.3.7.2. Modifying a live install ISO image to use a custom certificate authority	2199
10.4.11.3.7.3. Modifying a live install ISO image with customized network settings	2199
10.4.11.3.8. Customizing a live RHCOS PXE environment	2201
10.4.11.3.8.1. Modifying a live install PXE environment to enable the serial console	2201
10.4.11.3.8.2. Modifying a live install PXE environment to use a custom certificate authority	2202
10.4.11.3.8.3. Modifying a live install PXE environment with customized network settings	2203
10.4.11.3.9. Advanced RHCOS installation reference	2204
10.4.11.3.9.1. Networking and bonding options for ISO installations	2204
Configuring DHCP or static IP addresses	2205
Configuring an IP address without a static hostname	2205
Specifying multiple network interfaces	2206
Configuring default gateway and route	2206
Disabling DHCP on a single interface	2206
Combining DHCP and static IP configurations	2206
Configuring VLANs on individual interfaces	2206
Providing multiple DNS servers	2207
Bonding multiple network interfaces to a single interface	2207
Bonding multiple SR-IOV network interfaces to a dual port NIC interface	2207

Using network teaming	2208
10.4.11.3.9.2. coreos-installer options for ISO and PXE installations	2208
10.4.11.3.9.3. coreos.inst boot options for ISO or PXE installations	2213
10.4.11.4. Enabling multipathing with kernel arguments on RHCOS	2214
10.4.12. Waiting for the bootstrap process to complete	2216
10.4.13. Logging in to the cluster by using the CLI	2217
10.4.14. Approving the certificate signing requests for your machines	2218
10.4.15. Initial Operator configuration	2220
10.4.15.1. Disabling the default OperatorHub catalog sources	2221
10.4.15.2. Image registry storage configuration	2222
10.4.15.2.1. Changing the image registry's management state	2222
10.4.15.2.2. Configuring registry storage for bare metal and other manual installations	2222
10.4.15.2.3. Configuring storage for the image registry in non-production clusters	2224
10.4.15.2.4. Configuring block registry storage for bare metal	2224
10.4.16. Completing installation on user-provisioned infrastructure	2226
10.4.17. Telemetry access for OpenShift Container Platform	2228
10.4.18. Next steps	2228
10.5. SCALING A USER-PROVISIONED CLUSTER WITH THE BARE METAL OPERATOR	2229
10.5.1. About scaling a user-provisioned cluster with the Bare Metal Operator	2229
10.5.1.1. Prerequisites for scaling a user-provisioned cluster	2229
10.5.1.2. Limitations for scaling a user-provisioned cluster	2229
10.5.2. Configuring a provisioning resource to scale user-provisioned clusters	2229
10.5.3. Provisioning new hosts in a user-provisioned cluster by using the BMO	2230
10.5.4. Optional: Managing existing hosts in a user-provisioned cluster by using the BMO	2233
10.5.5. Removing hosts from a user-provisioned cluster by using the BMO	2234
10.6. INSTALLATION CONFIGURATION PARAMETERS FOR BARE METAL	2236
10.6.1. Available installation configuration parameters for bare metal	2236
10.6.1.1. Required configuration parameters	2236
10.6.1.2. Network configuration parameters	2237
10.6.1.3. Optional configuration parameters	2240
CHAPTER 11. INSTALLING ON-PREMISE WITH ASSISTED INSTALLER	2246
11.1. INSTALLING AN ON-PREMISE CLUSTER USING THE ASSISTED INSTALLER	2246
11.1.1. Using the Assisted Installer	2246
11.1.2. API support for the Assisted Installer	2247
CHAPTER 12. INSTALLING AN ON-PREMISE CLUSTER WITH THE AGENT-BASED INSTALLER	2248
12.1. PREPARING TO INSTALL WITH THE AGENT-BASED INSTALLER	2248
12.1.1. About the Agent-based Installer	2248
12.1.2. Understanding Agent-based Installer	2248
12.1.2.1. Agent-based Installer workflow	2249
12.1.2.2. Recommended resources for topologies	2250
12.1.3. About FIPS compliance	2250
12.1.4. Configuring FIPS through the Agent-based Installer	2251
12.1.5. Host configuration	2252
12.1.5.1. Host roles	2252
12.1.5.2. About root device hints	2253
12.1.6. About networking	2254
12.1.6.1. DHCP	2254
12.1.6.2. Static networking	2254
12.1.7. Requirements for a cluster using the platform "none" option	2256
12.1.7.1. Platform "none" DNS requirements	2256
12.1.7.1.1. Example DNS configuration for platform "none" clusters	2258

12.1.7.2. Platform "none" Load balancing requirements	2260
12.1.7.2.1. Example load balancer configuration for platform "none" clusters	2262
12.1.8. Example: Bonds and VLAN interface node network configuration	2263
12.1.9. Example: Bonds and SR-IOV dual-nic node network configuration	2265
12.1.10. Sample install-config.yaml file for bare metal	2268
12.1.11. Validation checks before agent ISO creation	2271
12.1.11.1. ZTP manifests	2271
12.1.12. Next steps	2271
12.2. UNDERSTANDING DISCONNECTED INSTALLATION MIRRORING	2271
12.2.1. Mirroring images for a disconnected installation through the Agent-based Installer	2272
12.2.2. About mirroring the OpenShift Container Platform image repository for a disconnected registry	2272
12.2.2.1. Configuring the Agent-based Installer to use mirrored images	2273
12.3. INSTALLING AN OPENSIFT CONTAINER PLATFORM CLUSTER WITH THE AGENT-BASED INSTALLER	2274
12.3.1. Prerequisites	2274
12.3.2. Installing OpenShift Container Platform with the Agent-based Installer	2274
12.3.2.1. Downloading the Agent-based Installer	2274
12.3.2.2. Creating the preferred configuration inputs	2274
12.3.2.3. Creating additional manifest files	2278
12.3.2.3.1. Creating a directory to contain additional manifests	2278
12.3.2.3.2. Disk partitioning	2278
12.3.2.4. Using ZTP manifests	2280
12.3.2.5. Encrypting the disk	2281
12.3.2.6. Creating and booting the agent image	2282
12.3.2.7. Verifying that the current installation host can pull release images	2282
12.3.2.8. Tracking and verifying installation progress	2284
12.3.3. Sample GitOps ZTP custom resources	2286
12.3.4. Gathering log data from a failed Agent-based installation	2289
12.4. PREPARING PXE ASSETS FOR OPENSIFT CONTAINER PLATFORM	2290
12.4.1. Prerequisites	2290
12.4.2. Downloading the Agent-based Installer	2290
12.4.3. Creating the preferred configuration inputs	2291
12.4.4. Creating the PXE assets	2294
12.5. PREPARING AN AGENT-BASED INSTALLED CLUSTER FOR THE MULTICLUSTER ENGINE FOR KUBERNETES OPERATOR	2295
12.5.1. Prerequisites	2295
12.5.2. Preparing an Agent-based cluster deployment for the multicluster engine for Kubernetes Operator while disconnected	2295
12.5.3. Preparing an Agent-based cluster deployment for the multicluster engine for Kubernetes Operator while connected	2298
12.6. INSTALLATION CONFIGURATION PARAMETERS FOR THE AGENT-BASED INSTALLER	2302
12.6.1. Available installation configuration parameters	2302
12.6.1.1. Required configuration parameters	2303
12.6.1.2. Network configuration parameters	2304
12.6.1.3. Optional configuration parameters	2307
12.6.2. Available Agent configuration parameters	2312
12.6.2.1. Required configuration parameters	2313
12.6.2.2. Optional configuration parameters	2313
CHAPTER 13. INSTALLING ON A SINGLE NODE	2317
13.1. PREPARING TO INSTALL ON A SINGLE NODE	2317
13.1.1. Prerequisites	2317
13.1.2. About OpenShift on a single node	2317

13.1.3. Requirements for installing OpenShift on a single node	2317
13.2. INSTALLING OPENSIFT ON A SINGLE NODE	2319
13.2.1. Installing single-node OpenShift using the Assisted Installer	2319
13.2.1.1. Generating the discovery ISO with the Assisted Installer	2319
13.2.1.2. Installing single-node OpenShift with the Assisted Installer	2320
13.2.2. Installing single-node OpenShift manually	2321
13.2.2.1. Generating the installation ISO with coreos-installer	2321
13.2.2.2. Monitoring the cluster installation using openshift-install	2323
13.2.3. Installing single-node OpenShift on cloud providers	2324
13.2.3.1. Additional requirements for installing single-node OpenShift on a cloud provider	2324
13.2.3.2. Supported cloud providers for single-node OpenShift	2325
13.2.3.3. Installing single-node OpenShift on AWS	2325
13.2.3.4. Installing single-node OpenShift on Azure	2325
13.2.3.5. Installing single-node OpenShift on GCP	2325
13.2.4. Creating a bootable ISO image on a USB drive	2325
13.2.5. Booting from an HTTP-hosted ISO image using the Redfish API	2326
13.2.6. Creating a custom live RHCOS ISO for remote server access	2327
13.2.7. Installing single-node OpenShift with IBM Z and IBM LinuxONE	2328
Hardware requirements	2329
13.2.7.1. Installing single-node OpenShift with z/VM on IBM Z and IBM LinuxONE	2329
13.2.7.2. Installing single-node OpenShift with RHEL KVM on IBM Z and IBM LinuxONE	2334
13.2.8. Installing single-node OpenShift with IBM Power	2337
Hardware requirements	2337
13.2.8.1. Setting up basion for single-node OpenShift with IBM Power	2338
13.2.8.2. Installing single-node OpenShift with IBM Power	2341
CHAPTER 14. DEPLOYING INSTALLER-PROVISIONED CLUSTERS ON BARE METAL	2342
14.1. OVERVIEW	2342
14.2. PREREQUISITES	2343
14.2.1. Node requirements	2344
14.2.2. Minimum resource requirements for cluster installation	2345
14.2.3. Planning a bare metal cluster for OpenShift Virtualization	2346
14.2.4. Firmware requirements for installing with virtual media	2347
14.2.5. Network requirements	2348
14.2.5.1. Ensuring required ports are open	2348
14.2.5.2. Increase the network MTU	2350
14.2.5.3. Configuring NICs	2350
14.2.5.4. DNS requirements	2350
14.2.5.5. Dynamic Host Configuration Protocol (DHCP) requirements	2352
14.2.5.6. Reserving IP addresses for nodes with the DHCP server	2352
14.2.5.7. Provisioner node requirements	2353
14.2.5.8. Network Time Protocol (NTP)	2353
14.2.5.9. Port access for the out-of-band management IP address	2354
14.2.6. Configuring nodes	2354
Configuring nodes when using the provisioning network	2354
Configuring nodes without the provisioning network	2355
Configuring nodes for Secure Boot manually	2355
14.2.7. Out-of-band management	2356
14.2.8. Required data for installation	2356
14.2.9. Validation checklist for nodes	2357
14.3. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT INSTALLATION	2357
14.3.1. Installing RHEL on the provisioner node	2357
14.3.2. Preparing the provisioner node for OpenShift Container Platform installation	2357

14.3.3. Checking NTP server synchronization	2359
14.3.4. Configuring networking	2360
14.3.5. Establishing communication between subnets	2362
14.3.6. Retrieving the OpenShift Container Platform installer	2364
14.3.7. Extracting the OpenShift Container Platform installer	2364
14.3.8. Optional: Creating an RHCOS images cache	2365
14.3.9. Setting the cluster node hostnames through DHCP	2367
14.3.10. Configuring the install-config.yaml file	2368
14.3.10.1. Configuring the install-config.yaml file	2368
14.3.10.2. Additional install-config parameters	2371
Hosts	2375
14.3.10.3. BMC addressing	2376
IPMI	2376
Redfish network boot	2377
Redfish APIs	2377
14.3.10.4. BMC addressing for Dell iDRAC	2378
BMC address formats for Dell iDRAC	2379
Redfish virtual media for Dell iDRAC	2379
Redfish network boot for iDRAC	2380
14.3.10.5. BMC addressing for HPE iLO	2381
Redfish virtual media for HPE iLO	2382
Redfish network boot for HPE iLO	2382
14.3.10.6. BMC addressing for Fujitsu iRMC	2383
14.3.10.7. Root device hints	2384
14.3.10.8. Optional: Setting proxy settings	2385
14.3.10.9. Optional: Deploying with no provisioning network	2386
14.3.10.10. Optional: Deploying with dual-stack networking	2386
14.3.10.11. Optional: Configuring host network interfaces	2387
14.3.10.12. Configuring host network interfaces for subnets	2389
14.3.10.13. Optional: Configuring address generation modes for SLAAC in dual-stack networks	2391
14.3.10.14. Optional: Configuring host network interfaces for dual port NIC	2392
14.3.10.15. Configuring multiple cluster nodes	2395
14.3.10.16. Optional: Configuring managed Secure Boot	2396
14.3.11. Manifest configuration files	2396
14.3.11.1. Creating the OpenShift Container Platform manifests	2396
14.3.11.2. Optional: Configuring NTP for disconnected clusters	2397
14.3.11.3. Configuring network components to run on the control plane	2399
14.3.11.4. Optional: Deploying routers on worker nodes	2401
14.3.11.5. Optional: Configuring the BIOS	2402
14.3.11.6. Optional: Configuring the RAID	2403
14.3.11.7. Optional: Configuring storage on nodes	2404
14.3.12. Creating a disconnected registry	2405
Prerequisites	2405
14.3.12.1. Preparing the registry node to host the mirrored registry	2405
14.3.12.2. Mirroring the OpenShift Container Platform image repository for a disconnected registry	2406
14.3.12.3. Modify the install-config.yaml file to use the disconnected registry	2409
14.3.13. Validation checklist for installation	2410
14.4. INSTALLING A CLUSTER	2410
14.4.1. Cleaning up previous installations	2410
14.4.2. Deploying the cluster via the OpenShift Container Platform installer	2411
14.4.3. Following the progress of the installation	2411
14.4.4. Verifying static IP address configuration	2411
14.4.5. Additional resources	2411

14.5. TROUBLESHOOTING THE INSTALLATION	2411
14.5.1. Troubleshooting the installation program workflow	2411
14.5.2. Troubleshooting install-config.yaml	2414
14.5.3. Bootstrap VM issues	2414
14.5.3.1. Bootstrap VM cannot boot up the cluster nodes	2416
14.5.3.2. Inspecting logs	2416
14.5.4. Cluster nodes will not PXE boot	2417
14.5.5. Unable to discover new bare metal hosts using the BMC	2418
14.5.6. The API is not accessible	2418
14.5.7. Troubleshooting worker nodes that cannot join the cluster	2419
14.5.8. Cleaning up previous installations	2420
14.5.9. Issues with creating the registry	2421
14.5.10. Miscellaneous issues	2421
14.5.10.1. Addressing the runtime network not ready error	2421
14.5.10.2. Addressing the "No disk found with matching rootDeviceHints" error message	2422
14.5.10.3. Cluster nodes not getting the correct IPv6 address over DHCP	2423
14.5.10.4. Cluster nodes not getting the correct hostname over DHCP	2423
14.5.10.5. Routes do not reach endpoints	2425
14.5.10.6. Failed Ignition during Firstboot	2426
14.5.10.7. NTP out of sync	2426
14.5.11. Reviewing the installation	2428
14.6. INSTALLER-PROVISIONED POSTINSTALLATION CONFIGURATION	2428
14.6.1. Optional: Configuring NTP for disconnected clusters	2429
14.6.2. Enabling a provisioning network after installation	2431
14.6.3. Services for an external load balancer	2433
14.6.3.1. Configuring an external load balancer	2436
14.7. EXPANDING THE CLUSTER	2441
14.7.1. Preparing the bare metal node	2442
14.7.2. Replacing a bare-metal control plane node	2446
14.7.3. Preparing to deploy with Virtual Media on the baremetal network	2450
14.7.4. Diagnosing a duplicate MAC address when provisioning a new host in the cluster	2452
14.7.5. Provisioning the bare metal node	2453
CHAPTER 15. INSTALLING IBM CLOUD BARE METAL (CLASSIC)	2455
15.1. PREREQUISITES	2455
15.1.1. Setting up IBM Cloud Bare Metal (Classic) infrastructure	2455
Use one data center per cluster	2455
Create public and private VLANs	2455
Ensure subnets have sufficient IP addresses	2455
Configuring NICs	2456
Configuring canonical names	2457
Creating DNS entries	2457
Network Time Protocol (NTP)	2458
Configure a DHCP server	2458
Ensure BMC access privileges	2458
Create bare metal servers	2459
15.2. SETTING UP THE ENVIRONMENT FOR AN OPENSIFT CONTAINER PLATFORM INSTALLATION	2459
15.2.1. Preparing the provisioner node on IBM Cloud(R) Bare Metal (Classic) infrastructure	2459
15.2.2. Configuring the public subnet	2463
15.2.3. Retrieving the OpenShift Container Platform installer	2465
15.2.4. Extracting the OpenShift Container Platform installer	2466
15.2.5. Configuring the install-config.yaml file	2466
15.2.6. Additional install-config parameters	2468

Hosts	2472
15.2.7. Root device hints	2473
15.2.8. Creating the OpenShift Container Platform manifests	2474
15.2.9. Deploying the cluster via the OpenShift Container Platform installer	2475
15.2.10. Following the progress of the installation	2475
CHAPTER 16. INSTALLING ON IBM Z AND IBM LINUXONE	2476
16.1. PREPARING TO INSTALL ON IBM Z AND IBM LINUXONE	2476
16.1.1. Prerequisites	2476
16.1.2. Choosing a method to install OpenShift Container Platform on IBM Z or IBM LinuxONE	2476
16.1.2.1. User-provisioned infrastructure installation of OpenShift Container Platform on IBM Z	2476
16.2. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND IBM LINUXONE	2477
16.2.1. Prerequisites	2477
16.2.2. Internet access for OpenShift Container Platform	2478
16.2.3. Requirements for a cluster with user-provisioned infrastructure	2478
16.2.3.1. Required machines for cluster installation	2478
16.2.3.2. Minimum resource requirements for cluster installation	2479
16.2.3.3. Minimum IBM Z system environment	2480
Hardware requirements	2480
Operating system requirements	2480
IBM Z network connectivity requirements	2480
Disk storage for the z/VM guest virtual machines	2480
Storage / Main Memory	2481
16.2.3.4. Preferred IBM Z system environment	2481
Hardware requirements	2481
Operating system requirements	2481
IBM Z network connectivity requirements	2481
Disk storage for the z/VM guest virtual machines	2481
Storage / Main Memory	2482
16.2.3.5. Certificate signing requests management	2482
16.2.3.6. Networking requirements for user-provisioned infrastructure	2482
16.2.3.6.1. Network connectivity requirements	2482
NTP configuration for user-provisioned infrastructure	2484
16.2.3.7. User-provisioned DNS requirements	2484
16.2.3.7.1. Example DNS configuration for user-provisioned clusters	2486
16.2.3.8. Load balancing requirements for user-provisioned infrastructure	2488
16.2.3.8.1. Example load balancer configuration for user-provisioned clusters	2490
16.2.4. Preparing the user-provisioned infrastructure	2491
16.2.5. Validating DNS resolution for user-provisioned infrastructure	2493
16.2.6. Generating a key pair for cluster node SSH access	2495
16.2.7. Obtaining the installation program	2497
16.2.8. Installing the OpenShift CLI by downloading the binary	2498
Installing the OpenShift CLI on Linux	2498
Installing the OpenShift CLI on Windows	2498
Installing the OpenShift CLI on macOS	2499
16.2.9. Manually creating the installation configuration file	2499
16.2.9.1. Sample install-config.yaml file for IBM Z	2500
16.2.9.2. Configuring the cluster-wide proxy during installation	2503
16.2.9.3. Configuring a three-node cluster	2504
16.2.10. Cluster Network Operator configuration	2505
16.2.10.1. Cluster Network Operator configuration object	2506
defaultNetwork object configuration	2507
Configuration for the OpenShift SDN network plugin	2507

Configuration for the OVN-Kubernetes network plugin	2508
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2513
16.2.11. Creating the Kubernetes manifest and Ignition config files	2513
16.2.12. Configuring NBDE with static IP in an IBM Z or IBM LinuxONE environment	2515
16.2.13. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2517
16.2.13.1. Advanced RHCOS installation reference	2520
16.2.13.1.1. Networking and bonding options for ISO installations	2520
Configuring DHCP or static IP addresses	2521
Configuring an IP address without a static hostname	2521
Specifying multiple network interfaces	2522
Configuring default gateway and route	2522
Disabling DHCP on a single interface	2522
Combining DHCP and static IP configurations	2522
Configuring VLANs on individual interfaces	2522
Providing multiple DNS servers	2523
Bonding multiple network interfaces to a single interface	2523
Bonding multiple network interfaces to a single interface	2523
Using network teaming	2523
16.2.14. Waiting for the bootstrap process to complete	2524
16.2.15. Logging in to the cluster by using the CLI	2525
16.2.16. Approving the certificate signing requests for your machines	2525
16.2.17. Initial Operator configuration	2528
16.2.17.1. Image registry storage configuration	2529
16.2.17.1.1. Configuring registry storage for IBM Z	2529
16.2.17.1.2. Configuring storage for the image registry in non-production clusters	2531
16.2.18. Completing installation on user-provisioned infrastructure	2531
16.2.19. Telemetry access for OpenShift Container Platform	2534
16.2.20. Next steps	2534
16.3. INSTALLING A CLUSTER WITH Z/VM ON IBM Z AND IBM LINUXONE IN A RESTRICTED NETWORK	2534
16.3.1. Prerequisites	2534
16.3.2. About installations in restricted networks	2535
16.3.2.1. Additional limits	2535
16.3.3. Internet access for OpenShift Container Platform	2536
16.3.4. Requirements for a cluster with user-provisioned infrastructure	2536
16.3.4.1. Required machines for cluster installation	2536
16.3.4.2. Minimum resource requirements for cluster installation	2537
16.3.4.3. Minimum IBM Z system environment	2537
Hardware requirements	2538
Operating system requirements	2538
IBM Z network connectivity requirements	2538
Disk storage for the z/VM guest virtual machines	2538
Storage / Main Memory	2538
16.3.4.4. Preferred IBM Z system environment	2539
Hardware requirements	2539
Operating system requirements	2539
IBM Z network connectivity requirements	2539
Disk storage for the z/VM guest virtual machines	2539
Storage / Main Memory	2539
16.3.4.5. Certificate signing requests management	2540
16.3.4.6. Networking requirements for user-provisioned infrastructure	2540
16.3.4.6.1. Setting the cluster node hostnames through DHCP	2540
16.3.4.6.2. Network connectivity requirements	2541

NTP configuration for user-provisioned infrastructure	2542
16.3.4.7. User-provisioned DNS requirements	2542
16.3.4.7.1. Example DNS configuration for user-provisioned clusters	2544
16.3.4.8. Load balancing requirements for user-provisioned infrastructure	2546
16.3.4.8.1. Example load balancer configuration for user-provisioned clusters	2548
16.3.5. Preparing the user-provisioned infrastructure	2550
16.3.6. Validating DNS resolution for user-provisioned infrastructure	2551
16.3.7. Generating a key pair for cluster node SSH access	2553
16.3.8. Manually creating the installation configuration file	2555
16.3.8.1. Sample install-config.yaml file for IBM Z	2556
16.3.8.2. Configuring the cluster-wide proxy during installation	2559
16.3.8.3. Configuring a three-node cluster	2561
16.3.9. Cluster Network Operator configuration	2562
16.3.9.1. Cluster Network Operator configuration object	2562
defaultNetwork object configuration	2563
Configuration for the OpenShift SDN network plugin	2563
Configuration for the OVN-Kubernetes network plugin	2564
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2569
16.3.10. Creating the Kubernetes manifest and Ignition config files	2569
16.3.11. Configuring NBDE with static IP in an IBM Z or IBM LinuxONE environment	2571
16.3.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2573
16.3.12.1. Advanced RHCOS installation reference	2576
16.3.12.1.1. Networking and bonding options for ISO installations	2576
Configuring DHCP or static IP addresses	2577
Configuring an IP address without a static hostname	2577
Specifying multiple network interfaces	2578
Configuring default gateway and route	2578
Disabling DHCP on a single interface	2578
Combining DHCP and static IP configurations	2578
Configuring VLANs on individual interfaces	2578
Providing multiple DNS servers	2579
Bonding multiple network interfaces to a single interface	2579
Bonding multiple network interfaces to a single interface	2579
Using network teaming	2580
16.3.13. Waiting for the bootstrap process to complete	2580
16.3.14. Logging in to the cluster by using the CLI	2581
16.3.15. Approving the certificate signing requests for your machines	2581
16.3.16. Initial Operator configuration	2584
16.3.16.1. Disabling the default OperatorHub catalog sources	2585
16.3.16.2. Image registry storage configuration	2586
16.3.16.2.1. Configuring registry storage for IBM Z	2586
16.3.16.2.2. Configuring storage for the image registry in non-production clusters	2587
16.3.17. Completing installation on user-provisioned infrastructure	2588
16.3.18. Next steps	2590
16.4. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND IBM LINUXONE	2591
16.4.1. Prerequisites	2591
16.4.2. Internet access for OpenShift Container Platform	2591
16.4.3. Machine requirements for a cluster with user-provisioned infrastructure	2592
16.4.3.1. Required machines	2592
16.4.3.2. Network connectivity requirements	2592
16.4.3.3. IBM Z network connectivity requirements	2593
16.4.3.4. Host machine resource requirements	2593
16.4.3.5. Minimum IBM Z system environment	2593

Hardware requirements	2593
Operating system requirements	2593
16.4.3.6. Minimum resource requirements	2594
16.4.3.7. Preferred IBM Z system environment	2594
Hardware requirements	2594
Operating system requirements	2594
16.4.3.8. Preferred resource requirements	2595
16.4.3.9. Certificate signing requests management	2595
16.4.3.10. Networking requirements for user-provisioned infrastructure	2595
16.4.3.10.1. Setting the cluster node hostnames through DHCP	2596
16.4.3.10.2. Network connectivity requirements	2596
NTP configuration for user-provisioned infrastructure	2597
16.4.3.11. User-provisioned DNS requirements	2597
16.4.3.11.1. Example DNS configuration for user-provisioned clusters	2599
16.4.3.12. Load balancing requirements for user-provisioned infrastructure	2602
16.4.3.12.1. Example load balancer configuration for user-provisioned clusters	2603
16.4.4. Preparing the user-provisioned infrastructure	2605
16.4.5. Validating DNS resolution for user-provisioned infrastructure	2607
16.4.6. Generating a key pair for cluster node SSH access	2610
16.4.7. Obtaining the installation program	2611
16.4.8. Installing the OpenShift CLI by downloading the binary	2612
Installing the OpenShift CLI on Linux	2612
Installing the OpenShift CLI on Windows	2613
Installing the OpenShift CLI on macOS	2613
16.4.9. Manually creating the installation configuration file	2614
16.4.9.1. Sample install-config.yaml file for IBM Z	2615
16.4.9.2. Configuring the cluster-wide proxy during installation	2617
16.4.9.3. Configuring a three-node cluster	2619
16.4.10. Cluster Network Operator configuration	2620
16.4.10.1. Cluster Network Operator configuration object	2620
defaultNetwork object configuration	2621
Configuration for the OpenShift SDN network plugin	2622
Configuration for the OVN-Kubernetes network plugin	2623
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2628
16.4.11. Creating the Kubernetes manifest and Ignition config files	2628
16.4.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2630
16.4.12.1. Installing RHCOS using IBM Secure Execution	2630
16.4.12.2. Configuring NBDE with static IP in an IBM Z or IBM LinuxONE environment	2633
16.4.12.3. Fast-track installation by using a prepackaged QCOW2 disk image	2635
16.4.12.4. Full installation on a new QCOW2 disk image	2636
16.4.12.5. Advanced RHCOS installation reference	2638
16.4.12.5.1. Networking options for ISO installations	2638
Configuring DHCP or static IP addresses	2638
Configuring an IP address without a static hostname	2639
Specifying multiple network interfaces	2639
Configuring default gateway and route	2639
Disabling DHCP on a single interface	2639
Combining DHCP and static IP configurations	2640
Configuring VLANs on individual interfaces	2640
Providing multiple DNS servers	2640
16.4.13. Waiting for the bootstrap process to complete	2640
16.4.14. Logging in to the cluster by using the CLI	2641
16.4.15. Approving the certificate signing requests for your machines	2642

16.4.16. Initial Operator configuration	2644
16.4.16.1. Image registry storage configuration	2645
16.4.16.1.1. Configuring registry storage for IBM Z	2645
16.4.16.1.2. Configuring storage for the image registry in non-production clusters	2647
16.4.17. Completing installation on user-provisioned infrastructure	2648
16.4.18. Telemetry access for OpenShift Container Platform	2650
16.4.19. Next steps	2650
16.5. INSTALLING A CLUSTER WITH RHEL KVM ON IBM Z AND IBM LINUXONE IN A RESTRICTED NETWORK	2650
16.5.1. Prerequisites	2651
16.5.2. About installations in restricted networks	2651
16.5.2.1. Additional limits	2652
16.5.3. Internet access for OpenShift Container Platform	2652
16.5.4. Machine requirements for a cluster with user-provisioned infrastructure	2652
16.5.4.1. Required machines	2652
16.5.4.2. Network connectivity requirements	2653
16.5.4.3. IBM Z network connectivity requirements	2653
16.5.4.4. Host machine resource requirements	2653
16.5.4.5. Minimum IBM Z system environment	2653
Hardware requirements	2654
Operating system requirements	2654
16.5.4.6. Minimum resource requirements	2654
16.5.4.7. Preferred IBM Z system environment	2654
Hardware requirements	2654
Operating system requirements	2655
16.5.4.8. Preferred resource requirements	2655
16.5.4.9. Certificate signing requests management	2655
16.5.4.10. Networking requirements for user-provisioned infrastructure	2655
16.5.4.10.1. Setting the cluster node hostnames through DHCP	2656
16.5.4.10.2. Network connectivity requirements	2656
NTP configuration for user-provisioned infrastructure	2657
16.5.4.11. User-provisioned DNS requirements	2658
16.5.4.11.1. Example DNS configuration for user-provisioned clusters	2660
16.5.4.12. Load balancing requirements for user-provisioned infrastructure	2662
16.5.4.12.1. Example load balancer configuration for user-provisioned clusters	2664
16.5.5. Preparing the user-provisioned infrastructure	2665
16.5.6. Validating DNS resolution for user-provisioned infrastructure	2667
16.5.7. Generating a key pair for cluster node SSH access	2670
16.5.8. Manually creating the installation configuration file	2672
16.5.8.1. Sample install-config.yaml file for IBM Z	2672
16.5.8.2. Configuring the cluster-wide proxy during installation	2676
16.5.8.3. Configuring a three-node cluster	2677
16.5.9. Cluster Network Operator configuration	2678
16.5.9.1. Cluster Network Operator configuration object	2679
defaultNetwork object configuration	2680
Configuration for the OpenShift SDN network plugin	2680
Configuration for the OVN-Kubernetes network plugin	2681
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2686
16.5.10. Creating the Kubernetes manifest and Ignition config files	2686
16.5.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2688
16.5.11.1. Installing RHCOS using IBM Secure Execution	2688
16.5.11.2. Configuring NBDE with static IP in an IBM Z or IBM LinuxONE environment	2691
16.5.11.3. Fast-track installation by using a prepackaged QCOW2 disk image	2693

16.5.11.4. Full installation on a new QCOW2 disk image	2694
16.5.11.5. Advanced RHCOS installation reference	2696
16.5.11.5.1. Networking options for ISO installations	2696
Configuring DHCP or static IP addresses	2696
Configuring an IP address without a static hostname	2697
Specifying multiple network interfaces	2697
Configuring default gateway and route	2697
Disabling DHCP on a single interface	2697
Combining DHCP and static IP configurations	2698
Configuring VLANs on individual interfaces	2698
Providing multiple DNS servers	2698
16.5.12. Waiting for the bootstrap process to complete	2698
16.5.13. Logging in to the cluster by using the CLI	2699
16.5.14. Approving the certificate signing requests for your machines	2700
16.5.15. Initial Operator configuration	2702
16.5.15.1. Disabling the default OperatorHub catalog sources	2703
16.5.15.2. Image registry storage configuration	2704
16.5.15.2.1. Configuring registry storage for IBM Z	2704
16.5.15.2.2. Configuring storage for the image registry in non-production clusters	2706
16.5.16. Completing installation on user-provisioned infrastructure	2706
16.5.17. Next steps	2709
16.6. INSTALLATION CONFIGURATION PARAMETERS FOR IBM Z AND IBM LINUXONE	2709
16.6.1. Available installation configuration parameters for IBM Z	2709
16.6.1.1. Required configuration parameters	2709
16.6.1.2. Network configuration parameters	2711
16.6.1.3. Optional configuration parameters	2713
CHAPTER 17. INSTALLING ON IBM POWER	2720
17.1. PREPARING TO INSTALL ON IBM POWER	2720
17.1.1. Prerequisites	2720
17.1.2. Choosing a method to install OpenShift Container Platform on IBM Power	2720
17.2. INSTALLING A CLUSTER ON IBM POWER	2720
17.2.1. Prerequisites	2720
17.2.2. Internet access for OpenShift Container Platform	2721
17.2.3. Requirements for a cluster with user-provisioned infrastructure	2721
17.2.3.1. Required machines for cluster installation	2721
17.2.3.2. Minimum resource requirements for cluster installation	2722
17.2.3.3. Minimum IBM Power requirements	2723
Hardware requirements	2723
Operating system requirements	2723
Disk storage for the IBM Power guest virtual machines	2723
Network for the PowerVM guest virtual machines	2724
Storage / main memory	2724
17.2.3.4. Recommended IBM Power system requirements	2724
Hardware requirements	2724
Operating system requirements	2724
Disk storage for the IBM Power guest virtual machines	2724
Network for the PowerVM guest virtual machines	2724
Storage / main memory	2724
17.2.3.5. Certificate signing requests management	2724
17.2.3.6. Networking requirements for user-provisioned infrastructure	2725
17.2.3.6.1. Setting the cluster node hostnames through DHCP	2725
17.2.3.6.2. Network connectivity requirements	2725

NTP configuration for user-provisioned infrastructure	2727
17.2.3.7. User-provisioned DNS requirements	2727
17.2.3.7.1. Example DNS configuration for user-provisioned clusters	2729
17.2.3.8. Load balancing requirements for user-provisioned infrastructure	2731
17.2.3.8.1. Example load balancer configuration for user-provisioned clusters	2733
17.2.4. Preparing the user-provisioned infrastructure	2735
17.2.5. Validating DNS resolution for user-provisioned infrastructure	2736
17.2.6. Generating a key pair for cluster node SSH access	2739
17.2.7. Obtaining the installation program	2740
17.2.8. Installing the OpenShift CLI by downloading the binary	2741
Installing the OpenShift CLI on Linux	2741
Installing the OpenShift CLI on Windows	2742
Installing the OpenShift CLI on macOS	2742
17.2.9. Manually creating the installation configuration file	2743
17.2.9.1. Sample install-config.yaml file for IBM Power	2744
17.2.9.2. Configuring the cluster-wide proxy during installation	2746
17.2.9.3. Configuring a three-node cluster	2748
17.2.10. Cluster Network Operator configuration	2749
17.2.10.1. Cluster Network Operator configuration object	2749
defaultNetwork object configuration	2750
Configuration for the OpenShift SDN network plugin	2751
Configuration for the OVN-Kubernetes network plugin	2752
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2757
17.2.11. Creating the Kubernetes manifest and Ignition config files	2757
17.2.12. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2759
17.2.12.1. Installing RHCOS by using an ISO image	2759
17.2.12.1.1. Advanced RHCOS installation reference	2763
17.2.12.1.1.1. Networking and bonding options for ISO installations	2763
Configuring DHCP or static IP addresses	2763
Configuring an IP address without a static hostname	2764
Specifying multiple network interfaces	2764
Configuring default gateway and route	2764
Disabling DHCP on a single interface	2764
Combining DHCP and static IP configurations	2765
Configuring VLANs on individual interfaces	2765
Providing multiple DNS servers	2765
Bonding multiple network interfaces to a single interface	2765
Bonding multiple SR-IOV network interfaces to a dual port NIC interface	2766
17.2.12.2. Installing RHCOS by using PXE booting	2766
17.2.12.3. Enabling multipathing with kernel arguments on RHCOS	2770
17.2.13. Waiting for the bootstrap process to complete	2771
17.2.14. Logging in to the cluster by using the CLI	2772
17.2.15. Approving the certificate signing requests for your machines	2773
17.2.16. Initial Operator configuration	2776
17.2.16.1. Image registry storage configuration	2777
17.2.16.1.1. Configuring registry storage for IBM Power	2777
17.2.16.1.2. Configuring storage for the image registry in non-production clusters	2778
17.2.17. Completing installation on user-provisioned infrastructure	2779
17.2.18. Telemetry access for OpenShift Container Platform	2781
17.2.19. Next steps	2781
17.3. INSTALLING A CLUSTER ON IBM POWER IN A RESTRICTED NETWORK	2782
17.3.1. Prerequisites	2782
17.3.2. About installations in restricted networks	2782

17.3.2.1. Additional limits	2783
17.3.3. Internet access for OpenShift Container Platform	2783
17.3.4. Requirements for a cluster with user-provisioned infrastructure	2783
17.3.4.1. Required machines for cluster installation	2783
17.3.4.2. Minimum resource requirements for cluster installation	2784
17.3.4.3. Minimum IBM Power requirements	2785
Hardware requirements	2785
Operating system requirements	2785
Disk storage for the IBM Power guest virtual machines	2785
Network for the PowerVM guest virtual machines	2786
Storage / main memory	2786
17.3.4.4. Recommended IBM Power system requirements	2786
Hardware requirements	2786
Operating system requirements	2786
Disk storage for the IBM Power guest virtual machines	2786
Network for the PowerVM guest virtual machines	2786
Storage / main memory	2786
17.3.4.5. Certificate signing requests management	2786
17.3.4.6. Networking requirements for user-provisioned infrastructure	2787
17.3.4.6.1. Setting the cluster node hostnames through DHCP	2787
17.3.4.6.2. Network connectivity requirements	2787
NTP configuration for user-provisioned infrastructure	2789
17.3.4.7. User-provisioned DNS requirements	2789
17.3.4.7.1. Example DNS configuration for user-provisioned clusters	2791
17.3.4.8. Load balancing requirements for user-provisioned infrastructure	2793
17.3.4.8.1. Example load balancer configuration for user-provisioned clusters	2795
17.3.5. Preparing the user-provisioned infrastructure	2796
17.3.6. Validating DNS resolution for user-provisioned infrastructure	2798
17.3.7. Generating a key pair for cluster node SSH access	2801
17.3.8. Manually creating the installation configuration file	2802
17.3.8.1. Sample install-config.yaml file for IBM Power	2803
17.3.8.2. Configuring the cluster-wide proxy during installation	2806
17.3.8.3. Configuring a three-node cluster	2808
17.3.9. Cluster Network Operator configuration	2809
17.3.9.1. Cluster Network Operator configuration object	2809
defaultNetwork object configuration	2810
Configuration for the OpenShift SDN network plugin	2811
Configuration for the OVN-Kubernetes network plugin	2812
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	2817
17.3.10. Creating the Kubernetes manifest and Ignition config files	2817
17.3.11. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	2819
17.3.11.1. Installing RHCOS by using an ISO image	2819
17.3.11.1.1. Advanced RHCOS installation reference	2823
17.3.11.1.1.1. Networking and bonding options for ISO installations	2823
Configuring DHCP or static IP addresses	2823
Configuring an IP address without a static hostname	2824
Specifying multiple network interfaces	2824
Configuring default gateway and route	2824
Disabling DHCP on a single interface	2825
Combining DHCP and static IP configurations	2825
Configuring VLANs on individual interfaces	2825
Providing multiple DNS servers	2825
Bonding multiple network interfaces to a single interface	2825

Bonding multiple SR-IOV network interfaces to a dual port NIC interface	2826
17.3.11.2. Installing RHCOS by using PXE booting	2827
17.3.11.3. Enabling multipathing with kernel arguments on RHCOS	2830
17.3.12. Waiting for the bootstrap process to complete	2832
17.3.13. Logging in to the cluster by using the CLI	2833
17.3.14. Approving the certificate signing requests for your machines	2833
17.3.15. Initial Operator configuration	2836
17.3.15.1. Disabling the default OperatorHub catalog sources	2837
17.3.15.2. Image registry storage configuration	2837
17.3.15.2.1. Changing the image registry's management state	2837
17.3.15.2.2. Configuring registry storage for IBM Power	2838
17.3.15.2.3. Configuring storage for the image registry in non-production clusters	2839
17.3.16. Completing installation on user-provisioned infrastructure	2840
17.3.17. Next steps	2842
17.4. INSTALLATION CONFIGURATION PARAMETERS FOR IBM POWER	2842
17.4.1. Available installation configuration parameters for IBM Power	2842
17.4.1.1. Required configuration parameters	2843
17.4.1.2. Network configuration parameters	2844
17.4.1.3. Optional configuration parameters	2846
CHAPTER 18. INSTALLING ON IBM POWER VIRTUAL SERVER	2854
18.1. PREPARING TO INSTALL ON IBM POWER VIRTUAL SERVER	2854
18.1.1. Prerequisites	2854
18.1.2. Requirements for installing OpenShift Container Platform on IBM Power Virtual Server	2854
18.1.3. Choosing a method to install OpenShift Container Platform on IBM Power Virtual Server	2854
18.1.3.1. Installing a cluster on installer-provisioned infrastructure	2854
18.1.4. Configuring the Cloud Credential Operator utility	2855
18.1.5. Next steps	2856
18.2. CONFIGURING AN IBM CLOUD ACCOUNT	2856
18.2.1. Prerequisites	2857
18.2.2. Quotas and limits on IBM Power Virtual Server	2857
Virtual Private Cloud	2857
Application load balancer	2857
Cloud connections	2857
Dynamic Host Configuration Protocol Service	2858
Networking	2858
Virtual Server Instances	2858
18.2.3. Configuring DNS resolution	2858
18.2.4. Using IBM Cloud Internet Services for DNS resolution	2858
18.2.5. IBM Cloud IAM Policies and API Key	2860
18.2.5.1. Pre-requisite permissions	2860
18.2.5.2. Cluster-creation permissions	2860
18.2.5.3. Access policy assignment	2861
18.2.5.4. Creating an API key	2861
18.2.6. Supported IBM Power Virtual Server regions and zones	2862
18.2.7. Next steps	2863
18.3. CREATING AN IBM POWER VIRTUAL SERVER WORKSPACE	2863
18.3.1. Creating an IBM Power Virtual Server workspace	2863
18.3.2. Next steps	2863
18.4. INSTALLING A CLUSTER ON IBM POWER VIRTUAL SERVER WITH CUSTOMIZATIONS	2863
18.4.1. Prerequisites	2864
18.4.2. Internet access for OpenShift Container Platform	2864
18.4.3. Generating a key pair for cluster node SSH access	2864

18.4.4. Obtaining the installation program	2866
18.4.5. Exporting the API key	2867
18.4.6. Creating the installation configuration file	2867
18.4.6.1. Sample customized install-config.yaml file for IBM Power Virtual Server	2869
18.4.6.2. Configuring the cluster-wide proxy during installation	2870
18.4.7. Manually creating IAM	2872
18.4.8. Deploying the cluster	2874
18.4.9. Installing the OpenShift CLI by downloading the binary	2876
Installing the OpenShift CLI on Linux	2876
Installing the OpenShift CLI on Windows	2877
Installing the OpenShift CLI on macOS	2877
18.4.10. Logging in to the cluster by using the CLI	2878
18.4.11. Telemetry access for OpenShift Container Platform	2878
18.4.12. Next steps	2878
18.5. INSTALLING A CLUSTER ON IBM POWER VIRTUAL SERVER INTO AN EXISTING VPC	2879
18.5.1. Prerequisites	2879
18.5.2. About using a custom VPC	2879
18.5.2.1. Requirements for using your VPC	2879
18.5.2.2. VPC validation	2880
18.5.2.3. Isolation between clusters	2880
18.5.3. Internet access for OpenShift Container Platform	2880
18.5.4. Generating a key pair for cluster node SSH access	2881
18.5.5. Obtaining the installation program	2883
18.5.6. Exporting the API key	2883
18.5.7. Creating the installation configuration file	2884
18.5.7.1. Minimum resource requirements for cluster installation	2885
18.5.7.2. Sample customized install-config.yaml file for IBM Power Virtual Server	2886
18.5.7.3. Configuring the cluster-wide proxy during installation	2888
18.5.8. Manually creating IAM	2889
18.5.9. Deploying the cluster	2892
18.5.10. Installing the OpenShift CLI by downloading the binary	2893
Installing the OpenShift CLI on Linux	2893
Installing the OpenShift CLI on Windows	2894
Installing the OpenShift CLI on macOS	2894
18.5.11. Logging in to the cluster by using the CLI	2895
18.5.12. Telemetry access for OpenShift Container Platform	2896
18.5.13. Next steps	2896
18.6. INSTALLING A PRIVATE CLUSTER ON IBM POWER VIRTUAL SERVER	2896
18.6.1. Prerequisites	2896
18.6.2. Private clusters	2897
18.6.3. Private clusters in IBM Power Virtual Server	2897
18.6.3.1. Limitations	2898
18.6.4. Requirements for using your VPC	2898
18.6.4.1. VPC validation	2898
18.6.4.2. Isolation between clusters	2899
18.6.5. Internet access for OpenShift Container Platform	2899
18.6.6. Generating a key pair for cluster node SSH access	2899
18.6.7. Obtaining the installation program	2901
18.6.8. Exporting the API key	2901
18.6.9. Manually creating the installation configuration file	2902
18.6.9.1. Minimum resource requirements for cluster installation	2903
18.6.9.2. Sample customized install-config.yaml file for IBM Power Virtual Server	2904
18.6.9.3. Configuring the cluster-wide proxy during installation	2906

18.6.10. Manually creating IAM	2907
18.6.11. Deploying the cluster	2910
18.6.12. Installing the OpenShift CLI by downloading the binary	2911
Installing the OpenShift CLI on Linux	2911
Installing the OpenShift CLI on Windows	2912
Installing the OpenShift CLI on macOS	2912
18.6.13. Logging in to the cluster by using the CLI	2913
18.6.14. Telemetry access for OpenShift Container Platform	2914
18.6.15. Next steps	2914
18.7. INSTALLING A CLUSTER ON IBM POWER VIRTUAL SERVER IN A RESTRICTED NETWORK	2914
18.7.1. Prerequisites	2914
18.7.2. About installations in restricted networks	2915
18.7.2.1. Additional limits	2915
18.7.3. About using a custom VPC	2915
18.7.3.1. Requirements for using your VPC	2915
18.7.3.2. VPC validation	2916
18.7.3.3. Isolation between clusters	2916
18.7.4. Internet access for OpenShift Container Platform	2916
18.7.5. Generating a key pair for cluster node SSH access	2917
18.7.6. Exporting the API key	2918
18.7.7. Creating the installation configuration file	2919
18.7.7.1. Minimum resource requirements for cluster installation	2921
18.7.7.2. Sample customized install-config.yaml file for IBM Power Virtual Server	2922
18.7.7.3. Configuring the cluster-wide proxy during installation	2924
18.7.8. Manually creating IAM	2926
18.7.9. Deploying the cluster	2928
18.7.10. Installing the OpenShift CLI by downloading the binary	2930
Installing the OpenShift CLI on Linux	2930
Installing the OpenShift CLI on Windows	2931
Installing the OpenShift CLI on macOS	2931
18.7.11. Logging in to the cluster by using the CLI	2932
18.7.12. Disabling the default OperatorHub catalog sources	2932
18.7.13. Telemetry access for OpenShift Container Platform	2933
18.7.14. Next steps	2933
18.8. UNINSTALLING A CLUSTER ON IBM POWER VIRTUAL SERVER	2933
18.8.1. Removing a cluster that uses installer-provisioned infrastructure	2933
18.9. INSTALLATION CONFIGURATION PARAMETERS FOR IBM POWER VIRTUAL SERVER	2935
18.9.1. Available installation configuration parameters for IBM Power Virtual Server	2935
18.9.1.1. Required configuration parameters	2935
18.9.1.2. Network configuration parameters	2937
18.9.1.3. Optional configuration parameters	2939
CHAPTER 19. INSTALLING ON OPENSTACK	2946
19.1. PREPARING TO INSTALL ON OPENSTACK	2946
19.1.1. Prerequisites	2946
19.1.2. Choosing a method to install OpenShift Container Platform on OpenStack	2946
19.1.2.1. Installing a cluster on installer-provisioned infrastructure	2946
19.1.2.2. Installing a cluster on user-provisioned infrastructure	2946
19.1.3. Scanning RHOSP endpoints for legacy HTTPS certificates	2947
19.1.3.1. Scanning RHOSP endpoints for legacy HTTPS certificates manually	2949
19.2. PREPARING TO INSTALL A CLUSTER THAT USES SR-IOV OR OVS-DPDK ON OPENSTACK	2950
19.2.1. Requirements for clusters on RHOSP that use either SR-IOV or OVS-DPDK	2950
19.2.1.1. Requirements for clusters on RHOSP that use SR-IOV	2950

19.2.1.2. Requirements for clusters on RHOSP that use OVS-DPDK	2951
19.2.2. Preparing to install a cluster that uses SR-IOV	2951
19.2.2.1. Creating SR-IOV networks for compute machines	2951
19.2.3. Preparing to install a cluster that uses OVS-DPDK	2952
19.2.4. Next steps	2952
19.3. INSTALLING A CLUSTER ON OPENSTACK WITH CUSTOMIZATIONS	2953
19.3.1. Prerequisites	2953
19.3.2. Resource guidelines for installing OpenShift Container Platform on RHOSP	2953
19.3.2.1. Control plane machines	2954
19.3.2.2. Compute machines	2954
19.3.2.3. Bootstrap machine	2955
19.3.2.4. Load balancing requirements for user-provisioned infrastructure	2955
19.3.2.4.1. Example load balancer configuration for clusters that are deployed with user-managed load balancers	2957
19.3.3. Internet access for OpenShift Container Platform	2959
19.3.4. Enabling Swift on RHOSP	2959
19.3.5. Configuring an image registry with custom storage on clusters that run on RHOSP	2960
19.3.6. Verifying external network access	2962
19.3.7. Defining parameters for the installation program	2963
19.3.8. Setting OpenStack Cloud Controller Manager options	2965
19.3.9. Obtaining the installation program	2966
19.3.10. Creating the installation configuration file	2967
19.3.10.1. Configuring the cluster-wide proxy during installation	2969
19.3.10.2. Custom subnets in RHOSP deployments	2970
19.3.10.3. Deploying a cluster with bare metal machines	2971
19.3.10.4. Cluster deployment on RHOSP provider networks	2973
19.3.10.4.1. RHOSP provider network requirements for cluster installation	2974
19.3.10.4.2. Deploying a cluster that has a primary interface on a provider network	2975
19.3.10.5. Sample customized install-config.yaml file for RHOSP	2976
19.3.10.6. Optional: Configuring a cluster with dual-stack networking	2977
19.3.10.6.1. Deploying the dual-stack cluster	2977
19.3.10.7. Installation configuration for a cluster on OpenStack with a user-managed load balancer	2979
19.3.11. Generating a key pair for cluster node SSH access	2980
19.3.12. Enabling access to the environment	2982
19.3.12.1. Enabling access with floating IP addresses	2982
19.3.12.2. Completing installation without floating IP addresses	2983
19.3.13. Deploying the cluster	2984
19.3.14. Verifying cluster status	2985
19.3.15. Logging in to the cluster by using the CLI	2986
19.3.16. Telemetry access for OpenShift Container Platform	2987
19.3.17. Next steps	2987
19.4. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR	2987
19.4.1. Prerequisites	2987
19.4.2. About Kuryr SDN	2988
19.4.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr	2989
19.4.3.1. Increasing quota	2991
19.4.3.2. Configuring Neutron	2991
19.4.3.3. Configuring Octavia	2991
19.4.3.3.1. The Octavia OVN Driver	2992
19.4.3.4. Known limitations of installing with Kuryr	2993
RHOSP general limitations	2993
RHOSP version limitations	2993
RHOSP upgrade limitations	2994

19.4.3.5. Control plane machines	2994
19.4.3.6. Compute machines	2994
19.4.3.7. Bootstrap machine	2995
19.4.3.8. Load balancing requirements for user-provisioned infrastructure	2995
19.4.3.8.1. Example load balancer configuration for clusters that are deployed with user-managed load balancers	2997
19.4.4. Internet access for OpenShift Container Platform	2999
19.4.5. Enabling Swift on RHOSP	2999
19.4.6. Verifying external network access	3000
19.4.7. Defining parameters for the installation program	3001
19.4.8. Setting OpenStack Cloud Controller Manager options	3002
19.4.9. Obtaining the installation program	3004
19.4.10. Creating the installation configuration file	3005
19.4.10.1. Configuring the cluster-wide proxy during installation	3006
19.4.10.2. Custom subnets in RHOSP deployments	3008
19.4.10.3. Sample customized install-config.yaml file for RHOSP with Kuryr	3009
19.4.10.4. Installation configuration for a cluster on OpenStack with a user-managed load balancer	3010
19.4.10.5. Cluster deployment on RHOSP provider networks	3011
19.4.10.5.1. RHOSP provider network requirements for cluster installation	3012
19.4.10.5.2. Deploying a cluster that has a primary interface on a provider network	3013
19.4.10.6. Kuryr ports pools	3015
19.4.10.7. Adjusting Kuryr ports pools during installation	3015
19.4.11. Generating a key pair for cluster node SSH access	3017
19.4.12. Enabling access to the environment	3019
19.4.12.1. Enabling access with floating IP addresses	3019
19.4.12.2. Completing installation without floating IP addresses	3020
19.4.13. Deploying the cluster	3021
19.4.14. Verifying cluster status	3022
19.4.15. Logging in to the cluster by using the CLI	3023
19.4.16. Telemetry access for OpenShift Container Platform	3024
19.4.17. Next steps	3024
19.5. INSTALLING A CLUSTER ON OPENSTACK ON YOUR OWN INFRASTRUCTURE	3024
19.5.1. Prerequisites	3024
19.5.2. Internet access for OpenShift Container Platform	3025
19.5.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	3025
19.5.3.1. Control plane machines	3026
19.5.3.2. Compute machines	3026
19.5.3.3. Bootstrap machine	3027
19.5.4. Downloading playbook dependencies	3027
19.5.5. Downloading the installation playbooks	3028
19.5.6. Obtaining the installation program	3029
19.5.7. Generating a key pair for cluster node SSH access	3030
19.5.8. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	3032
19.5.9. Verifying external network access	3033
19.5.10. Enabling access to the environment	3033
19.5.10.1. Enabling access with floating IP addresses	3034
19.5.10.2. Completing installation without floating IP addresses	3035
19.5.11. Defining parameters for the installation program	3036
19.5.12. Creating the installation configuration file	3037
19.5.12.1. Custom subnets in RHOSP deployments	3039
19.5.12.2. Sample customized install-config.yaml file for RHOSP	3040
19.5.12.3. Setting a custom subnet for machines	3040
19.5.12.4. Emptying compute machine pools	3041

19.5.12.5. Cluster deployment on RHOSP provider networks	3042
19.5.12.5.1. RHOSP provider network requirements for cluster installation	3043
19.5.12.5.2. Deploying a cluster that has a primary interface on a provider network	3044
19.5.13. Creating the Kubernetes manifest and Ignition config files	3045
19.5.14. Preparing the bootstrap Ignition files	3047
19.5.15. Creating control plane Ignition config files on RHOSP	3049
19.5.16. Creating network resources on RHOSP	3050
19.5.16.1. Deploying a cluster with bare metal machines	3052
19.5.17. Creating the bootstrap machine on RHOSP	3053
19.5.18. Creating the control plane machines on RHOSP	3054
19.5.19. Logging in to the cluster by using the CLI	3054
19.5.20. Deleting bootstrap resources from RHOSP	3055
19.5.21. Creating compute machines on RHOSP	3056
19.5.22. Approving the certificate signing requests for your machines	3056
19.5.23. Verifying a successful installation	3059
19.5.24. Telemetry access for OpenShift Container Platform	3059
19.5.25. Next steps	3060
19.6. INSTALLING A CLUSTER ON OPENSTACK WITH KURYR ON YOUR OWN INFRASTRUCTURE	3060
19.6.1. Prerequisites	3060
19.6.2. About Kuryr SDN	3061
19.6.3. Resource guidelines for installing OpenShift Container Platform on RHOSP with Kuryr	3062
19.6.3.1. Increasing quota	3064
19.6.3.2. Configuring Neutron	3064
19.6.3.3. Configuring Octavia	3064
19.6.3.3.1. The Octavia OVN Driver	3065
19.6.3.4. Known limitations of installing with Kuryr	3066
RHOSP general limitations	3066
RHOSP version limitations	3067
RHOSP upgrade limitations	3067
19.6.3.5. Control plane machines	3067
19.6.3.6. Compute machines	3067
19.6.3.7. Bootstrap machine	3068
19.6.4. Internet access for OpenShift Container Platform	3068
19.6.5. Downloading playbook dependencies	3068
19.6.6. Downloading the installation playbooks	3069
19.6.7. Obtaining the installation program	3070
19.6.8. Generating a key pair for cluster node SSH access	3071
19.6.9. Creating the Red Hat Enterprise Linux CoreOS (RHCOS) image	3073
19.6.10. Verifying external network access	3074
19.6.11. Enabling access to the environment	3075
19.6.11.1. Enabling access with floating IP addresses	3075
19.6.11.2. Completing installation without floating IP addresses	3076
19.6.12. Defining parameters for the installation program	3077
19.6.13. Creating the installation configuration file	3078
19.6.13.1. Custom subnets in RHOSP deployments	3080
19.6.13.2. Sample customized install-config.yaml file for RHOSP with Kuryr	3081
19.6.13.3. Cluster deployment on RHOSP provider networks	3082
19.6.13.3.1. RHOSP provider network requirements for cluster installation	3083
19.6.13.3.2. Deploying a cluster that has a primary interface on a provider network	3084
19.6.13.4. Kuryr ports pools	3086
19.6.13.5. Adjusting Kuryr ports pools during installation	3086
19.6.13.6. Setting a custom subnet for machines	3088
19.6.13.7. Emptying compute machine pools	3089

19.6.13.8. Modifying the network type	3089
19.6.14. Creating the Kubernetes manifest and Ignition config files	3090
19.6.15. Preparing the bootstrap Ignition files	3092
19.6.16. Creating control plane Ignition config files on RHOSP	3094
19.6.17. Creating network resources on RHOSP	3095
19.6.18. Creating the bootstrap machine on RHOSP	3096
19.6.19. Creating the control plane machines on RHOSP	3097
19.6.20. Logging in to the cluster by using the CLI	3098
19.6.21. Deleting bootstrap resources from RHOSP	3098
19.6.22. Creating compute machines on RHOSP	3099
19.6.23. Approving the certificate signing requests for your machines	3100
19.6.24. Verifying a successful installation	3102
19.6.25. Telemetry access for OpenShift Container Platform	3103
19.6.26. Next steps	3103
19.7. INSTALLING A CLUSTER ON OPENSTACK IN A RESTRICTED NETWORK	3103
19.7.1. Prerequisites	3103
19.7.2. About installations in restricted networks	3104
19.7.2.1. Additional limits	3104
19.7.3. Resource guidelines for installing OpenShift Container Platform on RHOSP	3104
19.7.3.1. Control plane machines	3105
19.7.3.2. Compute machines	3105
19.7.3.3. Bootstrap machine	3106
19.7.4. Internet access for OpenShift Container Platform	3106
19.7.5. Enabling Swift on RHOSP	3106
19.7.6. Defining parameters for the installation program	3107
19.7.7. Setting OpenStack Cloud Controller Manager options	3108
19.7.8. Creating the RHCOS image for restricted network installations	3110
19.7.9. Creating the installation configuration file	3111
19.7.9.1. Configuring the cluster-wide proxy during installation	3114
19.7.9.2. Sample customized install-config.yaml file for restricted OpenStack installations	3116
19.7.10. Generating a key pair for cluster node SSH access	3117
19.7.11. Enabling access to the environment	3119
19.7.11.1. Enabling access with floating IP addresses	3119
19.7.11.2. Completing installation without floating IP addresses	3120
19.7.12. Deploying the cluster	3121
19.7.13. Verifying cluster status	3122
19.7.14. Logging in to the cluster by using the CLI	3123
19.7.15. Disabling the default OperatorHub catalog sources	3124
19.7.16. Telemetry access for OpenShift Container Platform	3124
19.7.17. Next steps	3124
19.8. CONFIGURING NETWORK SETTINGS AFTER INSTALLING OPENSTACK	3124
19.8.1. Configuring application access with floating IP addresses	3125
19.8.2. Enabling OVS hardware offloading	3125
19.8.3. Attaching an OVS hardware offloading network	3128
19.8.4. Enabling IPv6 connectivity to pods on RHOSP	3128
19.8.5. Create pods that have IPv6 connectivity on RHOSP	3129
19.8.6. Adding IPv6 connectivity to pods on RHOSP	3130
19.9. OPENSTACK CLOUD CONTROLLER MANAGER REFERENCE GUIDE	3131
19.9.1. The OpenStack Cloud Controller Manager	3131
19.9.2. The OpenStack Cloud Controller Manager (CCM) config map	3132
19.9.2.1. Load balancer options	3133
19.9.2.2. Options that the Operator overrides	3136
19.10. UNINSTALLING A CLUSTER ON OPENSTACK	3137

19.10.1. Removing a cluster that uses installer-provisioned infrastructure	3137
19.11. UNINSTALLING A CLUSTER ON RHOSP FROM YOUR OWN INFRASTRUCTURE	3138
19.11.1. Downloading playbook dependencies	3138
19.11.2. Removing a cluster from RHOSP that uses your own infrastructure	3139
19.12. INSTALLATION CONFIGURATION PARAMETERS FOR OPENSTACK	3140
19.12.1. Available installation configuration parameters for OpenStack	3140
19.12.1.1. Required configuration parameters	3140
19.12.1.2. Network configuration parameters	3141
19.12.1.3. Optional configuration parameters	3143
19.12.1.4. Optional AWS configuration parameters	3150
19.12.1.5. Additional Red Hat OpenStack Platform (RHOSP) configuration parameters	3156
19.12.1.6. Optional RHOSP configuration parameters	3158
19.12.1.7. Additional Google Cloud Platform (GCP) configuration parameters	3163
CHAPTER 20. INSTALLING ON OCI	3198
20.1. INSTALLING A CLUSTER ON ORACLE CLOUD INFRASTRUCTURE (OCI) BY USING THE ASSISTED INSTALLER	3198
20.1.1. The Assisted Installer and OCI overview	3198
20.1.2. Creating OCI resources and services	3199
20.1.3. Using the Assisted Installer to generate an OCI-compatible discovery ISO image	3199
20.1.4. Provisioning OCI infrastructure for your cluster	3201
20.1.5. Completing the remaining Assisted Installer steps	3202
20.1.6. Verifying a successful cluster installation on OCI	3202
20.1.7. Troubleshooting the installation of a cluster on OCI	3203
The Ingress Load Balancer in OCI is not at a healthy status	3203
OCI create stack operation fails with an Error: 400-InvalidParameter message	3204
20.2. INSTALLING A CLUSTER ON ORACLE CLOUD INFRASTRUCTURE (OCI) BY USING THE AGENT-BASED INSTALLER	3204
20.2.1. The Agent-based Installer and OCI overview	3204
20.2.2. Creating OCI infrastructure resources and services	3207
20.2.3. Creating configuration files for installing a cluster on OCI	3208
20.2.4. Configuring your firewall for OpenShift Container Platform	3212
20.2.5. Running a cluster on OCI	3215
20.2.6. Verifying that your Agent-based cluster installation runs on OCI	3216
CHAPTER 21. INSTALLING ON VSPHERE	3218
21.1. INSTALLATION METHODS	3218
21.1.1. Assisted Installer	3218
21.1.2. Agent-based Installer	3218
21.1.3. Installer-provisioned infrastructure installation	3218
21.1.4. User-provisioned infrastructure installation	3218
21.1.5. Additional resources	3219
21.2. INSTALLER-PROVISIONED INFRASTRUCTURE	3219
21.2.1. vSphere installation requirements	3219
21.2.1.1. VMware vSphere infrastructure requirements	3219
21.2.1.2. Network connectivity requirements	3221
21.2.1.3. VMware vSphere CSI Driver Operator requirements	3222
21.2.1.4. vCenter requirements	3222
Required vCenter account privileges	3223
Using OpenShift Container Platform with vMotion	3231
Cluster resources	3232
Cluster limits	3232
Networking requirements	3232

Required IP Addresses	3233
DNS records	3233
Static IP addresses for vSphere nodes	3234
21.2.2. Preparing to install a cluster using installer-provisioned infrastructure	3236
21.2.2.1. Obtaining the installation program	3236
21.2.2.2. Installing the OpenShift CLI by downloading the binary	3237
Installing the OpenShift CLI on Linux	3237
Installing the OpenShift CLI on Windows	3238
Installing the OpenShift CLI on macOS	3238
21.2.2.3. Generating a key pair for cluster node SSH access	3239
21.2.2.4. Adding vCenter root CA certificates to your system trust	3240
21.2.3. Installing a cluster on vSphere	3241
21.2.3.1. Prerequisites	3242
21.2.3.2. Internet access for OpenShift Container Platform	3242
21.2.3.3. Deploying the cluster	3243
21.2.3.4. Logging in to the cluster by using the CLI	3247
21.2.3.5. Creating registry storage	3247
21.2.3.5.1. Image registry removed during installation	3247
21.2.3.5.2. Image registry storage configuration	3247
21.2.3.5.2.1. Configuring registry storage for VMware vSphere	3248
21.2.3.5.2.2. Configuring block registry storage for VMware vSphere	3249
21.2.3.6. Telemetry access for OpenShift Container Platform	3250
21.2.3.7. Next steps	3251
21.2.4. Installing a cluster on vSphere with customizations	3251
21.2.4.1. Prerequisites	3251
21.2.4.2. Internet access for OpenShift Container Platform	3252
21.2.4.3. VMware vSphere region and zone enablement	3252
21.2.4.4. Creating the installation configuration file	3254
21.2.4.4.1. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3257
21.2.4.4.2. Configuring the cluster-wide proxy during installation	3258
21.2.4.4.3. Configuring regions and zones for a VMware vCenter	3260
21.2.4.5. Deploying the cluster	3262
21.2.4.6. Logging in to the cluster by using the CLI	3264
21.2.4.7. Creating registry storage	3265
21.2.4.7.1. Image registry removed during installation	3265
21.2.4.7.2. Image registry storage configuration	3265
21.2.4.7.2.1. Configuring registry storage for VMware vSphere	3265
21.2.4.7.2.2. Configuring block registry storage for VMware vSphere	3267
21.2.4.8. Telemetry access for OpenShift Container Platform	3268
21.2.4.9. Services for an external load balancer	3268
21.2.4.9.1. Configuring an external load balancer	3271
21.2.4.10. Next steps	3277
21.2.5. Installing a cluster on vSphere with network customizations	3277
21.2.5.1. Prerequisites	3277
21.2.5.2. Internet access for OpenShift Container Platform	3278
21.2.5.3. VMware vSphere region and zone enablement	3278
21.2.5.4. Creating the installation configuration file	3280
21.2.5.4.1. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3283
21.2.5.4.2. Configuring the cluster-wide proxy during installation	3285
21.2.5.4.3. Optional: Deploying with dual-stack networking	3286
21.2.5.4.4. Configuring regions and zones for a VMware vCenter	3287
21.2.5.5. Network configuration phases	3289
21.2.5.6. Specifying advanced network configuration	3290

21.2.5.7. Cluster Network Operator configuration	3291
21.2.5.7.1. Cluster Network Operator configuration object	3292
defaultNetwork object configuration	3293
Configuration for the OpenShift SDN network plugin	3293
Configuration for the OVN-Kubernetes network plugin	3294
kubeProxyConfig object configuration (OpenShiftSDN container network interface only)	3299
21.2.5.8. Deploying the cluster	3299
21.2.5.9. Logging in to the cluster by using the CLI	3301
21.2.5.10. Creating registry storage	3302
21.2.5.10.1. Image registry removed during installation	3302
21.2.5.10.2. Image registry storage configuration	3302
21.2.5.10.2.1. Configuring registry storage for VMware vSphere	3302
21.2.5.10.2.2. Configuring block registry storage for VMware vSphere	3304
21.2.5.11. Telemetry access for OpenShift Container Platform	3305
21.2.5.12. Services for an external load balancer	3305
21.2.5.12.1. Configuring an external load balancer	3308
21.2.5.13. Configuring network components to run on the control plane	3314
21.2.5.14. Next steps	3316
21.2.6. Installing a cluster on vSphere in a restricted network	3316
21.2.6.1. Prerequisites	3317
21.2.6.2. About installations in restricted networks	3317
21.2.6.2.1. Additional limits	3318
21.2.6.3. Internet access for OpenShift Container Platform	3318
21.2.6.4. Creating the RHCOS image for restricted network installations	3318
21.2.6.5. VMware vSphere region and zone enablement	3319
21.2.6.6. Creating the installation configuration file	3320
21.2.6.6.1. Sample install-config.yaml file for an installer-provisioned VMware vSphere cluster	3324
21.2.6.6.2. Configuring the cluster-wide proxy during installation	3326
21.2.6.6.3. Configuring regions and zones for a VMware vCenter	3328
21.2.6.7. Deploying the cluster	3330
21.2.6.8. Logging in to the cluster by using the CLI	3332
21.2.6.9. Disabling the default OperatorHub catalog sources	3333
21.2.6.10. Creating registry storage	3333
21.2.6.10.1. Image registry removed during installation	3333
21.2.6.10.2. Image registry storage configuration	3334
21.2.6.10.2.1. Configuring registry storage for VMware vSphere	3334
21.2.6.11. Telemetry access for OpenShift Container Platform	3335
21.2.6.12. Services for an external load balancer	3336
21.2.6.12.1. Configuring an external load balancer	3339
21.2.6.13. Next steps	3344
21.3. USER-PROVISIONED INFRASTRUCTURE	3345
21.3.1. vSphere installation requirements for user-provisioned infrastructure	3345
21.3.1.1. VMware vSphere infrastructure requirements	3345
21.3.1.2. VMware vSphere CSI Driver Operator requirements	3347
21.3.1.3. Requirements for a cluster with user-provisioned infrastructure	3347
21.3.1.3.1. vCenter requirements	3347
Required vCenter account privileges	3347
Using OpenShift Container Platform with vMotion	3356
Cluster resources	3356
Cluster limits	3357
Networking requirements	3357
Required IP Addresses	3358
DNS records	3358

21.3.1.3.2. Required machines for cluster installation	3358
21.3.1.3.3. Minimum resource requirements for cluster installation	3359
21.3.1.3.4. Requirements for encrypting virtual machines	3360
21.3.1.3.5. Certificate signing requests management	3361
21.3.1.3.6. Networking requirements for user-provisioned infrastructure	3361
21.3.1.3.6.1. Setting the cluster node hostnames through DHCP	3361
21.3.1.3.6.2. Network connectivity requirements	3361
21.3.1.3.7. User-provisioned DNS requirements	3363
21.3.1.3.7.1. Example DNS configuration for user-provisioned clusters	3364
21.3.1.3.8. Load balancing requirements for user-provisioned infrastructure	3367
21.3.1.3.8.1. Example load balancer configuration for user-provisioned clusters	3368
21.3.2. Preparing to install a cluster using user-provisioned infrastructure	3370
21.3.2.1. Obtaining the installation program	3371
21.3.2.2. Installing the OpenShift CLI by downloading the binary	3372
Installing the OpenShift CLI on Linux	3372
Installing the OpenShift CLI on Windows	3372
Installing the OpenShift CLI on macOS	3373
21.3.2.3. Generating a key pair for cluster node SSH access	3373
21.3.2.4. Preparing the user-provisioned infrastructure	3375
21.3.2.5. Validating DNS resolution for user-provisioned infrastructure	3377
21.3.3. Installing a cluster on vSphere with user-provisioned infrastructure	3379
21.3.3.1. Prerequisites	3380
21.3.3.2. Internet access for OpenShift Container Platform	3380
21.3.3.3. VMware vSphere region and zone enablement	3381
21.3.3.4. Manually creating the installation configuration file	3382
21.3.3.4.1. Sample install-config.yaml file for VMware vSphere	3383
21.3.3.4.2. Configuring the cluster-wide proxy during installation	3386
21.3.3.4.3. Configuring regions and zones for a VMware vCenter	3388
21.3.3.5. Creating the Kubernetes manifest and Ignition config files	3390
21.3.3.6. Extracting the infrastructure name	3393
21.3.3.7. Installing RHCOS and starting the OpenShift Container Platform bootstrap process	3393
21.3.3.8. Adding more compute machines to a cluster in vSphere	3398
21.3.3.9. Disk partitioning	3399
Creating a separate /var partition	3400
21.3.3.10. Waiting for the bootstrap process to complete	3402
21.3.3.11. Logging in to the cluster by using the CLI	3403
21.3.3.12. Approving the certificate signing requests for your machines	3403
21.3.3.13. Initial Operator configuration	3406
21.3.3.13.1. Image registry removed during installation	3407
21.3.3.13.2. Image registry storage configuration	3407
21.3.3.13.2.1. Configuring registry storage for VMware vSphere	3408
21.3.3.13.2.2. Configuring storage for the image registry in non-production clusters	3409
21.3.3.13.2.3. Configuring block registry storage for VMware vSphere	3410
21.3.3.14. Completing installation on user-provisioned infrastructure	3411
21.3.3.15. Configuring vSphere DRS anti-affinity rules for control plane nodes	3414
21.3.3.16. Telemetry access for OpenShift Container Platform	3415
21.3.3.17. Next steps	3415
21.3.4. Installing a cluster on vSphere with network customizations	3415
21.3.4.1. Prerequisites	3416
21.3.4.2. Internet access for OpenShift Container Platform	3416
21.3.4.3. VMware vSphere region and zone enablement	3416
21.3.4.4. Manually creating the installation configuration file	3418
21.3.4.4.1. Sample install-config.yaml file for VMware vSphere	3419

21.3.4.4.2. Configuring the cluster-wide proxy during installation	3422
21.3.4.4.3. Configuring regions and zones for a VMware vCenter	3423
21.3.4.5. Network configuration phases	3426
21.3.4.6. Specifying advanced network configuration	3426
21.3.4.7. Cluster Network Operator configuration	3428
21.3.4.7.1. Cluster Network Operator configuration object	3428

CHAPTER 1. INSTALLATION OVERVIEW

1.1. OPENSIFT CONTAINER PLATFORM INSTALLATION OVERVIEW

1.1.1. About OpenShift Container Platform installation

The OpenShift Container Platform installation program offers four methods for deploying a cluster which are detailed in the following list:

- **Interactive:** You can deploy a cluster with the web-based [Assisted Installer](#). This is an ideal approach for clusters with networks connected to the internet. The Assisted Installer is the easiest way to install OpenShift Container Platform, it provides smart defaults, and it performs pre-flight validations before installing the cluster. It also provides a RESTful API for automation and advanced configuration scenarios.
- **Local Agent-based:** You can deploy a cluster locally with the Agent-based Installer for disconnected environments or restricted networks. It provides many of the benefits of the Assisted Installer, but you must download and configure the [Agent-based Installer](#) first. Configuration is done with a command-line interface. This approach is ideal for disconnected environments.
- **Automated:** You can deploy a cluster on installer-provisioned infrastructure. The installation program uses each cluster host's baseboard management controller (BMC) for provisioning. You can deploy clusters in connected or disconnected environments.
- **Full control:** You can deploy a cluster on infrastructure that you prepare and maintain, which provides maximum customizability. You can deploy clusters in connected or disconnected environments.

Each method deploys a cluster with the following characteristics:

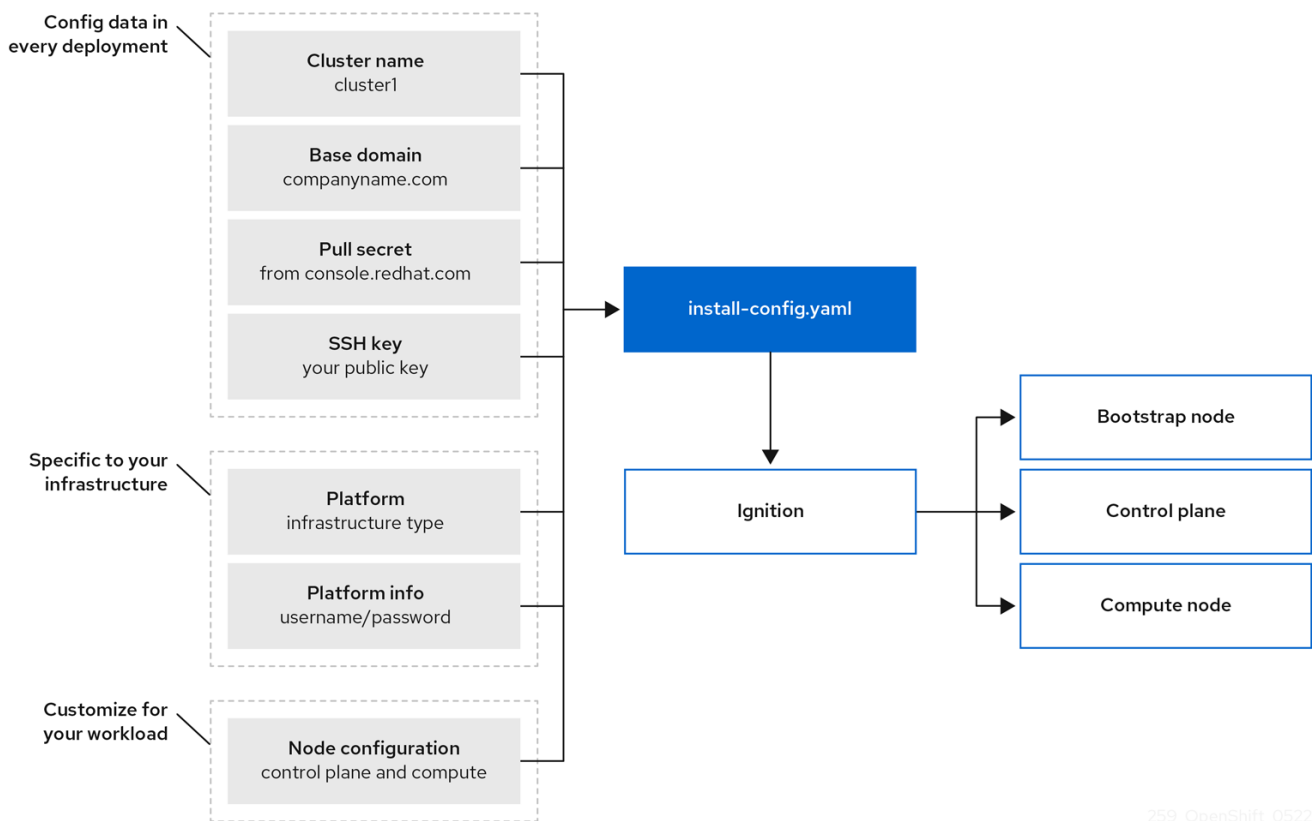

- Highly available infrastructure with no single points of failure, which is available by default.
- Administrators can control what updates are applied and when.

1.1.1.1. About the installation program

You can use the installation program to deploy each type of cluster. The installation program generates the main assets, such as Ignition config files for the bootstrap, control plane, and compute machines. You can start an OpenShift Container Platform cluster with these three machine configurations, provided you correctly configured the infrastructure.

The OpenShift Container Platform installation program uses a set of targets and dependencies to manage cluster installations. The installation program has a set of targets that it must achieve, and each target has a set of dependencies. Because each target is only concerned with its own dependencies, the installation program can act to achieve multiple targets in parallel with the ultimate target being a running cluster. The installation program recognizes and uses existing components instead of running commands to create them again because the program meets the dependencies.

Figure 1.1. OpenShift Container Platform installation targets and dependencies

1.1.1.2. About Red Hat Enterprise Linux CoreOS (RHCOS)

Post-installation, each cluster machine uses Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. RHCOS is the immutable container host version of Red Hat Enterprise Linux (RHEL) and features a RHEL kernel with SELinux enabled by default. RHCOS includes the **kubelet**, which is the Kubernetes node agent, and the CRI-O container runtime, which is optimized for Kubernetes.

Every control plane machine in an OpenShift Container Platform 4.14 cluster must use RHCOS, which includes a critical first-boot provisioning tool called Ignition. This tool enables the cluster to configure the machines. Operating system updates are delivered as a bootable container image, using **OSTree** as a backend, that is deployed across the cluster by the Machine Config Operator. Actual operating system changes are made in-place on each machine as an atomic operation by using **rpm-ostree**. Together, these technologies enable OpenShift Container Platform to manage the operating system like it manages any other application on the cluster, by in-place upgrades that keep the entire platform up to date. These in-place updates can reduce the burden on operations teams.

If you use RHCOS as the operating system for all cluster machines, the cluster manages all aspects of its components and machines, including the operating system. Because of this, only the installation program and the Machine Config Operator can change machines. The installation program uses Ignition config files to set the exact state of each machine, and the Machine Config Operator completes more changes to the machines, such as the application of new certificates or keys, after installation.

1.1.1.3. Glossary of common terms for OpenShift Container Platform installing

The glossary defines common terms that relate to the installation content. Read the following list of terms to better understand the installation process.

Assisted Installer

An installer hosted at console.redhat.com that provides a web-based user interface or a RESTful API

for creating a cluster configuration. The [Assisted Installer](#) generates a discovery image. Cluster machines boot with the discovery image, which installs RHCOS and an agent. Together, the Assisted Installer and agent provide preinstallation validation and installation for the cluster.

Agent-based Installer

An installer similar to the Assisted Installer, but you must download the [Agent-based Installer](#) first. The Agent-based Installer is ideal for disconnected environments.

Bootstrap node

A temporary machine that runs a minimal Kubernetes configuration required to deploy the OpenShift Container Platform control plane.

Control plane

A container orchestration layer that exposes the API and interfaces to define, deploy, and manage the lifecycle of containers. Also known as control plane machines.

Compute node

Nodes that are responsible for executing workloads for cluster users. Also known as worker nodes.

Disconnected installation

In some situations, parts of a data center might not have access to the internet, even through proxy servers. You can still install the OpenShift Container Platform in these environments, but you must download the required software and images and make them available to the disconnected environment.

The OpenShift Container Platform installation program

A program that provisions the infrastructure and deploys a cluster.

Installer-provisioned infrastructure

The installation program deploys and configures the infrastructure that the cluster runs on.

Ignition config files

A file that the Ignition tool uses to configure Red Hat Enterprise Linux CoreOS (RHCOS) during operating system initialization. The installation program generates different Ignition configuration files to initialize bootstrap, control plane, and worker nodes.

Kubernetes manifests

Specifications of a Kubernetes API object in a JSON or YAML format. A configuration file can include deployments, config maps, secrets, daemonsets, and so on.

Kubelet

A primary node agent that runs on each node in the cluster to ensure that containers are running in a pod.

Load balancers

A load balancer serves as the single point of contact for clients. Load balancers for the API distribute incoming traffic across control plane nodes.

Machine Config Operator

An Operator that manages and applies configurations and updates of the base operating system and container runtime, including everything between the kernel and kubelet, for the nodes in the cluster.

Operators

The preferred method of packaging, deploying, and managing a Kubernetes application in an OpenShift Container Platform cluster. An operator takes human operational knowledge and encodes it into software that is easily packaged and shared with customers.

User-provisioned infrastructure

You can install OpenShift Container Platform on infrastructure that you provide. You can use the installation program to generate the assets required to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

1.1.1.4. Installation process

Except for the Assisted Installer, when you install an OpenShift Container Platform cluster, you must download the installation program from the appropriate [Cluster Type](#) page on the OpenShift Cluster Manager Hybrid Cloud Console. This console manages:

- REST API for accounts.
- Registry tokens, which are the pull secrets that you use to obtain the required components.
- Cluster registration, which associates the cluster identity to your Red Hat account to facilitate the gathering of usage metrics.

In OpenShift Container Platform 4.14, the installation program is a Go binary file that performs a series of file transformations on a set of assets. The way you interact with the installation program differs depending on your installation type. Consider the following installation use cases:

- To deploy a cluster with the Assisted Installer, you must configure the cluster settings by using the [Assisted Installer](#). There is no installation program to download and configure. After you finish setting the cluster configuration, you download a discovery ISO and then boot cluster machines with that image. You can install clusters with the Assisted Installer on Nutanix, vSphere, and bare metal with full integration, and other platforms without integration. If you install on bare metal, you must provide all of the cluster infrastructure and resources, including the networking, load balancing, storage, and individual cluster machines.
- To deploy clusters with the Agent-based Installer, you can download the [Agent-based Installer](#) first. You can then configure the cluster and generate a discovery image. You boot cluster machines with the discovery image, which installs an agent that communicates with the installation program and handles the provisioning for you instead of you interacting with the installation program or setting up a provisioner machine yourself. You must provide all of the cluster infrastructure and resources, including the networking, load balancing, storage, and individual cluster machines. This approach is ideal for disconnected environments.
- For clusters with installer-provisioned infrastructure, you delegate the infrastructure bootstrapping and provisioning to the installation program instead of doing it yourself. The installation program creates all of the networking, machines, and operating systems that are required to support the cluster, except if you install on bare metal. If you install on bare metal, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.
- If you provision and manage the infrastructure for your cluster, you must provide all of the cluster infrastructure and resources, including the bootstrap machine, networking, load balancing, storage, and individual cluster machines.

For the installation program, the program uses three sets of files during installation: an installation configuration file that is named **install-config.yaml**, Kubernetes manifests, and Ignition config files for your machine types.

IMPORTANT

You can modify Kubernetes and the Ignition config files that control the underlying RHCOS operating system during installation. However, no validation is available to confirm the suitability of any modifications that you make to these objects. If you modify these objects, you might render your cluster non-functional. Because of this risk, modifying Kubernetes and Ignition config files is not supported unless you are following documented procedures or are instructed to do so by Red Hat support.

The installation configuration file is transformed into Kubernetes manifests, and then the manifests are wrapped into Ignition config files. The installation program uses these Ignition config files to create the cluster.

The installation configuration files are all pruned when you run the installation program, so be sure to back up all the configuration files that you want to use again.

IMPORTANT

You cannot modify the parameters that you set during installation, but you can modify many cluster attributes after installation.

The installation process with the Assisted Installer

Installation with the [Assisted Installer](#) involves creating a cluster configuration interactively by using the web-based user interface or the RESTful API. The Assisted Installer user interface prompts you for required values and provides reasonable default values for the remaining parameters, unless you change them in the user interface or with the API. The Assisted Installer generates a discovery image, which you download and use to boot the cluster machines. The image installs RHCOS and an agent, and the agent handles the provisioning for you. You can install OpenShift Container Platform with the Assisted Installer and full integration on Nutanix, vSphere, and bare metal. Additionally, you can install OpenShift Container Platform with the Assisted Installer on other platforms without integration.

OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

If possible, use the Assisted Installer feature to avoid having to download and configure the Agent-based Installer.

The installation process with Agent-based infrastructure

Agent-based installation is similar to using the Assisted Installer, except that you must initially download and install the [Agent-based Installer](#). An Agent-based installation is useful when you want the convenience of the Assisted Installer, but you need to install a cluster in a disconnected environment.

If possible, use the Agent-based installation feature to avoid having to create a provisioner machine with a bootstrap VM, and then provision and maintain the cluster infrastructure.

The installation process with installer-provisioned infrastructure

The default installation type uses installer-provisioned infrastructure. By default, the installation program acts as an installation wizard, prompting you for values that it cannot determine on its own and providing reasonable default values for the remaining parameters. You can also customize the installation process to support advanced infrastructure scenarios. The installation program provisions the underlying infrastructure for the cluster.

You can install either a standard cluster or a customized cluster. With a standard cluster, you provide minimum details that are required to install the cluster. With a customized cluster, you can specify more details about the platform, such as the number of machines that the control plane uses, the type of

virtual machine that the cluster deploys, or the CIDR range for the Kubernetes service network.

If possible, use this feature to avoid having to provision and maintain the cluster infrastructure. In all other environments, you use the installation program to generate the assets that you require to provision your cluster infrastructure.

With installer-provisioned infrastructure clusters, OpenShift Container Platform manages all aspects of the cluster, including the operating system itself. Each machine boots with a configuration that references resources hosted in the cluster that it joins. This configuration allows the cluster to manage itself as updates are applied.

The installation process with user-provisioned infrastructure

You can also install OpenShift Container Platform on infrastructure that you provide. You use the installation program to generate the assets that you require to provision the cluster infrastructure, create the cluster infrastructure, and then deploy the cluster to the infrastructure that you provided.

If you do not use infrastructure that the installation program provisioned, you must manage and maintain the cluster resources yourself. The following list details some of these self-managed resources:

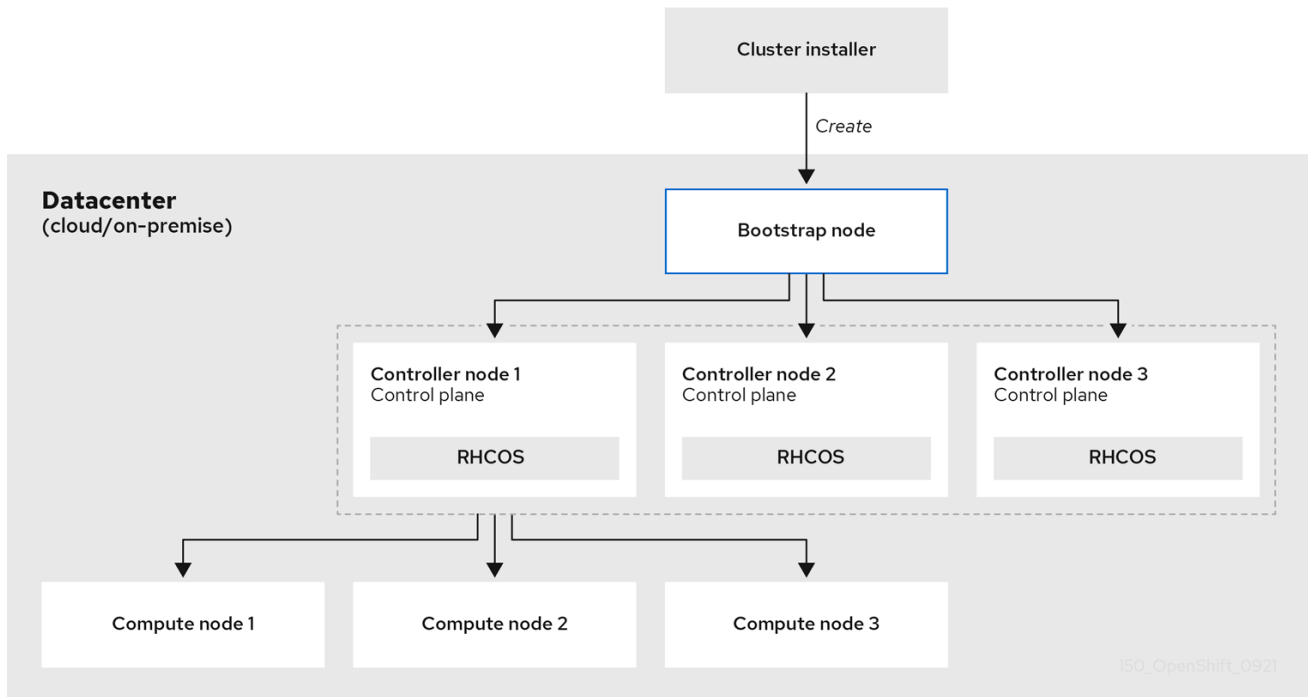

- The underlying infrastructure for the control plane and compute machines that make up the cluster
- Load balancers
- Cluster networking, including the DNS records and required subnets
- Storage for the cluster infrastructure and applications

If your cluster uses user-provisioned infrastructure, you have the option of adding RHEL compute machines to your cluster.

Installation process details

When a cluster is provisioned, each machine in the cluster requires information about the cluster. OpenShift Container Platform uses a temporary bootstrap machine during initial configuration to provide the required information to the permanent control plane. The temporary bootstrap machine boots by using an Ignition config file that describes how to create the cluster. The bootstrap machine creates the control plane machines that make up the control plane. The control plane machines then create the compute machines, which are also known as worker machines. The following figure illustrates this process:

Figure 1.2. Creating the bootstrap, control plane, and compute machines

After the cluster machines initialize, the bootstrap machine is destroyed. All clusters use the bootstrap process to initialize the cluster, but if you provision the infrastructure for your cluster, you must complete many of the steps manually.

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrap** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- Consider using Ignition config files within 12 hours after they are generated, because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Bootstrapping a cluster involves the following steps:

1. The bootstrap machine boots and starts hosting the remote resources required for the control plane machines to boot. If you provision the infrastructure, this step requires manual intervention.
2. The bootstrap machine starts a single-node etcd cluster and a temporary Kubernetes control plane.
3. The control plane machines fetch the remote resources from the bootstrap machine and finish booting. If you provision the infrastructure, this step requires manual intervention.

4. The temporary control plane schedules the production control plane to the production control plane machines.
5. The Cluster Version Operator (CVO) comes online and installs the etcd Operator. The etcd Operator scales up etcd on all control plane nodes.
6. The temporary control plane shuts down and passes control to the production control plane.
7. The bootstrap machine injects OpenShift Container Platform components into the production control plane.
8. The installation program shuts down the bootstrap machine. If you provision the infrastructure, this step requires manual intervention.
9. The control plane sets up the compute nodes.
10. The control plane installs additional services in the form of a set of Operators.

The result of this bootstrapping process is a running OpenShift Container Platform cluster. The cluster then downloads and configures remaining components needed for the day-to-day operations, including the creation of compute machines in supported environments.

Additional resources

- [Red Hat OpenShift Network Calculator](#)

1.1.1.5. Verifying node state after installation

The OpenShift Container Platform installation completes when the following installation health checks are successful:

- The provisioner can access the OpenShift Container Platform web console.
- All control plane nodes are ready.
- All cluster Operators are available.

NOTE

After the installation completes, the specific cluster Operators responsible for the worker nodes continuously attempt to provision all worker nodes. Some time is required before all worker nodes report as **READY**. For installations on bare metal, wait a minimum of 60 minutes before troubleshooting a worker node. For installations on all other platforms, wait a minimum of 40 minutes before troubleshooting a worker node. A **DEGRADED** state for the cluster Operators responsible for the worker nodes depends on the Operators' own resources and not on the state of the nodes.

After your installation completes, you can continue to monitor the condition of the nodes in your cluster.

Prerequisites

- The installation program resolves successfully in the terminal.

Procedure

1. Show the status of all worker nodes:

```
$ oc get nodes
```

Example output

NAME	STATUS	ROLES	AGE	VERSION
example-compute1.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute2.example.com	Ready	worker	13m	v1.21.6+bb8d50a
example-compute4.example.com	Ready	worker	14m	v1.21.6+bb8d50a
example-control1.example.com	Ready	master	52m	v1.21.6+bb8d50a
example-control2.example.com	Ready	master	55m	v1.21.6+bb8d50a
example-control3.example.com	Ready	master	55m	v1.21.6+bb8d50a

2. Show the phase of all worker machine nodes:

```
$ oc get machines -A
```

Example output

NAMESPACE	NAME	PHASE	TYPE	REGION	ZONE	AGE
openshift-machine-api	example-zbbt6-master-0	Running			95m	
openshift-machine-api	example-zbbt6-master-1	Running			95m	
openshift-machine-api	example-zbbt6-master-2	Running			95m	
openshift-machine-api	example-zbbt6-worker-0-25bhp	Running			49m	
openshift-machine-api	example-zbbt6-worker-0-8b4c2	Running			49m	
openshift-machine-api	example-zbbt6-worker-0-jkbqt	Running			49m	
openshift-machine-api	example-zbbt6-worker-0-qrl5b	Running			49m	

Additional resources

- [Getting the BareMetalHost resource](#)
- [Following the progress of the installation](#)
- [Validating an installation](#)
- [Agent-based Installer](#)
- [Assisted Installer for OpenShift Container Platform](#)

Installation scope

The scope of the OpenShift Container Platform installation program is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more configuration tasks after installation completes.

Additional resources

- See [Available cluster customizations](#) for details about OpenShift Container Platform configuration resources.

1.1.1.6. OpenShift Local overview

OpenShift Local supports rapid application development to get started building OpenShift Container Platform clusters. OpenShift Local is designed to run on a local computer to simplify setup and testing, and to emulate the cloud development environment locally with all of the tools needed to develop container-based applications.

Regardless of the programming language you use, OpenShift Local hosts your application and brings a minimal, preconfigured Red Hat OpenShift Container Platform cluster to your local PC without the need for a server-based infrastructure.

On a hosted environment, OpenShift Local can create microservices, convert them into images, and run them in Kubernetes-hosted containers directly on your laptop or desktop running Linux, macOS, or Windows 10 or later.

For more information about OpenShift Local, see [Red Hat OpenShift Local Overview](#).

1.1.2. Supported platforms for OpenShift Container Platform clusters

In OpenShift Container Platform 4.14, you can install a cluster that uses installer-provisioned infrastructure on the following platforms:

- Alibaba Cloud
- Amazon Web Services (AWS)
- Bare metal
- Google Cloud Platform (GCP)
- IBM Cloud®
- Microsoft Azure
- Microsoft Azure Stack Hub
- Nutanix
- Red Hat OpenStack Platform (RHOSP)
 - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the [OpenShift Container Platform on RHOSP support matrix](#).
- VMware vSphere

For these clusters, all machines, including the computer that you run the installation process on, must have direct internet access to pull images for platform containers and provide telemetry data to Red Hat.

IMPORTANT

After installation, the following changes are not supported:

- Mixing cloud provider platforms.
- Mixing cloud provider components. For example, using a persistent storage framework from a another platform on the platform where you installed the cluster.

In OpenShift Container Platform 4.14, you can install a cluster that uses user-provisioned infrastructure on the following platforms:

- AWS
- Azure
- Azure Stack Hub
- Bare metal
- GCP
- IBM Power®
- IBM Z® or IBM® LinuxONE
- RHOSP
 - The latest OpenShift Container Platform release supports both the latest RHOSP long-life release and intermediate release. For complete RHOSP release compatibility, see the [OpenShift Container Platform on RHOSP support matrix](#).
- VMware Cloud on AWS
- VMware vSphere

Depending on the supported cases for the platform, you can perform installations on user-provisioned infrastructure, so that you can run machines with full internet access, place your cluster behind a proxy, or perform a disconnected installation.

In a disconnected installation, you can download the images that are required to install a cluster, place them in a mirror registry, and use that data to install your cluster. While you require internet access to pull images for platform containers, with a disconnected installation on vSphere or bare metal infrastructure, your cluster machines do not require direct internet access.

The [OpenShift Container Platform 4.x Tested Integrations](#) page contains details about integration testing for different platforms.

Additional resources

- See [Supported installation methods for different platforms](#) for more information about the types of installations that are available for each supported platform.
- See [Selecting a cluster installation method and preparing it for users](#) for information about choosing an installation method and preparing the required resources.
- [Red Hat OpenShift Network Calculator](#) can help you design your cluster network during both the deployment and expansion phases. It addresses common questions related to the cluster network and provides output in a convenient JSON format.

1.2. SELECTING A CLUSTER INSTALLATION METHOD AND PREPARING IT FOR USERS

Before you install OpenShift Container Platform, decide what kind of installation process to follow and verify that you have all of the required resources to prepare the cluster for users.

1.2.1. Selecting a cluster installation type

Before you install an OpenShift Container Platform cluster, you need to select the best installation instructions to follow. Think about your answers to the following questions to select the best option.

1.2.1.1. Do you want to install and manage an OpenShift Container Platform cluster yourself?

If you want to install and manage OpenShift Container Platform yourself, you can install it on the following platforms:

- Alibaba Cloud
- Amazon Web Services (AWS) on 64-bit x86 instances
- Amazon Web Services (AWS) on 64-bit ARM instances
- Microsoft Azure on 64-bit x86 instances
- Microsoft Azure on 64-bit ARM instances
- Microsoft Azure Stack Hub
- Google Cloud Platform (GCP) on 64-bit x86 instances
- Google Cloud Platform (GCP) on 64-bit ARM instances
- Red Hat OpenStack Platform (RHOSP)
- IBM Cloud®
- IBM Z® or IBM® LinuxONE
- IBM Z® or IBM® LinuxONE for Red Hat Enterprise Linux (RHEL) KVM
- IBM Power®
- IBM Power® Virtual Server
- Nutanix
- VMware vSphere
- Bare metal or other platform agnostic infrastructure

You can deploy an OpenShift Container Platform 4 cluster to both on-premise hardware and to cloud hosting services, but all of the machines in a cluster must be in the same data center or cloud hosting service.

If you want to use OpenShift Container Platform but do not want to manage the cluster yourself, you have several managed service options. If you want a cluster that is fully managed by Red Hat, you can use [OpenShift Dedicated](#) or [OpenShift Online](#). You can also use OpenShift as a managed service on Azure, AWS, IBM Cloud®, or Google Cloud. For more information about managed services, see the [OpenShift Products](#) page. If you install an OpenShift Container Platform cluster with a cloud virtual machine as a virtual bare metal, the corresponding cloud-based storage is not supported.

1.2.1.2. Have you used OpenShift Container Platform 3 and want to use OpenShift Container Platform 4?

If you used OpenShift Container Platform 3 and want to try OpenShift Container Platform 4, you need to understand how different OpenShift Container Platform 4 is. OpenShift Container Platform 4 weaves the Operators that package, deploy, and manage Kubernetes applications and the operating system that the platform runs on, Red Hat Enterprise Linux CoreOS (RHCOS), together seamlessly. Instead of deploying machines and configuring their operating systems so that you can install OpenShift Container Platform on them, the RHCOS operating system is an integral part of the OpenShift Container Platform cluster. Deploying the operating system for the cluster machines is part of the installation process for OpenShift Container Platform. See [Differences between OpenShift Container Platform 3 and 4](#).

Because you need to provision machines as part of the OpenShift Container Platform cluster installation process, you cannot upgrade an OpenShift Container Platform 3 cluster to OpenShift Container Platform 4. Instead, you must create a new OpenShift Container Platform 4 cluster and migrate your OpenShift Container Platform 3 workloads to them. For more information about migrating, see [Migrating from OpenShift Container Platform 3 to 4 overview](#). Because you must migrate to OpenShift Container Platform 4, you can use any type of production cluster installation process to create your new cluster.

1.2.1.3. Do you want to use existing components in your cluster?

Because the operating system is integral to OpenShift Container Platform, it is easier to let the installation program for OpenShift Container Platform stand up all of the infrastructure. These are called *installer provisioned infrastructure* installations. In this type of installation, you can provide some existing infrastructure to the cluster, but the installation program deploys all of the machines that your cluster initially needs.

You can deploy an installer-provisioned infrastructure cluster without specifying any customizations to the cluster or its underlying machines to [Alibaba Cloud](#), [AWS](#), [Azure](#), [Azure Stack Hub](#), [GCP](#), [Nutanix](#).

If you need to perform basic configuration for your installer-provisioned infrastructure cluster, such as the instance type for the cluster machines, you can customize an installation for [Alibaba Cloud](#), [AWS](#), [Azure](#), [GCP](#), [Nutanix](#).

For installer-provisioned infrastructure installations, you can use an existing [VPC in AWS](#), [vNet in Azure](#), or [VPC in GCP](#). You can also reuse part of your networking infrastructure so that your cluster in [AWS](#), [Azure](#), [GCP](#) can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations. If you have existing accounts and credentials on these clouds, you can re-use them, but you might need to modify the accounts to have the required permissions to install OpenShift Container Platform clusters on them.

You can use the installer-provisioned infrastructure method to create appropriate machine instances on your hardware for [RHOSP](#), [RHOSP with Kuryr](#), [vSphere](#), and [bare metal](#). Additionally, for [vSphere](#), you can also customize additional network parameters during installation.

For some installer-provisioned infrastructure installations, for example on the VMware vSphere and bare metal platforms, the external traffic that reaches the ingress virtual IP (VIP) is not balanced between the default **IngressController** replicas. For vSphere and bare metal installer-provisioned infrastructure installations where exceeding the baseline **IngressController** router performance is expected, you must configure an external load balancer. Configuring an external load balancer achieves the performance of multiple **IngressController** replicas. For more information about the baseline **IngressController** performance, see [Baseline Ingress Controller \(router\) performance](#). For more information about configuring an external load balancer, see [Configuring an external load balancer](#).

If you want to reuse extensive cloud infrastructure, you can complete a *user-provisioned infrastructure* installation. With these installations, you manually deploy the machines that your cluster requires during

the installation process. If you perform a user-provisioned infrastructure installation on [AWS](#), [Azure](#), [Azure Stack Hub](#), you can use the provided templates to help you stand up all of the required components. You can also reuse a shared [VPC on GCP](#). Otherwise, you can use the [provider-agnostic](#) installation method to deploy a cluster into other clouds.

You can also complete a user-provisioned infrastructure installation on your existing hardware. If you use [RHOSP](#), [IBM Z® or IBM® LinuxONE](#), [IBM Z® and IBM® LinuxONE with RHEL KVM](#), [IBM Power](#), or [vSphere](#), use the specific installation instructions to deploy your cluster. If you use other supported hardware, follow the [bare metal installation](#) procedure. For some of these platforms, such as [RHOSP](#), [vSphere](#), and [bare metal](#), you can also customize additional network parameters during installation.

1.2.1.4. Do you need extra security for your cluster?

If you use a user-provisioned installation method, you can configure a proxy for your cluster. The instructions are included in each installation procedure.

If you want to prevent your cluster on a public cloud from exposing endpoints externally, you can deploy a private cluster with installer-provisioned infrastructure on [AWS](#), [Azure](#), or [GCP](#).

If you need to install your cluster that has limited access to the internet, such as a disconnected or restricted network cluster, you can [mirror the installation packages](#) and install the cluster from them. Follow detailed instructions for user provisioned infrastructure installations into restricted networks for [AWS](#), [GCP](#), [IBM Z® or IBM® LinuxONE](#), [IBM Z® or IBM® LinuxONE with RHEL KVM](#), [\], xref:installing-restricted-networks-vsphere\[vSphere](#), or [bare metal](#). You can also install a cluster into a restricted network using installer-provisioned infrastructure by following detailed instructions for [AWS](#), [GCP](#), [Nutanix](#), [RHOSP](#), and [vSphere](#).

If you need to deploy your cluster to an [AWS GovCloud region](#), [AWS China region](#), or [Azure government region](#), you can configure those custom regions during an installer-provisioned infrastructure installation.

You can also configure the cluster machines to use the RHEL cryptographic libraries that have been submitted to NIST for [FIPS 140-2/140-3 Validation](#) during installation.

IMPORTANT

When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

1.2.2. Preparing your cluster for users after installation

Some configuration is not required to install the cluster but recommended before your users access the cluster. You can customize the cluster itself by [customizing](#) the Operators that make up your cluster and integrate your cluster with other required systems, such as an identity provider.

For a production cluster, you must configure the following integrations:

- [Persistent storage](#)
- [An identity provider](#)
- [Monitoring core OpenShift Container Platform components](#)

1.2.3. Preparing your cluster for workloads

Depending on your workload needs, you might need to take extra steps before you begin deploying applications. For example, after you prepare infrastructure to support your application [build strategy](#), you might need to make provisions for [low-latency](#) workloads or to [protect sensitive workloads](#). You can also configure [monitoring](#) for application workloads. If you plan to run [Windows workloads](#), you must enable [hybrid networking with OVN-Kubernetes](#) during the installation process; hybrid networking cannot be enabled after your cluster is installed.

1.2.4. Supported installation methods for different platforms

You can perform different types of installations on different platforms.

NOTE

Not all installation options are supported for all platforms, as shown in the following tables. A checkmark indicates that the option is supported and links to the relevant section.

Table 1.1. Installer-provisioned infrastructure options

	Alibaba	AWSS (64-bit x86_64)	AWS (64-bit ARM)	Azure (64-bit x86_64)	Azure (64-bit ARM)	Azure (64-bit x86_64)	Google Cloud (64-bit x86_64)	Google Cloud (64-bit ARM)	Ubuntu	RHEL	Baremetal (64-bit x86_64)	Baremetal (64-bit ARM)	vSphere	IBM Cloud®	IBM Z®	IBM Power®	IBM i

1.3. CLUSTER CAPABILITIES

Cluster administrators can use cluster capabilities to enable or disable optional components prior to installation. Cluster administrators can enable cluster capabilities at anytime after installation.

NOTE

Cluster administrators cannot disable a cluster capability after it is enabled.

1.3.1. Selecting cluster capabilities

You can select cluster capabilities by following one of the installation methods that include customizing your cluster, such as "Installing a cluster on AWS with customizations" or "Installing a cluster on GCP with customizations".

During a customized installation, you create an **install-config.yaml** file that contains the configuration parameters for your cluster.

NOTE

If you customize your cluster by enabling or disabling specific cluster capabilities, you are responsible for manually maintaining your **install-config.yaml** file. New OpenShift Container Platform updates might declare new capability handles for existing components, or introduce new components altogether. Users who customize their **install-config.yaml** file should consider periodically updating their **install-config.yaml** file as OpenShift Container Platform is updated.

You can use the following configuration parameters to select cluster capabilities:

capabilities:

baselineCapabilitySet: v4.11 **1**

additionalEnabledCapabilities: **2**

- CSISnapshot
- Console
- Storage

- 1** Defines a baseline set of capabilities to install. Valid values are **None**, **vCurrent** and **v4.x**. If you select **None**, all optional capabilities will be disabled. The default value is **vCurrent**, which enables all optional capabilities.

NOTE

v4.x refers to any value up to and including the current cluster version. For example, valid values for a OpenShift Container Platform 4.12 cluster are **v4.11** and **v4.12**.

- 2** Defines a list of capabilities to explicitly enable. These will be enabled in addition to the capabilities specified in **baselineCapabilitySet**.

NOTE

In this example, the default capability is set to **v4.11**. The **additionalEnabledCapabilities** field enables additional capabilities over the default **v4.11** capability set.

The following table describes the **baselineCapabilitySet** values.

Table 1.3. Cluster capabilities **baselineCapabilitySet** values description

Value	Description
vCurrent	Specify this option when you want to automatically add new, default capabilities that are introduced in new releases.

Value	Description
v4.11	Specify this option when you want to enable the default capabilities for OpenShift Container Platform 4.11. By specifying v4.11 , capabilities that are introduced in newer versions of OpenShift Container Platform are not enabled. The default capabilities in OpenShift Container Platform 4.11 are baremetal , MachineAPI , marketplace , and openshift-samples .
v4.12	Specify this option when you want to enable the default capabilities for OpenShift Container Platform 4.12. By specifying v4.12 , capabilities that are introduced in newer versions of OpenShift Container Platform are not enabled. The default capabilities in OpenShift Container Platform 4.12 are baremetal , MachineAPI , marketplace , openshift-samples , Console , Insights , Storage , and CSISnapshot .
v4.13	Specify this option when you want to enable the default capabilities for OpenShift Container Platform 4.13. By specifying v4.13 , capabilities that are introduced in newer versions of OpenShift Container Platform are not enabled. The default capabilities in OpenShift Container Platform 4.13 are baremetal , MachineAPI , marketplace , openshift-samples , Console , Insights , Storage , CSISnapshot , and NodeTuning .
v4.14	Specify this option when you want to enable the default capabilities for OpenShift Container Platform 4.14. By specifying v4.14 , capabilities that are introduced in newer versions of OpenShift Container Platform are not enabled. The default capabilities in OpenShift Container Platform 4.14 are baremetal , MachineAPI , marketplace , openshift-samples , Console , Insights , Storage , CSISnapshot , NodeTuning , ImageRegistry , Build , and DeploymentConfig .
None	Specify when the other sets are too large, and you do not need any capabilities or want to fine-tune via additionalEnabledCapabilities .

Additional resources

- [Installing a cluster on AWS with customizations](#)
- [Installing a cluster on GCP with customizations](#)

1.3.2. Optional cluster capabilities in OpenShift Container Platform 4.14

Currently, cluster Operators provide the features for these optional capabilities. The following summarizes the features provided by each capability and what functionality you lose if it is disabled.

Additional resources

- [Cluster Operators reference](#)

1.3.2.1. Bare-metal capability

Purpose

The Cluster Baremetal Operator provides the features for the **baremetal** capability.

The Cluster Baremetal Operator (CBO) deploys all the components necessary to take a bare-metal server to a fully functioning worker node ready to run OpenShift Container Platform compute nodes. The CBO ensures that the metal3 deployment, which consists of the Bare Metal Operator (BMO) and Ironic containers, runs on one of the control plane nodes within the OpenShift Container Platform cluster. The CBO also listens for OpenShift Container Platform updates to resources that it watches and takes appropriate action.

The bare-metal capability is required for deployments using installer-provisioned infrastructure. Disabling the bare-metal capability can result in unexpected problems with these deployments.

It is recommended that cluster administrators only disable the bare-metal capability during installations with user-provisioned infrastructure that do not have any **BareMetalHost** resources in the cluster.

IMPORTANT

If the bare-metal capability is disabled, the cluster cannot provision or manage bare-metal nodes. Only disable the capability if there are no **BareMetalHost** resources in your deployment. The **baremetal** capability depends on the **MachineAPI** capability. If you enable the **baremetal** capability, you must also enable **MachineAPI**.

Additional resources

- [Deploying installer-provisioned clusters on bare metal](#)
- [Preparing for bare metal cluster installation](#)
- [Bare metal configuration](#)

1.3.2.2. Build capability

Purpose

The **Build** capability enables the **Build** API. The **Build** API manages the lifecycle of **Build** and **BuildConfig** objects.

IMPORTANT

If the **Build** capability is disabled, the cluster cannot use **Build** or **BuildConfig** resources. Disable the capability only if **Build** and **BuildConfig** resources are not required in the cluster.

1.3.2.3. Cluster storage capability

Purpose

The Cluster Storage Operator provides the features for the **Storage** capability.

The Cluster Storage Operator sets OpenShift Container Platform cluster-wide storage defaults. It ensures a default **storageclass** exists for OpenShift Container Platform clusters. It also installs Container Storage Interface (CSI) drivers which enable your cluster to use various storage backends.

IMPORTANT

If the cluster storage capability is disabled, the cluster will not have a default **storageclass** or any CSI drivers. Users with administrator privileges can create a default **storageclass** and manually install CSI drivers if the cluster storage capability is disabled.

Notes

- The storage class that the Operator creates can be made non-default by editing its annotation, but this storage class cannot be deleted as long as the Operator runs.

1.3.2.4. Console capability

Purpose

The Console Operator provides the features for the **Console** capability.

The Console Operator installs and maintains the OpenShift Container Platform web console on a cluster. The Console Operator is installed by default and automatically maintains a console.

Additional resources

- [Web console overview](#)

1.3.2.5. CSI snapshot controller capability

Purpose

The Cluster CSI Snapshot Controller Operator provides the features for the **CSISnapshot** capability.

The Cluster CSI Snapshot Controller Operator installs and maintains the CSI Snapshot Controller. The CSI Snapshot Controller is responsible for watching the **VolumeSnapshot** CRD objects and manages the creation and deletion lifecycle of volume snapshots.

Additional resources

- [CSI volume snapshots](#)

1.3.2.6. DeploymentConfig capability

Purpose

The **DeploymentConfig** capability enables and manages the **DeploymentConfig** API.

IMPORTANT

If the **DeploymentConfig** capability is disabled, the cluster cannot use **DeploymentConfig** resources. Disable the capability only if **DeploymentConfig** resources are not required in the cluster.

1.3.2.7. Insights capability

Purpose

The Insights Operator provides the features for the **Insights** capability.

The Insights Operator gathers OpenShift Container Platform configuration data and sends it to Red Hat. The data is used to produce proactive insights recommendations about potential issues that a cluster might be exposed to. These insights are communicated to cluster administrators through Insights Advisor on console.redhat.com.

Notes

Insights Operator complements OpenShift Container Platform Telemetry.

Additional resources

- [Using Insights Operator](#)

1.3.2.8. Machine API capability

Purpose

The **machine-api-operator**, **cluster-autoscaler-operator**, and **cluster-control-plane-machine-set-operator** Operators provide the features for the **MachineAPI** capability. You can disable this capability only if you install a cluster with user-provisioned infrastructure.

The Machine API capability is responsible for all machine configuration and management in the cluster. If you disable the Machine API capability during installation, you need to manage all machine-related tasks manually.

Additional resources

- [Overview of machine management](#)
- [Machine API Operator](#)
- [Cluster Autoscaler Operator](#)
- [Control Plane Machine Set Operator](#)

1.3.2.9. Marketplace capability

Purpose

The Marketplace Operator provides the features for the **marketplace** capability.

The Marketplace Operator simplifies the process for bringing off-cluster Operators to your cluster by using a set of default Operator Lifecycle Manager (OLM) catalogs on the cluster. When the Marketplace Operator is installed, it creates the **openshift-marketplace** namespace. OLM ensures catalog sources installed in the **openshift-marketplace** namespace are available for all namespaces on the cluster.

If you disable the **marketplace** capability, the Marketplace Operator does not create the **openshift-marketplace** namespace. Catalog sources can still be configured and managed on the cluster manually, but OLM depends on the **openshift-marketplace** namespace in order to make catalogs available to all namespaces on the cluster. Users with elevated permissions to create namespaces prefixed with **openshift-**, such as system or cluster administrators, can manually create the **openshift-marketplace** namespace.

If you enable the **marketplace** capability, you can enable and disable individual catalogs by configuring the Marketplace Operator.

Additional resources

- [Red Hat-provided Operator catalogs](#)

1.3.2.10. Node Tuning capability

Purpose

The Node Tuning Operator provides features for the **NodeTuning** capability.

The Node Tuning Operator helps you manage node-level tuning by orchestrating the TuneD daemon and achieves low latency performance by using the Performance Profile controller. The majority of high-performance applications require some level of kernel tuning. The Node Tuning Operator provides a unified management interface to users of node-level sysctls and more flexibility to add custom tuning specified by user needs.

If you disable the NodeTuning capability, some default tuning settings will not be applied to the control-plane nodes. This might limit the scalability and performance of large clusters with over 900 nodes or 900 routes.

Additional resources

- [Using the Node Tuning Operator](#)

1.3.2.11. OpenShift samples capability

Purpose

The Cluster Samples Operator provides the features for the **openshift-samples** capability.

The Cluster Samples Operator manages the sample image streams and templates stored in the **openshift** namespace.

On initial start up, the Operator creates the default samples configuration resource to initiate the creation of the image streams and templates. The configuration object is a cluster scoped object with the key **cluster** and type **configs.samples**.

The image streams are the Red Hat Enterprise Linux CoreOS (RHCOS)-based OpenShift Container Platform image streams pointing to images on **registry.redhat.io**. Similarly, the templates are those categorized as OpenShift Container Platform templates.

If you disable the samples capability, users cannot access the image streams, samples, and templates it provides. Depending on your deployment, you might want to disable this component if you do not need it.

Additional resources

- [Configuring the Cluster Samples Operator](#)

1.3.2.12. Cluster Image Registry capability

Purpose

The Cluster Image Registry Operator provides features for the **ImageRegistry** capability.

The Cluster Image Registry Operator manages a singleton instance of the OpenShift image registry. It manages all configuration of the registry, including creating storage.

On initial start up, the Operator creates a default **image-registry** resource instance based on the configuration detected in the cluster. This indicates what cloud storage type to use based on the cloud provider.

If insufficient information is available to define a complete **image-registry** resource, then an incomplete resource is defined and the Operator updates the resource status with information about what is missing.

The Cluster Image Registry Operator runs in the **openshift-image-registry** namespace and it also manages the registry instance in that location. All configuration and workload resources for the registry reside in that namespace.

In order to integrate the image registry into the cluster's user authentication and authorization system, a service account token secret and an image pull secret are generated for each service account in the cluster.

IMPORTANT

If you disable the **ImageRegistry** capability or if you disable the integrated OpenShift image registry in the Cluster Image Registry Operator's configuration, the service account token secret and image pull secret are not generated for each service account.

If you disable the **ImageRegistry** capability, you can reduce the overall resource footprint of OpenShift Container Platform in resource-constrained environments. Depending on your deployment, you can disable this component if you do not need it.

1.3.3. Additional resources

- [Enabling cluster capabilities after installation](#)

1.4. SUPPORT FOR FIPS CRYPTOGRAPHY

You can install an OpenShift Container Platform cluster in FIPS mode.

OpenShift Container Platform is designed for FIPS. When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

For more information about the NIST validation program, see [Cryptographic Module Validation Program](#). For the latest NIST status for the individual versions of RHEL cryptographic libraries that have been submitted for validation, see [Compliance Activities and Government Standards](#).

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a RHEL 8 computer that is configured to operate in FIPS mode. Running RHEL 9 with FIPS mode enabled to install an OpenShift Container Platform cluster is not possible.

For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#).

For the Red Hat Enterprise Linux CoreOS (RHCOS) machines in your cluster, this change is applied when the machines are deployed based on the status of an option in the **install-config.yaml** file, which governs the cluster options that a user can change during cluster deployment. With Red Hat Enterprise Linux (RHEL) machines, you must enable FIPS mode when you install the operating system on the machines that you plan to use as worker machines.

Because FIPS must be enabled before the operating system that your cluster uses boots for the first time, you cannot enable FIPS after you deploy a cluster.

1.4.1. FIPS validation in OpenShift Container Platform

OpenShift Container Platform uses certain FIPS validated or Modules In Process modules within RHEL and RHCOS for the operating system components that it uses. See [RHEL8 core crypto components](#). For example, when users use SSH to connect to OpenShift Container Platform clusters and containers, those connections are properly encrypted.

OpenShift Container Platform components are written in Go and built with Red Hat's golang compiler. When you enable FIPS mode for your cluster, all OpenShift Container Platform components that require cryptographic signing call RHEL and RHCOS cryptographic libraries.

Table 1.4. FIPS mode attributes and limitations in OpenShift Container Platform 4.14

Attributes	Limitations
FIPS support in RHEL 8 and RHCOS operating systems.	The FIPS implementation does not offer a single function that both computes hash functions and validates the keys that are based on that hash. This limitation will continue to be evaluated and improved in future OpenShift Container Platform releases.
FIPS support in CRI-O runtimes.	
FIPS support in OpenShift Container Platform services.	
FIPS validated or Modules In Process cryptographic module and algorithms that are obtained from RHEL 8 and RHCOS binaries and images.	
Use of FIPS compatible golang compiler.	TLS FIPS support is not complete but is planned for future OpenShift Container Platform releases.
FIPS support across multiple architectures.	FIPS is currently only supported on OpenShift Container Platform deployments using x86_64 , ppc64le , and s390x architectures.

1.4.2. FIPS support in components that the cluster uses

Although the OpenShift Container Platform cluster itself uses FIPS validated or Modules In Process modules, ensure that the systems that support your OpenShift Container Platform cluster use FIPS validated or Modules In Process modules for cryptography.

1.4.2.1. etcd

To ensure that the secrets that are stored in etcd use FIPS validated or Modules In Process encryption, boot the node in FIPS mode. After you install the cluster in FIPS mode, you can [encrypt the etcd data](#) by using the FIPS-approved **aes cbc** cryptographic algorithm.

1.4.2.2. Storage

For local storage, use RHEL-provided disk encryption or Container Native Storage that uses RHEL-provided disk encryption. By storing all data in volumes that use RHEL-provided disk encryption and enabling FIPS mode for your cluster, both data at rest and data in motion, or network data, are protected by FIPS validated or Modules In Process encryption. You can configure your cluster to encrypt the root filesystem of each node, as described in [Customizing nodes](#).

1.4.2.3. Runtimes

To ensure that containers know that they are running on a host that is using FIPS validated or Modules In Process cryptography modules, use CRI-O to manage your runtimes.

1.4.3. Installing a cluster in FIPS mode

To install a cluster in FIPS mode, follow the instructions to install a customized cluster on your preferred infrastructure. Ensure that you set **fips: true** in the **install-config.yaml** file before you deploy your cluster.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a RHEL computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#).

- [Amazon Web Services](#)
- [Alibaba Cloud](#)
- [Microsoft Azure](#)
- [Bare metal](#)
- [Google Cloud Platform](#)
- [IBM Cloud®](#)
- [IBM Power®](#)
- [IBM Z® and IBM® LinuxONE](#)
- [IBM Z® and IBM® LinuxONE with RHEL KVM](#)

- [Red Hat OpenStack Platform \(RHOSP\)](#)
- [VMware vSphere](#)

**NOTE**

If you are using Azure File storage, you cannot enable FIPS mode.

To apply **AES CBC** encryption to your etcd data store, follow the [Encrypting etcd data](#) process after you install your cluster.

If you add RHEL nodes to your cluster, ensure that you enable FIPS mode on the machines before their initial boot. See [Adding RHEL compute machines to an OpenShift Container Platform cluster](#) and [Enabling FIPS Mode](#) in the RHEL 8 documentation.

CHAPTER 2. DISCONNECTED INSTALLATION MIRRORING

2.1. ABOUT DISCONNECTED INSTALLATION MIRRORING

You can use a mirror registry to ensure that your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

2.1.1. Creating a mirror registry

If you already have a container image registry, such as Red Hat Quay, you can use it as your mirror registry. If you do not already have a registry, you can [create a mirror registry using the *mirror registry for Red Hat OpenShift*](#).

2.1.2. Mirroring images for a disconnected installation

You can use one of the following procedures to mirror your OpenShift Container Platform image repository to your mirror registry:

- [Mirroring images for a disconnected installation](#)
- [Mirroring images for a disconnected installation using the oc-mirror plugin](#)

2.2. CREATING A MIRROR REGISTRY WITH MIRROR REGISTRY FOR RED HAT OPENSIFT

The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

If you already have a container image registry, such as Red Hat Quay, you can skip this section and go straight to [Mirroring the OpenShift Container Platform image repository](#).

2.2.1. Prerequisites

- An OpenShift Container Platform subscription.
- Red Hat Enterprise Linux (RHEL) 8 and 9 with Podman 3.4.2 or later and OpenSSL installed.
- Fully qualified domain name for the Red Hat Quay service, which must resolve through a DNS server.
- Key-based SSH connectivity on the target host. SSH keys are automatically generated for local installs. For remote hosts, you must generate your own SSH keys.
- 2 or more vCPUs.
- 8 GB of RAM.
- About 12 GB for OpenShift Container Platform 4.14 release images, or about 358 GB for OpenShift Container Platform 4.14 release images and OpenShift Container Platform 4.14 Red Hat Operator images. Up to 1 TB per stream or more is suggested.

IMPORTANT

These requirements are based on local testing results with only release images and Operator images. Storage requirements can vary based on your organization's needs. You might require more space, for example, when you mirror multiple z-streams. You can use standard [Red Hat Quay functionality](#) or the proper [API callout](#) to remove unnecessary images and free up space.

2.2.2. Mirror registry for Red Hat OpenShift introduction

For disconnected deployments of OpenShift Container Platform, a container registry is required to carry out the installation of the clusters. To run a production-grade registry service on such a cluster, you must create a separate registry deployment to install the first cluster. The *mirror registry for Red Hat OpenShift* addresses this need and is included in every OpenShift subscription. It is available for download on the [OpenShift console Downloads](#) page.

The *mirror registry for Red Hat OpenShift* allows users to install a small-scale version of Red Hat Quay and its required components using the **mirror-registry** command line interface (CLI) tool. The *mirror registry for Red Hat OpenShift* is deployed automatically with preconfigured local storage and a local database. It also includes auto-generated user credentials and access permissions with a single set of inputs and no additional configuration choices to get started.

The *mirror registry for Red Hat OpenShift* provides a pre-determined network configuration and reports deployed component credentials and access URLs upon success. A limited set of optional configuration inputs like fully qualified domain name (FQDN) services, superuser name and password, and custom TLS certificates are also provided. This provides users with a container registry so that they can easily create an offline mirror of all OpenShift Container Platform release content when running OpenShift Container Platform in restricted network environments.

Use of the *mirror registry for Red Hat OpenShift* is optional if another container registry is already available in the install environment.

2.2.2.1. Mirror registry for Red Hat OpenShift limitations

The following limitations apply to the *mirror registry for Red Hat OpenShift*:

- The *mirror registry for Red Hat OpenShift* is not a highly-available registry and only local file system storage is supported. It is not intended to replace Red Hat Quay or the internal image registry for OpenShift Container Platform.
- The *mirror registry for Red Hat OpenShift* is not intended to be a substitute for a production deployment of Red Hat Quay.
- The *mirror registry for Red Hat OpenShift* is only supported for hosting images that are required to install a disconnected OpenShift Container Platform cluster, such as Release images or Red Hat Operator images. It uses local storage on your Red Hat Enterprise Linux (RHEL) machine, and storage supported by RHEL is supported by the *mirror registry for Red Hat OpenShift*.

NOTE

Because the *mirror registry for Red Hat OpenShift* uses local storage, you should remain aware of the storage usage consumed when mirroring images and use Red Hat Quay's garbage collection feature to mitigate potential issues. For more information about this feature, see "Red Hat Quay garbage collection".

- Support for Red Hat product images that are pushed to the *mirror registry for Red Hat OpenShift* for bootstrapping purposes are covered by valid subscriptions for each respective product. A list of exceptions to further enable the bootstrap experience can be found on the [Self-managed Red Hat OpenShift sizing and subscription guide](#).
- Content built by customers should not be hosted by the *mirror registry for Red Hat OpenShift*.
- Using the *mirror registry for Red Hat OpenShift* with more than one cluster is discouraged because multiple clusters can create a single point of failure when updating your cluster fleet. It is advised to leverage the *mirror registry for Red Hat OpenShift* to install a cluster that can host a production-grade, highly-available registry such as Red Hat Quay, which can serve OpenShift Container Platform content to other clusters.

2.2.3. Mirroring on a local host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a local host using the **mirror-registry** installer tool. By doing so, users can create a local host registry running on port 443 for the purpose of storing a mirror of OpenShift Container Platform images.

NOTE

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **\$HOME/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ ./mirror-registry install \
  --quayHostname <host_example_com> \
  --quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the registry by running the following command:

```
$ podman login -u init \
  -p <password> \
  <host_example_com>:8443> \
  --tls-verify=false ❶
```

- ❶ You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

**NOTE**

You can also log in by accessing the UI at **`https://<host.example.com>:8443`** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

**NOTE**

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

2.2.4. Updating mirror registry for Red Hat OpenShift from a local host

This procedure explains how to update the *mirror registry for Red Hat OpenShift* from a local host using the **upgrade** command. Updating to the latest version ensures new features, bug fixes, and security vulnerability fixes.

**IMPORTANT**

When upgrading from version 1 to version 2, be aware of the following constraints:

- The worker count is set to **1** because multiple writes are not allowed in SQLite.
- You must not use the *mirror registry for Red Hat OpenShift* user interface (UP).
- Do not access the **sqlite-storage** Podman volume during the upgrade.
- There is intermittent downtime of your mirror registry because it is restarted during the upgrade process.
- PostgreSQL data is backed up under the **`/$HOME/quay-instal/quay-postgres-backup/`** directory for recovery.

Prerequisites

- You have installed the *mirror registry for Red Hat OpenShift* on a local host.

Procedure

- If you are upgrading the *mirror registry for Red Hat OpenShift* from 1.3 → 2.y, and your installation directory is the default at **`/etc/quay-install`**, you can enter the following command:

```
$ sudo ./mirror-registry upgrade -v
```

**NOTE**

- *mirror registry for Red Hat OpenShift* migrates Podman volumes for Quay storage, Postgres data, and **/etc/quay-install** data to the new **\$HOME/quay-install** location. This allows you to use *mirror registry for Red Hat OpenShift* without the **--quayRoot** flag during future upgrades.
- Users who upgrade *mirror registry for Red Hat OpenShift* with the **./mirror-registry upgrade -v** flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayHostname <host_example_com>** and **--quayRoot <example_directory_name>**, you must include that string to properly upgrade the mirror registry.

- If you are upgrading *the mirror registry for Red Hat OpenShift* from 1.3 → 2.y and you used a custom quay configuration and storage directory in your 1.y deployment, you must pass in the **--quayRoot** and **--quayStorage** flags. For example:

```
$ sudo ./mirror-registry upgrade --quayHostname <host_example_com> --quayRoot
<example_directory_name> --quayStorage <example_directory_name>/quay-storage -v
```

- If you are upgrading the *mirror registry for Red Hat OpenShift* from 1.3 → 2.y and want to specify a custom SQLite storage path, you must pass in the **--sqliteStorage** flag, for example:

```
$ sudo ./mirror-registry upgrade --sqliteStorage <example_directory_name>/sqlite-storage -v
```

2.2.5. Mirroring on a remote host with mirror registry for Red Hat OpenShift

This procedure explains how to install the *mirror registry for Red Hat OpenShift* on a remote host using the **mirror-registry** tool. By doing so, users can create a registry to hold a mirror of OpenShift Container Platform images.

**NOTE**

Installing the *mirror registry for Red Hat OpenShift* using the **mirror-registry** CLI tool makes several changes to your machine. After installation, a **\$HOME/quay-install** directory is created, which has installation files, local storage, and the configuration bundle. Trusted SSH keys are generated in case the deployment target is the local host, and systemd files on the host machine are set up to ensure that container runtimes are persistent. Additionally, an initial user named **init** is created with an automatically generated password. All access credentials are printed at the end of the install routine.

Procedure

1. Download the **mirror-registry.tar.gz** package for the latest version of the *mirror registry for Red Hat OpenShift* found on the [OpenShift console Downloads](#) page.
2. Install the *mirror registry for Red Hat OpenShift* on your local host with your current user account by using the **mirror-registry** tool. For a full list of available flags, see "mirror registry for Red Hat OpenShift flags".

```
$ ./mirror-registry install -v \
--targetHostname <host_example_com> \
--targetUsername <example_user> \
```

```
-k ~/.ssh/my_ssh_key \
--quayHostname <host_example_com> \
--quayRoot <example_directory_name>
```

3. Use the user name and password generated during installation to log into the mirror registry by running the following command:

```
$ podman login -u init \
-p <password> \
<host_example_com>:8443> \
--tls-verify=false 1
```

- 1 You can avoid running **--tls-verify=false** by configuring your system to trust the generated rootCA certificates. See "Using SSL to protect connections to Red Hat Quay" and "Configuring the system to trust the certificate authority" for more information.

NOTE

You can also log in by accessing the UI at **<https://<host.example.com>:8443>** after installation.

4. You can mirror OpenShift Container Platform images after logging in. Depending on your needs, see either the "Mirroring the OpenShift Container Platform image repository" or the "Mirroring Operator catalogs for use with disconnected clusters" sections of this document.

NOTE

If there are issues with images stored by the *mirror registry for Red Hat OpenShift* due to storage layer problems, you can remirror the OpenShift Container Platform images, or reinstall mirror registry on more stable storage.

2.2.6. Updating mirror registry for Red Hat OpenShift from a remote host

This procedure explains how to update the *mirror registry for Red Hat OpenShift* from a remote host using the **upgrade** command. Updating to the latest version ensures bug fixes and security vulnerability fixes.

IMPORTANT

When upgrading from version 1 to version 2, be aware of the following constraints:

- The worker count is set to **1** because multiple writes are not allowed in SQLite.
- You must not use the *mirror registry for Red Hat OpenShift* user interface (UI).
- Do not access the **sqlite-storage** Podman volume during the upgrade.
- There is intermittent downtime of your mirror registry because it is restarted during the upgrade process.
- PostgreSQL data is backed up under the **`/$HOME/quay-instal/quay-postgres-backup/`** directory for recovery.

Prerequisites

- You have installed the *mirror registry for Red Hat OpenShift* on a remote host.

Procedure

- To upgrade the *mirror registry for Red Hat OpenShift* from a remote host, enter the following command:

```
$ ./mirror-registry upgrade -v --targetHostname <remote_host_url> --targetUsername
<user_name> -k ~/.ssh/my_ssh_key
```

NOTE

Users who upgrade the *mirror registry for Red Hat OpenShift* with the **`./mirror-registry upgrade -v`** flag must include the same credentials used when creating their mirror registry. For example, if you installed the *mirror registry for Red Hat OpenShift* with **`--quayHostname <host_example_com>`** and **`--quayRoot <example_directory_name>`**, you must include that string to properly upgrade the mirror registry.

- If you are upgrading the *mirror registry for Red Hat OpenShift* from 1.3 → 2.y and want to specify a custom SQLite storage path, you must pass in the **`--sqliteStorage`** flag, for example:

```
$ ./mirror-registry upgrade -v --targetHostname <remote_host_url> --targetUsername
<user_name> -k ~/.ssh/my_ssh_key --sqliteStorage <example_directory_name>/quay-
storage
```

2.2.7. Replacing mirror registry for Red Hat OpenShift SSL/TLS certificates

In some cases, you might want to update your SSL/TLS certificates for the *mirror registry for Red Hat OpenShift*. This is useful in the following scenarios:

- If you are replacing the current *mirror registry for Red Hat OpenShift* certificate.
- If you are using the same certificate as the previous *mirror registry for Red Hat OpenShift* installation.
- If you are periodically updating the *mirror registry for Red Hat OpenShift* certificate.

Use the following procedure to replace *mirror registry for Red Hat OpenShift* SSL/TLS certificates.

Prerequisites

- You have downloaded the **`./mirror-registry`** binary from the [OpenShift console Downloads](#) page.

Procedure

1. Enter the following command to install the *mirror registry for Red Hat OpenShift*:

```
$ ./mirror-registry install \
--quayHostname <host_example_com> \
--quayRoot <example_directory_name>
```

-

This installs the *mirror registry for Red Hat OpenShift* to the **\$HOME/quay-install** directory.

2. Prepare a new certificate authority (CA) bundle and generate new **ssl.key** and **ssl.crt** key files. For more information, see [Using SSL/TLS to protect connections to Red Hat Quay](#) .
3. Assign **/\$HOME/quay-install** an environment variable, for example, **QUAY**, by entering the following command:

```
$ export QUAY=/$HOME/quay-install
```

4. Copy the new **ssl.crt** file to the **/\$HOME/quay-install** directory by entering the following command:

```
$ cp ~/ssl.crt $QUAY/quay-config
```

5. Copy the new **ssl.key** file to the **/\$HOME/quay-install** directory by entering the following command:

```
$ cp ~/ssl.key $QUAY/quay-config
```

6. Restart the **quay-app** application pod by entering the following command:

```
$ systemctl restart quay-app
```

2.2.8. Uninstalling the mirror registry for Red Hat OpenShift

- You can uninstall the *mirror registry for Red Hat OpenShift* from your local host by running the following command:

```
$ ./mirror-registry uninstall -v \
  --quayRoot <example_directory_name>
```

NOTE

- Deleting the *mirror registry for Red Hat OpenShift* will prompt the user before deletion. You can use **--autoApprove** to skip this prompt.
- Users who install the *mirror registry for Red Hat OpenShift* with the **--quayRoot** flag must include the **--quayRoot** flag when uninstalling. For example, if you installed the *mirror registry for Red Hat OpenShift* with **--quayRoot example_directory_name**, you must include that string to properly uninstall the mirror registry.

2.2.9. Mirror registry for Red Hat OpenShift flags

The following flags are available for the *mirror registry for Red Hat OpenShift*:

Flags	Description
-------	-------------

Flags	Description
--autoApprove	A boolean value that disables interactive prompts. If set to true , the quayRoot directory is automatically deleted when uninstalling the mirror registry. Defaults to false if left unspecified.
--initPassword	The password of the init user created during Quay installation. Must be at least eight characters and contain no whitespace.
--initUser string	Shows the username of the initial user. Defaults to init if left unspecified.
--no-color, -c	Allows users to disable color sequences and propagate that to Ansible when running install, uninstall, and upgrade commands.
--quayHostname	The fully-qualified domain name of the mirror registry that clients will use to contact the registry. Equivalent to SERVER_HOSTNAME in the Quay config.yaml . Must resolve by DNS. Defaults to <targetHostname>:8443 if left unspecified. ^[1]
--quayStorage	The folder where Quay persistent storage data is saved. Defaults to the quay-storage Podman volume. Root privileges are required to uninstall.
--quayRoot, -r	The directory where container image layer and configuration data is saved, including rootCA.key , rootCA.pem , and rootCA.srl certificates. Defaults to \$HOME/quay-install if left unspecified.
--sqliteStorage	The folder where SQLite database data is saved. Defaults to sqlite-storage Podman volume if not specified. Root is required to uninstall.
--ssh-key, -k	The path of your SSH identity key. Defaults to ~/.ssh/quay_installer if left unspecified.
--sslCert	The path to the SSL/TLS public key / certificate. Defaults to {quayRoot}/quay-config and is auto-generated if left unspecified.
--sslCheckSkip	Skips the check for the certificate hostname against the SERVER_HOSTNAME in the config.yaml file. ^[2]
--sslKey	The path to the SSL/TLS private key used for HTTPS communication. Defaults to {quayRoot}/quay-config and is auto-generated if left unspecified.
--targetHostname, -H	The hostname of the target you want to install Quay to. Defaults to \$HOST , for example, a local host, if left unspecified.
--targetUsername, -u	The user on the target host which will be used for SSH. Defaults to \$USER , for example, the current user if left unspecified.

Flags	Description
--verbose, -v	Shows debug logs and Ansible playbook outputs.
--version	Shows the version for the <i>mirror registry for Red Hat OpenShift</i>

1. **--quayHostname** must be modified if the public DNS name of your system is different from the local hostname. Additionally, the **--quayHostname** flag does not support installation with an IP address. Installation with a hostname is required.
2. **--sslCheckSkip** is used in cases when the mirror registry is set behind a proxy and the exposed hostname is different from the internal Quay hostname. It can also be used when users do not want the certificates to be validated against the provided Quay hostname during installation.

2.2.10. Mirror registry for Red Hat OpenShift release notes

The *mirror registry for Red Hat OpenShift* is a small and streamlined container registry that you can use as a target for mirroring the required container images of OpenShift Container Platform for disconnected installations.

These release notes track the development of the *mirror registry for Red Hat OpenShift* in OpenShift Container Platform.

2.2.10.1. Mirror registry for Red Hat OpenShift 2.0 release notes

The following sections provide details for each 2.0 release of the mirror registry for Red Hat OpenShift

2.2.10.1.1. Mirror registry for Red Hat OpenShift 2.0.1

Issued: 26 September 2024

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.12.1.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:7070 - mirror registry for Red Hat OpenShift 2.0.1](#)

2.2.10.1.2. Mirror registry for Red Hat OpenShift 2.0.0

Issued: 03 September 2024

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.12.0.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:5277 - mirror registry for Red Hat OpenShift 2.0.0](#)

2.2.10.1.2.1. New features

- With the release of *mirror registry for Red Hat OpenShift*, the internal database has been upgraded from PostgreSQL to SQLite. As a result, data is now stored on the **sqlite-storage** Podman volume by default, and the overall tarball size is reduced by 300 MB.

New installations use SQLite by default. Before upgrading to version 2.0, see "Updating mirror registry for Red Hat OpenShift from a local host" or "Updating mirror registry for Red Hat OpenShift from a remote host" depending on your environment.

- A new feature flag, **--sqliteStorage** has been added. With this flag, you can manually set the location where SQLite database data is saved.

2.2.10.2. Mirror registry for Red Hat OpenShift 1.3 release notes

The following sections provide details for each 1.3.z release of the *mirror registry for Red Hat OpenShift*

2.2.10.2.1. Mirror registry for Red Hat OpenShift 1.3.11

Issued: 2024-04-23

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.15.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2024:1758 - mirror registry for Red Hat OpenShift 1.3.11](#)

2.2.10.2.2. Mirror registry for Red Hat OpenShift 1.3.10

Issued: 2023-12-07

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.14.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:7628 - mirror registry for Red Hat OpenShift 1.3.10](#)

2.2.10.2.3. Mirror registry for Red Hat OpenShift 1.3.9

Issued: 2023-09-19

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.12.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:5241 - mirror registry for Red Hat OpenShift 1.3.9](#)

2.2.10.2.4. Mirror registry for Red Hat OpenShift 1.3.8

Issued: 2023-08-16

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.11.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:4622 - mirror registry for Red Hat OpenShift 1.3.8](#)

2.2.10.2.5. Mirror registry for Red Hat OpenShift 1.3.7

Issued: 2023-07-19

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.10.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:4087 - mirror registry for Red Hat OpenShift 1.3.7](#)

2.2.10.2.6. Mirror registry for Red Hat OpenShift 1.3.6

Issued: 2023-05-30

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.8.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:3302 - mirror registry for Red Hat OpenShift 1.3.6](#)

2.2.10.2.7. Mirror registry for Red Hat OpenShift 1.3.5

Issued: 2023-05-18

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.7.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:3225 - mirror registry for Red Hat OpenShift 1.3.5](#)

2.2.10.2.8. Mirror registry for Red Hat OpenShift 1.3.4

Issued: 2023-04-25

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.6.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1914 - mirror registry for Red Hat OpenShift 1.3.4](#)

2.2.10.2.9. Mirror registry for Red Hat OpenShift 1.3.3

Issued: 2023-04-05

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.5.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1528 - mirror registry for Red Hat OpenShift 1.3.3](#)

2.2.10.2.10. Mirror registry for Red Hat OpenShift 1.3.2

Issued: 2023-03-21

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.4.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1376 - mirror registry for Red Hat OpenShift 1.3.2](#)

2.2.10.2.11. Mirror registry for Red Hat OpenShift 1.3.1

Issued: 2023-03-7

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.3.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:1086 - mirror registry for Red Hat OpenShift 1.3.1](#)

2.2.10.2.12. Mirror registry for Red Hat OpenShift 1.3.0

Issued: 2023-02-20

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.8.1.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2023:0558 - mirror registry for Red Hat OpenShift 1.3.0](#)

2.2.10.2.12.1. New features

- *Mirror registry for Red Hat OpenShift* is now supported on Red Hat Enterprise Linux (RHEL) 9 installations.
- IPv6 support is now available on *mirror registry for Red Hat OpenShift* local host installations. IPv6 is currently unsupported on *mirror registry for Red Hat OpenShift* remote host installations.
- A new feature flag, **--quayStorage**, has been added. By specifying this flag, you can manually set the location for the Quay persistent storage.
- A new feature flag, **--pgStorage**, has been added. By specifying this flag, you can manually set the location for the Postgres persistent storage.
- Previously, users were required to have root privileges (**sudo**) to install *mirror registry for Red Hat OpenShift*. With this update, **sudo** is no longer required to install *mirror registry for Red Hat OpenShift*.

When *mirror registry for Red Hat OpenShift* was installed with **sudo**, an **/etc/quay-install** directory that contained installation files, local storage, and the configuration bundle was created. With the removal of the **sudo** requirement, installation files and the configuration bundle are now installed to **\$HOME/quay-install**. Local storage, for example Postgres and Quay, are now stored in named volumes automatically created by Podman.

To override the default directories that these files are stored in, you can use the command line arguments for *mirror registry for Red Hat OpenShift*. For more information about *mirror registry for Red Hat OpenShift* command line arguments, see "*Mirror registry for Red Hat OpenShift* flags".

2.2.10.2.12.2. Bug fixes

- Previously, the following error could be returned when attempting to uninstall *mirror registry for Red Hat OpenShift*: **["Error: no container with name or ID \"quay-postgres\" found: no such container"], "stdout": "", "stdout_lines": []**. With this update, the order that *mirror registry for Red Hat OpenShift* services are stopped and uninstalled have been changed so that the error no longer occurs when uninstalling *mirror registry for Red Hat OpenShift*. For more information, see [PROQUAY-4629](#).

2.2.10.3. Mirror registry for Red Hat OpenShift 1.2 release notes

The following sections provide details for each 1.2.z release of the *mirror registry for Red Hat OpenShift*

2.2.10.3.1. Mirror registry for Red Hat OpenShift 1.2.9

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.10.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:7369 - mirror registry for Red Hat OpenShift 1.2.9](#)

2.2.10.3.2. Mirror registry for Red Hat OpenShift 1.2.8

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.9.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:7065 - mirror registry for Red Hat OpenShift 1.2.8](#)

2.2.10.3.3. Mirror registry for Red Hat OpenShift 1.2.7

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.8.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:6500 - mirror registry for Red Hat OpenShift 1.2.7](#)

2.2.10.3.3.1. Bug fixes

- Previously, **getFQDN()** relied on the fully-qualified domain name (FQDN) library to determine its FQDN, and the FQDN library tried to read the **/etc/hosts** folder directly. Consequently, on some Red Hat Enterprise Linux CoreOS (RHCOS) installations with uncommon DNS configurations, the FQDN library would fail to install and abort the installation. With this update, *mirror registry for Red Hat OpenShift* uses **hostname** to determine the FQDN. As a result, the FQDN library does not fail to install. ([PROJQUAY-4139](#))

2.2.10.3.4. Mirror registry for Red Hat OpenShift 1.2.6

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.7.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:6278 - mirror registry for Red Hat OpenShift 1.2.6](#)

2.2.10.3.4.1. New features

A new feature flag, **--no-color (-c)** has been added. This feature flag allows users to disable color sequences and propagate that to Ansible when running install, uninstall, and upgrade commands.

2.2.10.3.5. Mirror registry for Red Hat OpenShift 1.2.5

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.6.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:6071 - mirror registry for Red Hat OpenShift 1.2.5](#)

2.2.10.3.6. Mirror registry for Red Hat OpenShift 1.2.4

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.5.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:5884 - mirror registry for Red Hat OpenShift 1.2.4](#)

2.2.10.3.7. Mirror registry for Red Hat OpenShift 1.2.3

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.4.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:5649 - mirror registry for Red Hat OpenShift 1.2.3](#)

2.2.10.3.8. Mirror registry for Red Hat OpenShift 1.2.2

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.3.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:5501 - mirror registry for Red Hat OpenShift 1.2.2](#)

2.2.10.3.9. Mirror registry for Red Hat OpenShift 1.2.1

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.2.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:4986 - mirror registry for Red Hat OpenShift 1.2.1](#)

2.2.10.3.10. Mirror registry for Red Hat OpenShift 1.2.0

Mirror registry for Red Hat OpenShift is now available with Red Hat Quay 3.7.1.

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:4986 - mirror registry for Red Hat OpenShift 1.2.0](#)

2.2.10.3.10.1. Bug fixes

- Previously, all components and workers running inside of the Quay pod Operator had log levels set to **DEBUG**. As a result, large traffic logs were created that consumed unnecessary space. With this update, log levels are set to **WARN** by default, which reduces traffic information while emphasizing problem scenarios. ([PROJQUAY-3504](#))

2.2.10.4. Mirror registry for Red Hat OpenShift 1.1 release notes

The following section provides details 1.1.0 release of the *mirror registry for Red Hat OpenShift*

2.2.10.4.1. Mirror registry for Red Hat OpenShift 1.1.0

The following advisory is available for the *mirror registry for Red Hat OpenShift*:

- [RHBA-2022:0956 - mirror registry for Red Hat OpenShift 1.1.0](#)

2.2.10.4.1.1. New features

- A new command, **mirror-registry upgrade** has been added. This command upgrades all container images without interfering with configurations or data.

NOTE

If **quayRoot** was previously set to something other than default, it must be passed into the upgrade command.

2.2.10.4.1.2. Bug fixes

- Previously, the absence of **quayHostname** or **targetHostname** did not default to the local hostname. With this update, **quayHostname** and **targetHostname** now default to the local hostname if they are missing. ([PROJQUAY-3079](#))
- Previously, the command `./mirror-registry --version` returned an **unknown flag** error. Now, running `./mirror-registry --version` returns the current version of the *mirror registry for Red Hat OpenShift*. ([PROJQUAY-3086](#))
- Previously, users could not set a password during installation, for example, when running `./mirror-registry install --initUser <user_name> --initPassword <password> --verbose`. With this update, users can set a password during installation. ([PROJQUAY-3149](#))
- Previously, the *mirror registry for Red Hat OpenShift* did not recreate pods if they were destroyed. Now, pods are recreated if they are destroyed. ([PROJQUAY-3261](#))

2.2.11. Troubleshooting mirror registry for Red Hat OpenShift

To assist in troubleshooting *mirror registry for Red Hat OpenShift*, you can gather logs of systemd services installed by the mirror registry. The following services are installed:

- quay-app.service
- quay-postgres.service
- quay-redis.service
- quay-pod.service

Prerequisites

- You have installed *mirror registry for Red Hat OpenShift*.

Procedure

- If you installed *mirror registry for Red Hat OpenShift* with root privileges, you can get the status information of its systemd services by entering the following command:

```
$ sudo systemctl status <service>
```

- If you installed *mirror registry for Red Hat OpenShift* as a standard user, you can get the status information of its systemd services by entering the following command:

```
$ systemctl --user status <service>
```

2.2.12. Additional resources

- [Red Hat Quay garbage collection](#)
- [Using SSL to protect connections to Red Hat Quay](#)
- [Configuring the system to trust the certificate authority](#)
- [Mirroring the OpenShift Container Platform image repository](#)
- [Mirroring Operator catalogs for use with disconnected clusters](#)

2.3. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION

You can ensure your clusters only use container images that satisfy your organizational controls on external content. Before you install a cluster on infrastructure that you provision in a restricted network, you must mirror the required container images into that environment. To mirror container images, you must have a registry for mirroring.

IMPORTANT

You must have access to the internet to obtain the necessary container images. In this procedure, you place your mirror registry on a mirror host that has access to both your network and the internet. If you do not have access to a mirror host, use the [Mirroring Operator catalogs for use with disconnected clusters](#) procedure to copy images to a device you can move across network boundaries with.

2.3.1. Prerequisites

- You must have a container image registry that supports [Docker v2-2](#) in the location that will host the OpenShift Container Platform cluster, such as one of the following registries:
 - [Red Hat Quay](#)
 - [JFrog Artifactory](#)
 - [Sonatype Nexus Repository](#)
 - [Harbor](#)

If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay [for proof-of-concept purposes](#) or [by using the Red Hat Quay Operator](#). If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat Support.

- If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a [mirror registry for Red Hat OpenShift](#). The *mirror registry for Red Hat OpenShift* is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

2.3.2. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry such as Red Hat Quay, JFrog Artifactory,

Sonatype Nexus Repository, or Harbor. If you do not have access to a large-scale container registry, you can use the *mirror registry for Red Hat OpenShift*, a small-scale container registry included with OpenShift Container Platform subscriptions.

You can use any container registry that supports [Docker v2-2](#), such as Red Hat Quay, the *mirror registry for Red Hat OpenShift*, Artifactory, Sonatype Nexus Repository, or Harbor. Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

IMPORTANT

The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the *mirror registry for Red Hat OpenShift*, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the **crictl images** command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

NOTE

Red Hat does not test third party registries with OpenShift Container Platform.

Additional information

For information about viewing the CRI-O logs to view the image source, see [Viewing the image pull source](#).

2.3.3. Preparing your mirror host

Before you perform the mirror procedure, you must prepare the host to retrieve content and push it to the remote location.

2.3.3.1. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

2.3.4. Configuring credentials that allow images to be mirrored

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

WARNING

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

WARNING

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

Prerequisites

- You configured a mirror registry to use in your disconnected environment.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

Procedure

Complete the following steps on the installation host:

1. Download your **registry.redhat.io** [pull secret from Red Hat OpenShift Cluster Manager](#) .
2. Make a copy of your pull secret in JSON format:

```
$ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json> 1
```

- 1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

The contents of the file resemble the following example:

```
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

3. Generate the base64-encoded user name and password or token for your mirror registry:

```
$ echo -n '<user_name>:<password>' | base64 -w0 1
BGVtbYk3ZHAAtqXs=
```

- 1 For **<user_name>** and **<password>**, specify the user name and password that you configured for your registry.

4. Edit the JSON file and add a section that describes your registry to it:

```
"auths": {
  "<mirror_registry>": { 1
    "auth": "<credentials>", 2
    "email": "you@example.com"
  }
},
```

- 1 For **<mirror_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:8443**
- 2 For **<credentials>**, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{
  "auths": {
    "registry.example.com": {
      "auth": "BGVtbYk3ZHAAtqXs=",
      "email": "you@example.com"
    },
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

2.3.5. Mirroring the OpenShift Container Platform image repository

Mirror the OpenShift Container Platform image repository to your registry to use during cluster installation or upgrade.

Prerequisites

- Your mirror host has access to the internet.
- You configured a mirror registry to use in your restricted network and can access the certificate and credentials that you configured.
- You downloaded the [pull secret from Red Hat OpenShift Cluster Manager](#) and modified it to include authentication to your mirror repository.
- If you use self-signed certificates, you have specified a Subject Alternative Name in the certificates.

Procedure

Complete the following steps on the mirror host:

1. Review the [OpenShift Container Platform downloads page](#) to determine the version of OpenShift Container Platform that you want to install and determine the corresponding tag on the [Repository Tags](#) page.
2. Set the required environment variables:

- a. Export the release version:

```
$ OCP_RELEASE=<release_version>
```

For **<release_version>**, specify the tag that corresponds to the version of OpenShift Container Platform to install, such as **4.5.4**.

- b. Export the local registry name and host port:

```
$ LOCAL_REGISTRY='<local_registry_host_name>:<local_registry_host_port>'
```

For **<local_registry_host_name>**, specify the registry domain name for your mirror repository, and for **<local_registry_host_port>**, specify the port that it serves content on.

- c. Export the local repository name:

```
$ LOCAL_REPOSITORY='<local_repository_name>'
```

For **<local_repository_name>**, specify the name of the repository to create in your registry, such as **ocp4/openshift4**.

- d. Export the name of the repository to mirror:

```
$ PRODUCT_REPO='openshift-release-dev'
```

For a production release, you must specify **openshift-release-dev**.

- e. Export the path to your registry pull secret:

```
$ LOCAL_SECRET_JSON='<path_to_pull_secret>'
```

For **<path_to_pull_secret>**, specify the absolute path to and file name of the pull secret for your mirror registry that you created.

- f. Export the release mirror:

```
$ RELEASE_NAME="ocp-release"
```

For a production release, you must specify **ocp-release**.

- g. Export the type of architecture for your cluster:

```
$ ARCHITECTURE=<cluster_architecture> 1
```

- 1 Specify the architecture of the cluster, such as **x86_64**, **aarch64**, **s390x**, or **ppc64le**.

- h. Export the path to the directory to host the mirrored images:

```
$ REMOVABLE_MEDIA_PATH=<path> 1
```

- 1 Specify the full path, including the initial forward slash (/) character.

3. Mirror the version images to the mirror registry:

- If your mirror host does not have internet access, take the following actions:
 - i. Connect the removable media to a system that is connected to the internet.
 - ii. Review the images and configuration manifests to mirror:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-
  image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE} --dry-run
```

- iii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.

- iv. Mirror the images to a directory on the removable media:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} --to-
  dir=${REMOVABLE_MEDIA_PATH}/mirror
  quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE}
```

- v. Take the media to the restricted network environment and upload the images to the local container registry.

```
$ oc image mirror -a ${LOCAL_SECRET_JSON} --from-
```

```
dir=${REMOVABLE_MEDIA_PATH}/mirror
"file://openshift/release:${OCP_RELEASE}"
${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} 1
```

- 1 For **REMOVABLE_MEDIA_PATH**, you must use the same path that you specified when you mirrored the images.

IMPORTANT

Running **oc image mirror** might result in the following error: **error: unable to retrieve source image**. This error occurs when image indexes include references to images that no longer exist on the image registry. Image indexes might retain older references to allow users running those images an upgrade path to newer points on the upgrade graph. As a temporary workaround, you can use the **--skip-missing** option to bypass the error and continue downloading the image index. For more information, see [Service Mesh Operator mirroring failed](#).

- If the local container registry is connected to the mirror host, take the following actions:
 - i. Directly push the release images to the local registry by using following command:

```
$ oc adm release mirror -a ${LOCAL_SECRET_JSON} \
  --from=quay.io/${PRODUCT_REPO}/${RELEASE_NAME}:${OCP_RELEASE}-
  ${ARCHITECTURE} \
  --to=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY} \
  --to-release-
  image=${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE}
```

This command pulls the release information as a digest, and its output includes the **imageContentSources** data that you require when you install your cluster.

- ii. Record the entire **imageContentSources** section from the output of the previous command. The information about your mirrors is unique to your mirrored repository, and you must add the **imageContentSources** section to the **install-config.yaml** file during installation.

NOTE

The image name gets patched to Quay.io during the mirroring process, and the podman images will show Quay.io in the registry on the bootstrap virtual machine.

4. To create the installation program that is based on the content that you mirrored, extract it and pin it to the release:

- If your mirror host does not have internet access, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --icsp-file=<file> --
  command=openshift-install
  "${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
  ${ARCHITECTURE}"
```

- If the local container registry is connected to the mirror host, run the following command:

```
$ oc adm release extract -a ${LOCAL_SECRET_JSON} --command=openshift-install
"${LOCAL_REGISTRY}/${LOCAL_REPOSITORY}:${OCP_RELEASE}-
${ARCHITECTURE}"
```

IMPORTANT

To ensure that you use the correct images for the version of OpenShift Container Platform that you selected, you must extract the installation program from the mirrored content.

You must perform this step on a machine with an active internet connection.

5. For clusters using installer-provisioned infrastructure, run the following command:

```
$ openshift-install
```

2.3.6. The Cluster Samples Operator in a disconnected environment

In a disconnected environment, you must take additional steps after you install a cluster to configure the Cluster Samples Operator. Review the following information in preparation.

2.3.6.1. Cluster Samples Operator assistance for mirroring

During installation, OpenShift Container Platform creates a config map named **imagestreamtag-to-image** in the **openshift-cluster-samples-operator** namespace. The **imagestreamtag-to-image** config map contains an entry, the populating image, for each image stream tag.

The format of the key for each entry in the data field in the config map is **<image_stream_name>_<image_stream_tag_name>**.

During a disconnected installation of OpenShift Container Platform, the status of the Cluster Samples Operator is set to **Removed**. If you choose to change it to **Managed**, it installs samples.

NOTE

The use of samples in a network-restricted or discontinued environment may require access to services external to your network. Some example services include: Github, Maven Central, npm, RubyGems, PyPi and others. There might be additional steps to take that allow the cluster samples operators's objects to reach the services they require.

You can use this config map as a reference for which images need to be mirrored for your image streams to import.

- While the Cluster Samples Operator is set to **Removed**, you can create your mirrored registry, or determine which existing mirrored registry you want to use.
- Mirror the samples you want to the mirrored registry using the new config map as your guide.
- Add any of the image streams you did not mirror to the **skippedImagestreams** list of the Cluster Samples Operator configuration object.

- Set **samplesRegistry** of the Cluster Samples Operator configuration object to the mirrored registry.
- Then set the Cluster Samples Operator to **Managed** to install the image streams you have mirrored.

2.3.7. Mirroring Operator catalogs for use with disconnected clusters

You can mirror the Operator contents of a Red Hat-provided catalog, or a custom catalog, into a container image registry using the **oc adm catalog mirror** command. The target registry must support [Docker v2-2](#). For a cluster on a restricted network, this registry can be one that the cluster has network access to, such as a mirror registry created during a restricted network cluster installation.

IMPORTANT

- The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.
- Running **oc adm catalog mirror** might result in the following error: **error: unable to retrieve source image**. This error occurs when image indexes include references to images that no longer exist on the image registry. Image indexes might retain older references to allow users running those images an upgrade path to newer points on the upgrade graph. As a temporary workaround, you can use the **--skip-missing** option to bypass the error and continue downloading the image index. For more information, see [Service Mesh Operator mirroring failed](#).

The **oc adm catalog mirror** command also automatically mirrors the index image that is specified during the mirroring process, whether it be a Red Hat-provided index image or your own custom-built index image, to the target registry. You can then use the mirrored index image to create a catalog source that allows Operator Lifecycle Manager (OLM) to load the mirrored catalog onto your OpenShift Container Platform cluster.

Additional resources

- [Using Operator Lifecycle Manager on restricted networks](#)

2.3.7.1. Prerequisites

Mirroring Operator catalogs for use with disconnected clusters has the following prerequisites:

- Workstation with unrestricted network access.
- **podman** version 1.9.3 or later.
- If you want to filter, or *prune*, an existing catalog and selectively mirror only a subset of Operators, see the following sections:
 - [Installing the opm CLI](#)
 - [Updating or filtering a file-based catalog image](#)
- If you want to mirror a Red Hat-provided catalog, run the following command on your workstation with unrestricted network access to authenticate with **registry.redhat.io**:

```
$ podman login registry.redhat.io
```

- Access to a mirror registry that supports [Docker v2-2](#).
- On your mirror registry, decide which repository, or namespace, to use for storing mirrored Operator content. For example, you might create an **olm-mirror** repository.
- If your mirror registry does not have internet access, connect removable media to your workstation with unrestricted network access.
- If you are working with private registries, including **registry.redhat.io**, set the **REG_CREDS** environment variable to the file path of your registry credentials for use in later steps. For example, for the **podman** CLI:

```
$ REG_CREDS=${XDG_RUNTIME_DIR}/containers/auth.json
```

2.3.7.2. Extracting and mirroring catalog contents

The **oc adm catalog mirror** command extracts the contents of an index image to generate the manifests required for mirroring. The default behavior of the command generates manifests, then automatically mirrors all of the image content from the index image, as well as the index image itself, to your mirror registry.

Alternatively, if your mirror registry is on a completely disconnected, or *airgapped*, host, you can first mirror the content to removable media, move the media to the disconnected environment, then mirror the content from the media to the registry.

2.3.7.2.1. Mirroring catalog contents to registries on the same network

If your mirror registry is co-located on the same network as your workstation with unrestricted network access, take the following actions on your workstation.

Procedure

1. If your mirror registry requires authentication, run the following command to log in to the registry:

```
$ podman login <mirror_registry>
```

2. Run the following command to extract and mirror the content to the mirror registry:

```
$ oc adm catalog mirror \
  <index_image> \ 1
  <mirror_registry>:<port>[/<repository>] \ 2
  [-a ${REG_CREDS}] \ 3
  [--insecure] \ 4
  [--index-filter-by-os='<platform>/<arch>'] \ 5
  [--manifests-only] 6
```

- 1** Specify the index image for the catalog that you want to mirror.
- 2** Specify the fully qualified domain name (FQDN) for the target registry to mirror the Operator contents to. The mirror registry **<repository>** can be any existing repository, or namespace, on the registry, for example **olm-mirror** as outlined in the prerequisites. If

namespace, on the registry, for example **oc mirror** as outlined in the prerequisites. If there is an existing repository found during mirroring, the repository name is added to the resulting image name. If you do not want the image name to include the repository name, omit the **<repository>** value from this line, for example **<mirror_registry>:<port>**.

- 3 Optional: If required, specify the location of your registry credentials file. **{REG_CREDS}** is required for **registry.redhat.io**.
- 4 Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5 Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are passed as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, **linux/arm64**.
- 6 Optional: Generate only the manifests required for mirroring without actually mirroring the image content to a registry. This option can be useful for reviewing what will be mirrored, and lets you make any changes to the mapping list, if you require only a subset of packages. You can then use the **mapping.txt** file with the **oc image mirror** command to mirror the modified list of images in a later step. This flag is intended for only advanced selective mirroring of content from the catalog.

Example output

```
src image has index label for database path: /database/index.db
using database path mapping: /database/index.db:/tmp/153048078
wrote database to /tmp/153048078 1
...
wrote mirroring manifests to manifests-redhat-operator-index-1614211642 2
```

- 1 Directory for the temporary **index.db** database generated by the command.
- 2 Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.

NOTE

Red Hat Quay does not support nested repositories. As a result, running the **oc adm catalog mirror** command will fail with a **401** unauthorized error. As a workaround, you can use the **--max-components=2** option when running the **oc adm catalog mirror** command to disable the creation of nested repositories. For more information on this workaround, see the [Unauthorized error thrown while using catalog mirror command with Quay registry](#) Knowledgebase Solution.

Additional resources

- [Architecture and operating system support for Operators](#)

2.3.7.2.2. Mirroring catalog contents to airgapped registries

If your mirror registry is on a completely disconnected, or airgapped, host, take the following actions.

Procedure

1. Run the following command on your workstation with unrestricted network access to mirror the content to local files:

```
$ oc adm catalog mirror \
  <index_image> \ 1
  file:///local/index \ 2
  -a ${REG_CREDS} \ 3
  --insecure \ 4
  --index-filter-by-os='<platform>/<arch>' 5
```

- 1** Specify the index image for the catalog that you want to mirror.
- 2** Specify the content to mirror to local files in your current directory.
- 3** Optional: If required, specify the location of your registry credentials file.
- 4** Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- 5** Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, **linux/arm64**, and *****.

Example output

```
...
info: Mirroring completed in 5.93s (5.915MB/s)
wrote mirroring manifests to manifests-my-index-1614985528 1
```

To upload local images to a registry, run:

```
oc adm catalog mirror file:///local/index/myrepo/my-index:v1 REGISTRY/REPOSITORY 2
```

- 1** Record the manifests directory name that is generated. This directory is referenced in subsequent procedures.
- 2** Record the expanded **file://** path that is based on your provided index image. This path is referenced in a subsequent step.

This command creates a **v2/** directory in your current directory.

2. Copy the **v2/** directory to removable media.
3. Physically remove the media and attach it to a host in the disconnected environment that has access to the mirror registry.
4. If your mirror registry requires authentication, run the following command on your host in the disconnected environment to log in to the registry:

```
$ podman login <mirror_registry>
```

- Run the following command from the parent directory containing the **v2/** directory to upload the images from local files to the mirror registry:

```
$ oc adm catalog mirror \
  file:///local/index/<repository>/<index_image>:<tag> \ ❶
  <mirror_registry>:<port>[/<repository>] \ ❷
  -a ${REG_CREDS} \ ❸
  --insecure \ ❹
  --index-filter-by-os='<platform>/<arch>' ❺
```

- ❶ Specify the **file://** path from the previous command output.
- ❷ Specify the fully qualified domain name (FQDN) for the target registry to mirror the Operator contents to. The mirror registry **<repository>** can be any existing repository, or namespace, on the registry, for example **olm-mirror** as outlined in the prerequisites. If there is an existing repository found during mirroring, the repository name is added to the resulting image name. If you do not want the image name to include the repository name, omit the **<repository>** value from this line, for example **<mirror_registry>:<port>**.
- ❸ Optional: If required, specify the location of your registry credentials file.
- ❹ Optional: If you do not want to configure trust for the target registry, add the **--insecure** flag.
- ❺ Optional: Specify which platform and architecture of the index image to select when multiple variants are available. Images are specified as '**<platform>/<arch>[/<variant>]**'. This does not apply to images referenced by the index. Valid values are **linux/amd64**, **linux/ppc64le**, **linux/s390x**, **linux/arm64**, and *****.

NOTE

Red Hat Quay does not support nested repositories. As a result, running the **oc adm catalog mirror** command will fail with a **401** unauthorized error. As a workaround, you can use the **--max-components=2** option when running the **oc adm catalog mirror** command to disable the creation of nested repositories. For more information on this workaround, see the [Unauthorized error thrown while using catalog mirror command with Quay registry](#) Knowledgebase Solution.

- Run the **oc adm catalog mirror** command again. Use the newly mirrored index image as the source and the same mirror registry target used in the previous step:

```
$ oc adm catalog mirror \
  <mirror_registry>:<port>/<index_image> \
  <mirror_registry>:<port>[/<repository>] \
  --manifests-only ❶
  [-a ${REG_CREDS}] \
  [--insecure]
```

- ❶ The **--manifests-only** flag is required for this step so that the command does not copy all of the mirrored content again.

IMPORTANT

This step is required because the image mappings in the **imageContentSourcePolicy.yaml** file generated during the previous step must be updated from local paths to valid mirror locations. Failure to do so will cause errors when you create the **ImageContentSourcePolicy** object in a later step.

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the **ImageContentSourcePolicy** and **CatalogSource** objects. These objects are required to enable installation of Operators from OperatorHub.

Additional resources

- [Architecture and operating system support for Operators](#)

2.3.7.3. Generated manifests

After mirroring Operator catalog content to your mirror registry, a manifests directory is generated in your current directory.

If you mirrored content to a registry on the same network, the directory name takes the following pattern:

```
manifests-<index_image_name>-<random_number>
```

If you mirrored content to a registry on a disconnected host in the previous section, the directory name takes the following pattern:

```
manifests-index/<repository>/<index_image_name>-<random_number>
```

NOTE

The manifests directory name is referenced in subsequent procedures.

The manifests directory contains the following files, some of which might require further modification:

- The **catalogSource.yaml** file is a basic definition for a **CatalogSource** object that is pre-populated with your index image tag and other relevant metadata. This file can be used as is or modified to add the catalog source to your cluster.

IMPORTANT

If you mirrored the content to local files, you must modify your **catalogSource.yaml** file to remove any backslash (\) characters from the **metadata.name** field. Otherwise, when you attempt to create the object, it fails with an "invalid resource name" error.

- The **imageContentSourcePolicy.yaml** file defines an **ImageContentSourcePolicy** object that can configure nodes to translate between the image references stored in Operator manifests and the mirrored registry.

**NOTE**

If your cluster uses an **ImageContentSourcePolicy** object to configure repository mirroring, you can use only global pull secrets for mirrored registries. You cannot add a pull secret to a project.

- The **mapping.txt** file contains all of the source images and where to map them in the target registry. This file is compatible with the **oc image mirror** command and can be used to further customize the mirroring configuration.

**IMPORTANT**

If you used the **--manifests-only** flag during the mirroring process and want to further trim the subset of packages to mirror, see the steps in the [Mirroring a package manifest format catalog image](#) procedure of the OpenShift Container Platform 4.7 documentation about modifying your **mapping.txt** file and using the file with the **oc image mirror** command.

2.3.7.4. Postinstallation requirements

After you mirror the catalog, you can continue with the remainder of your cluster installation. After your cluster installation has finished successfully, you must specify the manifests directory from this procedure to create the **ImageContentSourcePolicy** and **CatalogSource** objects. These objects are required to populate and enable installation of Operators from OperatorHub.

Additional resources

- [Populating OperatorHub from mirrored Operator catalogs](#)
- [Updating or filtering a file-based catalog image](#)

2.3.8. Next steps

- Install a cluster on infrastructure that you provision in your restricted network, such as on [VMware vSphere](#), [bare metal](#), or [Amazon Web Services](#).

2.3.9. Additional resources

- See [Gathering data about specific features](#) for more information about using must-gather.

2.4. MIRRORING IMAGES FOR A DISCONNECTED INSTALLATION USING THE OC-MIRROR PLUGIN

Running your cluster in a restricted network without direct internet connectivity is possible by installing the cluster from a mirrored set of OpenShift Container Platform container images in a private registry. This registry must be running at all times as long as the cluster is running. See the [Prerequisites](#) section for more information.

You can use the oc-mirror OpenShift CLI (**oc**) plugin to mirror images to a mirror registry in your fully or partially disconnected environments. You must run oc-mirror from a system with internet connectivity in order to download the required images from the official Red Hat registries.

The following steps outline the high-level workflow on how to use the oc-mirror plugin to mirror images to a mirror registry:

1. Create an image set configuration file.
2. Mirror the image set to the mirror registry by using one of the following methods:
 - Mirror an image set directly to the mirror registry.
 - Mirror an image set to disk, transfer the image set to the target environment, then upload the image set to the target mirror registry.
3. Configure your cluster to use the resources generated by the oc-mirror plugin.
4. Repeat these steps to update your mirror registry as necessary.

2.4.1. About the oc-mirror plugin

You can use the oc-mirror OpenShift CLI (**oc**) plugin to mirror all required OpenShift Container Platform content and other images to your mirror registry by using a single tool. It provides the following features:

- Provides a centralized method to mirror OpenShift Container Platform releases, Operators, helm charts, and other images.
- Maintains update paths for OpenShift Container Platform and Operators.
- Uses a declarative image set configuration file to include only the OpenShift Container Platform releases, Operators, and images that your cluster needs.
- Performs incremental mirroring, which reduces the size of future image sets.
- Prunes images from the target mirror registry that were excluded from the image set configuration since the previous execution.
- Optionally generates supporting artifacts for OpenShift Update Service (OSUS) usage.

When using the oc-mirror plugin, you specify which content to mirror in an image set configuration file. In this YAML file, you can fine-tune the configuration to only include the OpenShift Container Platform releases and Operators that your cluster needs. This reduces the amount of data that you need to download and transfer. The oc-mirror plugin can also mirror arbitrary helm charts and additional container images to assist users in seamlessly synchronizing their workloads onto mirror registries.

The first time you run the oc-mirror plugin, it populates your mirror registry with the required content to perform your disconnected cluster installation or update. In order for your disconnected cluster to continue receiving updates, you must keep your mirror registry updated. To update your mirror registry, you run the oc-mirror plugin using the same configuration as the first time you ran it. The oc-mirror plugin references the metadata from the storage backend and only downloads what has been released since the last time you ran the tool. This provides update paths for OpenShift Container Platform and Operators and performs dependency resolution as required.

IMPORTANT

When using the oc-mirror CLI plugin to populate a mirror registry, any further updates to the mirror registry must be made using the oc-mirror tool.

2.4.2. oc-mirror compatibility and support

The oc-mirror plugin supports mirroring OpenShift Container Platform payload images and Operator catalogs for OpenShift Container Platform versions 4.10 and later.

NOTE

On **aarch64**, **ppc64le**, and **s390x** architectures the oc-mirror plugin is only supported for OpenShift Container Platform versions 4.14 and later.

Use the latest available version of the oc-mirror plugin regardless of which versions of OpenShift Container Platform you need to mirror.

IMPORTANT

If you used the Technology Preview OCI local catalogs feature for the oc-mirror plugin for OpenShift Container Platform 4.12, you can no longer use the OCI local catalogs feature of the oc-mirror plugin to copy a catalog locally and convert it to OCI format as a first step to mirroring to a fully disconnected cluster.

2.4.3. About the mirror registry

You can mirror the images that are required for OpenShift Container Platform installation and subsequent product updates to a container mirror registry that supports [Docker v2-2](#), such as Red Hat Quay. If you do not have access to a large-scale container registry, you can use the *mirror registry for Red Hat OpenShift*, which is a small-scale container registry included with OpenShift Container Platform subscriptions.

Regardless of your chosen registry, the procedure to mirror content from Red Hat hosted sites on the internet to an isolated image registry is the same. After you mirror the content, you configure each cluster to retrieve this content from your mirror registry.

IMPORTANT

The OpenShift image registry cannot be used as the target registry because it does not support pushing without a tag, which is required during the mirroring process.

If choosing a container registry that is not the *mirror registry for Red Hat OpenShift*, it must be reachable by every machine in the clusters that you provision. If the registry is unreachable, installation, updating, or normal operations such as workload relocation might fail. For that reason, you must run mirror registries in a highly available way, and the mirror registries must at least match the production availability of your OpenShift Container Platform clusters.

When you populate your mirror registry with OpenShift Container Platform images, you can follow two scenarios. If you have a host that can access both the internet and your mirror registry, but not your cluster nodes, you can directly mirror the content from that machine. This process is referred to as *connected mirroring*. If you have no such host, you must mirror the images to a file system and then bring that host or removable media into your restricted environment. This process is referred to as *disconnected mirroring*.

For mirrored registries, to view the source of pulled images, you must review the **Trying to access** log entry in the CRI-O logs. Other methods to view the image pull source, such as using the **crictl images** command on a node, show the non-mirrored image name, even though the image is pulled from the mirrored location.

**NOTE**

Red Hat does not test third party registries with OpenShift Container Platform.

Additional resources

- For information about viewing the CRI-O logs to view the image source, see [Viewing the image pull source](#).

2.4.4. Prerequisites

- You must have a container image registry that supports [Docker v2-2](#) in the location that will host the OpenShift Container Platform cluster, such as Red Hat Quay.

**NOTE**

If you use Red Hat Quay, you must use version 3.6 or later with the oc-mirror plugin. If you have an entitlement to Red Hat Quay, see the documentation on deploying Red Hat Quay [for proof-of-concept purposes](#) or [by using the Red Hat Quay Operator](#). If you need additional assistance selecting and installing a registry, contact your sales representative or Red Hat Support.

If you do not already have an existing solution for a container image registry, subscribers of OpenShift Container Platform are provided a [mirror registry for Red Hat OpenShift](#). The *mirror registry for Red Hat OpenShift* is included with your subscription and is a small-scale container registry that can be used to mirror the required container images of OpenShift Container Platform in disconnected installations.

2.4.5. Preparing your mirror hosts

Before you can use the oc-mirror plugin to mirror images, you must install the plugin and create a container image registry credentials file to allow the mirroring from Red Hat to your mirror.

2.4.5.1. Installing the oc-mirror OpenShift CLI plugin

To use the oc-mirror OpenShift CLI plugin to mirror registry images, you must install the plugin. If you are mirroring image sets in a fully disconnected environment, ensure that you install the oc-mirror plugin on the host with internet access and the host in the disconnected environment with access to the mirror registry.

Prerequisites

- You have installed the OpenShift CLI (**oc**).
- You have set the **umask** parameter to **0022** on the operating system that uses oc-mirror.
- You have installed the correct binary for the RHEL version that you are using.

Procedure

1. Download the oc-mirror CLI plugin.
 - a. Navigate to the [Downloads](#) page of the [OpenShift Cluster Manager](#).

- b. Under the **OpenShift disconnected installation tools** section, click **Download** for **OpenShift Client (oc) mirror plugin** and save the file.

2. Extract the archive:

```
$ tar xvf oc-mirror.tar.gz
```

3. If necessary, update the plugin file to be executable:

```
$ chmod +x oc-mirror
```

NOTE

Do not rename the **oc-mirror** file.

4. Install the oc-mirror CLI plugin by placing the file in your **PATH**, for example, **/usr/local/bin**:

```
$ sudo mv oc-mirror /usr/local/bin/.
```

Verification

- Run **oc mirror help** to verify that the plugin was successfully installed:

```
$ oc mirror help
```

Additional resources

- [Installing and using CLI plugins](#)

2.4.5.2. Configuring credentials that allow images to be mirrored

Create a container image registry credentials file that allows mirroring images from Red Hat to your mirror.

WARNING

Do not use this image registry credentials file as the pull secret when you install a cluster. If you provide this file when you install cluster, all of the machines in the cluster will have write access to your mirror registry.

**WARNING**

This process requires that you have write access to a container image registry on the mirror registry and adds the credentials to a registry pull secret.

Prerequisites

- You configured a mirror registry to use in your disconnected environment.
- You identified an image repository location on your mirror registry to mirror images into.
- You provisioned a mirror registry account that allows images to be uploaded to that image repository.

Procedure

Complete the following steps on the installation host:

1. Download your **registry.redhat.io** pull secret from [Red Hat OpenShift Cluster Manager](#) .
2. Make a copy of your pull secret in JSON format:

```
$ cat ./pull-secret | jq . > <path>/<pull_secret_file_in_json> 1
```

- 1 Specify the path to the folder to store the pull secret in and a name for the JSON file that you create.

The contents of the file resemble the following example:

```
{
  "auths": {
    "cloud.openshift.com": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "quay.io": {
      "auth": "b3BlbnNo...",
      "email": "you@example.com"
    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}
```

3. Save the file as either `~/.docker/config.json` or `$XDG_RUNTIME_DIR/containers/auth.json`:

- a. If the **.docker** or **\$XDG_RUNTIME_DIR/containers** directories do not exist, create one by entering the following command:

```
$ mkdir -p <directory_name>
```

Where **<directory_name>** is either **~/.docker** or **\$XDG_RUNTIME_DIR/containers**.

- b. Copy the pull secret to the appropriate directory by entering the following command:

```
$ cp <path>/<pull_secret_file_in_json> <directory_name>/<auth_file>
```

Where **<directory_name>** is either **~/.docker** or **\$XDG_RUNTIME_DIR/containers**, and **<auth_file>** is either **config.json** or **auth.json**.

4. Generate the base64-encoded user name and password or token for your mirror registry:

```
$ echo -n '<user_name>:<password>' | base64 -w0 ❶  
BGVtbYk3ZHAtdXs=
```

- ❶ For **<user_name>** and **<password>**, specify the user name and password that you configured for your registry.

5. Edit the JSON file and add a section that describes your registry to it:

```
"auths": {  
  "<mirror_registry>": { ❶  
    "auth": "<credentials>", ❷  
    "email": "you@example.com"  
  }  
},
```

- ❶ For **<mirror_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example, **registry.example.com** or **registry.example.com:8443**
- ❷ For **<credentials>**, specify the base64-encoded user name and password for the mirror registry.

The file resembles the following example:

```
{  
  "auths": {  
    "registry.example.com": {  
      "auth": "BGVtbYk3ZHAtdXs=",  
      "email": "you@example.com"  
    },  
    "cloud.openshift.com": {  
      "auth": "b3BlbnNo...",  
      "email": "you@example.com"  
    },  
    "quay.io": {  
      "auth": "b3BlbnNo...",  
      "email": "you@example.com"  
    }  
  }  
}
```

```

    },
    "registry.connect.redhat.com": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    },
    "registry.redhat.io": {
      "auth": "NTE3Njg5Nj...",
      "email": "you@example.com"
    }
  }
}

```

2.4.6. Creating the image set configuration

Before you can use the `oc-mirror` plugin to mirror image sets, you must create an image set configuration file. This image set configuration file defines which OpenShift Container Platform releases, Operators, and other images to mirror, along with other configuration settings for the `oc-mirror` plugin.

You must specify a storage backend in the image set configuration file. This storage backend can be a local directory or a registry that supports [Docker v2-2](#). The `oc-mirror` plugin stores metadata in this storage backend during image set creation.

IMPORTANT

Do not delete or modify the metadata that is generated by the `oc-mirror` plugin. You must use the same storage backend every time you run the `oc-mirror` plugin for the same mirror registry.

Prerequisites

- You have created a container image registry credentials file. For instructions, see *Configuring credentials that allow images to be mirrored*.

Procedure

1. Use the **`oc mirror init`** command to create a template for the image set configuration and save it to a file called **`imageset-config.yaml`**:

```
$ oc mirror init --registry example.com/mirror/oc-mirror-metadata > imageset-config.yaml 1
```

1. Replace **`example.com/mirror/oc-mirror-metadata`** with the location of your registry for the storage backend.

2. Edit the file and adjust the settings as necessary:

```

kind: ImageSetConfiguration
apiVersion: mirror.openshift.io/v1alpha2
archiveSize: 4
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false

```

1

2

3

```

mirror:
  platform:
    channels:
      - name: stable-4.14
    type: ocp
    graph: true
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14
    packages:
      - name: serverless-operator
        channels:
          - name: stable
  additionalImages:
    - name: registry.redhat.io/ubi9/ubi:latest
  helm: {}

```

- 1 Add **archiveSize** to set the maximum size, in GiB, of each file within the image set.
- 2 Set the back-end location to save the image set metadata to. This location can be a registry or local directory. It is required to specify **storageConfig** values.
- 3 Set the registry URL for the storage backend.
- 4 Set the channel to retrieve the OpenShift Container Platform images from.
- 5 Add **graph: true** to build and push the graph-data image to the mirror registry. The graph-data image is required to create OpenShift Update Service (OSUS). The **graph: true** field also generates the **UpdateService** custom resource manifest. The **oc** command-line interface (CLI) can use the **UpdateService** custom resource manifest to create OSUS. For more information, see *About the OpenShift Update Service*.
- 6 Set the Operator catalog to retrieve the OpenShift Container Platform images from.
- 7 Specify only certain Operator packages to include in the image set. Remove this field to retrieve all packages in the catalog.
- 8 Specify only certain channels of the Operator packages to include in the image set. You must always include the default channel for the Operator package even if you do not use the bundles in that channel. You can find the default channel by running the following command: **oc mirror list operators --catalog=<catalog_name> --package=<package_name>**.
- 9 Specify any additional images to include in image set.

NOTE

The **graph: true** field also mirrors the **ubi-micro** image along with other mirrored images.

When upgrading OpenShift Container Platform Extended Update Support (EUS) versions, an intermediate version might be required between the current and target versions. For example, if the current version is **4.14** and target version is **4.16**, you might need to include a version such as **4.15.8** in the **ImageSetConfiguration** when using the oc-mirror plugin v1.

The oc-mirror plugin v1 might not always detect this automatically, so check the [Cincinnati graph web page](#) to confirm any required intermediate versions and add them manually to your configuration.

See *Image set configuration parameters* for the full list of parameters and *Image set configuration examples* for various mirroring use cases.

3. Save the updated file.
This image set configuration file is required by the **oc mirror** command when mirroring content.

Additional resources

- [Image set configuration parameters](#)
- [Image set configuration examples](#)
- [Using the OpenShift Update Service in a disconnected environment](#)

2.4.7. Mirroring an image set to a mirror registry

You can use the oc-mirror CLI plugin to mirror images to a mirror registry in a [partially disconnected environment](#) or in a [fully disconnected environment](#).

These procedures assume that you already have your mirror registry set up.

2.4.7.1. Mirroring an image set in a partially disconnected environment

In a partially disconnected environment, you can mirror an image set directly to the target mirror registry.

2.4.7.1.1. Mirroring from mirror to mirror

You can use the oc-mirror plugin to mirror an image set directly to a target mirror registry that is accessible during image set creation.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a Docker v2 registry. The oc-mirror plugin stores metadata in this storage backend during image set creation.

IMPORTANT

Do not delete or modify the metadata that is generated by the oc-mirror plugin. You must use the same storage backend every time you run the oc-mirror plugin for the same mirror registry.

Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (**oc**).
- You have installed the **oc-mirror** CLI plugin.
- You have created the image set configuration file.

Procedure

- Run the **oc mirror** command to mirror the images from the specified image set configuration to a specified registry:

```
$ oc mirror --config=./imageset-config.yaml \ 1
docker://registry.example:5000 2
```

- 1 Pass in the image set configuration file that was created. This procedure assumes that it is named **imageset-config.yaml**.
- 2 Specify the registry to mirror the image set file to. The registry must start with **docker://**. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

Verification

1. Navigate into the **oc-mirror-workspace/** directory that was generated.
2. Navigate into the results directory, for example, **results-1639608409/**.
3. Verify that YAML files are present for the **ImageContentSourcePolicy** and **CatalogSource** resources.

NOTE

The **repositoryDigestMirrors** section of the **ImageContentSourcePolicy** YAML file is used for the **install-config.yaml** file during installation.

+

Next steps

- Configure your cluster to use the resources generated by oc-mirror.

Troubleshooting

- [Unable to retrieve source image](#) .

2.4.7.2. Mirroring an image set in a fully disconnected environment

To mirror an image set in a fully disconnected environment, you must first [mirror the image set to disk](#) , then [mirror the image set file on disk to a mirror](#) .

2.4.7.2.1. Mirroring from mirror to disk

You can use the `oc-mirror` plugin to generate an image set and save the contents to disk. The generated image set can then be transferred to the disconnected environment and mirrored to the target registry.

IMPORTANT

Depending on the configuration specified in the image set configuration file, using `oc-mirror` to mirror images might download several hundreds of gigabytes of data to disk.

The initial image set download when you populate the mirror registry is often the largest. Because you only download the images that changed since the last time you ran the command, when you run the `oc-mirror` plugin again, the generated image set is often smaller.

You are required to specify a storage backend in the image set configuration file. This storage backend can be a local directory or a docker v2 registry. The `oc-mirror` plugin stores metadata in this storage backend during image set creation.

IMPORTANT

Do not delete or modify the metadata that is generated by the `oc-mirror` plugin. You must use the same storage backend every time you run the `oc-mirror` plugin for the same mirror registry.

Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (**oc**).
- You have installed the **oc-mirror** CLI plugin.
- You have created the image set configuration file.

Procedure

- Run the **oc mirror** command to mirror the images from the specified image set configuration to disk:

```
$ oc mirror --config=./imageset-config.yaml \ 1
file://<path_to_output_directory> 2
```

- 1 Pass in the image set configuration file that was created. This procedure assumes that it is named **imageset-config.yaml**.
- 2 Specify the target directory where you want to output the image set file. The target directory path must start with **file://**.

Verification

1. Navigate to your output directory:

—

```
$ cd <path_to_output_directory>
```

2. Verify that an image set **.tar** file was created:

```
$ ls
```

Example output

```
mirror_seq1_000000.tar
```

Next steps

- Transfer the image set **.tar** file to the disconnected environment.

Troubleshooting

- [Unable to retrieve source image](#) .

2.4.7.2.2. Mirroring from disk to mirror

You can use the **oc-mirror** plugin to mirror the contents of a generated image set to the target mirror registry.

Prerequisites

- You have installed the OpenShift CLI (**oc**) in the disconnected environment.
- You have installed the **oc-mirror** CLI plugin in the disconnected environment.
- You have generated the image set file by using the **oc mirror** command.
- You have transferred the image set file to the disconnected environment.

Procedure

- Run the **oc mirror** command to process the image set file on disk and mirror the contents to a target mirror registry:

```
$ oc mirror --from=./mirror_seq1_000000.tar \ 1
docker://registry.example:5000 2
```

- 1 Pass in the image set **.tar** file to mirror, named **mirror_seq1_000000.tar** in this example. If an **archiveSize** value was specified in the image set configuration file, the image set might be broken up into multiple **.tar** files. In this situation, you can pass in a directory that contains the image set **.tar** files.
- 2 Specify the registry to mirror the image set file to. The registry must start with **docker://**. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

This command updates the mirror registry with the image set and generates the **ImageContentSourcePolicy** and **CatalogSource** resources.

Verification

1. Navigate into the **oc-mirror-workspace/** directory that was generated.
2. Navigate into the results directory, for example, **results-1639608409/**.
3. Verify that YAML files are present for the **ImageContentSourcePolicy** and **CatalogSource** resources.

Next steps

- Configure your cluster to use the resources generated by oc-mirror.

Troubleshooting

- [Unable to retrieve source image](#).

2.4.8. Configuring your cluster to use the resources generated by oc-mirror

After you have mirrored your image set to the mirror registry, you must apply the generated **ImageContentSourcePolicy**, **CatalogSource**, and release image signature resources into the cluster.

The **ImageContentSourcePolicy** resource associates the mirror registry with the source registry and redirects image pull requests from the online registries to the mirror registry. The **CatalogSource** resource is used by Operator Lifecycle Manager (OLM) to retrieve information about the available Operators in the mirror registry. The release image signatures are used to verify the mirrored release images.

Prerequisites

- You have mirrored the image set to the registry mirror in the disconnected environment.
- You have access to the cluster as a user with the **cluster-admin** role.

Procedure

1. Log in to the OpenShift CLI as a user with the **cluster-admin** role.
2. Apply the YAML files from the results directory to the cluster by running the following command:

```
$ oc apply -f ./oc-mirror-workspace/results-1639608409/
```

3. If you mirrored release images, apply the release image signatures to the cluster by running the following command:

```
$ oc apply -f ./oc-mirror-workspace/results-1639608409/release-signatures/
```

NOTE

If you are mirroring Operators instead of clusters, you do not need to run **\$ oc apply -f ./oc-mirror-workspace/results-1639608409/release-signatures/**. Running that command will return an error, as there are no release image signatures to apply.

Verification

1. Verify that the **ImageContentSourcePolicy** resources were successfully installed by running the following command:

```
$ oc get imagecontentsourcepolicy
```

2. Verify that the **CatalogSource** resources were successfully installed by running the following command:

```
$ oc get catalogsource -n openshift-marketplace
```

2.4.9. Keeping your mirror registry content updated

After your target mirror registry is populated with the initial image set, be sure to update it regularly so that it has the latest content. You can optionally set up a cron job, if possible, so that the mirror registry is updated on a regular basis.

Ensure that you update your image set configuration to add or remove OpenShift Container Platform and Operator releases as necessary. Any images that are removed are pruned from the mirror registry.

2.4.9.1. About updating your mirror registry content

When you run the oc-mirror plugin again, it generates an image set that only contains new and updated images since the previous execution. Because it only pulls in the differences since the previous image set was created, the generated image set is often smaller and faster to process than the initial image set.

IMPORTANT

Generated image sets are sequential and must be pushed to the target mirror registry in order. You can derive the sequence number from the file name of the generated image set archive file.

Adding new and updated images

Depending on the settings in your image set configuration, future executions of oc-mirror can mirror additional new and updated images. Review the settings in your image set configuration to ensure that you are retrieving new versions as necessary. For example, you can set the minimum and maximum versions of Operators to mirror if you want to restrict to specific versions. Alternatively, you can set the minimum version as a starting point to mirror, but keep the version range open so you keep receiving new Operator versions on future executions of oc-mirror. Omitting any minimum or maximum version gives you the full version history of an Operator in a channel. Omitting explicitly named channels gives you all releases in all channels of the specified Operator. Omitting any named Operator gives you the entire catalog of all Operators and all their versions ever released.

All these constraints and conditions are evaluated against the publicly released content by Red Hat on every invocation of oc-mirror. This way, it automatically picks up new releases and entirely new Operators. Constraints can be specified by only listing a desired set of Operators, which will not automatically add other newly released Operators into the mirror set. You can also specify a particular release channel, which limits mirroring to just this channel and not any new channels that have been added. This is important for Operator products, such as Red Hat Quay, that use different release channels for their minor releases. Lastly, you can specify a maximum version of a particular Operator, which causes the tool to only mirror the specified version range so that you do not automatically get any

newer releases past the maximum version mirrored. In all these cases, you must update the image set configuration file to broaden the scope of the mirroring of Operators to get other Operators, new channels, and newer versions of Operators to be available in your target registry.

It is recommended to align constraints like channel specification or version ranges with the release strategy that a particular Operator has chosen. For example, when the Operator uses a **stable** channel, you should restrict mirroring to that channel and potentially a minimum version to find the right balance between download volume and getting stable updates regularly. If the Operator chooses a release version channel scheme, for example **stable-3.7**, you should mirror all releases in that channel. This allows you to keep receiving patch versions of the Operator, for example **3.7.1**. You can also regularly adjust the image set configuration to add channels for new product releases, for example **stable-3.8**.

Pruning images

Images are pruned automatically from the target mirror registry if they are no longer included in the latest image set that was generated and mirrored. This allows you to easily manage and clean up unneeded content and reclaim storage resources.

If there are OpenShift Container Platform releases or Operator versions that you no longer need, you can modify your image set configuration to exclude them, and they will be pruned from the mirror registry upon mirroring. This can be done by adjusting a minimum or maximum version range setting per Operator in the image set configuration file or by deleting the Operator from the list of Operators to mirror from the catalog. You can also remove entire Operator catalogs or entire OpenShift Container Platform releases from the configuration file.

IMPORTANT

If there are no new or updated images to mirror, the excluded images are not pruned from the target mirror registry. Additionally, if an Operator publisher removes an Operator version from a channel, the removed versions are pruned from the target mirror registry.

To disable automatic pruning of images from the target mirror registry, pass the **--skip-pruning** flag to the **oc mirror** command.

2.4.9.2. Updating your mirror registry content

After you publish the initial image set to the mirror registry, you can use the **oc-mirror** plugin to keep your disconnected clusters updated.

Depending on your image set configuration, **oc-mirror** automatically detects newer releases of OpenShift Container Platform and your selected Operators that have been released after you completed the initial mirror. It is recommended to run **oc-mirror** at regular intervals, for example in a nightly cron job, to receive product and security updates on a timely basis.

Prerequisites

- You have used the **oc-mirror** plugin to mirror the initial image set to your mirror registry.
- You have access to the storage backend that was used for the initial execution of the **oc-mirror** plugin.

**NOTE**

You must use the same storage backend as the initial execution of `oc-mirror` for the same mirror registry. Do not delete or modify the metadata image that is generated by the `oc-mirror` plugin.

Procedure

1. If necessary, update your image set configuration file to pick up new OpenShift Container Platform and Operator versions. See *Image set configuration examples* for example mirroring use cases.
2. Follow the same steps that you used to mirror your initial image set to the mirror registry. For instructions, see *Mirroring an image set in a partially disconnected environment* or *Mirroring an image set in a fully disconnected environment*.

**IMPORTANT**

- You must provide the same storage backend so that only a differential image set is created and mirrored.
- If you specified a top-level namespace for the mirror registry during the initial image set creation, then you must use this same namespace every time you run the `oc-mirror` plugin for the same mirror registry.

3. Configure your cluster to use the resources generated by `oc-mirror`.

Additional resources

- [Image set configuration examples](#)
- [Mirroring an image set in a partially disconnected environment](#)
- [Mirroring an image set in a fully disconnected environment](#)
- [Configuring your cluster to use the resources generated by `oc-mirror`](#)

2.4.10. Performing a dry run

You can use `oc-mirror` to perform a dry run, without actually mirroring any images. This allows you to review the list of images that would be mirrored, as well as any images that would be pruned from the mirror registry. It also allows you to catch any errors with your image set configuration early or use the generated list of images with other tools to carry out the mirroring operation.

Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (**oc**).
- You have installed the **oc-mirror** CLI plugin.
- You have created the image set configuration file.

Procedure

1. Run the **oc mirror** command with the **--dry-run** flag to perform a dry run:

```
$ oc mirror --config=./imageset-config.yaml \
  docker://registry.example:5000 \
  --dry-run
```

- 1 Pass in the image set configuration file that was created. This procedure assumes that it is named **imageset-config.yaml**.
- 2 Specify the mirror registry. Nothing is mirrored to this registry as long as you use the **--dry-run** flag.
- 3 Use the **--dry-run** flag to generate the dry run artifacts and not an actual image set file.

Example output

```
Checking push permissions for registry.example:5000
Creating directory: oc-mirror-workspace/src/publish
Creating directory: oc-mirror-workspace/src/v2
Creating directory: oc-mirror-workspace/src/charts
Creating directory: oc-mirror-workspace/src/release-signatures
No metadata detected, creating new workspace
wrote mirroring manifests to oc-mirror-workspace/operators.1658342351/manifests-redhat-operator-index

...

info: Planning completed in 31.48s
info: Dry run complete
Writing image mapping to oc-mirror-workspace/mapping.txt
```

2. Navigate into the workspace directory that was generated:

```
$ cd oc-mirror-workspace/
```

3. Review the **mapping.txt** file that was generated.
This file contains a list of all images that would be mirrored.
4. Review the **pruning-plan.json** file that was generated.
This file contains a list of all images that would be pruned from the mirror registry when the image set is published.

NOTE

The **pruning-plan.json** file is only generated if your **oc-mirror** command points to your mirror registry and there are images to be pruned.

2.4.11. Including local OCI Operator catalogs

While mirroring OpenShift Container Platform releases, Operator catalogs, and additional images from a registry to a partially disconnected cluster, you can include Operator catalog images from a local file-based catalog on disk. The local catalog must be in the Open Container Initiative (OCI) format.

The local catalog and its contents are mirrored to your target mirror registry based on the filtering information in the image set configuration file.

IMPORTANT

When mirroring local OCI catalogs, any OpenShift Container Platform releases or additional images that you want to mirror along with the local OCI-formatted catalog must be pulled from a registry.

You cannot mirror OCI catalogs along with an `oc-mirror` image set file on disk.

One example use case for using the OCI feature is if you have a CI/CD system building an OCI catalog to a location on disk, and you want to mirror that OCI catalog along with an OpenShift Container Platform release to your mirror registry.

NOTE

If you used the Technology Preview OCI local catalogs feature for the `oc-mirror` plugin for OpenShift Container Platform 4.12, you can no longer use the OCI local catalogs feature of the `oc-mirror` plugin to copy a catalog locally and convert it to OCI format as a first step to mirroring to a fully disconnected cluster.

Prerequisites

- You have access to the internet to obtain the necessary container images.
- You have installed the OpenShift CLI (**oc**).
- You have installed the **oc-mirror** CLI plugin.

Procedure

1. Create the image set configuration file and adjust the settings as necessary.
The following example image set configuration mirrors an OCI catalog on disk along with an OpenShift Container Platform release and a UBI image from **registry.redhat.io**.

```
kind: ImageSetConfiguration
apiVersion: mirror.openshift.io/v1alpha2
storageConfig:
  local:
    path: /home/user/metadata 1
  mirror:
    platform:
      channels:
        - name: stable-4.14 2
          type: ocp
          graph: false
      operators:
        - catalog: oci:///home/user/oc-mirror/my-oci-catalog 3
          targetCatalog: my-namespace/redhat-operator-index 4
          packages:
            - name: aws-load-balancer-operator
        - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14 5
          packages:
```

```
- name: rhacs-operator
additionalImages:
- name: registry.redhat.io/ubi9/ubi:latest
```

6

- 1 Set the back-end location to save the image set metadata to. This location can be a registry or local directory. It is required to specify **storageConfig** values.
- 2 Optionally, include an OpenShift Container Platform release to mirror from **registry.redhat.io**.
- 3 Specify the absolute path to the location of the OCI catalog on disk. The path must start with **oci://** when using the OCI feature.
- 4 Optionally, specify an alternative namespace and name to mirror the catalog as.
- 5 Optionally, specify additional Operator catalogs to pull from a registry.
- 6 Optionally, specify additional images to pull from a registry.

2. Run the **oc mirror** command to mirror the OCI catalog to a target mirror registry:

```
$ oc mirror --config=./imageset-config.yaml \ 1
docker://registry.example:5000 2
```

- 1 Pass in the image set configuration file. This procedure assumes that it is named **imageset-config.yaml**.
- 2 Specify the registry to mirror the content to. The registry must start with **docker://**. If you specify a top-level namespace for the mirror registry, you must also use this same namespace on subsequent executions.

Optionally, you can specify other flags to adjust the behavior of the OCI feature:

--oci-insecure-signature-policy

Do not push signatures to the target mirror registry.

--oci-registries-config

Specify the path to a TOML-formatted **registries.conf** file. You can use this to mirror from a different registry, such as a pre-production location for testing, without having to change the image set configuration file. This flag only affects local OCI catalogs, not any other mirrored content.

Example registries.conf file

```
[[registry]]
location = "registry.redhat.io:5000"
insecure = false
blocked = false
mirror-by-digest-only = true
prefix = ""
[[registry.mirror]]
location = "preprod-registry.example.com"
insecure = false
```

Next steps

- Configure your cluster to use the resources generated by oc-mirror.

Additional resources

- [Configuring your cluster to use the resources generated by oc-mirror](#)

2.4.12. Image set configuration parameters

The oc-mirror plugin requires an image set configuration file that defines what images to mirror. The following table lists the available parameters for the **ImageSetConfiguration** resource.

Table 2.1. **ImageSetConfiguration** parameters

Parameter	Description	Values
apiVersion	The API version for the ImageSetConfiguration content.	String. For example: mirror.openshift.io/v1alpha2 .
archiveSize	The maximum size, in GiB, of each archive file within the image set.	Integer. For example: 4
mirror	The configuration of the image set.	Object
mirror.additionalImages	The additional images configuration of the image set.	Array of objects. For example: <pre> additionalImages: - name: registry.redhat.io/ubi8/ubi:latest </pre>
mirror.additionalImages.name	The tag or digest of the image to mirror.	String. For example: registry.redhat.io/ubi8/ubi:latest
mirror.blockedImages	The full tag, digest, or pattern of images to block from mirroring.	Array of strings. For example: docker.io/library/alpine
mirror.helm	The helm configuration of the image set. Note that the oc-mirror plugin supports only helm charts that do not require user input when rendered.	Object

Parameter	Description	Values
mirror.helm.local	The local helm charts to mirror.	Array of objects. For example: <pre>local: - name: podinfo path: /test/podinfo- 5.0.0.tar.gz</pre>
mirror.helm.local.name	The name of the local helm chart to mirror.	String. For example: podinfo .
mirror.helm.local.path	The path of the local helm chart to mirror.	String. For example: /test/podinfo-5.0.0.tar.gz .
mirror.helm.repositories	The remote helm repositories to mirror from.	Array of objects. For example: <pre>repositories: - name: podinfo url: https://example.github.io/podinfo charts: - name: podinfo version: 5.0.0</pre>
mirror.helm.repositories.name	The name of the helm repository to mirror from.	String. For example: podinfo .
mirror.helm.repositories.url	The URL of the helm repository to mirror from.	String. For example: https://example.github.io/podinfo .
mirror.helm.repositories.charts	The remote helm charts to mirror.	Array of objects.
mirror.helm.repositories.charts.name	The name of the helm chart to mirror.	String. For example: podinfo .

Parameter	Description	Values
mirror.helm.repositories.charts.version	The version of the named helm chart to mirror.	String. For example: 5.0.0 .
mirror.operators	The Operators configuration of the image set.	Array of objects. For example: <pre> operators: - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14 packages: - name: elasticsearch-operator minVersion: '2.4.0'</pre>
mirror.operators.catalog	The Operator catalog to include in the image set.	String. For example: registry.redhat.io/redhat/redhat-operator-index:v4.14 .
mirror.operators.full	When true , downloads the full catalog, Operator package, or Operator channel.	Boolean. The default value is false .
mirror.operators.packages	The Operator packages configuration.	Array of objects. For example: <pre> operators: - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14 packages: - name: elasticsearch-operator minVersion: '5.2.3-31'</pre>

Parameter	Description	Values
mirror.operators.packages.name	The Operator package name to include in the image set	String. For example: elasticsearch-operator .
mirror.operators.packages.channels	The Operator package channel configuration.	Object
mirror.operators.packages.channels.name	The Operator channel name, unique within a package, to include in the image set.	String. For example: fast or stable-v4.14 .
mirror.operators.packages.channels.maxVersion	The highest version of the Operator mirror across all channels in which it exists. See the following note for further information.	String. For example: 5.2.3-31
mirror.operators.packages.channels.minBundle	The name of the minimum bundle to include, plus all bundles in the update graph to the channel head. Set this field only if the named bundle has no semantic version metadata.	String. For example: bundleName
mirror.operators.packages.channels.minVersion	The lowest version of the Operator to mirror across all channels in which it exists. See the following note for further information.	String. For example: 5.2.3-31
mirror.operators.packages.maxVersion	The highest version of the Operator to mirror across all channels in which it exists. See the following note for further information.	String. For example: 5.2.3-31 .
mirror.operators.packages.minVersion	The lowest version of the Operator to mirror across all channels in which it exists. See the following note for further information.	String. For example: 5.2.3-31 .
mirror.operators.skipDependencies	If true , dependencies of bundles are not included.	Boolean. The default value is false .

Parameter	Description	Values
mirror.operators.targetCatalog	An alternative name and optional namespace hierarchy to mirror the referenced catalog as.	String. For example: my-namespace/my-operator-catalog
mirror.operators.targetName	An alternative name to mirror the referenced catalog as. The targetName parameter is deprecated. Use the targetCatalog parameter instead.	String. For example: my-operator-catalog
mirror.operators.targetTag	An alternative tag to append to the targetName or targetCatalog .	String. For example: v1
mirror.platform	The platform configuration of the image set.	Object
mirror.platform.architectures	The architecture of the platform release payload to mirror.	<p>Array of strings. For example:</p> <pre>architectures: - amd64 - arm64 - multi - ppc64le - s390x</pre> <p>The default value is amd64. The value multi ensures that the mirroring is supported for all available architectures, eliminating the need to specify individual architectures.</p>
mirror.platform.channels	The platform channel configuration of the image set.	<p>Array of objects. For example:</p> <pre>channels: - name: stable-4.10 - name: stable-4.14</pre>

Parameter	Description	Values
mirror.platform.channels.full	When true , sets the minVersion to the first release in the channel and the maxVersion to the last release in the channel.	Boolean. The default value is false .
mirror.platform.channels.name	The name of the release channel.	String. For example: stable-4.14
mirror.platform.channels.minVersion	The minimum version of the referenced platform to be mirrored.	String. For example: 4.12.6
mirror.platform.channels.maxVersion	The highest version of the referenced platform to be mirrored.	String. For example: 4.14.1
mirror.platform.channels.shortestPath	Toggles shortest path mirroring or full range mirroring.	Boolean. The default value is false .
mirror.platform.channels.type	The type of the platform to be mirrored.	String. For example: ocp or okd . The default is ocp .
mirror.platform.graph	Indicates whether the OSUS graph is added to the image set and subsequently published to the mirror.	Boolean. The default value is false .
storageConfig	The back-end configuration of the image set.	Object
storageConfig.local	The local back-end configuration of the image set.	Object
storageConfig.local.path	The path of the directory to contain the image set metadata.	String. For example: ./path/to/dir/ .
storageConfig.registry	The registry back-end configuration of the image set.	Object
storageConfig.registry.imageURL	The back-end registry URI. Can optionally include a namespace reference in the URI.	String. For example: quay.io/myuser/imageset:metadata .

Parameter	Description	Values
storageConfig.registry.skipTLS	Optionally skip TLS verification of the referenced back-end registry.	Boolean. The default value is false .

NOTE

Using the **minVersion** and **maxVersion** properties to filter for a specific Operator version range can result in a multiple channel heads error. The error message will state that there are **multiple channel heads**. This is because when the filter is applied, the update graph of the operator is truncated.

The Operator Lifecycle Manager requires that every operator channel contains versions that form an update graph with exactly one end point, that is, the latest version of the operator. When applying the filter range that graph can turn into two or more separate graphs or a graph that has more than one end point.

To avoid this error, do not filter out the latest version of an operator. If you still run into the error, depending on the operator, either the **maxVersion** property needs to be increased or the **minVersion** property needs to be decreased. Because every operator graph can be different, you might need to adjust these values, according to the procedure, until the error is gone.

2.4.13. Image set configuration examples

The following **ImageSetConfiguration** file examples show the configuration for various mirroring use cases.

Use case: Including the shortest OpenShift Container Platform update path

The following **ImageSetConfiguration** file uses a local storage backend and includes all OpenShift Container Platform versions along the shortest update path from the minimum version of **4.11.37** to the maximum version of **4.12.15**.

Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
storageConfig:
  local:
    path: /home/user/metadata
mirror:
  platform:
    channels:
      - name: stable-4.12
        minVersion: 4.11.37
        maxVersion: 4.12.15
        shortestPath: true
```

Use case: Including all versions of OpenShift Container Platform from a minimum to the latest version for multi-architecture releases

The following **ImageSetConfiguration** file uses a registry storage backend and includes all OpenShift Container Platform versions starting at a minimum version of **4.13.4** to the latest version in the channel.

On every invocation of `oc-mirror` with this image set configuration, the latest release of the **stable-4.13** channel is evaluated, so running `oc-mirror` at regular intervals ensures that you automatically receive the latest releases of OpenShift Container Platform images.

By setting the value of **platform.architectures** to **multi**, you can ensure that the mirroring is supported for multi-architecture releases.

Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1 alpha2
kind: ImageSetConfiguration
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false
mirror:
  platform:
    architectures:
      - "multi"
  channels:
    - name: stable-4.13
      minVersion: 4.13.4
      maxVersion: 4.13.6
```

Use case: Including Operator versions from a minimum to the latest

The following **ImageSetConfiguration** file uses a local storage backend and includes only the Red Hat Advanced Cluster Security for Kubernetes Operator, versions starting at 4.0.1 and later in the **stable** channel.

NOTE

When you specify a minimum or maximum version range, you might not receive all Operator versions in that range.

By default, `oc-mirror` excludes any versions that are skipped or replaced by a newer version in the Operator Lifecycle Manager (OLM) specification. Operator versions that are skipped might be affected by a CVE or contain bugs. Use a newer version instead. For more information on skipped and replaced versions, see [Creating an update graph with OLM](#).

To receive all Operator versions in a specified range, you can set the **mirror.operators.full** field to **true**.

Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1 alpha2
kind: ImageSetConfiguration
storageConfig:
  local:
    path: /home/user/metadata
mirror:
  operators:
    - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14
      packages:
```

```
- name: rhacs-operator
  channels:
  - name: stable
    minVersion: 4.0.1
```

NOTE

To specify a maximum version instead of the latest, set the **mirror.operators.packages.channels.maxVersion** field.

Use case: Including the Nutanix CSI Operator

The following **ImageSetConfiguration** file uses a local storage backend and includes the Nutanix CSI Operator, the OpenShift Update Service (OSUS) graph image, and an additional Red Hat Universal Base Image (UBI).

Example ImageSetConfiguration file

```
kind: ImageSetConfiguration
apiVersion: mirror.openshift.io/v1alpha2
storageConfig:
  registry:
    imageURL: mylocalregistry/ocp-mirror/openshift4
    skipTLS: false
  mirror:
    platform:
      channels:
      - name: stable-4.11
        type: ocp
      graph: true
    operators:
    - catalog: registry.redhat.io/redhat/certified-operator-index:v4.14
      packages:
      - name: nutanixcsioperator
        channels:
        - name: stable
    additionalImages:
    - name: registry.redhat.io/ubi9/ubi:latest
```

Use case: Including the default Operator channel

The following **ImageSetConfiguration** file includes the **stable-5.7** and **stable** channels for the OpenShift Elasticsearch Operator. Even if only the packages from the **stable-5.7** channel are needed, the **stable** channel must also be included in the **ImageSetConfiguration** file, because it is the default channel for the Operator. You must always include the default channel for the Operator package even if you do not use the bundles in that channel.

TIP

You can find the default channel by running the following command: **oc mirror list operators --catalog=<catalog_name> --package=<package_name>**.

Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1alpha2
```

```

kind: ImageSetConfiguration
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false
mirror:
  operators:
  - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14
  packages:
  - name: elasticsearch-operator
  channels:
  - name: stable-5.7
  - name: stable

```

Use case: Including an entire catalog (all versions)

The following **ImageSetConfiguration** file sets the **mirror.operators.full** field to **true** to include all versions for an entire Operator catalog.

Example ImageSetConfiguration file

```

apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false
mirror:
  operators:
  - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14
    full: true

```

Use case: Including an entire catalog (channel heads only)

The following **ImageSetConfiguration** file includes the channel heads for an entire Operator catalog.

By default, for each Operator in the catalog, oc-mirror includes the latest Operator version (channel head) from the default channel. If you want to mirror all Operator versions, and not just the channel heads, you must set the **mirror.operators.full** field to **true**.

This example also uses the **targetCatalog** field to specify an alternative namespace and name to mirror the catalog as.

Example ImageSetConfiguration file

```

apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false
mirror:
  operators:
  - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14
    targetCatalog: my-namespace/my-operator-catalog

```

Use case: Including arbitrary images and helm charts

The following **ImageSetConfiguration** file uses a registry storage backend and includes helm charts and an additional Red Hat Universal Base Image (UBI).

Example ImageSetConfiguration file

```
apiVersion: mirror.openshift.io/v1alpha2
kind: ImageSetConfiguration
archiveSize: 4
storageConfig:
  registry:
    imageURL: example.com/mirror/oc-mirror-metadata
    skipTLS: false
mirror:
  platform:
    architectures:
      - "s390x"
    channels:
      - name: stable-4.14
operators:
  - catalog: registry.redhat.io/redhat/redhat-operator-index:v4.14
helm:
  repositories:
    - name: redhat-helm-charts
      url: https://raw.githubusercontent.com/redhat-developer/redhat-helm-charts/master
  charts:
    - name: ibm-mongodb-enterprise-helm
      version: 0.2.0
additionalImages:
  - name: registry.redhat.io/ubi9/ubi:latest
```

Use case: Including the upgrade path for EUS releases

The following **ImageSetConfiguration** file includes the **eus-<version>** channel, where the **maxVersion** value is at least two minor versions higher than the **minVersion** value.

For example, in this **ImageSetConfiguration** file, the **minVersion** is set to **4.12.28**, while the **maxVersion** for the **eus-4.14** channel is **4.14.16**.

Example ImageSetConfiguration file

```
kind: ImageSetConfiguration
apiVersion: mirror.openshift.io/v2alpha1
mirror:
  platform:
    graph: true # Required for the OSUS Operator
    architectures:
      - amd64
    channels:
      - name: stable-4.12
        minVersion: '4.12.28'
        maxVersion: '4.12.28'
        shortestPath: true
        type: ocp
      - name: eus-4.14
        minVersion: '4.12.28'
```

```
maxVersion: '4.14.16'
shortestPath: true
type: ocp
```

2.4.14. Command reference for oc-mirror

The following tables describe the **oc mirror** subcommands and flags:

Table 2.2. oc mirror subcommands

Subcommand	Description
completion	Generate the autocompletion script for the specified shell.
describe	Output the contents of an image set.
help	Show help about any subcommand.
init	Output an initial image set configuration template.
list	List available platform and Operator content and their version.
version	Output the oc-mirror version.

Table 2.3. oc mirror flags

Flag	Description
-c, --config <string>	Specify the path to an image set configuration file.
--continue-on-error	If any non image-pull related error occurs, continue and attempt to mirror as much as possible.
--dest-skip-tls	Disable TLS validation for the target registry.
--dest-use-http	Use plain HTTP for the target registry.
--dry-run	Print actions without mirroring images. Generates mapping.txt and pruning-plan.json files.
--from <string>	Specify the path to an image set archive that was generated by an execution of oc-mirror to load into a target registry.
-h, --help	Show the help.
--ignore-history	Ignore past mirrors when downloading images and packing layers. Disables incremental mirroring and might download more data.

Flag	Description
--manifests-only	Generate manifests for ImageContentSourcePolicy objects to configure a cluster to use the mirror registry, but do not actually mirror any images. To use this flag, you must pass in an image set archive with the --from flag.
--max-nested-paths <int>	Specify the maximum number of nested paths for destination registries that limit nested paths. The default is 0 .
--max-per-registry <int>	Specify the number of concurrent requests allowed per registry. The default is 6 .
--oci-insecure-signature-policy	Do not push signatures when mirroring local OCI catalogs (with --include-local-oci-catalogs).
--oci-registries-config	Provide a registries configuration file to specify an alternative registry location to copy from when mirroring local OCI catalogs (with --include-local-oci-catalogs).
--skip-cleanup	Skip removal of artifact directories.
--skip-image-pin	Do not replace image tags with digest pins in Operator catalogs.
--skip-metadata-check	Skip metadata when publishing an image set. This is only recommended when the image set was created with --ignore-history .
--skip-missing	If an image is not found, skip it instead of reporting an error and aborting execution. Does not apply to custom images explicitly specified in the image set configuration.
--skip-pruning	Disable automatic pruning of images from the target mirror registry.
--skip-verification	Skip digest verification.
--source-skip-tls	Disable TLS validation for the source registry.
--source-use-http	Use plain HTTP for the source registry.
-v, --verbose <int>	Specify the number for the log level verbosity. Valid values are 0 - 9 . The default is 0 .

CHAPTER 3. INSTALLING ON ALIBABA

3.1. PREPARING TO INSTALL ON ALIBABA CLOUD

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

3.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

3.1.2. Requirements for installing OpenShift Container Platform on Alibaba Cloud

Before installing OpenShift Container Platform on Alibaba Cloud, you must configure and register your domain, create a Resource Access Management (RAM) user for the installation, and review the supported Alibaba Cloud data center regions and zones for the installation.

3.1.3. Registering and Configuring Alibaba Cloud Domain

To install OpenShift Container Platform, the Alibaba Cloud account you use must have a dedicated public hosted zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Alibaba Cloud or another source.

NOTE

If you purchase a new domain through Alibaba Cloud, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through Alibaba Cloud, see [Alibaba Cloud domains](#).

2. If you are using an existing domain and registrar, migrate its DNS to Alibaba Cloud. See [Domain name transfer](#) in the Alibaba Cloud documentation.
3. Configure DNS for your domain. This includes:
 - [Registering a generic domain name](#).

- [Completing real-name verification for your domain name](#) .
- [Applying for an Internet Content Provider \(ICP\) filing](#) .
- [Enabling domain name resolution](#).
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.

4. If you are using a subdomain, follow the procedures of your company to add its delegation records to the parent domain.

3.1.4. Supported Alibaba regions

You can deploy an OpenShift Container Platform cluster to the regions listed in the [Alibaba Regions and zones documentation](#).

3.1.5. Next steps

- [Create the required Alibaba Cloud resources](#) .

3.2. CREATING THE REQUIRED ALIBABA CLOUD RESOURCES

Before you install OpenShift Container Platform, you must use the Alibaba Cloud console to create a Resource Access Management (RAM) user that has sufficient permissions to install OpenShift Container Platform into your Alibaba Cloud. This user must also have permissions to create new RAM users. You can also configure and use the **ccoctl** tool to create new credentials for the OpenShift Container Platform components with the permissions that they require.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#) .

3.2.1. Creating the required RAM user

You must have a Alibaba Cloud Resource Access Management (RAM) user for the installation that has sufficient privileges. You can use the Alibaba Cloud Resource Access Management console to create a new user or modify an existing user. Later, you create credentials in OpenShift Container Platform based on this user's permissions.

When you configure the RAM user, be sure to consider the following requirements:

- The user must have an Alibaba Cloud AccessKey ID and AccessKey secret pair.
 - For a new user, you can select **Open API Access** for the Access Mode when creating the user. This mode generates the required AccessKey pair.

- For an existing user, you can add an AccessKey pair or you can [obtain the AccessKey pair](#) for that user.

NOTE

When created, the AccessKey secret is displayed only once. You must immediately save the AccessKey pair because the AccessKey pair is required for API calls.

- Add the AccessKey ID and secret to the `~/.alibabacloud/credentials` file on your local computer. Alibaba Cloud automatically creates this file when you log in to the console. The Cloud Credential Operator (CCO) utility, `ccoutil`, uses these credentials when processing **Credential Request** objects.

For example:

```
[default]                # Default client
type = access_key         # Certification type: access_key
access_key_id = LTAI5t8cefXKmt    # Key 1
access_key_secret = wYx56mszAN4Uunfh    # Secret
```

- 1 Add your AccessKeyID and AccessKeySecret here.

- The RAM user must have the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the OpenShift Container Platform cluster. This policy grants permissions to manage all Alibaba Cloud resources. When you attach the **AdministratorAccess** policy to a RAM user, you grant that user full access to all Alibaba Cloud services and resources. If you do not want to create a user with full access, create a custom policy with the following actions that you can add to your RAM user for installation. These actions are sufficient to install OpenShift Container Platform.

TIP

You can copy and paste the following JSON code into the Alibaba Cloud console to create a custom policy. For information on creating custom policies, see [Create a custom policy](#) in the Alibaba Cloud documentation.

Example 3.1. Example custom policy JSON file

```
{
  "Version": "1",
  "Statement": [
    {
      "Action": [
        "tag:ListTagResources",
        "tag:UntagResources"

      }
    }
  ]
}

```

For more information about creating a RAM user and granting permissions, see [Create a RAM user](#) and [Grant permissions to a RAM user](#) in the Alibaba Cloud documentation.

3.2.2. Configuring the Cloud Credential Operator utility

To assign RAM users and policies that provide long-term RAM AccessKeys (AKs) for each in-cluster component, extract and prepare the Cloud Credential Operator (CCO) utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable by running the following command:

```
-
```

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:

ccoctl [command]

Available Commands:

alibabacloud Manage credentials objects for alibaba cloud

aws Manage credentials objects for AWS cloud

azure Manage credentials objects for Azure

gcp Manage credentials objects for Google cloud

help Help about any command

ibmcloud Manage credentials objects for IBM Cloud

nutanix Manage credentials objects for Nutanix

Flags:

-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

Additional resources

- [Preparing to update a cluster with manually maintained credentials](#)

3.2.3. Next steps

- Install a cluster on Alibaba Cloud infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:
 - [Installing a cluster quickly on Alibaba Cloud](#) You can install a cluster quickly by using the default configuration options.
 - [Installing a customized cluster on Alibaba Cloud](#) The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).

3.3. INSTALLING A CLUSTER QUICKLY ON ALIBABA CLOUD

In OpenShift Container Platform version 4.14, you can install a cluster on Alibaba Cloud that uses the default configuration options.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

3.3.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- You have [created the required Alibaba Cloud resources](#).
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the kube-system namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

3.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

3.3.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **`./openshift-install gather`** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **`ssh-agent`** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **`ssh-agent`**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

3.3.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

3.3.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

1

For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

NOTE

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **alibabacloud** as the platform to target.
 - iii. Select the region to deploy the cluster to.
 - iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - v. Provide a descriptive name for your cluster.
2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**:

Example install-config.yaml configuration file with `credentialsMode` set to `Manual`

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

- 1** Add this line to set the **credentialsMode** to **Manual**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

3.3.6. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the directory in which the installation program creates files.

3.3.7. Creating credentials for OpenShift Container Platform components with the **ccoctl** tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (**access_key_id**) and AccessKeySecret (**access_key_secret**) of that RAM user into the [~/alibabacloud/credentials](#) file on your local computer.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:
 - a. Run the following command to use the tool:

```
$ ccoctl alibabacloud create-ram-users \
  --name <name> \1
  --region=<alibaba_region> \2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \3
  --output-dir=<path_to_ccoctl_output_dir> \4
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the Alibaba Cloud region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Specify the directory where the generated component credentials secrets will be placed.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Example output

-

```

2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-
machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-
machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-
alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...

```

NOTE

A RAM user can have up to two AccessKeys at the same time. If you run **ccocctl alibabacloud create-ram-users** more than twice, the previously generated manifests secret becomes stale and you must reapply the newly generated secrets.

- b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccocctl_output_dir>/manifests
```

Example output

```

openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml

```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

4. Copy the generated credential files to the target manifests directory:

```

$ cp ./<path_to_ccocctl_output_dir>/manifests/*credentials.yaml
./<path_to_installation>dir>/manifests/

```

where:

<path_to_ccocctl_output_dir>

Specifies the directory created by the **ccocctl alibabacloud create-ram-users** command.

<path_to_installation_dir>

Specifies the directory in which the installation program creates files.

3.3.8. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

3.3.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

-

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

3.3.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

3.3.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

**NOTE**

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

**NOTE**

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

3.3.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [About remote health monitoring](#) for more information about the Telemetry service

3.3.13. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).

3.4. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.14, you can install a customized cluster on infrastructure that the installation program provisions on Alibaba Cloud. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

3.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

3.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

**IMPORTANT**

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

3.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

3.4.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

3.4.4.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

NOTE

Always delete the **~/.powervs** directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
- Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- Select **alibabacloud** as the platform to target.
 - Select the region to deploy the cluster to.
 - Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.
 - Provide a descriptive name for your cluster.
2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**:

Example install-config.yaml configuration file with `credentialsMode` set to `Manual`

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
```

```
- architecture: amd64
  hyperthreading: Enabled
  ...
```

1 Add this line to set the **credentialsMode** to **Manual**.

3. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- [Installation configuration parameters for Alibaba Cloud](#)

3.4.4.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the directory in which the installation program creates files.

3.4.4.3. Creating credentials for OpenShift Container Platform components with the **ccctl** tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

NOTE

By default, **ccctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (**access_key_id**) and AccessKeySecret (**access_key_secret**) of that RAM user into the `~/.alibabacloud/credentials` file on your local computer.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:
 - a. Run the following command to use the tool:

```
$ ccoctl alibabacloud create-ram-users \
  --name <name> \1
  --region=<alibaba_region> \2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \3
  --output-dir=<path_to_ccoctl_output_dir> \4
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the Alibaba Cloud region in which cloud resources will be created.
- 3

Specify the directory containing the files for the component **CredentialsRequest** objects.

- 4 Specify the directory where the generated component credentials secrets will be placed.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Example output

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-
machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-
alibabacloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-
machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-
alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...
```

NOTE

A RAM user can have up to two AccessKeys at the same time. If you run **ccctl alibabacloud create-ram-users** more than twice, the previously generated manifests secret becomes stale and you must reapply the newly generated secrets.

- b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccctl_output_dir>/manifests
```

Example output

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

4. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml
./<path_to_installation>dir>/manifests/
```

where:

<path_to_ccoctl_output_dir>

Specifies the directory created by the **ccoctl alibabacloud create-ram-users** command.

<path_to_installation_dir>

Specifies the directory in which the installation program creates files.

3.4.4.4. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your cluster's platform or modify the values of the required parameters.

```
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:
  creationTimestamp: null
  name: test-cluster ❶
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OVNKubernetes ❷
  serviceNetwork:
  - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: ❸
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
    region: ap-southeast-1 ❹
    resourceGroupID: rg-acfnw6j3hyai ❺
    vpcID: vpc-0xifdjerdibmaqvtjob2b ❻
    vswitchIDs: ❼
    - vsw-0xi8ycgwc8wv5rhviwdq5
```

```
- vsw-0xiy6v3z2tedv009b4pz2
publish: External
pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }' 8
sshKey: |
ssh-rsa AAAA... 9
```

- 1** Required. The installation program prompts you for a cluster name.
- 2** The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 3** Optional. Specify parameters for machine pools that do not define their own platform configuration.
- 4** Required. The installation program prompts you for the region to deploy the cluster to.
- 5** Optional. Specify an existing resource group where the cluster should be installed.
- 8** Required. The installation program prompts you for the pull secret.
- 9** Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
- 6 7** Optional. These are example vswitchID values.

3.4.4.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

—

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

3.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

**IMPORTANT**

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

**IMPORTANT**

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

-

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

3.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.

To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.

To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.

5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

3.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

3.4.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.

- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

3.4.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

3.4.10. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

3.5. INSTALLING A CLUSTER ON ALIBABA CLOUD WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform 4.14, you can install a cluster on Alibaba Cloud with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#) .

3.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

3.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access [Quay.io](https://quay.io) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

3.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

3.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

3.5.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

IMPORTANT

The CIDR range **172.17.0.0/16** is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the network plugin during phase 2.

3.5.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1 For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

**NOTE**

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Enter a descriptive name for your cluster.
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- [Installation configuration parameters for Alibaba Cloud](#)

3.5.5.2. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the directory in which the installation program creates files.

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ ❶
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \ ❷
  --to=<path_to_directory_for_credentials_requests> ❸
```

- ❶ The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- ❷ Specify the location of the **install-config.yaml** file.
- ❸ Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3.5.5.3. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your cluster's platform or modify the values of the required parameters.

```

apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:
  creationTimestamp: null
  name: test-cluster ❶
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OVNKubernetes ❷
  serviceNetwork:
  - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: ❸
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
    region: ap-southeast-1 ❹
    resourceGroupID: rg-acfnw6j3hyai ❺
    vpcID: vpc-0xifdjerdibmaqvtjob2b ❻
    vswitchIDs: ❼
    - vsw-0xi8ycgwc8wv5rhviwdq5
    - vsw-0xiy6v3z2tedv009b4pz2
  publish: External
  pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }}' ❽
  sshKey: |
    ssh-rsa AAAA... ❾

```

- ❶ Required. The installation program prompts you for a cluster name.
- ❷ The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- ❸ Optional. Specify parameters for machine pools that do not define their own platform configuration.
- ❹ Required. The installation program prompts you for the region to deploy the cluster to.

- 5 Optional. Specify an existing resource group where the cluster should be installed.
- 8 Required. The installation program prompts you for the pull secret.
- 9 Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
- 6 7 Optional. These are example vswitchID values.

3.5.5.4. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

- Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: example.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.

- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with `.` to match subdomains only. For example, `.y.com` matches `x.y.com`, but not `y.com`. Use `*` to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

3.5.6. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group:

clusterNetwork

IP address pools from which pod IP addresses are allocated.

serviceNetwork

IP address pool for services.

defaultNetwork.type

Cluster network plugin, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network plugin configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

3.5.6.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

Table 3.1. Cluster Network Operator configuration object

Field	Type	Description
metadata.name	string	The name of the CNO object. This name is always cluster .
spec.clusterNetwork	array	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec: clusterNetwork: - cidr: 10.128.0.0/19 hostPrefix: 23 - cidr: 10.128.32.0/19 hostPrefix: 23</pre>
spec.serviceNetwork	array	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes network plugins support only a single IP address block for the service network. For example:</p> <pre>spec: serviceNetwork: - 172.30.0.0/14</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.defaultNetwork	object	Configures the network plugin for the cluster network.
spec.kubeProxyConfig	object	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network plugin, the kube-proxy configuration has no effect.

defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 3.2. **defaultNetwork** object

Field	Type	Description
type	string	<p>Either OpenShiftSDN or OVNKubernetes. The Red Hat OpenShift Networking network plugin is selected during installation. You can change this value by migrating from OpenShift SDN to OVN-Kubernetes.</p> <div>  <div> NOTE OpenShift Container Platform uses the OVN-Kubernetes network plugin by default. </div> </div>
openshiftSDNConfig	object	This object is only valid for the OpenShift SDN network plugin.
ovnKubernetesConfig	object	This object is only valid for the OVN-Kubernetes network plugin.

Configuration for the OpenShift SDN network plugin

The following table describes the configuration fields for the OpenShift SDN network plugin:

Table 3.3. **openshiftSDNConfig** object

Field	Type	Description
mode	string	<p>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy.</p> <p>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.</p> <p>This value cannot be changed after cluster installation.</p>
vxlanPort	integer	<p>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</p>

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes network plugin

The following table describes the configuration fields for the OVN-Kubernetes network plugin:

Table 3.4. ovnKubernetesConfig object

Field	Type	Description
-------	------	-------------

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</p>
genevePort	integer	The port to use for all Geneve packets. The default value is 6081 . This value cannot be changed after cluster installation.
ipsecConfig	object	Specify an empty object to enable IPsec encryption.
policyAuditConfig	object	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.
gatewayConfig	object	<p>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</p> <div>  <div> <p>NOTE</p> <p>While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.</p> </div> </div>

Field	Type	Description
v4InternalSubnet	<p>If your existing network infrastructure overlaps with the 100.64.0.0/16 IPv4 subnet, you can specify a different IP address range for internal use by OVN-Kubernetes. You must ensure that the IP address range does not overlap with any other subnet used by your OpenShift Container Platform installation. The IP address range must be larger than the maximum number of nodes that can be added to the cluster. For example, if the clusterNetwork.cidr value is 10.128.0.0/14 and the clusterNetwork.hostPrefix value is /23, then the maximum number of nodes is $2^{(23-14)}=512$.</p> <p>This field cannot be changed after installation.</p>	The default value is 100.64.0.0/16 .

Field	Type	Description
v6InternalSubnet	<p>If your existing network infrastructure overlaps with the fd98::/48 IPv6 subnet, you can specify a different IP address range for internal use by OVN-Kubernetes. You must ensure that the IP address range does not overlap with any other subnet used by your OpenShift Container Platform installation. The IP address range must be larger than the maximum number of nodes that can be added to the cluster.</p> <p>This field cannot be changed after installation.</p>	The default value is fd98::/48 .

Table 3.5. **policyAuditConfig** object

Field	Type	Description
rateLimit	integer	The maximum number of messages to generate every second per node. The default value is 20 messages per second.
maxFileSize	integer	The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.
maxLogFiles	integer	The maximum number of log files that are retained.

Field	Type	Description
destination	string	<p>One of the following additional audit log targets:</p> <p>libc The libc syslog() function of the journald process on the host.</p> <p>udp:<host>:<port> A syslog server. Replace <host>:<port> with the host and port of the syslog server.</p> <p>unix:<file> A Unix Domain Socket file specified by <file>.</p> <p>null Do not send the audit logs to any additional target.</p>
syslogFacility	string	The syslog facility, such as kern , as defined by RFC5424. The default value is local0 .

Table 3.6. gatewayConfig object

Field	Type	Description
routingViaHost	boolean	<p>Set this field to true to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is false.</p> <p>This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to true, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</p>
ipForwarding	object	You can control IP forwarding for all traffic on OVN-Kubernetes managed interfaces by using the ipForwarding specification in the Network resource. Specify Restricted to only allow IP forwarding for Kubernetes related traffic. Specify Global to allow forwarding of all IP traffic. For new installations, the default is Restricted . For updates to OpenShift Container Platform 4.14, the default is Global .

Example OVN-Kubernetes configuration with IPsec enabled

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
    mtu: 1400
    genevePort: 6081
    ipsecConfig: {}
```

kubeProxyConfig object configuration (OpenShiftSDN container network interface only)

The values for the **kubeProxyConfig** object are defined in the following table:

Table 3.7. **kubeProxyConfig** object

Field	Type	Description
iptablesSyncPeriod	string	<p>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</p> <div>  <div> <p>NOTE</p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptablesSyncPeriod parameter is no longer necessary.</p> </div> </div>
proxyArguments.iptables-min-sync-period	array	<p>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is:</p> <div>  <pre>kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</pre> </div>

3.5.7. Specifying advanced network configuration

You can use advanced network configuration for your network plugin to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 **<installation_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

3.5.8. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with the OVN-Kubernetes network plugin. This allows a hybrid cluster that supports different node networking configurations.

NOTE

This configuration is necessary to run both Linux and Windows nodes in the same cluster.

Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

where:

<installation_directory>

Specifies the directory name that contains the **manifests/** directory for your cluster.

3. Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
          hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2
```

1 Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.

2 Specify a custom VXLAN port for the additional overlay network. This is required for

NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

3.5.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ ❶
--log-level=info ❷
```

- ❶ For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- ❷ To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/./openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

3.5.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.

4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.

5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.

To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

**NOTE**

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

3.5.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

3.5.12. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

3.5.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

3.5.14. Next steps

- [Validate an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

3.6. INSTALLING A CLUSTER ON ALIBABA CLOUD INTO AN EXISTING VPC

In OpenShift Container Platform version 4.14, you can install a cluster into an existing Alibaba Virtual Private Cloud (VPC) on Alibaba Cloud Services. The installation program provisions the required infrastructure, which can then be customized. To customize the VPC installation, modify the parameters in the 'install-config.yaml' file before you install the cluster.

NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

IMPORTANT

Alibaba Cloud on OpenShift Container Platform is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#) .

3.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [registered your domain](#).
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If the cloud Resource Access Management (RAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system**

namespace, you can [manually create and maintain Resource Access Management \(RAM\) credentials](#).

3.6.2. Using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Virtual Private Cloud (VPC) in the Alibaba Cloud Platform. By deploying OpenShift Container Platform into an existing Alibaba VPC, you can avoid limit constraints in new accounts and more easily adhere to your organization's operational constraints. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option. You must configure networking using vSwitches.

3.6.2.1. Requirements for using your VPC

The union of the VPC CIDR block and the machine network CIDR must be non-empty. The vSwitches must be within the machine network.

The installation program does not create the following components:

- VPC
- vSwitches
- Route table
- NAT gateway

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

3.6.2.2. VPC validation

To ensure that the vSwitches you provide are suitable, the installation program confirms the following data:

- All the vSwitches that you specify must exist.
- You have provided one or more vSwitches for control plane machines and compute machines.
- The vSwitches' CIDRs belong to the machine CIDR that you specified.

3.6.2.3. Division of permissions

Some individuals can create different resources in your cloud than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components, such as VPCs or vSwitches.

3.6.2.4. Isolation between clusters

If you deploy OpenShift Container Platform into an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.

- ICMP ingress is allowed to the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

3.6.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

3.6.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **`./openshift-install gather`** command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

3.6.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

3.6.5.1. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Alibaba Cloud.

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

**NOTE**

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

b. At the prompts, provide the configuration details for your cloud:

i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

ii. Select **alibabacloud** as the platform to target.

iii. Select the region to deploy the cluster to.

iv. Select the base domain to deploy the cluster to. The base domain corresponds to the public DNS zone that you created for your cluster.

v. Provide a descriptive name for your cluster.

2. Installing the cluster into Alibaba Cloud requires that the Cloud Credential Operator (CCO) operate in manual mode. Modify the **install-config.yaml** file to set the **credentialsMode** parameter to **Manual**:

Example **install-config.yaml** configuration file with **credentialsMode** set to **Manual**

```
apiVersion: v1
baseDomain: cluster1.example.com
credentialsMode: Manual 1
compute:
- architecture: amd64
  hyperthreading: Enabled
...
```

1

Add this line to set the **credentialsMode** to **Manual**.

3. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

- [Installation configuration parameters for Alibaba Cloud](#)

3.6.5.2. Sample customized install-config.yaml file for Alibaba Cloud

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your cluster's platform or modify the values of the required parameters.

```
apiVersion: v1
baseDomain: alicloud-dev.devcluster.openshift.com
credentialsMode: Manual
compute:
- architecture: amd64
  hyperthreading: Enabled
  name: worker
  platform: {}
  replicas: 3
controlPlane:
  architecture: amd64
  hyperthreading: Enabled
  name: master
  platform: {}
  replicas: 3
metadata:
  creationTimestamp: null
  name: test-cluster ❶
networking:
  clusterNetwork:
  - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
  - cidr: 10.0.0.0/16
  networkType: OVNKubernetes ❷
  serviceNetwork:
  - 172.30.0.0/16
platform:
  alibabacloud:
    defaultMachinePlatform: ❸
    instanceType: ecs.g6.xlarge
    systemDiskCategory: cloud_efficiency
    systemDiskSize: 200
    region: ap-southeast-1 ❹
    resourceGroupID: rg-acfnw6j3hyai ❺
    vpcID: vpc-0xifdjerdibmaqvtjob2b ❻
    vswitchIDs: ❼
    - vsw-0xi8ycgwc8wv5rhviwdq5
    - vsw-0xiy6v3z2tedv009b4pz2
  publish: External
  pullSecret: '{"auths": {"cloud.openshift.com": {"auth": ... }}' ❽
  sshKey: |
    ssh-rsa AAAA... ❾
```

❶ Required. The installation program prompts you for a cluster name.

❷

The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

- 3 Optional. Specify parameters for machine pools that do not define their own platform configuration.
- 4 Required. The installation program prompts you for the region to deploy the cluster to.
- 5 Optional. Specify an existing resource group where the cluster should be installed.
- 8 Required. The installation program prompts you for the pull secret.
- 9 Optional. The installation program prompts you for the SSH key value that you use to access the machines in your cluster.
- 6 7 Optional. These are example vswitchID values.

3.6.5.3. Generating the required installation manifests

You must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

Procedure

1. Generate the manifests by running the following command from the directory that contains the installation program:

```
$ openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the directory in which the installation program creates files.

3.6.5.4. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccctl**) binary.

NOTE

The **ccctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

■

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

- Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

- Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:

ccoctl [command]

Available Commands:

alibabacloud	Manage credentials objects for alibaba cloud
aws	Manage credentials objects for AWS cloud
azure	Manage credentials objects for Azure
gcp	Manage credentials objects for Google cloud
help	Help about any command
ibmcloud	Manage credentials objects for IBM Cloud
nutanix	Manage credentials objects for Nutanix

Flags:

-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

3.6.5.5. Creating credentials for OpenShift Container Platform components with the ccoctl tool

You can use the OpenShift Container Platform Cloud Credential Operator (CCO) utility to automate the creation of Alibaba Cloud RAM users and policies for each in-cluster component.

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.
- Created a RAM user with sufficient permission to create the OpenShift Container Platform cluster.
- Added the AccessKeyID (**access_key_id**) and AccessKeySecret (**access_key_secret**) of that RAM user into the [~/alibabacloud/credentials](#) file on your local computer.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included 1 \
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml 2 \
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2** Specify the location of the **install-config.yaml** file.
- 3** Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

- a. Run the following command to use the tool:

```
$ ccoctl alibabacloud create-ram-users \
  --name <name> \ ❶
  --region=<alibaba_region> \ ❷
  --credentials-requests-dir=<path_to_credentials_requests_directory> \ ❸
  --output-dir=<path_to_ccoctl_output_dir> \ ❹
```

- ❶ Specify the name used to tag any cloud resources that are created for tracking.
- ❷ Specify the Alibaba Cloud region in which cloud resources will be created.
- ❸ Specify the directory containing the files for the component **CredentialsRequest** objects.
- ❹ Specify the directory where the generated component credentials secrets will be placed.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Example output

```
2022/02/11 16:18:26 Created RAM User: user1-alicloud-openshift-machine-api-
alicloud-credentials
2022/02/11 16:18:27 Ready for creating new ram policy user1-alicloud-openshift-
machine-api-alibabacloud-credentials-policy-policy
2022/02/11 16:18:27 RAM policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has created
2022/02/11 16:18:28 Policy user1-alicloud-openshift-machine-api-alibabacloud-
credentials-policy-policy has attached on user user1-alicloud-openshift-machine-api-
alicloud-credentials
2022/02/11 16:18:29 Created access keys for RAM User: user1-alicloud-openshift-
machine-api-alibabacloud-credentials
2022/02/11 16:18:29 Saved credentials configuration to: user1-
alicloud/manifests/openshift-machine-api-alibabacloud-credentials-credentials.yaml
...
```

NOTE

A RAM user can have up to two AccessKeys at the same time. If you run **ccoctl alibabacloud create-ram-users** more than twice, the previously generated manifests secret becomes stale and you must reapply the newly generated secrets.

- b. Verify that the OpenShift Container Platform secrets are created:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
openshift-cluster-csi-drivers-alibaba-disk-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-alibabacloud-credentials-credentials.yaml
```

You can verify that the RAM users and policies are created by querying Alibaba Cloud. For more information, refer to Alibaba Cloud documentation on listing RAM users and policies.

4. Copy the generated credential files to the target manifests directory:

```
$ cp ./<path_to_ccoctl_output_dir>/manifests/*credentials.yaml
./<path_to_installation>dir>/manifests/
```

where:

<path_to_ccoctl_output_dir>

Specifies the directory created by the **ccoctl alibabacloud create-ram-users** command.

<path_to_installation_dir>

Specifies the directory in which the installation program creates files.

3.6.6. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.

- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to `<installation_directory>/openshift_install.log`.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

3.6.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

3.6.8. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

3.6.9. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

3.6.10. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.
- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console

3.6.11. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).

3.7. INSTALLATION CONFIGURATION PARAMETERS FOR ALIBABA CLOUD

Before you deploy an OpenShift Container Platform cluster on Alibaba Cloud, you provide parameters to customize your cluster and the platform that hosts it. When you create the **install-config.yaml** file, you provide values for the required parameters through the command line. You can then modify the **install-config.yaml** file to customize your cluster further.

3.7.1. Available installation configuration parameters for Alibaba Cloud

The following tables specify the required, optional, and Alibaba Cloud-specific installation configuration parameters that you can set as part of the installation process.

NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

3.7.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 3.8. Required parameters

Parameter	Description	Values
-----------	-------------	--------

Parameter	Description	Values
apiVersion:	The API version for the install-config.yaml content. The current version is v1 . The installation program may also support older API versions.	String
baseDomain:	The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the baseDomain and metadata.name parameter values that uses the <metadata.name> . <baseDomain> format.	A fully-qualified domain or subdomain name, such as example.com .
metadata:	Kubernetes resource ObjectMeta , from which only the name parameter is consumed.	Object
metadata: name:	The name of the cluster. DNS records for the cluster are all subdomains of {{.metadata.name}} . {{.baseDomain}} .	String of lowercase letters, hyphens (-), and periods (.), such as dev .
platform:	The configuration for the specific platform upon which to perform the installation: alibabacloud , aws , baremetal , azure , gcp , ibmcloud , nutanix , openstack , powervs , vsphere , or {} . For additional information about platform . <platform> parameters, consult the table for your specific platform that follows.	Object

Parameter	Description	Values
 pullSecret:	Get a pull secret from Red Hat OpenShift Cluster Manager to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io.	 <pre>{ "auths":{ "cloud.openshift.com":{ "auth":"b3Blb=", "email":"you@example.com" }, "quay.io":{ "auth":"b3Blb=", "email":"you@example.com" } } }</pre>

3.7.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

NOTE

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 3.9. Network parameters

Parameter	Description	Values
 networking:	The configuration for the cluster network.	<div>Object</div> <div></div> <div> NOTE You cannot modify parameters specified by the networking object after installation. </div>

Parameter	Description	Values
<code>networking: networkType:</code>	The Red Hat OpenShift Networking network plugin to install.	Either OpenShiftSDN or OVNKubernetes . OpenShiftSDN is a CNI plugin for all-Linux networks. OVNKubernetes is a CNI plugin for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is OVNKubernetes .
<code>networking: clusterNetwork:</code>	<p>The IP address blocks for pods.</p> <p>The default value is 10.128.0.0/14 with a host prefix of /23.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: clusterNetwork: - cidr: 10.128.0.0/14 hostPrefix: 23</pre>
<code>networking: clusterNetwork: cidr:</code>	<p>Required if you use networking.clusterNetwork. An IP address block.</p> <p>An IPv4 network.</p>	An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between 0 and 32 .
<code>networking: clusterNetwork: hostPrefix:</code>	<p>The subnet prefix length to assign to each individual node. For example, if hostPrefix is set to 23 then each node is assigned a /23 subnet out of the given cidr. A hostPrefix value of 23 provides $2^{(32 - 23)} - 2$ pod IP addresses.</p>	<p>A subnet prefix.</p> <p>The default value is 23.</p>
<code>networking: serviceNetwork:</code>	<p>The IP address block for services. The default value is 172.30.0.0/16.</p> <p>The OpenShift SDN and OVN-Kubernetes network plugins support only a single IP address block for the service network.</p>	<p>An array with an IP address block in CIDR format. For example:</p> <pre>networking: serviceNetwork: - 172.30.0.0/16</pre>
<code>networking: machineNetwork:</code>	<p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>	<p>An array of objects. For example:</p> <pre>networking: machineNetwork: - cidr: 10.0.0.0/16</pre>

Parameter	Description	Values
networking: machineNetwork: cidr:	Required if you use networking.machineNetwork . An IP address block. The default value is 10.0.0.0/16 for all platforms other than libvirt and IBM Power® Virtual Server. For libvirt, the default value is 192.168.126.0/24 . For IBM Power® Virtual Server, the default value is 192.168.0.0/24 .	An IP network block in CIDR notation. For example, 10.0.0.0/16 .  <div> NOTE Set the networking.machineNetwork to match the CIDR that the preferred NIC resides in. </div>

3.7.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

Table 3.10. Optional parameters

Parameter	Description	Values
additionalTrustBundle:	A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.	String
capabilities:	Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components. For more information, see the "Cluster capabilities" page in <i>Installing</i> .	String array
capabilities: baselineCapabilitySet:	Selects an initial set of optional capabilities to enable. Valid values are None , v4.11 , v4.12 and vCurrent . The default value is vCurrent .	String
capabilities: additionalEnabledCapabilities:	Extends the set of optional capabilities beyond what you specify in baselineCapabilitySet . You may specify multiple capabilities in this parameter.	String array

Parameter	Description	Values
<div>cpuPartitioningMode:</div>	<p>Enables workload partitioning, which isolates OpenShift Container Platform services, cluster management workloads, and infrastructure pods to run on a reserved set of CPUs. Workload partitioning can only be enabled during installation and cannot be disabled after installation. While this field enables workload partitioning, it does not configure workloads to use specific CPUs. For more information, see the <i>Workload partitioning</i> page in the <i>Scalability and Performance</i> section.</p>	None or AllNodes . None is the default value.
<div>compute:</div>	<p>The configuration for the machines that comprise the compute nodes.</p>	Array of MachinePool objects.
<div>compute: architecture:</div>	<p>Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).</p>	String
<div>compute: hyperthreading:</div>	<div><div></div><div>IMPORTANT If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</div></div> <p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p>	Enabled or Disabled

Parameter	Description	Values
compute: name:	Required if you use compute . The name of the machine pool.	worker
compute: platform:	Required if you use compute . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the controlPlane.platform parameter value.	alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, powervs, vsphere , or {}
compute: replicas:	The number of compute machines, which are also known as worker machines, to provision.	A positive integer greater than or equal to 2 . The default value is 3 .
featureSet:	Enables the cluster for a feature set. A feature set is a collection of OpenShift Container Platform features that are not enabled by default. For more information about enabling a feature set during installation, see "Enabling features using feature gates".	String. The name of the feature set to enable, such as TechPreviewNoUpgrade .
controlPlane:	The configuration for the machines that comprise the control plane.	Array of MachinePool objects.
controlPlane: architecture:	Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are amd64 (the default).	String

Parameter	Description	Values
controlPlane: hyperthreading:	<p>Whether to enable or disable simultaneous multithreading, or hyperthreading, on control plane machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div>  <p>IMPORTANT</p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div>	Enabled or Disabled
controlPlane: name:	Required if you use controlPlane . The name of the machine pool.	master
controlPlane: platform:	Required if you use controlPlane . Use this parameter to specify the cloud provider that hosts the control plane machines. This parameter value must match the compute.platform parameter value.	alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, powervs, vsphere, or {}
controlPlane: replicas:	The number of control plane machines to provision.	Supported values are 3 , or 1 when deploying single-node OpenShift.
credentialsMode:	The Cloud Credential Operator (CCO) mode. If no mode is specified, the CCO dynamically tries to determine the capabilities of the provided credentials, with a preference for mint mode on the platforms where multiple modes are supported.	Mint, Passthrough, Manual or an empty string (""). ^[1]

Parameter	Description	Values
fips:	<p>Enable or disable FIPS mode. The default is false (disabled). If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.</p> <div>  <p>IMPORTANT</p> <p>To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see Installing the system in FIPS mode. When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.</p> </div> <div>  <p>NOTE</p> <p>If you are using Azure File storage, you cannot enable FIPS mode.</p> </div>	false or true

Parameter	Description	Values
imageContentSources:	Sources and repositories for the release-image content.	Array of objects. Includes a source and, optionally, mirrors , as described in the following rows of this table.
imageContentSources: source:	Required if you use imageContentSources . Specify the repository that users refer to, for example, in image pull specifications.	String
imageContentSources: mirrors:	Specify one or more repositories that may also contain the same images.	Array of strings
publish:	How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.	<p>Internal or External. The default value is External.</p> <p>Setting this field to Internal is not supported on non-cloud platforms.</p> <div>  <p>IMPORTANT</p> <p>If the value of the field is set to Internal, the cluster will become non-functional. For more information, refer to BZ#1953035.</p> </div>
sshKey:	<p>The SSH key to authenticate access to your cluster machines.</p> <div>  <p>NOTE</p> <p>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your ssh-agent process uses.</p> </div>	For example, sshKey: ssh-ed25519 AAAA...

1. Not all CCO modes are supported for all cloud providers. For more information about CCO modes, see the "Managing cloud provider credentials" entry in the *Authentication and authorization* content.

3.7.1.4. Additional Alibaba Cloud configuration parameters

Additional Alibaba Cloud configuration parameters are described in the following table. The **alibabacloud** parameters are the configuration used when installing on Alibaba Cloud. The **defaultMachinePlatform** parameters are the default configuration used when installing on Alibaba Cloud for machine pools that do not define their own platform configuration.

These parameters apply to both compute machines and control plane machines where specified.

NOTE

If defined, the parameters **compute.platform.alibabacloud** and **controlPlane.platform.alibabacloud** will overwrite **platform.alibabacloud.defaultMachinePlatform** settings for compute machines and control plane machines respectively.

Table 3.11. Optional Alibaba Cloud parameters

Parameter	Description	Values
compute: platform: alibabacloud: imageID:	The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.	String.
compute: platform: alibabacloud: instanceType:	InstanceType defines the ECS instance type. Example: ecs.g6.large	String.
compute: platform: alibabacloud: systemDiskCategory:	Defines the category of the system disk. Examples: cloud_efficiency,cloud_essd	String.

Parameter	Description	Values
<code>compute:</code> <code>platform:</code> <code>alibabacloud:</code> <code>systemDiskSize:</code>	Defines the size of the system disk in gibibytes (GiB).	Integer.
<code>compute:</code> <code>platform:</code> <code>alibabacloud:</code> <code>zones:</code>	The list of availability zones that can be used. Examples: cn-hangzhou-h, cn-hangzhou-j	String list.
<code>controlPlane:</code> <code>platform:</code> <code>alibabacloud:</code> <code>imageID:</code>	The imageID used to create the ECS instance. ImageID must belong to the same region as the cluster.	String.
<code>controlPlane:</code> <code>platform:</code> <code>alibabacloud:</code> <code>instanceType:</code>	InstanceType defines the ECS instance type. Example: ecs.g6.xlarge	String.
<code>controlPlane:</code> <code>platform:</code> <code>alibabacloud:</code> <code>systemDiskCategory:</code>	Defines the category of the system disk. Examples: cloud_efficiency, cloud_essd	String.
<code>controlPlane:</code> <code>platform:</code> <code>alibabacloud:</code> <code>systemDiskSize:</code>	Defines the size of the system disk in gibibytes (GiB).	Integer.

Parameter	Description	Values
<code>controlPlane:</code> <code>platform:</code> <code>alibabacloud:</code> <code>zones:</code>	<p>The list of availability zones that can be used. Examples: cn-hangzhou-h, cn-hangzhou-j</p>	String list.
<code>platform:</code> <code>alibabacloud:</code> <code>region:</code>	<p>Required. The Alibaba Cloud region where the cluster will be created.</p>	String.
<code>platform:</code> <code>alibabacloud:</code> <code>resourceGroupID:</code>	<p>The ID of an already existing resource group where the cluster will be installed. If empty, the installation program will create a new resource group for the cluster.</p>	String.
<code>platform:</code> <code>alibabacloud:</code> <code>tags:</code>	<p>Additional keys and values to apply to all Alibaba Cloud resources created for the cluster.</p>	Object.
<code>platform:</code> <code>alibabacloud:</code> <code>vpcID:</code>	<p>The ID of an already existing VPC where the cluster should be installed. If empty, the installation program will create a new VPC for the cluster.</p>	String.
<code>platform:</code> <code>alibabacloud:</code> <code>vswitchIDs:</code>	<p>The ID list of already existing VSwitches where cluster resources will be created. The existing VSwitches can only be used when also using existing VPC. If empty, the installation program will create new VSwitches for the cluster.</p>	String list.

Parameter	Description	Values
platform: alibabacloud: defaultMachinePlatform: imageID:	For both compute machines and control plane machines, the image ID that should be used to create ECS instance. If set, the image ID should belong to the same region as the cluster.	String.
platform: alibabacloud: defaultMachinePlatform: instanceType:	For both compute machines and control plane machines, the ECS instance type used to create the ECS instance. Example: ecs.g6.xlarge	String.
platform: alibabacloud: defaultMachinePlatform: systemDiskCategory:	For both compute machines and control plane machines, the category of the system disk. Examples: cloud_efficiency , cloud_essd .	String, for example "", cloud_efficiency , cloud_essd .
platform: alibabacloud: defaultMachinePlatform: systemDiskSize:	For both compute machines and control plane machines, the size of the system disk in gibibytes (GiB). The minimum is 120 .	Integer.
platform: alibabacloud: defaultMachinePlatform: zones:	For both compute machines and control plane machines, the list of availability zones that can be used. Examples: cn-hangzhou-h , cn-hangzhou-j	String list.

Parameter	Description	Values
<pre>platform: alibabacloud: privateZoneID :</pre>	<p>The ID of an existing private zone into which to add DNS records for the cluster's internal API. An existing private zone can only be used when also using existing VPC. The private zone must be associated with the VPC containing the subnets. Leave the private zone unset to have the installation program create the private zone on your behalf.</p>	String.

3.8. UNINSTALLING A CLUSTER ON ALIBABA CLOUD

You can remove a cluster that you deployed to Alibaba Cloud.

3.8.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

Prerequisites

- You have a copy of the installation program that you used to deploy the cluster.
- You have the files that the installation program generated when you created your cluster.

Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$ ./openshift-install destroy cluster \
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

**NOTE**

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

2. Optional: Delete the **<installation_directory>** directory and the OpenShift Container Platform installation program.

CHAPTER 4. INSTALLING ON AWS

4.1. PREPARING TO INSTALL ON AWS

4.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

4.1.2. Requirements for installing OpenShift Container Platform on AWS

Before installing OpenShift Container Platform on Amazon Web Services (AWS), you must create an AWS account. See [Configuring an AWS account](#) for details about configuring an account, account limits, account permissions, IAM user setup, and supported AWS regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Manually creating long-term credentials for AWS](#) or [configuring an AWS cluster to use short-term credentials](#) with Amazon Web Services Security Token Service (AWS STS).

4.1.3. Choosing a method to install OpenShift Container Platform on AWS

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

4.1.3.1. Installing a cluster on a single node

Installing OpenShift Container Platform on a single node alleviates some of the requirements for high availability and large scale clusters. However, you must address the [requirements for installing on a single node](#), and the [additional requirements for installing single-node OpenShift on a cloud provider](#). After addressing the requirements for single node installation, use the [Installing a customized cluster on AWS](#) procedure to install the cluster. The [installing single-node OpenShift manually](#) section contains an exemplary **install-config.yaml** file when installing an OpenShift Container Platform cluster on a single node.

4.1.3.2. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on AWS** You can install OpenShift Container Platform on AWS infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.

- **Installing a customized cluster on AWS** You can install a customized cluster on AWS infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- **Installing a cluster on AWS with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- **Installing a cluster on AWS in a restricted network** You can install OpenShift Container Platform on AWS on installer-provisioned infrastructure by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components.
- **Installing a cluster on an existing Virtual Private Cloud** You can install OpenShift Container Platform on an existing AWS Virtual Private Cloud (VPC). You can use this installation method if you have constraints set by the guidelines of your company, such as limits when creating new accounts or infrastructure.
- **Installing a private cluster on an existing VPC** You can install a private cluster on an existing AWS VPC. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on AWS into a government or secret region** OpenShift Container Platform can be deployed into AWS regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads in the cloud.

4.1.3.3. Installing a cluster on user-provisioned infrastructure

You can install a cluster on AWS infrastructure that you provision, by using one of the following methods:

- **Installing a cluster on AWS infrastructure that you provide** You can install OpenShift Container Platform on AWS infrastructure that you provide. You can use the provided CloudFormation templates to create stacks of AWS resources that represent each of the components required for an OpenShift Container Platform installation.
- **Installing a cluster on AWS in a restricted network with user-provisioned infrastructure** You can install OpenShift Container Platform on AWS infrastructure that you provide by using an internal mirror of the installation release content. You can use this method to install a cluster that does not require an active internet connection to obtain the software components. You can also use this installation method to ensure that your clusters only use container images that satisfy your organizational controls on external content. While you can install OpenShift Container Platform by using the mirrored content, your cluster still requires internet access to use the AWS APIs.

4.1.4. Next steps

- [Configuring an AWS account](#)

4.2. CONFIGURING AN AWS ACCOUNT

Before you can install OpenShift Container Platform, you must configure an Amazon Web Services (AWS) account.

4.2.1. Configuring Route 53

To install OpenShift Container Platform, the Amazon Web Services (AWS) account you use must have a dedicated public hosted zone in your Route 53 service. This zone must be authoritative for the domain. The Route 53 service provides cluster DNS resolution and name lookup for external connections to the cluster.

Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through AWS or another source.

NOTE

If you purchase a new domain through AWS, it takes time for the relevant DNS changes to propagate. For more information about purchasing domains through AWS, see [Registering Domain Names Using Amazon Route 53](#) in the AWS documentation.

2. If you are using an existing domain and registrar, migrate its DNS to AWS. See [Making Amazon Route 53 the DNS Service for an Existing Domain](#) in the AWS documentation.
3. Create a public hosted zone for your domain or subdomain. See [Creating a Public Hosted Zone](#) in the AWS documentation.
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. Extract the new authoritative name servers from the hosted zone records. See [Getting the Name Servers for a Public Hosted Zone](#) in the AWS documentation.
5. Update the registrar records for the AWS Route 53 name servers that your domain uses. For example, if you registered your domain to a Route 53 service in a different accounts, see the following topic in the AWS documentation: [Adding or Changing Name Servers or Glue Records](#).
6. If you are using a subdomain, add its delegation records to the parent domain. This gives Amazon Route 53 responsibility for the subdomain. Follow the delegation procedure outlined by the DNS provider of the parent domain. See [Creating a subdomain that uses Amazon Route 53 as the DNS service without migrating the parent domain](#) in the AWS documentation for an example high level procedure.

4.2.1.1. Ingress Operator endpoint configuration for AWS Route 53

If you install in either Amazon Web Services (AWS) GovCloud (US) US-West or US-East region, the Ingress Operator uses **us-gov-west-1** region for Route53 and tagging API clients.

The Ingress Operator uses <https://tagging.us-gov-west-1.amazonaws.com> as the tagging API endpoint if a tagging custom endpoint is configured that includes the string 'us-gov-east-1'.

For more information on AWS GovCloud (US) endpoints, see the [Service Endpoints](#) in the AWS documentation about GovCloud (US).

IMPORTANT

Private, disconnected installations are not supported for AWS GovCloud when you install in the **us-gov-east-1** region.

Example Route 53 configuration

```
platform:
  aws:
    region: us-gov-west-1
    serviceEndpoints:
      - name: ec2
        url: https://ec2.us-gov-west-1.amazonaws.com
      - name: elasticloadbalancing
        url: https://elasticloadbalancing.us-gov-west-1.amazonaws.com
      - name: route53
        url: https://route53.us-gov.amazonaws.com ❶
      - name: tagging
        url: https://tagging.us-gov-west-1.amazonaws.com ❷
```

❶ Route 53 defaults to <https://route53.us-gov.amazonaws.com> for both AWS GovCloud (US) regions.

❷ Only the US-West region has endpoints for tagging. Omit this parameter if your cluster is in another region.

4.2.2. AWS account limits

The OpenShift Container Platform cluster uses a number of Amazon Web Services (AWS) components, and the default [Service Limits](#) affect your ability to install OpenShift Container Platform clusters. If you use certain cluster configurations, deploy your cluster in certain AWS regions, or run multiple clusters from your account, you might need to request additional resources for your AWS account.

The following table summarizes the AWS components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

Component	Number of clusters available by default	Default AWS limit	Description

Component	Number of clusters available by default	Default AWS limit	Description
Instance Limits	Varies	Varies	<p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> • One bootstrap machine, which is removed after installation • Three control plane nodes • Three worker nodes <p>These instance type counts are within a new account's default limit. To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, review your account limits to ensure that your cluster can deploy the machines that you need.</p> <p>In most regions, the worker machines use an m6i.large instance and the bootstrap and control plane machines use m6i.xlarge instances. In some regions, including all regions that do not support these instance types, m5.large and m5.xlarge instances are used instead.</p>
Elastic IPs (EIPs)	0 to 1	5 EIPs per account	<p>To provision the cluster in a highly available configuration, the installation program creates a public and private subnet for each availability zone within a region. Each private subnet requires a NAT Gateway, and each NAT gateway requires a separate elastic IP. Review the AWS region map to determine how many availability zones are in each region. To take advantage of the default high availability, install the cluster in a region with at least three availability zones. To install a cluster in a region with more than five availability zones, you must increase the EIP limit.</p> <div>  <p>IMPORTANT</p> <p>To use the us-east-1 region, you must increase the EIP limit for your account.</p> </div>
Virtual Private Clouds (VPCs)	5	5 VPCs per region	Each cluster creates its own VPC.

Component	Number of clusters available by default	Default AWS limit	Description
Elastic Load Balancing (ELB/NLB)	3	20 per region	By default, each cluster creates internal and external network load balancers for the master API server and a single Classic Load Balancer for the router. Deploying more Kubernetes Service objects with type LoadBalancer will create additional load balancers .
NAT Gateways	5	5 per availability zone	The cluster deploys one NAT gateway in each availability zone.
Elastic Network Interfaces (ENIs)	At least 12	350 per region	The default installation creates 21 ENIs and an ENI for each availability zone in your region. For example, the us-east-1 region contains six availability zones, so a cluster that is deployed in that zone uses 27 ENIs. Review the AWS region map to determine how many availability zones are in each region. Additional ENIs are created for additional machines and ELB load balancers that are created by cluster usage and deployed workloads.
VPC Gateway	20	20 per account	Each cluster creates a single VPC Gateway for S3 access.
S3 buckets	99	100 buckets per account	Because the installation process creates a temporary bucket and the registry component in each cluster creates a bucket, you can create only 99 OpenShift Container Platform clusters per AWS account.
Security Groups	250	2,500 per account	Each cluster creates 10 distinct security groups.

4.2.3. Required AWS permissions for the IAM user

NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

Example 4.1. Required EC2 permissions for installation

- **ec2:AttachNetworkInterface**
- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2>CreateNetworkInterface**
- **ec2>CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2>CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**

- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroupRules**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.2. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**

- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

NOTE

If you use an existing Virtual Private Cloud (VPC), your account does not require these permissions for creating network resources.

Example 4.3. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**

- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:RegisterTargets**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

IMPORTANT

OpenShift Container Platform uses both the ELB and ELBv2 API services to provision load balancers. The permission list shows permissions required by both services. A known issue exists in the AWS web console where both services use the same **elasticloadbalancing** action prefix but do not recognize the same actions. You can ignore the warnings about the service not recognizing certain **elasticloadbalancing** actions.

Example 4.4. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

**NOTE**

If you have not created a load balancer in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

Example 4.5. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 4.6. Required Amazon Simple Storage Service (S3) permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketPolicy**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**

- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.7. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.8. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeletePlacementGroup**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:DeleteUserPolicy**
- **iam:ListAttachedRolePolicies**

- **iam:ListInstanceProfiles**
- **iam:ListRolePolicies**
- **iam:ListUserPolicies**
- **s3:DeleteObject**
- **s3:ListBucketVersions**
- **tag:GetResources**

Example 4.9. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**
- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

Example 4.10. Optional permissions for installing a cluster with a custom Key Management Service (KMS) key

- **kms:CreateGrant**
- **kms:Decrypt**
- **kms:DescribeKey**
- **kms:Encrypt**

- **kms:GenerateDataKey**
- **kms:GenerateDataKeyWithoutPlainText**
- **kms:ListGrants**
- **kms:RevokeGrant**

Example 4.11. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

Example 4.12. Additional IAM and S3 permissions that are required to create manifests

- **iam:GetUserPolicy**
- **iam:ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:AbortMultipartUpload**
- **s3:GetBucketPublicAccessBlock**
- **s3:ListBucket**
- **s3:ListBucketMultipartUploads**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**

NOTE

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

Example 4.13. Optional permissions for instance and quota checks for installation

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

Example 4.14. Optional permissions for the cluster owner account when installing a cluster on a shared VPC

- **sts:AssumeRole**

4.2.4. Creating an IAM user

Each Amazon Web Services (AWS) account contains a root user account that is based on the email address you used to create the account. This is a highly-privileged account, and it is recommended to use it for only initial account and billing configuration, creating an initial set of users, and securing the account.

Before you install OpenShift Container Platform, create a secondary IAM administrative user. As you complete the [Creating an IAM User in Your AWS Account](#) procedure in the AWS documentation, set the following options:

Procedure

1. Specify the IAM user name and select **Programmatic access**.
2. Attach the **AdministratorAccess** policy to ensure that the account has sufficient permission to create the cluster. This policy provides the cluster with the ability to grant credentials to each OpenShift Container Platform component. The cluster grants the components only the credentials that they require.

NOTE

While it is possible to create a policy that grants the all of the required AWS permissions and attach it to the user, this is not the preferred option. The cluster will not have the ability to grant additional credentials to individual components, so the same credentials are used by all components.

3. Optional: Add metadata to the user by attaching tags.
4. Confirm that the user name that you specified is granted the **AdministratorAccess** policy.
5. Record the access key ID and secret access key values. You must use these values when you configure your local machine to run the installation program.

IMPORTANT

You cannot use a temporary session token that you generated while using a multi-factor authentication device to authenticate to AWS when you deploy a cluster. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials.

4.2.5. IAM Policies and AWS authentication

By default, the installation program creates instance profiles for the bootstrap, control plane, and compute instances with the necessary permissions for the cluster to operate.

NOTE

To enable pulling images from the Amazon Elastic Container Registry (ECR) as a postinstallation task in a single-node OpenShift cluster, you must add the **AmazonEC2ContainerRegistryReadOnly** policy to the IAM role associated with the cluster's control plane role.

However, you can create your own IAM roles and specify them as part of the installation process. You might need to specify your own roles to deploy the cluster or to manage the cluster after installation. For example:

- Your organization's security policies require that you use a more restrictive set of permissions to install the cluster.
- After the installation, the cluster is configured with an Operator that requires access to additional services.

If you choose to specify your own IAM roles, you can take the following steps:

- Begin with the default policies and adapt as required. For more information, see "Default permissions for IAM instance profiles".
- Use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template that is based on the cluster's activity. For more information see, "Using AWS IAM Analyzer to create policy templates".

4.2.5.1. Default permissions for IAM instance profiles

By default, the installation program creates IAM instance profiles for the bootstrap, control plane and worker instances with the necessary permissions for the cluster to operate.

The following lists specify the default permissions for control plane and compute machines:

Example 4.15. Default IAM role permissions for control plane instance profiles

- **ec2:AttachVolume**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteVolume**
- **ec2:Describe***
- **ec2:DetachVolume**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyVolume**
- **ec2:RevokeSecurityGroupIngress**
- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**

- `elasticloadbalancing:CreateListener`
- `elasticloadbalancing:CreateLoadBalancer`
- `elasticloadbalancing:CreateLoadBalancerPolicy`
- `elasticloadbalancing:CreateLoadBalancerListeners`
- `elasticloadbalancing:CreateTargetGroup`
- `elasticloadbalancing:ConfigureHealthCheck`
- `elasticloadbalancing>DeleteListener`
- `elasticloadbalancing>DeleteLoadBalancer`
- `elasticloadbalancing>DeleteLoadBalancerListeners`
- `elasticloadbalancing>DeleteTargetGroup`
- `elasticloadbalancing:DeregisterInstancesFromLoadBalancer`
- `elasticloadbalancing:DeregisterTargets`
- `elasticloadbalancing:Describe*`
- `elasticloadbalancing:DetachLoadBalancerFromSubnets`
- `elasticloadbalancing:ModifyListener`
- `elasticloadbalancing:ModifyLoadBalancerAttributes`
- `elasticloadbalancing:ModifyTargetGroup`
- `elasticloadbalancing:ModifyTargetGroupAttributes`
- `elasticloadbalancing:RegisterInstancesWithLoadBalancer`
- `elasticloadbalancing:RegisterTargets`
- `elasticloadbalancing:SetLoadBalancerPoliciesForBackendServer`
- `elasticloadbalancing:SetLoadBalancerPoliciesOfListener`
- `kms:DescribeKey`

Example 4.16. Default IAM role permissions for compute instance profiles

- `ec2:DescribeInstances`
- `ec2:DescribeRegions`

4.2.5.2. Specifying an existing IAM role

Instead of allowing the installation program to create IAM instance profiles with the default permissions, you can use the **install-config.yaml** file to specify an existing IAM role for control plane and compute instances.

Prerequisites

- You have an existing **install-config.yaml** file.

Procedure

1. Update **compute.platform.aws.iamRole** with an existing role for the compute machines.

Sample install-config.yaml file with an IAM role for compute instances

```
compute:
  - hyperthreading: Enabled
    name: worker
    platform:
      aws:
        iamRole: ExampleRole
```

2. Update **controlPlane.platform.aws.iamRole** with an existing role for the control plane machines.

Sample install-config.yaml file with an IAM role for control plane instances

```
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      iamRole: ExampleRole
```

3. Save the file and reference it when installing the OpenShift Container Platform cluster.

NOTE

To change or update an IAM account after the cluster has been installed, see [RHOC P 4 AWS cloud-credentials access key is expired](#) (Red Hat Knowledgebase).

Additional resources

- See [Deploying the cluster](#).

4.2.5.3. Using AWS IAM Analyzer to create policy templates

The minimal set of permissions that the control plane and compute instance profiles require depends on how the cluster is configured for its daily operation.

One way to determine which permissions the cluster instances require is to use the AWS Identity and Access Management Access Analyzer (IAM Access Analyzer) to create a policy template:

- A policy template contains the permissions the cluster has used over a specified period of time.

- You can then use the template to create policies with fine-grained permissions.

Procedure

The overall process could be:

1. Ensure that CloudTrail is enabled. CloudTrail records all of the actions and events in your AWS account, including the API calls that are required to create a policy template. For more information, see the AWS documentation for [working with CloudTrail](#).
2. Create an instance profile for control plane instances and an instance profile for compute instances. Be sure to assign each role a permissive policy, such as PowerUserAccess. For more information, see the AWS documentation for [creating instance profile roles](#).
3. Install the cluster in a development environment and configure it as required. Be sure to deploy all of applications the cluster will host in a production environment.
4. Test the cluster thoroughly. Testing the cluster ensures that all of the required API calls are logged.
5. Use the IAM Access Analyzer to create a policy template for each instance profile. For more information, see the AWS documentation for [generating policies based on the CloudTrail logs](#).
6. Create and add a fine-grained policy to each instance profile.
7. Remove the permissive policy from each instance profile.
8. Deploy a production cluster using the existing instance profiles with the new policies.

NOTE

You can add [IAM Conditions](#) to your policy to make it more restrictive and compliant with your organization security requirements.

4.2.6. Supported AWS Marketplace regions

Installing an OpenShift Container Platform cluster using an AWS Marketplace image is available to customers who purchase the offer in North America.

While the offer must be purchased in North America, you can deploy the cluster to any of the following supported partitions:

- Public
- GovCloud

NOTE

Deploying a OpenShift Container Platform cluster using an AWS Marketplace image is not supported for the AWS secret regions or China regions.

4.2.7. Supported AWS regions

You can deploy an OpenShift Container Platform cluster to the following regions.

**NOTE**

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

4.2.7.1. AWS public regions

The following AWS public regions are supported:

- **af-south-1** (Cape Town)
- **ap-east-1** (Hong Kong)
- **ap-northeast-1** (Tokyo)
- **ap-northeast-2** (Seoul)
- **ap-northeast-3** (Osaka)
- **ap-south-1** (Mumbai)
- **ap-south-2** (Hyderabad)
- **ap-southeast-1** (Singapore)
- **ap-southeast-2** (Sydney)
- **ap-southeast-3** (Jakarta)
- **ap-southeast-4** (Melbourne)
- **ca-central-1** (Central)
- **ca-west-1** (Calgary)
- **eu-central-1** (Frankfurt)
- **eu-central-2** (Zurich)
- **eu-north-1** (Stockholm)
- **eu-south-1** (Milan)
- **eu-south-2** (Spain)
- **eu-west-1** (Ireland)
- **eu-west-2** (London)
- **eu-west-3** (Paris)
- **me-central-1** (UAE)
- **me-south-1** (Bahrain)
- **sa-east-1** (São Paulo)

- **us-east-1** (N. Virginia)
- **us-east-2** (Ohio)
- **us-west-1** (N. California)
- **us-west-2** (Oregon)

4.2.7.2. AWS GovCloud regions

The following AWS GovCloud regions are supported:

- **us-gov-west-1**
- **us-gov-east-1**

4.2.7.3. AWS SC2S and C2S secret regions

The following AWS secret regions are supported:

- **us-isob-east-1** Secret Commercial Cloud Services (SC2S)
- **us-iso-east-1** Commercial Cloud Services (C2S)

4.2.7.4. AWS China regions

The following AWS China regions are supported:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

4.2.8. Next steps

- Install an OpenShift Container Platform cluster:
 - [Quickly install a cluster](#) with default options on installer-provisioned infrastructure
 - [Install a cluster with cloud customizations on installer-provisioned infrastructure](#)
 - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
 - [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)
 - [Installing a cluster on AWS with remote workers on AWS Outposts](#)

4.3. INSTALLING A CLUSTER QUICKLY ON AWS

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) that uses the default configuration options.

4.3.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.3.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.3.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as **~/.ssh/id_ed25519**, of the new SSH key. If you have an existing key pair, ensure your public key is in the your **~/.ssh** directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the **~/.ssh/id_ed25519.pub** public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

NOTE

On some distributions, default SSH private key identities such as **~/.ssh/id_rsa** and **~/.ssh/id_dsa** are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.3.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.3.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1 For **<installation_directory>**, specify the directory name to store the files that the installation program creates.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Provide values at the prompts:

- a. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- b. Select **aws** as the platform to target.
- c. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

NOTE

The AWS access key ID and secret access key are stored in **~/.aws/credentials** in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- d. Select the AWS region to deploy the cluster to.
 - e. Select the base domain for the Route 53 service that you configured for your cluster.
 - f. Enter a descriptive name for your cluster.
 - g. Paste the [pull secret from Red Hat OpenShift Cluster Manager](#) .
3. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to `<installation_directory>/openshift_install.log`.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

4.3.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

■

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.3.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.3.8. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/openshift_install.log** log file on the installation host.

Example output

console	console-openshift-console.apps.<cluster_name>.<base_domain>	console
https	reencrypt/Redirect	None

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.3.9. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

4.3.10. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.4. INSTALLING A CLUSTER ON AWS WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.14, you can install a customized cluster on infrastructure that the installation program provisions on Amazon Web Services (AWS). To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

NOTE

The scope of the OpenShift Container Platform installation configurations is intentionally narrow. It is designed for simplicity and ensured success. You can complete many more OpenShift Container Platform configuration tasks after an installation completes.

4.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.

- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **`./openshift-install gather`** command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.4.4. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239 1
```

```

    type: m5.4xlarge
  replicas: 3
  metadata:
    name: test-cluster
  platform:
    aws:
      region: us-east-2
  sshKey: ssh-ed25519 AAAA...
  pullSecret: '{"auths": ...}'

```

- 1 The AMI ID from your AWS Marketplace subscription.
- 2 Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

4.4.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.4.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

NOTE

Always delete the **~/.powervs** directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
 - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
 - iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you are installing a three-node cluster, be sure to set the **compute.replicas** parameter to **0**. This ensures that the cluster's control planes are schedulable. For more information, see "Installing a three-node cluster on AWS".

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.4.6.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.1. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.4.6.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.17. Machine types based on 64-bit x86 architecture

- **c4.***
- **c5.***
- **c5a.***
- **i3.***
- **m4.***
- **m5.***
- **m5a.***
- **m6a.***
- **m6i.***
- **r4.***
- **r5.***
- **r5a.***
- **r6i.***
- **t3.***
- **t3a.***

4.4.6.3. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.18. Machine types based on 64-bit ARM architecture

- **c6g.***

- **c7g.***
- **m6g.***
- **m7g.***
- **r8g.***

4.4.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
      - us-west-2a
      - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      metadataService:
        authentication: Optional 7
        type: m6i.xlarge
      replicas: 3
compute: 8
  - hyperthreading: Enabled 9
    name: worker
    platform:
      aws:
        rootVolume:
          iops: 2000
          size: 500
          type: io1 10
        metadataService:
          authentication: Optional 11
          type: c5.4xlarge
        zones:
        - us-west-2c
      replicas: 3

```

```

metadata:
  name: test-cluster 12
networking:
  clusterNetwork:
    - cidr: 10.128.0.0/14
      hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OVNKubernetes 13
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 14
    propagateUserTags: true 15
    userTags:
      adminContact: jdoe
      costCenter: 7536
    amiID: ami-0c5d3e03c0ab9b19a 16
    serviceEndpoints: 17
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  fips: false 18
  sshKey: ssh-ed25519 AAAA... 19
  pullSecret: '{"auths": ...}' 20

```

1 12 14 20 Required. The installation program prompts you for this value.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.

3 8 15 If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

5 9 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

6 10 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **ioops** to **2000**.

options to `install`:

- 7 11** Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

- 13** The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 16** The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 17** The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 18** Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 19** You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

4.4.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ❶
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ❷
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com ❸
  additionalTrustBundle: | ❹
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> ❺
```

- ❶ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- ❷ A proxy URL to use for creating HTTPS connections outside the cluster.
- ❸ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- ❹ If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- ❺ Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and

user-ca-bundle config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.4.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

- Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version from the **Version** drop-down list.
- Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
- Unzip the archive with a ZIP program.
- Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

- Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
- Select the appropriate version from the **Version** drop-down list.
- Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.4.8. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.4.8.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

- Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

- Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- Specify the location of the **install-config.yaml** file.
- Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
  ...
```

- Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample **CredentialsRequest** object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
```

```

kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3:DeleteBucket
        resource: "*"
    ...
  secretRef:
    name: <component_secret>
    namespace: <component_namespace>
  ...

```

Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.4.8.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.4.8.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.

- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.19. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**

- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccctl** utility requires the following additional permissions:

Example 4.20. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccctl aws create-all** command.

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

- Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

- Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

- Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:
ccoctl [command]

Available Commands:

alibabacloud	Manage credentials objects for alibaba cloud
aws	Manage credentials objects for AWS cloud
azure	Manage credentials objects for Azure
gcp	Manage credentials objects for Google cloud
help	Help about any command
ibmcloud	Manage credentials objects for IBM Cloud
nutanix	Manage credentials objects for Nutanix

Flags:
-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

4.4.8.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.4.8.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.

2 Specify the location of the **install-config.yaml** file.

- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \ 3
  --output-dir=<path_to_ccoctl_output_dir> \ 4
  --create-private-s3-bucket 5
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the AWS region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5 Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
```

```

openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml

```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.4.8.2.2.2. Creating AWS resources individually

You can use the **ccoctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccoctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Some **ccoctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccoctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccoctl aws create-key-pair
```

Example output

```

2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer

```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **<path_to_ccoctl_output_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

- 1** **<name>** is the name used to tag any cloud resources that are created for tracking.
- 2** **<aws-region>** is the AWS region in which cloud resources will be created.
- 3** **<path_to_ccoctl_output_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in **<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml**. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:
 - a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ 1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.

- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.4.8.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccctl_output_dir>/tls .
```

4.4.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.4.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.4.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.4.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.4.13. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.5. INSTALLING A CLUSTER ON AWS WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) with customized network configuration options. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

4.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access [Quay.io](https://quay.io) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.5.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.5.5. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

NOTE

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

IMPORTANT

The CIDR range **172.17.0.0/16** is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the network plugin during phase 2.

4.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1 For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

NOTE

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
 - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
 - iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.5.6.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.2. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.5.6.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.21. Machine types based on 64-bit x86 architecture

- **c4.***
- **c5.***
- **c5a.***
- **i3.***
- **m4.***
- **m5.***
- **m5a.***
- **m6a.***
- **m6i.***
- **r4.***
- **r5.***
- **r5a.***
- **r6i.***
- **t3.***
- **t3a.***

4.5.6.3. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.22. Machine types based on 64-bit ARM architecture

- **c6g.***
- **c7g.***
- **m6g.***
- **m7g.***
- **r8g.***

4.5.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      metadataService:
        authentication: Optional 7
        type: m6i.xlarge
      replicas: 3
compute: 8
  - hyperthreading: Enabled 9
    name: worker
    platform:
```

```

aws:
  rootVolume:
    iops: 2000
    size: 500
    type: io1 10
  metadataService:
    authentication: Optional 11
    type: c5.4xlarge
    zones:
      - us-west-2c
  replicas: 3
metadata:
  name: test-cluster 12
networking: 13
  clusterNetwork:
    - cidr: 10.128.0.0/14
    hostPrefix: 23
  machineNetwork:
    - cidr: 10.0.0.0/16
  networkType: OVNKubernetes 14
  serviceNetwork:
    - 172.30.0.0/16
platform:
  aws:
    region: us-west-2 15
    propagateUserTags: true 16
    userTags:
      adminContact: jdoe
      costCenter: 7536
    amiID: ami-0c5d3e03c0ab9b19a 17
    serviceEndpoints: 18
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
  fips: false 19
  sshKey: ssh-ed25519 AAAA... 20
  pullSecret: '{"auths": ...}' 21

```

1 12 15 21 Required. The installation program prompts you for this value.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.

3 8 13 16 If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

5 9 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous

multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

6 10 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

7 11 Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

14 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

17 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

18 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

19 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

20 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

4.5.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle**.

in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.5.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.

2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

**NOTE**

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.5.8. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.5.8.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

- If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

- Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

- Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- Specify the location of the **install-config.yaml** file.
- Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
    ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample **CredentialsRequest** object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3:DeleteBucket
        resource: "*"
    ...
  secretRef:
    name: <component_secret>
    namespace: <component_namespace>
  ...

```

Sample **Secret** object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.5.8.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.5.8.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

**NOTE**

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.23. Required AWS permissions**Required iam permissions**

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**

- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.24. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

■

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccctl** tool.

3. Extract the **ccctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccctl** executable by running the following command:

```
$ chmod 775 ccctl
```

Verification

- To verify that **ccctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccctl.rhel9
```

Example output

```
OpenShift credentials provisioning tool
```

```
Usage:
```

```
ccctl [command]
```

```
Available Commands:
```

```
alibabacloud Manage credentials objects for alibaba cloud
```

```
aws          Manage credentials objects for AWS cloud
```

```
azure        Manage credentials objects for Azure
```

```
gcp          Manage credentials objects for Google cloud
```

```
help         Help about any command
```

```
ibmcloud     Manage credentials objects for IBM Cloud
```

```
nutanix      Manage credentials objects for Nutanix
```

```
Flags:
```

-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

4.5.8.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.5.8.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

**NOTE**

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> 1
  --region=<aws_region> 2
  --credentials-requests-dir=<path_to_credentials_requests_directory> 3
  --output-dir=<path_to_ccoctl_output_dir> 4
  --create-private-s3-bucket 5
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the AWS region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5 Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.5.8.2.2.2. Creating AWS resources individually

You can use the **ccoctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccoctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Some **ccoctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccoctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccoctl aws create-key-pair
```

Example output

```
2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer
```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in `/<path_to_ccoctl_output_dir>/tls/bound-service-account-signing-key.key`.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

- 1** `<name>` is the name used to tag any cloud resources that are created for tracking.
- 2** `<aws-region>` is the AWS region in which cloud resources will be created.
- 3** `<path_to_ccoctl_output_dir>` is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in `/<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml`. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:
 - a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ 1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
 - 2 Specify the location of the **install-config.yaml** file.
 - 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.
- c. Use the **ccctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.5.8.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccctl_output_dir>/tls .
```

4.5.9. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group:

clusterNetwork

IP address pools from which pod IP addresses are allocated.

serviceNetwork

IP address pool for services.

defaultNetwork.type

Cluster network plugin, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network plugin configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

4.5.9.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

Table 4.3. Cluster Network Operator configuration object

Field	Type	Description
metadata.name	string	The name of the CNO object. This name is always cluster .
spec.clusterNetwork	array	<p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec: clusterNetwork: - cidr: 10.128.0.0/19 hostPrefix: 23 - cidr: 10.128.32.0/19 hostPrefix: 23</pre>
spec.serviceNetwork	array	<p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes network plugins support only a single IP address block for the service network. For example:</p> <pre>spec: serviceNetwork: - 172.30.0.0/14</pre> <p>You can customize this field only in the install-config.yaml file before you create the manifests. The value is read-only in the manifest file.</p>
spec.defaultNetwork	object	Configures the network plugin for the cluster network.
spec.kubeProxyConfig	object	The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network plugin, the kube-proxy configuration has no effect.

defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 4.4. **defaultNetwork** object

Field	Type	Description
type	string	<p>Either OpenShiftSDN or OVNKubernetes. The Red Hat OpenShift Networking network plugin is selected during installation. You can change this value by migrating from OpenShift SDN to OVN-Kubernetes.</p> <div>  <div> NOTE OpenShift Container Platform uses the OVN-Kubernetes network plugin by default. </div> </div>
openshiftSDNConfig	object	This object is only valid for the OpenShift SDN network plugin.
ovnKubernetesConfig	object	This object is only valid for the OVN-Kubernetes network plugin.

Configuration for the OpenShift SDN network plugin

The following table describes the configuration fields for the OpenShift SDN network plugin:

Table 4.5. **openshiftSDNConfig** object

Field	Type	Description
mode	string	<p>Configures the network isolation mode for OpenShift SDN. The default value is NetworkPolicy.</p> <p>The values Multitenant and Subnet are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p>

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 50 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1450.</p> <p>This value cannot be changed after cluster installation.</p>
vxlanPort	integer	<p>The port to use for all VXLAN packets. The default value is 4789. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port 9000 and port 9999.</p>

Example OpenShift SDN configuration

```
defaultNetwork:
  type: OpenShiftSDN
  openshiftSDNConfig:
    mode: NetworkPolicy
    mtu: 1450
    vxlanPort: 4789
```

Configuration for the OVN-Kubernetes network plugin

The following table describes the configuration fields for the OVN-Kubernetes network plugin:

Table 4.6. `ovnKubernetesConfig` object

Field	Type	Description
-------	------	-------------

Field	Type	Description
mtu	integer	<p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to 100 less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of 9001, and some have an MTU of 1500, you must set this value to 1400.</p>
genevePort	integer	The port to use for all Geneve packets. The default value is 6081 . This value cannot be changed after cluster installation.
ipsecConfig	object	Specify an empty object to enable IPsec encryption.
policyAuditConfig	object	Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.
gatewayConfig	object	<p>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</p> <div>  <div> <p>NOTE</p> <p>While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.</p> </div> </div>

Field	Type	Description
v4InternalSubnet	<p>If your existing network infrastructure overlaps with the 100.64.0.0/16 IPv4 subnet, you can specify a different IP address range for internal use by OVN-Kubernetes. You must ensure that the IP address range does not overlap with any other subnet used by your OpenShift Container Platform installation. The IP address range must be larger than the maximum number of nodes that can be added to the cluster. For example, if the clusterNetwork.cidr value is 10.128.0.0/14 and the clusterNetwork.hostPrefix value is /23, then the maximum number of nodes is $2^{(23-14)}=512$.</p> <p>This field cannot be changed after installation.</p>	The default value is 100.64.0.0/16 .

Field	Type	Description
v6InternalSubnet	<p>If your existing network infrastructure overlaps with the fd98::/48 IPv6 subnet, you can specify a different IP address range for internal use by OVN-Kubernetes. You must ensure that the IP address range does not overlap with any other subnet used by your OpenShift Container Platform installation. The IP address range must be larger than the maximum number of nodes that can be added to the cluster.</p> <p>This field cannot be changed after installation.</p>	The default value is fd98::/48 .

Table 4.7. **policyAuditConfig** object

Field	Type	Description
rateLimit	integer	The maximum number of messages to generate every second per node. The default value is 20 messages per second.
maxFileSize	integer	The maximum size for the audit log in bytes. The default value is 50000000 or 50 MB.
maxLogFiles	integer	The maximum number of log files that are retained.

Field	Type	Description
destination	string	<p>One of the following additional audit log targets:</p> <p>libc The libc syslog() function of the journald process on the host.</p> <p>udp:<host>:<port> A syslog server. Replace <host>:<port> with the host and port of the syslog server.</p> <p>unix:<file> A Unix Domain Socket file specified by <file>.</p> <p>null Do not send the audit logs to any additional target.</p>
syslogFacility	string	The syslog facility, such as kern , as defined by RFC5424. The default value is local0 .

Table 4.8. gatewayConfig object

Field	Type	Description
routingViaHost	boolean	<p>Set this field to true to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is false.</p> <p>This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to true, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</p>
ipForwarding	object	You can control IP forwarding for all traffic on OVN-Kubernetes managed interfaces by using the ipForwarding specification in the Network resource. Specify Restricted to only allow IP forwarding for Kubernetes related traffic. Specify Global to allow forwarding of all IP traffic. For new installations, the default is Restricted . For updates to OpenShift Container Platform 4.14, the default is Global .

Example OVN-Kubernetes configuration with IPsec enabled

```
defaultNetwork:
  type: OVNKubernetes
  ovnKubernetesConfig:
```

```
mtu: 1400
genevePort: 6081
ipsecConfig: {}
```

kubeProxyConfig object configuration (OpenShiftSDN container network interface only)

The values for the **kubeProxyConfig** object are defined in the following table:

Table 4.9. kubeProxyConfig object

Field	Type	Description
iptablesSyncPeriod	string	<p>The refresh period for iptables rules. The default value is 30s. Valid suffixes include s, m, and h and are described in the Go time package documentation.</p> <div>  <div> <p>NOTE</p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the iptablesSyncPeriod parameter is no longer necessary.</p> </div> </div>
proxyArguments.iptables-min-sync-period	array	<p>The minimum duration before refreshing iptables rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include s, m, and h and are described in the Go time package. The default value is:</p> <pre>kubeProxyConfig: proxyArguments: iptables-min-sync-period: - 0s</pre>

4.5.10. Specifying advanced network configuration

You can use advanced network configuration for your network plugin to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

IMPORTANT

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

Procedure

PROCEDURE

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 **<installation_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    openshiftSDNConfig:
      vxlanPort: 4800
```

Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      ipsecConfig: {}
```

4. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

NOTE

For more information on using a Network Load Balancer (NLB) on AWS, see [Configuring Ingress cluster traffic on AWS using a Network Load Balancer](#).

4.5.11. Configuring an Ingress Controller Network Load Balancer on a new AWS cluster

You can create an Ingress Controller backed by an AWS Network Load Balancer (NLB) on a new cluster.

Prerequisites

- Create the **install-config.yaml** file and complete any modifications to it.

Procedure

Create an Ingress Controller backed by an AWS NLB on a new cluster.

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1 For **<installation_directory>**, specify the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a file that is named **cluster-ingress-default-ingresscontroller.yaml** in the **<installation_directory>/manifests/** directory:

```
$ touch <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml 1
```

- 1 For **<installation_directory>**, specify the directory name that contains the **manifests/** directory for your cluster.

After creating the file, several network configuration files are in the **manifests/** directory, as shown:

```
$ ls <installation_directory>/manifests/cluster-ingress-default-ingresscontroller.yaml
```

Example output

```
cluster-ingress-default-ingresscontroller.yaml
```

3. Open the **cluster-ingress-default-ingresscontroller.yaml** file in an editor and enter a custom resource (CR) that describes the Operator configuration you want:

```
apiVersion: operator.openshift.io/v1
kind: IngressController
metadata:
  creationTimestamp: null
  name: default
  namespace: openshift-ingress-operator
spec:
  endpointPublishingStrategy:
    loadBalancer:
      scope: External
      providerParameters:
        type: AWS
      aws:
        type: NLB
    type: LoadBalancerService
```

4. Save the **cluster-ingress-default-ingresscontroller.yaml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-ingress-default-ingresscontroller.yaml** file. The installation program deletes the **manifests/** directory when creating the cluster.

4.5.12. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with the OVN-Kubernetes network plugin. This allows a hybrid cluster that supports different node networking configurations.

NOTE

This configuration is necessary to run both Linux and Windows nodes in the same cluster.

Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$ ./openshift-install create manifests --dir <installation_directory>
```

where:

<installation_directory>

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
  name: cluster
spec:
EOF
```

where:

<installation_directory>

Specifies the directory name that contains the **manifests/** directory for your cluster.

3. Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
```

```

kind: Network
metadata:
  name: cluster
spec:
  defaultNetwork:
    ovnKubernetesConfig:
      hybridOverlayConfig:
        hybridClusterNetwork: 1
        - cidr: 10.132.0.0/14
          hostPrefix: 23
        hybridOverlayVXLANPort: 9898 2

```

- 1 Specify the CIDR configuration used for nodes on the additional overlay network. The **hybridClusterNetwork** CIDR cannot overlap with the **clusterNetwork** CIDR.
- 2 Specify a custom VXLAN port for the additional overlay network. This is required for running Windows nodes in a cluster installed on vSphere, and must not be configured for any other cloud provider. The custom port can be any open port excluding the default **4789** port. For more information on this requirement, see the Microsoft documentation on [Pod-to-pod connectivity between hosts is broken](#).

NOTE

Windows Server Long-Term Servicing Channel (LTSC): Windows Server 2019 is not supported on clusters with a custom **hybridOverlayVXLANPort** value because this Windows server version does not support selecting a custom VXLAN port.

4. Save the **cluster-network-03-config.yml** file and quit the text editor.
5. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program deletes the **manifests/** directory when creating the cluster.

NOTE

For more information on using Linux and Windows nodes in the same cluster, see [Understanding Windows container workloads](#).

4.5.13. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.5.14. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.5.15. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.5.16. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.5.17. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.6. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) in a restricted network by creating an internal mirror of the installation release content on an existing Amazon Virtual Private Cloud (VPC).

4.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [mirrored the images for a disconnected installation](#) to your registry and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You have an existing VPC in AWS. When installing to a restricted network using installer-provisioned infrastructure, you cannot use the installer-provisioned VPC. You must use a user-provisioned VPC that satisfies one of the following requirements:
 - Contains the mirror registry
 - Has firewall rules or a peering connection to access the mirror registry hosted elsewhere
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

**NOTE**

If you are configuring a proxy, be sure to also review this site list.

4.6.2. About installations in restricted networks

In OpenShift Container Platform 4.14, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware, Nutanix, or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift image registry and contains the installation media. You can create this registry on a mirror host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

4.6.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

4.6.3. About using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.6.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways

- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned, Name**, and **openshift.io/cluster** tags.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description	
Internet gateway	<ul style="list-style-type: none"> • AWS::EC2::InternetGateway • AWS::EC2::VPCGatewayAttachment • AWS::EC2::RouteTable • AWS::EC2::Route • AWS::EC2::SubnetRouteTableAssociation • AWS::EC2::NatGateway • AWS::EC2::EIP 	<p>You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.</p>	
Network access control	<ul style="list-style-type: none"> • AWS::EC2::NetworkAcl • AWS::EC2::NetworkAclEntry 	<p>You must allow the VPC to access the following ports:</p>	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::RouteTable • AWS::EC2::SubnetRouteTableAssociation 		
Private subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::RouteTable • AWS::EC2::SubnetRouteTableAssociation 	<p>Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.</p>	

4.6.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.6.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.6.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.6.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

4.6.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **`./openshift-install gather`** command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

1

Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.6.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- You have the **imageContentSources** values that were generated during mirror registry creation.
- You have obtained the contents of the certificate for your mirror registry.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

NOTE

Always delete the **~/.powervs** directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.

publish: Internal

By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Make any other modifications to the **install-config.yaml** file that you require. You can find more information about the available parameters in the **Installation configuration parameters** section.
4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.6.6.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.10. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.6.6.2. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-west-2a
        - us-west-2b
      rootVolume:

      -----BEGIN CERTIFICATE-----
      <MY_TRUSTED_CA_CERT>
      -----END CERTIFICATE-----
    imageContentSources: 24
    - mirrors:
      - <local_registry>/<local_repository_name>/release
      source: quay.io/openshift-release-dev/ocp-release

```

```
- mirrors:
- <local_registry>/<local_repository_name>/release
source: quay.io/openshift-release-dev/ocp-v4.0-art-dev
```

- 1 12 14** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.
- 3 8 15** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 9** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 10** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 7 11** Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

- 13** The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 16** If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 17** The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 18** The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.

- 19 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 For **<local_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.
- 23 Provide the contents of the certificate file that you used for your mirror registry.
- 24 Provide the **imageContentSources** section from the output of the command to mirror the repository.

4.6.6.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
  <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.6.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

**IMPORTANT**

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.6.8. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.6.8.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ ❶
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \ ❷
  --to=<path_to_directory_for_credentials_requests> \ ❸
```

- ❶ The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- ❷ Specify the location of the **install-config.yaml** file.
- ❸ Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
  ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample **CredentialsRequest** object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
```

```

providerSpec:
  apiVersion: cloudcredential.openshift.io/v1
  kind: AWSProviderSpec
  statementEntries:
    - effect: Allow
      action:
        - s3:CreateBucket
        - s3>DeleteBucket
      resource: "*"
  ...
secretRef:
  name: <component_secret>
  namespace: <component_namespace>
  ...

```

Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.6.8.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.6.8.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.25. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**

- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.26. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:

ccoctl [command]

Available Commands:

alibabacloud	Manage credentials objects for alibaba cloud
aws	Manage credentials objects for AWS cloud
azure	Manage credentials objects for Azure
gcp	Manage credentials objects for Google cloud
help	Help about any command
ibmcloud	Manage credentials objects for IBM Cloud
nutanix	Manage credentials objects for Nutanix

Flags:

-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

4.6.8.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).

- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.6.8.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

**NOTE**

This command might take a few moments to run.

3. Use the **ccocctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccocctl aws create-all \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \ 3
  --output-dir=<path_to_ccocctl_output_dir> \ 4
  --create-private-s3-bucket 5
```

- 1** Specify the name used to tag any cloud resources that are created for tracking.
- 2** Specify the AWS region in which cloud resources will be created.
- 3** Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4** Optional: Specify the directory in which you want the **ccocctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5** Optional: By default, the **ccocctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccocctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccocctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.6.8.2.2.2. Creating AWS resources individually

You can use the **ccctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccctl_output_dir>** to refer to this directory.

Some **ccctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccctl aws create-key-pair
```

Example output

```
2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer
```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **/<path_to_ccctl_output_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccctl aws create-identity-provider \
  --name=<name> 1
```

```
--region=<aws_region> \ 2
--public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

- 1** **<name>** is the name used to tag any cloud resources that are created for tracking.
- 2** **<aws-region>** is the AWS region in which cloud resources will be created.
- 3** **<path_to_ccoctl_output_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in **/<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml**. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:

- a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ 1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2** Specify the location of the **install-config.yaml** file.
- 3** Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.6.8.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccoctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.

- You have configured the Cloud Credential Operator utility (**ccoctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccoctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccoctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccoctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccoctl_output_dir>/tls .
```

4.6.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.6.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

4.6.11. Disabling the default OperatorHub catalog sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
  -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

TIP

Alternatively, you can use the web console to manage catalog sources. From the **Administration** → **Cluster Settings** → **Configuration** → **OperatorHub** page, click the **Sources** tab, where you can create, update, delete, disable, and enable individual sources.

4.6.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

4.6.13. Next steps

- [Validate an installation](#).
- [Customize your cluster](#).
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#).
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#).

4.7. INSTALLING A CLUSTER ON AWS INTO AN EXISTING VPC

In OpenShift Container Platform version 4.14, you can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

4.7.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.

- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.
- If the existing VPC is owned by a different account than the cluster, you [shared the VPC](#) between accounts.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.7.2. About using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.7.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- Create a public and private subnet for each availability zone that your cluster uses. Each availability zone can contain no more than one public and one private subnet. For an example of this type of configuration, see [VPC with public and private subnets \(NAT\)](#) in the AWS documentation.
Record each subnet ID. Completing the installation requires that you enter these values in the **platform** section of the **install-config.yaml** file. See [Finding a subnet ID](#) in the AWS documentation.
- The VPC's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.
- The VPC must have a public internet gateway attached to it. For each availability zone:
 - The public subnet requires a route to the internet gateway.
 - The public subnet requires a NAT gateway with an EIP address.
 - The private subnet requires a route to the NAT gateway in public subnet.
- The VPC must not use the **kubernetes.io/cluster/.*: owned, Name**, and **openshift.io/cluster** tags.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description	
Internet gateway	<ul style="list-style-type: none">• AWS::EC2::InternetGateway• AWS::EC2::VPCGatewayAttachment• AWS::EC2::RouteTable• AWS::EC2::Route• AWS::EC2::SubnetRouteTableAssociation• AWS::EC2::NatGateway• AWS::EC2::EIP	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.	
Network access control	<ul style="list-style-type: none">• AWS::EC2::NetworkAcl• AWS::EC2::NetworkAclEntry	You must allow the VPC to access the following ports:	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
0 - 65535	Outbound ephemeral traffic		
Private subnets	<ul style="list-style-type: none">• AWS::EC2::Subnet• AWS::EC2::RouteTable• AWS::EC2::SubnetRouteTableAssociation	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

4.7.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.7.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.7.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.7.2.5. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing

traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Applying existing AWS security groups to the cluster".

4.7.2.6. Modifying trust policy when installing into a shared VPC

If you install your cluster using a shared VPC, you can use the **Passthrough** or **Manual** credentials mode. You must add the IAM role used to install the cluster as a principal in the trust policy of the account that owns the VPC.

If you use **Passthrough** mode, add the Amazon Resource Name (ARN) of the account that creates the cluster, such as **arn:aws:iam::123456789012:user/clustercreator**, to the trust policy as a principal.

If you use **Manual** mode, add the ARN of the account that creates the cluster as well as the ARN of the ingress operator role in the cluster owner account, such as **arn:aws:iam::123456789012:role/<cluster-name>-openshift-ingress-operator-cloud-credentials**, to the trust policy as principals.

You must add the following actions to the policy:

Example 4.27. Required actions for shared VPC installation

- **route53:ChangeResourceRecordSets**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:GetAccountLimit**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**
- **tag:GetResources**
- **tag:UntagResources**

4.7.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.7.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.7.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.7.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create the **install-config.yaml** file.

- a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

NOTE

Always delete the **~/.powervs** directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
- iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
- iv. Select the AWS region to deploy the cluster to.
- v. Select the base domain for the Route 53 service that you configured for your cluster.

- vi. Enter a descriptive name for your cluster.
2. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.
3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.7.6.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.11. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

**NOTE**

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.7.6.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

**NOTE**

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.28. Machine types based on 64-bit x86 architecture

- **c4.***
- **c5.***
- **c5a.***
- **i3.***
- **m4.***
- **m5.***
- **m5a.***
- **m6a.***
- **m6i.***

- **r4.***
- **r5.***
- **r5a.***
- **r6i.***
- **t3.***
- **t3a.***

4.7.6.3. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.29. Machine types based on 64-bit ARM architecture

- **c6g.***
- **c7g.***
- **m6g.***
- **m7g.***
- **r8g.***

4.7.6.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
```

```

      - subnet-1
      - subnet-2
      - subnet-3
    amiID: ami-0c5d3e03c0ab9b19a 17
    serviceEndpoints: 18
      - name: ec2

```

```
url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
hostedZone: Z3URY6TWQ91KVV 19
fips: false 20
sshKey: ssh-ed25519 AAAA... 21
pullSecret: '{"auths": ...}' 22
```

- 1 12 14 22** Required. The installation program prompts you for this value.
- 2** Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.
- 3 8 15** If you do not provide these parameters and values, the installation program provides the default value.
- 4** The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 9** Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 10** To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.
- 7 11** Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

- 13** The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 16** If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 17** The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

- 18 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 19 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

4.7.6.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.7.6.6. Applying existing AWS security groups to the cluster

Applying existing AWS security groups to your control plane and compute machines can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

Prerequisites

- You have created the security groups in AWS. For more information, see the AWS documentation about working with [security groups](#).
- The security groups must be associated with the existing VPC that you are deploying the cluster to. The security groups cannot be associated with another VPC.
- You have an existing **install-config.yaml** file.

Procedure

1. In the **install-config.yaml** file, edit the **compute.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your compute machines.
2. Edit the **controlPlane.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your control plane machines.
3. Save the file and reference it when deploying the cluster.

Sample **install-config.yaml** file that specifies custom security groups

```
# ...
compute:
- hyperthreading: Enabled
  name: worker
```

```

platform:
  aws:
    additionalSecurityGroupIDs:
      - sg-1 1
      - sg-2
  replicas: 3
controlPlane:
  hyperthreading: Enabled
  name: master
platform:
  aws:
    additionalSecurityGroupIDs:
      - sg-3
      - sg-4
  replicas: 3
platform:
  aws:
    region: us-east-1
  subnets: 2
    - subnet-1
    - subnet-2
    - subnet-3

```

- 1** Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.
- 2** Specify subnets for each availability zone that your cluster uses.

4.7.7. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

**NOTE**

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.7.8. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.7.8.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSPProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
  ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample **CredentialsRequest** object with secrets

■

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3:DeleteBucket
        resource: "*"
    ...
  secretRef:
    name: <component_secret>
    namespace: <component_namespace>
  ...

```

Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.7.8.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.7.8.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.30. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**

- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.31. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

- Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

- Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

- Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:

ccoctl [command]

Available Commands:

```
alibabacloud Manage credentials objects for alibaba cloud
aws           Manage credentials objects for AWS cloud
azure         Manage credentials objects for Azure
gcp           Manage credentials objects for Google cloud
help          Help about any command
ibmcloud      Manage credentials objects for IBM Cloud
nutanix       Manage credentials objects for Nutanix
```

Flags:

```
-h, --help  help for ccoctl
```

Use "ccoctl [command] --help" for more information about a command.

4.7.8.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.7.8.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.

2 Specify the location of the **install-config.yaml** file.

- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

**NOTE**

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \ 3
  --output-dir=<path_to_ccoctl_output_dir> \ 4
  --create-private-s3-bucket 5
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the AWS region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5 Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
```

```

openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml

```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.7.8.2.2.2. Creating AWS resources individually

You can use the **ccoctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccoctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Some **ccoctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccoctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccoctl aws create-key-pair
```

Example output

```

2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer

```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **<path_to_ccoctl_output_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

- 1** **<name>** is the name used to tag any cloud resources that are created for tracking.
- 2** **<aws-region>** is the AWS region in which cloud resources will be created.
- 3** **<path_to_ccoctl_output_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in **<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml**. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:
 - a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ 1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.

- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.7.8.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccocctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccocctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccocctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccocctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccocctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccocctl_output_dir>/tls .
```

4.7.9. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.7.10. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.7.11. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.7.12. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.7.13. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.8. INSTALLING A PRIVATE CLUSTER ON AWS

In OpenShift Container Platform version 4.14, you can install a private cluster into an existing VPC on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

4.8.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.8.2. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
 - The API services for the cloud to which you provision.
 - The hosts on the network that you provision.
 - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.8.2.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.8.2.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

4.8.3. About using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.8.3.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned, Name**, and **openshift.io/cluster** tags.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared**

tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.

- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description	
VPC	<ul style="list-style-type: none">• AWS::EC2::VPC• AWS::EC2::VPCEndpoint	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.	
Public subnets	<ul style="list-style-type: none">• AWS::EC2::Subnet• AWS::EC2::SubnetNetworkAclAssociation	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.	
Internet gateway	<ul style="list-style-type: none">• AWS::EC2::InternetGateway• AWS::EC2::VPCGatewayAttachment• AWS::EC2::RouteTable• AWS::EC2::Route• AWS::EC2::SubnetRouteTableAssociation• AWS::EC2::NatGateway• AWS::EC2::EIP	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.	
Network access control	<ul style="list-style-type: none">• AWS::EC2::NetworkAcl• AWS::EC2::NetworkAclEntry	You must allow the VPC to access the following ports:	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
		0 - 65535	Outbound ephemeral traffic

Component	AWS type	Description
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.

4.8.3.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.8.3.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.8.3.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.8.3.5. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Applying existing AWS security groups to the cluster".

4.8.4. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.8.5. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.8.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.

3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.8.7. Manually creating the installation configuration file

When installing a private OpenShift Container Platform cluster, you must manually generate the installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

**IMPORTANT**

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

**NOTE**

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.8.7.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.12. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so

you might need to over-allocate storage volume to obtain sufficient performance.

3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.8.7.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.32. Machine types based on 64-bit x86 architecture

- **c4.***
- **c5.***
- **c5a.***
- **i3.***
- **m4.***

- m5.*
- m5a.*
- m6a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

4.8.7.3. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.33. Machine types based on 64-bit ARM architecture

- c6g.*
- c7g.*
- m6g.*
- m7g.*
- r8g.*

4.8.7.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

1 12 14 23 Required. The installation program prompts you for this value.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.

3 8 15 If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

5 9 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

6 10 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

7 11 Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

13 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

- 16 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 17 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 18 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 19 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

4.8.7.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2,Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.8.7.6. Applying existing AWS security groups to the cluster

Applying existing AWS security groups to your control plane and compute machines can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

Prerequisites

- You have created the security groups in AWS. For more information, see the AWS documentation about working with [security groups](#).
- The security groups must be associated with the existing VPC that you are deploying the cluster to. The security groups cannot be associated with another VPC.
- You have an existing **install-config.yaml** file.

Procedure

1. In the **install-config.yaml** file, edit the **compute.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your compute machines.
2. Edit the **controlPlane.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your control plane machines.
3. Save the file and reference it when deploying the cluster.

Sample **install-config.yaml** file that specifies custom security groups

```
# ...
compute:
- hyperthreading: Enabled
  name: worker
```

```

platform:
  aws:
    additionalSecurityGroupIDs:
      - sg-1 ❶
      - sg-2
  replicas: 3
controlPlane:
  hyperthreading: Enabled
  name: master
platform:
  aws:
    additionalSecurityGroupIDs:
      - sg-3
      - sg-4
  replicas: 3
platform:
  aws:
    region: us-east-1
    subnets: ❷
      - subnet-1
      - subnet-2
      - subnet-3

```

❶ Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.

❷ Specify subnets for each availability zone that your cluster uses.

4.8.8. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

**NOTE**

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.8.9. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.8.9.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSPProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
  ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample **CredentialsRequest** object with secrets

■

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3:DeleteBucket
        resource: "*"
    ...
  secretRef:
    name: <component_secret>
    namespace: <component_namespace>
  ...

```

Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.8.9.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.8.9.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.34. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**

- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.35. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccctl** tool.

3. Extract the **ccctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccctl** executable by running the following command:

```
$ chmod 775 ccctl
```

Verification

- To verify that **ccctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:

ccctl [command]

Available Commands:

alibabacloud	Manage credentials objects for alibaba cloud
aws	Manage credentials objects for AWS cloud
azure	Manage credentials objects for Azure
gcp	Manage credentials objects for Google cloud
help	Help about any command
ibmcloud	Manage credentials objects for IBM Cloud
nutanix	Manage credentials objects for Nutanix

Flags:

-h, --help help for ccctl

Use "ccctl [command] --help" for more information about a command.

4.8.9.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.8.9.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.

- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \ 3
  --output-dir=<path_to_ccoctl_output_dir> \ 4
  --create-private-s3-bucket 5
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the AWS region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5 Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
```

```

openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml

```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.8.9.2.2.2. Creating AWS resources individually

You can use the **ccctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccctl_output_dir>** to refer to this directory.

Some **ccctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccctl aws create-key-pair
```

Example output

```

2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer

```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **<path_to_ccctl_output_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

- 1** **<name>** is the name used to tag any cloud resources that are created for tracking.
- 2** **<aws-region>** is the AWS region in which cloud resources will be created.
- 3** **<path_to_ccoctl_output_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in **<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml**. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:
 - a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ 1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.

- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.8.9.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccoctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccoctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccoctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccoctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccoctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccoctl_output_dir>/tls .
```

4.8.10. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.8.11. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.8.12. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.8.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.8.14. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.9. INSTALLING A CLUSTER ON AWS INTO A GOVERNMENT REGION

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) into a government region. To configure the region, modify parameters in the **install-config.yaml** file before you install the cluster.

4.9.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.9.2. AWS government regions

OpenShift Container Platform supports deploying a cluster to an [AWS GovCloud \(US\)](#) region.

The following AWS GovCloud partitions are supported:

- **us-gov-east-1**
- **us-gov-west-1**

4.9.3. Installation requirements

Before you can install the cluster, you must:

- Provide an existing private AWS VPC and subnets to host the cluster. Public zones are not supported in Route 53 in AWS GovCloud. As a result, clusters must be private when you deploy to an AWS government region.
- Manually create the installation configuration file (**install-config.yaml**).

4.9.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

NOTE

Public zones are not supported in Route 53 in an AWS GovCloud Region. Therefore, clusters must be private if they are deployed to an AWS GovCloud Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
 - The API services for the cloud to which you provision.
 - The hosts on the network that you provision.
 - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.9.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.9.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

4.9.5. About using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.9.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

**NOTE**

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned, Name**, and **openshift.io/cluster** tags.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.
Internet gateway	<ul style="list-style-type: none"> • AWS::EC2::InternetGateway • AWS::EC2::VPCGatewayAttachment • AWS::EC2::RouteTable • AWS::EC2::Route • AWS::EC2::SubnetRouteTableAssociation • AWS::EC2::NatGateway • AWS::EC2::EIP 	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

Component	AWS type	Description	
Network access control	<ul style="list-style-type: none"> ● AWS::EC2::NetworkAcl ● AWS::EC2::NetworkAclEntry 	You must allow the VPC to access the following ports:	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
		0 - 65535	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

4.9.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.9.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.9.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.9.5.5. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Applying existing AWS security groups to the cluster".

4.9.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.9.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.9.8. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      amiID: ami-06c4d345f7c207239 1
      type: m5.4xlarge
    replicas: 3
  metadata:
    name: test-cluster
  platform:
    aws:
      region: us-east-2 2
sshKey: ssh-ed25519 AAAA...
pullSecret: '{"auths": ...}'
```

- 1** The AMI ID from your AWS Marketplace subscription.
- 2** Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

4.9.9. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.9.10. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites

- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.9.10.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.13. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.9.10.2. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.36. Machine types based on 64-bit x86 architecture

- **c4.***
- **c5.***
- **c5a.***
- **i3.***

- **m4.***
- **m5.***
- **m5a.***
- **m6a.***
- **m6i.***
- **r4.***
- **r5.***
- **r5a.***
- **r6i.***
- **t3.***
- **t3a.***

4.9.10.3. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.37. Machine types based on 64-bit ARM architecture

- **c6g.***
- **c7g.***
- **m6g.***
- **m7g.***
- **r8g.***

4.9.10.4. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master
  platform:
    aws:
      zones:
        - us-gov-west-1a
        - us-gov-west-1b
      rootVolume:
        iops: 4000
        size: 500
        type: io1 6
      metadataService:
        authentication: Optional 7
        type: m6i.xlarge
      replicas: 3
compute: 8
- hyperthreading: Enabled 9
  name: worker
  platform:
    aws:
      rootVolume:
        iops: 2000
        size: 500
        type: io1 10
      metadataService:
        authentication: Optional 11
        type: c5.4xlarge
      zones:
        - us-gov-west-1c
      replicas: 3
metadata:
  name: test-cluster 12
networking:
  clusterNetwork:

sshKey: ssh-ed25519 AAAA... 21
publish: Internal 22
pullSecret: '{"auths": ...}' 23

```

1 12 14 23 Required.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.

3 8 15 If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

5 9 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

6 10 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

7 11 Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

**NOTE**

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

- 13 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 16 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 17 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 18 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 19 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 20 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

**IMPORTANT**

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 21 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 22 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

4.9.10.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ❶
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ❷
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com ❸
  additionalTrustBundle: | ❹
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> ❺
```

- ❶ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- ❷ A proxy URL to use for creating HTTPS connections outside the cluster.
- ❸ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- ❹ If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.9.10.6. Applying existing AWS security groups to the cluster

Applying existing AWS security groups to your control plane and compute machines can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

Prerequisites

- You have created the security groups in AWS. For more information, see the AWS documentation about working with [security groups](#).
- The security groups must be associated with the existing VPC that you are deploying the cluster to. The security groups cannot be associated with another VPC.
- You have an existing **install-config.yaml** file.

Procedure

1. In the **install-config.yaml** file, edit the **compute.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your compute machines.
2. Edit the **controlPlane.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your control plane machines.
3. Save the file and reference it when deploying the cluster.

Sample **install-config.yaml** file that specifies custom security groups

■

```
# ...
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      additionalSecurityGroupIDs:
        - sg-1 1
        - sg-2
    replicas: 3
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      additionalSecurityGroupIDs:
        - sg-3
        - sg-4
    replicas: 3
platform:
  aws:
    region: us-east-1
    subnets: 2
      - subnet-1
      - subnet-2
      - subnet-3
```

- 1** Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.
- 2** Specify subnets for each availability zone that your cluster uses.

4.9.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.

4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

**NOTE**

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.9.12. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Incorporating the Cloud Credential Operator utility manifests](#).

4.9.12.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ ❶
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \ ❷
  --to=<path_to_directory_for_credentials_requests> ❸
```

- ❶ The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- ❷ Specify the location of the **install-config.yaml** file.
- ❸ Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
  ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample `CredentialsRequest` object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3:DeleteBucket
        resource: "*"
    ...
  secretRef:
    name: <component_secret>
    namespace: <component_namespace>
    ...

```

Sample `Secret` object

```

apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.9.12.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.9.12.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.38. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**

- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.39. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccctl** tool.

3. Extract the **ccctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccctl** executable by running the following command:

```
$ chmod 775 ccctl
```

Verification

- To verify that **ccctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccctl.rhel9
```

Example output

OpenShift credentials provisioning tool

Usage:

ccctl [command]

Available Commands:

alibabacloud	Manage credentials objects for alibaba cloud
aws	Manage credentials objects for AWS cloud
azure	Manage credentials objects for Azure
gcp	Manage credentials objects for Google cloud
help	Help about any command
ibmcloud	Manage credentials objects for IBM Cloud
nutanix	Manage credentials objects for Nutanix

Flags:

-h, --help help for ccctl

Use "ccctl [command] --help" for more information about a command.

4.9.12.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.9.12.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.

- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

**NOTE**

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \ 3
  --output-dir=<path_to_ccoctl_output_dir> \ 4
  --create-private-s3-bucket 5
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the AWS region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5 Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

**NOTE**

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
```

```

openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml

```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.9.12.2.2.2. Creating AWS resources individually

You can use the **ccctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccctl_output_dir>** to refer to this directory.

Some **ccctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccctl aws create-key-pair
```

Example output

```

2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer

```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in `/<path_to_ccoctl_output_dir>/tls/bound-service-account-signing-key.key`.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

- 1** `<name>` is the name used to tag any cloud resources that are created for tracking.
- 2** `<aws-region>` is the AWS region in which cloud resources will be created.
- 3** `<path_to_ccoctl_output_dir>` is the path to the public key file that the `ccoctl aws create-key-pair` command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in `/<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml`. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:
 - a. Set a `$RELEASE_IMAGE` variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ 1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.9.12.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccctl_output_dir>/tls .
```

4.9.13. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
```

```
console.apps.mycluster.example.com
```

```
INFO Login to the console with user: "kubeadmin", and password: "password"
```

```
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.9.14. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.9.15. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

4.9.16. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

4.9.17. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#) .

4.10. INSTALLING A CLUSTER ON AWS INTO A SECRET OR TOP SECRET REGION

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) into the following secret regions:

- Secret Commercial Cloud Services (SC2S)
- Commercial Cloud Services (C2S)

To configure a cluster in either region, you change parameters in the **install config.yaml** file before you install the cluster.

4.10.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multifactor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

4.10.2. AWS secret regions

The following AWS secret partitions are supported:

- **us-isob-east-1** (SC2S)
- **us-iso-east-1** (C2S)

NOTE

The maximum supported MTU in an AWS SC2S and C2S Regions is not the same as AWS commercial. For more information about configuring MTU during installation, see the *Cluster Network Operator configuration object* section in *Installing a cluster on AWS with network customizations*

4.10.3. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image for the AWS Secret and Top Secret Regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (**install-config.yaml**).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

IMPORTANT

You must also define a custom CA certificate in the **additionalTrustBundle** field of the **install-config.yaml** file because the AWS API requires a custom CA trust bundle. To allow the installation program to access the AWS API, the CA certificates must also be defined on the machine that runs the installation program. You must add the CA bundle to the trust store on the machine, use the **AWS_CA_BUNDLE** environment variable, or define the CA bundle in the **ca_bundle** field of the AWS config file.

4.10.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

NOTE

Public zones are not supported in Route 53 in an AWS Top Secret Region. Therefore, clusters must be private if they are deployed to an AWS Top Secret Region.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
 - The API services for the cloud to which you provision.
 - The hosts on the network that you provision.
 - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network or a machine that has access to the network through a VPN.

4.10.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.10.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

4.10.5. About using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.10.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options
- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned, Name**, and **openshift.io/cluster** tags.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared**

tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.

- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

A cluster in an SC2S or C2S Region is unable to reach the public IP addresses for the EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

SC2S

- **elasticloadbalancing.<aws_region>.sc2s.sgov.gov**
- **ec2.<aws_region>.sc2s.sgov.gov**
- **s3.<aws_region>.sc2s.sgov.gov**

C2S

- **elasticloadbalancing.<aws_region>.c2s.ic.gov**
- **ec2.<aws_region>.c2s.ic.gov**
- **s3.<aws_region>.c2s.ic.gov**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

SC2S

- **elasticloadbalancing.<aws_region>.sc2s.sgov.gov**
- **ec2.<aws_region>.sc2s.sgov.gov**

- **s3.<aws_region>.sc2s.sgov.gov**

C2S

- **elasticloadbalancing.<aws_region>.c2s.ic.gov**
- **ec2.<aws_region>.c2s.ic.gov**
- **s3.<aws_region>.c2s.ic.gov**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description	
VPC	<ul style="list-style-type: none">● AWS::EC2::VPC● AWS::EC2::VPCEndpoint	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.	
Public subnets	<ul style="list-style-type: none">● AWS::EC2::Subnet● AWS::EC2::SubnetNetworkAclAssociation	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.	
Internet gateway	<ul style="list-style-type: none">● AWS::EC2::InternetGateway● AWS::EC2::VPCGatewayAttachment● AWS::EC2::RouteTable● AWS::EC2::Route● AWS::EC2::SubnetRouteTableAssociation● AWS::EC2::NatGateway● AWS::EC2::EIP	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.	
Network access control	<ul style="list-style-type: none">● AWS::EC2::NetworkAcl● AWS::EC2::NetworkAclEntry	You must allow the VPC to access the following ports:	
		Port	Reason

Component	AWS type	Description	
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
		0 - 65535	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::RouteTable • AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

4.10.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.10.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics

the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.10.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.10.5.5. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Applying existing AWS security groups to the cluster".

4.10.6. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.10.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

1 1 1 The RHCOS VMDK version, like **4.14.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
```

```
"UserBucket": {
  "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
  "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
}
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" \ 1
  --disk-container "file://<file_path>/containers.json" 2
```

- 1** The description of your RHCOS disk being imported, like **rhcos-\${RHCOS_VERSION}-x86_64-aws.x86_64**.
- 2** The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
```

```
--ena-support \
--name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❸
--virtualization-type hvm \
--root-device-name '/dev/xvda' \
--block-device-mappings 'DeviceName=/dev/xvda,Ebs=
{DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' ❹
```

- ❶ The RHCOS VMDK architecture type, like **x86_64**, **aarch64**, **s390x**, or **ppc64le**.
- ❷ The **Description** from the imported snapshot.
- ❸ The name of the RHCOS AMI.
- ❹ The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

4.10.8. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> ❶
```

- ❶ Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.10.9. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.10.10. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.
- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.10.10.1. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.40. Machine types based on 64-bit x86 architecture for secret regions

- **c4.***
- **c5.***
- **i3.***
- **m4.***
- **m5.***
- **r4.***
- **r5.***
- **t3.***

4.10.10.2. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```

apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
  hyperthreading: Enabled 5
  name: master

      propagateUserTags: true 15
      userTags:
        adminContact: jdoe
        costCenter: 7536
      subnets: 16
      - subnet-1
      - subnet-2
      - subnet-3
      amiID: ami-96c6f8f7 17 18
      serviceEndpoints: 19
      - name: ec2
        url: https://vpce-id.ec2.us-west-2.vpce.amazonaws.com
      hostedZone: Z3URY6TWQ91KVV 20
  fips: false 21
  sshKey: ssh-ed25519 AAAA... 22
  publish: Internal 23
  pullSecret: '{"auths": ...}' 24
  additionalTrustBundle: | 25
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----

```

1 **12** **14** **17** **24** Required.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.

3 **8** **15**

If you do not provide these parameters and values, the installation program provides the default value.

- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 9 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 6 10 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **ios** to **2000**.
- 7 11 Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

- 13 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 16 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 18 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.
- 19 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 20 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 21 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 22 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 23 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.
- 25 The custom CA certificate. This is required when deploying to the SC2S or C2S Regions because the AWS API requires a custom CA trust bundle.

4.10.10.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ❶
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ❷
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com ❸
  additionalTrustBundle: | ❹
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> ❺
```

- ❶ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- ❷ A proxy URL to use for creating HTTPS connections outside the cluster.
- ❸ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- ❹ If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- ❺ Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.10.10.4. Applying existing AWS security groups to the cluster

Applying existing AWS security groups to your control plane and compute machines can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

Prerequisites

- You have created the security groups in AWS. For more information, see the AWS documentation about working with [security groups](#).
- The security groups must be associated with the existing VPC that you are deploying the cluster to. The security groups cannot be associated with another VPC.
- You have an existing **install-config.yaml** file.

Procedure

1. In the **install-config.yaml** file, edit the **compute.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your compute machines.
2. Edit the **controlPlane.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your control plane machines.
3. Save the file and reference it when deploying the cluster.

Sample **install-config.yaml** file that specifies custom security groups

```
# ...
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      additionalSecurityGroupIDs:
        - sg-1 1
        - sg-2
  replicas: 3
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      additionalSecurityGroupIDs:
        - sg-3
        - sg-4
```

```
replicas: 3
platform:
aws:
  region: us-east-1
  subnets: 2
    - subnet-1
    - subnet-2
    - subnet-3
```

- 1 Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.
- 2 Specify subnets for each availability zone that your cluster uses.

4.10.11. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.10.12. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.10.12.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1 \
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2 \
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
          - iam:ListAccessKeys
        resource: "*"
  ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample **CredentialsRequest** object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3>DeleteBucket
        resource: "*"
  ...
  secretRef:
```

```
name: <component_secret>
namespace: <component_namespace>
...
```

Sample Secret object

```
apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.10.12.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.10.12.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.41. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**

- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required **s3** permissions

- **s3:CreateBucket**
- **s3:DeleteBucket**
- **s3:DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**

- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.42. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

NOTE

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

```
OpenShift credentials provisioning tool

Usage:
ccoctl [command]

Available Commands:
alibabacloud Manage credentials objects for alibaba cloud
aws           Manage credentials objects for AWS cloud
azure         Manage credentials objects for Azure
gcp           Manage credentials objects for Google cloud
help          Help about any command
ibmcloud      Manage credentials objects for IBM Cloud
nutanix       Manage credentials objects for Nutanix

Flags:
-h, --help  help for ccoctl

Use "ccoctl [command] --help" for more information about a command.
```

4.10.12.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.10.12.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> \1
```

```
--region=<aws_region> \ 2
--credentials-requests-dir=<path_to_credentials_requests_directory> \ 3
--output-dir=<path_to_ccoctl_output_dir> \ 4
--create-private-s3-bucket 5
```

- 1** Specify the name used to tag any cloud resources that are created for tracking.
- 2** Specify the AWS region in which cloud resources will be created.
- 3** Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4** Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5** Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.10.12.2.2.2. Creating AWS resources individually

You can use the **ccoctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccoctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Some **ccoctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccoctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccoctl aws create-key-pair
```

Example output

```
2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer
```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **/<path_to_ccoctl_output_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3
```

1 **<name>** is the name used to tag any cloud resources that are created for tracking.

2 **<aws-region>** is the AWS region in which cloud resources will be created.

3 **<path_to_ccoctl_output_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in `/<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml`. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:

- a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included 1 \
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
2 \
  --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2** Specify the location of the **install-config.yaml** file.
- 3** Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
<aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.10.12.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccoctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccoctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccoctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...
```

- If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

- Copy the manifests that the **ccocctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccocctl_output_dir>/manifests/* ./manifests/
```

- Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccocctl_output_dir>/tls .
```

4.10.13. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

- Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrap** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.10.14. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.10.15. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/openshift_install.log** log file on the installation host.

- List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

- Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

Additional resources

- [Accessing the web console](#)

4.10.16. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- [About remote health monitoring](#)

4.10.17. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

4.11. INSTALLING A CLUSTER ON AWS CHINA

In OpenShift Container Platform version 4.14, you can install a cluster to the following Amazon Web Services (AWS) China regions:

- **cn-north-1** (Beijing)
- **cn-northwest-1** (Ningxia)

4.11.1. Prerequisites

- You have an Internet Content Provider (ICP) license.
- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

4.11.2. Installation requirements

Red Hat does not publish a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) for the AWS China regions.

Before you can install the cluster, you must:

- Upload a custom RHCOS AMI.
- Manually create the installation configuration file (**install-config.yaml**).
- Specify the AWS region, and the accompanying custom AMI, in the installation configuration file.

You cannot use the OpenShift Container Platform installation program to create the installation configuration file. The installer does not list an AWS region without native support for an RHCOS AMI.

4.11.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.11.4. Private clusters

You can deploy a private OpenShift Container Platform cluster that does not expose external endpoints. Private clusters are accessible from only an internal network and are not visible to the internet.

By default, OpenShift Container Platform is provisioned to use publicly-accessible DNS and endpoints. A private cluster sets the DNS, Ingress Controller, and API server to private when you deploy your cluster. This means that the cluster resources are only accessible from your internal network and are not visible to the internet.

IMPORTANT

If the cluster has any public subnets, load balancer services created by administrators might be publicly accessible. To ensure cluster security, verify that these services are explicitly annotated as private.

To deploy a private cluster, you must:

- Use existing networking that meets your requirements. Your cluster resources might be shared between other clusters on the network.
- Deploy from a machine that has access to:
 - The API services for the cloud to which you provision.
 - The hosts on the network that you provision.
 - The internet to obtain installation media.

You can use any machine that meets these access requirements and follows your company's guidelines. For example, this machine can be a bastion host on your cloud network.

NOTE

AWS China does not support a VPN connection between the VPC and your network. For more information about the Amazon VPC service in the Beijing and Ningxia regions, see [Amazon Virtual Private Cloud](#) in the AWS China documentation.

4.11.4.1. Private clusters in AWS

To create a private cluster on Amazon Web Services (AWS), you must provide an existing private VPC and subnets to host the cluster. The installation program must also be able to resolve the DNS records that the cluster requires. The installation program configures the Ingress Operator and API server for access from only the private network.

The cluster still requires access to internet to access the AWS APIs.

The following items are not required or created when you install a private cluster:

- Public subnets
- Public load balancers, which support public ingress
- A public Route 53 zone that matches the **baseDomain** for the cluster

The installation program does use the **baseDomain** that you specify to create a private Route 53 zone and the required records for the cluster. The cluster is configured so that the Operators do not create public records for the cluster and all cluster machines are placed in the private subnets that you specify.

4.11.4.1.1. Limitations

The ability to add public functionality to a private cluster is limited.

- You cannot make the Kubernetes API endpoints public after installation without taking additional actions, including creating public subnets in the VPC for each availability zone in use, creating a public load balancer, and configuring the control plane security groups to allow traffic from the internet on 6443 (Kubernetes API port).
- If you use a public Service type load balancer, you must tag a public subnet in each availability zone with **kubernetes.io/cluster/<cluster-infra-id>: shared** so that AWS can use them to create public load balancers.

4.11.5. About using a custom VPC

In OpenShift Container Platform 4.14, you can deploy a cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). By deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set. If you cannot obtain the infrastructure creation permissions that are required to create the VPC yourself, use this installation option.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

4.11.5.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables
- VPCs
- VPC DHCP options

- VPC endpoints

NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

- The VPC must not use the **kubernetes.io/cluster/.*: owned, Name**, and **openshift.io/cluster** tags.
The installation program modifies your subnets to add the **kubernetes.io/cluster/.*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com.cn**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com.cn**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.
Internet gateway	<ul style="list-style-type: none"> • AWS::EC2::InternetGateway • AWS::EC2::VPCGatewayAttachment • AWS::EC2::RouteTable • AWS::EC2::Route • AWS::EC2::SubnetRouteTableAssociation • AWS::EC2::NatGateway • AWS::EC2::EIP 	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.

Component	AWS type	Description	
Network access control	<ul style="list-style-type: none"> ● AWS::EC2::NetworkAcl ● AWS::EC2::NetworkAclEntry 	You must allow the VPC to access the following ports:	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 		
Private subnets	<ul style="list-style-type: none"> ● AWS::EC2::Subnet ● AWS::EC2::RouteTable ● AWS::EC2::SubnetRouteTableAssociation 	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

4.11.5.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains no more than one public and one private subnet. If you use a private cluster, provide only a private subnet for each availability zone. Otherwise, provide exactly one public and private subnet for each availability zone.
- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.*: shared** tag is removed from the subnets that it used.

4.11.5.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

4.11.5.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

4.11.5.5. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Applying existing AWS security groups to the cluster".

4.11.6. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the **~/.ssh/authorized_keys** list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

4.11.7. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> ❶
```

- ❶ The AWS profile name that holds your AWS credentials, like **beijingadmin**.

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> ❶
```

- ❶ The AWS region, like **cn-north-1**.

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> ❶
```

- ❶ The RHCOS VMDK version, like **4.14.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
{
  "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
  "Format": "vmdk",
  "UserBucket": {
    "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
    "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
  }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
  --description "<description>" ❶ \
  --disk-container "file://<file_path>/containers.json" ❷
```

- ❶ The description of your RHCOS disk being imported, like **rhcos-\${RHCOS_VERSION}-x86_64-aws.x86_64**.

- ❷ The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

Example output

```
{
  "ImportSnapshotTasks": [
    {
      "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
      "ImportTaskId": "import-snap-fh6i8uil",
      "SnapshotTaskDetail": {
        "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
        "DiskImageSize": 819056640.0,
        "Format": "VMDK",
        "SnapshotId": "snap-06331325870076318",
        "Status": "completed",
        "UserBucket": {
          "S3Bucket": "external-images",
          "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
        }
      }
    }
  ]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
  --region ${AWS_DEFAULT_REGION} \
  --architecture x86_64 \ 1
  --description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 2
  --ena-support \
  --name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ 3
  --virtualization-type hvm \
  --root-device-name '/dev/xvda' \
  --block-device-mappings 'DeviceName=/dev/xvda,Ebs={DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' 4
```

- 1** The RHCOS VMDK architecture type, like **x86_64**, **aarch64**, **s390x**, or **ppc64le**.
- 2** The **Description** from the imported snapshot.
- 3** The name of the RHCOS AMI.
- 4** The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

4.11.8. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.11.9. Manually creating the installation configuration file

Installing the cluster requires that you manually generate the installation configuration file.

Prerequisites

- You have uploaded a custom RHCOS AMI.
- You have an SSH public key on your local machine to provide to the installation program. The key will be used for SSH authentication onto your cluster nodes for debugging and disaster recovery.

- You have obtained the OpenShift Container Platform installation program and the pull secret for your cluster.

Procedure

1. Create an installation directory to store your required installation assets in:

```
$ mkdir <installation_directory>
```

IMPORTANT

You must create a directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

2. Customize the sample **install-config.yaml** file template that is provided and save it in the **<installation_directory>**.

NOTE

You must name this configuration file **install-config.yaml**.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

IMPORTANT

The **install-config.yaml** file is consumed during the next step of the installation process. You must back it up now.

Additional resources

- [Installation configuration parameters for AWS](#)

4.11.9.1. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

IMPORTANT

This sample YAML file is provided for reference only. Use it as a resource to enter parameter values into the installation configuration file that you created manually.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
hyperthreading: Enabled 5
```

```

name: master
platform:
  aws:

      costCenter: 7536
    subnets: 16
      - subnet-1
      - subnet-2
      - subnet-3
    amiID: ami-96c6f8f7 17 18
    serviceEndpoints: 19
      - name: ec2

```

```
url: https://vpce-id.ec2.cn-north-1.vpce.amazonaws.com.cn
hostedZone: Z3URY6TWQ91KVV 20
fips: false 21
sshKey: ssh-ed25519 AAAA... 22
publish: Internal 23
pullSecret: '{"auths": ...}' 24
```

1 12 14 17 24 Required.

2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.

3 8 15 If you do not provide these parameters and values, the installation program provides the default value.

4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

5 9 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

6 10 To configure faster storage for etcd, especially for larger clusters, set the storage type as **io1** and set **iops** to **2000**.

7 11 Whether to require the [Amazon EC2 Instance Metadata Service v2](#) (IMDSv2). To require IMDSv2, set the parameter value to **Required**. To allow the use of both IMDSv1 and IMDSv2, set the parameter value to **Optional**. If no value is specified, both IMDSv1 and IMDSv2 are allowed.

NOTE

The IMDS configuration for control plane machines that is set during cluster installation can only be changed by using the AWS CLI. The IMDS configuration for compute machines can be changed by using compute machine sets.

13 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

16 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.

18 The ID of the AMI used to boot machines for the cluster. If set, the AMI must belong to the same region as the cluster.

- 19 The AWS service endpoints. Custom endpoints are required when installing to an unknown AWS region. The endpoint URL must use the **https** protocol and the host must trust the certificate.
- 20 The ID of your existing Route 53 private hosted zone. Providing an existing hosted zone requires that you supply your own VPC and the hosted zone is already associated with the VPC prior to installing your cluster. If undefined, the installation program creates a new hosted zone.
- 21 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86_64, ppc64le, and s390x architectures.

- 22 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- 23 How to publish the user-facing endpoints of your cluster. Set **publish** to **Internal** to deploy a private cluster, which cannot be accessed from the internet. The default value is **External**.

4.11.9.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.14. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.11.9.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.43. Machine types based on 64-bit x86 architecture

- **c4.***

- c5.*
- c5a.*
- i3.*
- m4.*
- m5.*
- m5a.*
- m6a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

4.11.9.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.44. Machine types based on 64-bit ARM architecture

- c6g.*
- c7g.*
- m6g.*
- m7g.*
- r8g.*

4.11.9.5. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> ❶
  httpsProxy: https://<username>:<pswd>@<ip>:<port> ❷
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
    <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com ❸
  additionalTrustBundle: | ❹
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> ❺
```

- ❶ A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- ❷ A proxy URL to use for creating HTTPS connections outside the cluster.
- ❸ A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- ❹ If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then

creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.

- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

NOTE

The installation program does not support the proxy **readinessEndpoints** field.

NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

NOTE

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.11.9.6. Applying existing AWS security groups to the cluster

Applying existing AWS security groups to your control plane and compute machines can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

Prerequisites

- You have created the security groups in AWS. For more information, see the AWS documentation about working with [security groups](#).
- The security groups must be associated with the existing VPC that you are deploying the cluster to. The security groups cannot be associated with another VPC.
- You have an existing **install-config.yaml** file.

Procedure

1. In the **install-config.yaml** file, edit the **compute.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your compute machines.

2. Edit the **controlPlane.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your control plane machines.
3. Save the file and reference it when deploying the cluster.

Sample install-config.yaml file that specifies custom security groups

```
# ...
compute:
- hyperthreading: Enabled
  name: worker
  platform:
    aws:
      additionalSecurityGroupIDs:
        - sg-1 1
        - sg-2
  replicas: 3
controlPlane:
  hyperthreading: Enabled
  name: master
  platform:
    aws:
      additionalSecurityGroupIDs:
        - sg-3
        - sg-4
  replicas: 3
platform:
  aws:
    region: us-east-1
    subnets: 2
      - subnet-1
      - subnet-2
      - subnet-3
```

- 1** Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.
- 2** Specify subnets for each availability zone that your cluster uses.

4.11.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

**NOTE**

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

4.11.11. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

4.11.11.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```
apiVersion: v1
```

```
baseDomain: example.com
credentialsMode: Manual
# ...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \ ❶
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \ ❷
  --to=<path_to_directory_for_credentials_requests> ❸
```

- ❶ The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- ❷ Specify the location of the **install-config.yaml** file.
- ❸ Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

Sample CredentialsRequest object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - iam:GetUser
          - iam:GetUserPolicy
```

```
- iam:ListAccessKeys
  resource: "*"
...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

Sample CredentialsRequest object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
  name: <component_credentials_request>
  namespace: openshift-cloud-credential-operator
  ...
spec:
  providerSpec:
    apiVersion: cloudcredential.openshift.io/v1
    kind: AWSProviderSpec
    statementEntries:
      - effect: Allow
        action:
          - s3:CreateBucket
          - s3>DeleteBucket
        resource: "*"
      ...
  secretRef:
    name: <component_secret>
    namespace: <component_namespace>
  ...
```

Sample Secret object

```
apiVersion: v1
kind: Secret
metadata:
  name: <component_secret>
  namespace: <component_namespace>
data:
  aws_access_key_id: <base64_encoded_aws_access_key_id>
  aws_secret_access_key: <base64_encoded_aws_secret_access_key>
```

IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

4.11.11.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

4.11.11.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

Example 4.45. Required AWS permissions

Required iam permissions

- **iam:CreateOpenIDConnectProvider**
- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

Required s3 permissions

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**

- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccoctl** utility requires the following additional permissions:

Example 4.46. Additional permissions for a private S3 bucket with CloudFront

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

**NOTE**

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccoctl aws create-all** command.

Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

**NOTE**

Ensure that the architecture of the **\$RELEASE_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$ ./ccoctl.rhel9
```

Example output

```
OpenShift credentials provisioning tool
```

```
Usage:
```

```
ccoctl [command]
```

```
Available Commands:
```

```
alibabacloud Manage credentials objects for alibaba cloud
```

```
aws          Manage credentials objects for AWS cloud
```

```
azure       Manage credentials objects for Azure
```

```

gcp      Manage credentials objects for Google cloud
help     Help about any command
ibmcloud Manage credentials objects for IBM Cloud
nutanix  Manage credentials objects for Nutanix

```

Flags:

```
-h, --help  help for ccoctl
```

Use "ccoctl [command] --help" for more information about a command.

4.11.11.2.2. Creating AWS resources with the Cloud Credential Operator utility

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually. See [Creating AWS resources individually](#).

4.11.11.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path_to_ccoctl_output_dir>** to refer to this directory.

Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

Procedure

1. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

NOTE

This command might take a few moments to run.

3. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-all \
  --name=<name> \1
  --region=<aws_region> \2
  --credentials-requests-dir=<path_to_credentials_requests_directory> \3
  --output-dir=<path_to_ccoctl_output_dir> \4
  --create-private-s3-bucket \5
```

- 1 Specify the name used to tag any cloud resources that are created for tracking.
- 2 Specify the AWS region in which cloud resources will be created.
- 3 Specify the directory containing the files for the component **CredentialsRequest** objects.
- 4 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 5 Optional: By default, the **ccoctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the `<path_to_ccoctl_output_dir>/manifests` directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.11.11.2.2.2. Creating AWS resources individually

You can use the **ccoctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccoctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses `<path_to_ccoctl_output_dir>` to refer to this directory.

Some **ccoctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

Prerequisites

- Extract and prepare the **ccoctl** binary.

Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccoctl aws create-key-pair
```

Example output

```
2021/04/13 11:01:02 Generating RSA keypair
```

```

2021/04/13 11:01:03 Writing private key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccoctl_output_dir>/serviceaccount-
signer.public
2021/04/13 11:01:03 Copying signing key for use by installer

```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **/<path_to_ccoctl_output_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```

$ ccoctl aws create-identity-provider \
  --name=<name> \ 1
  --region=<aws_region> \ 2
  --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public 3

```

- 1** **<name>** is the name used to tag any cloud resources that are created for tracking.
- 2** **<aws-region>** is the AWS region in which cloud resources will be created.
- 3** **<path_to_ccoctl_output_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

Example output

```

2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com

```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in **/<path_to_ccoctl_output_dir>/manifests/cluster-authentication-02-config.yaml**. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

3. Create IAM roles for each component in the cluster:
 - a. Set a **\$RELEASE_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
  --from=$RELEASE_IMAGE \
  --credentials-requests \
  --included \1
  --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
  --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
  --name=<name> \
  --region=<aws_region> \
  --credentials-requests-dir=<path_to_credentials_requests_directory> \
  --identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
  <aws_region>.amazonaws.com
```

NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccoctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path_to_ccoctl_output_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
```

```

openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml

```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

4.11.11.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccocctl**) created to the correct directories for the installation program.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccocctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccocctl** utility.

Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

Sample configuration file snippet

```

apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
# ...

```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccocctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccocctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccocctl_output_dir>/tls .
```

4.11.12. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$ ./openshift-install create cluster --dir <installation_directory> \ 1  
--log-level=info 2
```

- 1** For **<installation_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation_directory>/openshift_install.log**.

IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

4.11.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

Example output

```
system:admin
```

/validating-an-installation.adoc

4.11.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation_directory>/.openshift_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation_directory>/.openshift_install.log** log file on the installation host.

Example output

```
console    console-openshift-console.apps.<cluster_name>.<base_domain>    console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

4.11.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [About remote health monitoring](#) for more information about the Telemetry service.

4.11.16. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#).
- If necessary, you can [remove cloud provider credentials](#).

4.12. INSTALLING A CLUSTER ON USER-PROVISIONED INFRASTRUCTURE IN AWS BY USING CLOUDFORMATION TEMPLATES

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) that uses infrastructure that you provide.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

4.12.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or UNIX\)](#) in the AWS documentation.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain long-term credentials](#).

4.12.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

4.12.3. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

4.12.3.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

Table 4.15. Minimum required hosts

Hosts	Description
One temporary bootstrap machine	The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster.
Three control plane machines	The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane.
At least two compute machines, which are also known as worker machines.	The workloads requested by OpenShift Container Platform users run on the compute machines.

IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.6 and later.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 9.2 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

4.12.3.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

Table 4.16. Minimum resource requirements

Machine	Operating System	vCPU [1]	Virtual RAM	Storage	Input/Output Per Second (IOPS)[2]
Bootstrap	RHCOS	4	16 GB	100 GB	300
Control plane	RHCOS	4	16 GB	100 GB	300
Compute	RHCOS, RHEL 8.6 and later [3]	2	8 GB	100 GB	300

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.

2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

Additional resources

- [Optimizing storage](#)

4.12.3.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.47. Machine types based on 64-bit x86 architecture

- **c4.***
- **c5.***
- **c5a.***
- **i3.***

- m4.*
- m5.*
- m5a.*
- m6a.*
- m6i.*
- r4.*
- r5.*
- r5a.*
- r6i.*
- t3.*
- t3a.*

4.12.3.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

Example 4.48. Machine types based on 64-bit ARM architecture

- c6g.*
- c7g.*
- m6g.*
- m7g.*
- r8g.*

4.12.3.5. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using

kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

4.12.4. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

4.12.4.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**

- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws_region>.amazonaws.com**
- **elasticloadbalancing.<aws_region>.amazonaws.com**
- **s3.<aws_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

Component	AWS type	Description
VPC	<ul style="list-style-type: none"> • AWS::EC2::VPC • AWS::EC2::VPCEndpoint 	You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.
Public subnets	<ul style="list-style-type: none"> • AWS::EC2::Subnet • AWS::EC2::SubnetNetworkACLAssociation 	Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.

Component	AWS type	Description	
Internet gateway	<ul style="list-style-type: none">● AWS::EC2::InternetGateway● AWS::EC2::VPCGatewayAttachment● AWS::EC2::RouteTable● AWS::EC2::Route● AWS::EC2::SubnetRouteTableAssociation● AWS::EC2::NatGateway● AWS::EC2::EIP	You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios.	
Network access control	<ul style="list-style-type: none">● AWS::EC2::NetworkAcl● AWS::EC2::NetworkAclEntry	You must allow the VPC to access the following ports:	
		Port	Reason
		80	Inbound HTTP traffic
		443	Inbound HTTPS traffic
		22	Inbound SSH traffic
		1024 - 65535	Inbound ephemeral traffic
		0 - 65535	Outbound ephemeral traffic
Private subnets	<ul style="list-style-type: none">● AWS::EC2::Subnet● AWS::EC2::RouteTable● AWS::EC2::SubnetRouteTableAssociation	Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them.	

Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api**.

<cluster_name>.<domain> must point to the external load balancer, and an entry for **api-int.<cluster_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

Component	AWS type	Description
DNS	AWS::Route53::HostedZone	The hosted zone for your internal DNS.
Public load balancer	AWS::ElasticLoadBalancingV2::LoadBalancer	The load balancer for your public subnets.
External API server record	AWS::Route53::RecordSetGroup	Alias records for the external API server.
External listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 6443 for the external load balancer.
External target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the external load balancer.
Private load balancer	AWS::ElasticLoadBalancingV2::LoadBalancer	The load balancer for your private subnets.
Internal API server record	AWS::Route53::RecordSetGroup	Alias records for the internal API server.
Internal listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 22623 for the internal load balancer.
Internal target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the internal load balancer.

Component	AWS type	Description
Internal listener	AWS::ElasticLoadBalancingV2::Listener	A listener on port 6443 for the internal load balancer.
Internal target group	AWS::ElasticLoadBalancingV2::TargetGroup	The target group for the internal load balancer.

Security groups

The control plane and worker machines require access to the following ports:

Group	Type	IP Protocol	Port range
MasterSecurityGroup	AWS::EC2::SecurityGroup	icmp	0
		tcp	22
		tcp	6443
		tcp	22623
WorkerSecurityGroup	AWS::EC2::SecurityGroup	icmp	0
		tcp	22
BootstrapSecurityGroup	AWS::EC2::SecurityGroup	tcp	22
		tcp	19531

Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
MasterIngressEtcd	etcd	tcp	2379- 2380
MasterIngressVxlan	Vxlan packets	udp	4789

Ingress group	Description	IP protocol	Port range
MasterIngress WorkerVxlan	Vxlan packets	udp	4789
MasterIngress Internal	Internal cluster communication and Kubernetes proxy metrics	tcp	9000 - 9999
MasterIngress WorkerInternal	Internal cluster communication	tcp	9000 - 9999
MasterIngress Kube	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
MasterIngress WorkerKube	Kubernetes kubelet, scheduler and controller manager	tcp	10250 - 10259
MasterIngress IngressServices	Kubernetes Ingress services	tcp	30000 - 32767
MasterIngress WorkerIngress Services	Kubernetes Ingress services	tcp	30000 - 32767
MasterIngress Geneve	Geneve packets	udp	6081
MasterIngress WorkerGeneve	Geneve packets	udp	6081
MasterIngress IpsecIke	IPsec IKE packets	udp	500
MasterIngress WorkerIpsecIke	IPsec IKE packets	udp	500
MasterIngress IpsecNat	IPsec NAT-T packets	udp	4500
MasterIngress WorkerIpsecNat	IPsec NAT-T packets	udp	4500

Ingress group	Description	IP protocol	Port range
MasterIngress IpsecEsp	IPsec ESP packets	50	All
MasterIngress WorkerIpsecE sp	IPsec ESP packets	50	All
MasterIngress InternalUDP	Internal cluster communication	udp	9000 - 9999
MasterIngress WorkerInterna IUDP	Internal cluster communication	udp	9000 - 9999
MasterIngress IngressServic esUDP	Kubernetes Ingress services	udp	30000 - 32767
MasterIngress WorkerIngress ServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

Ingress group	Description	IP protocol	Port range
WorkerIngress Vxlan	Vxlan packets	udp	4789
WorkerIngress WorkerVxlan	Vxlan packets	udp	4789
WorkerIngress Internal	Internal cluster communication	tcp	9000 - 9999
WorkerIngress WorkerInterna I	Internal cluster communication	tcp	9000 - 9999
WorkerIngress Kube	Kubernetes kubelet, scheduler, and controller manager	tcp	10250

Ingress group	Description	IP protocol	Port range
WorkerIngress WorkerKube	Kubernetes kubelet, scheduler, and controller manager	tcp	10250
WorkerIngress IngressServices	Kubernetes Ingress services	tcp	30000 - 32767
WorkerIngress WorkerIngress Services	Kubernetes Ingress services	tcp	30000 - 32767
WorkerIngress Geneve	Geneve packets	udp	6081
WorkerIngress MasterGeneve	Geneve packets	udp	6081
WorkerIngress IpsecIke	IPsec IKE packets	udp	500
WorkerIngress MasterIpsecIke	IPsec IKE packets	udp	500
WorkerIngress IpsecNat	IPsec NAT-T packets	udp	4500
WorkerIngress MasterIpsecNat	IPsec NAT-T packets	udp	4500
WorkerIngress IpsecEsp	IPsec ESP packets	50	All
WorkerIngress MasterIpsecEsp	IPsec ESP packets	50	All
WorkerIngress InternalUDP	Internal cluster communication	udp	9000 - 9999
WorkerIngress MasterInternal UDP	Internal cluster communication	udp	9000 - 9999
WorkerIngress IngressServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Ingress group	Description	IP protocol	Port range
WorkerIngress MasterIngress ServicesUDP	Kubernetes Ingress services	udp	30000 - 32767

Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

Role	Effect	Action	Resource
Master	Allow	ec2:*	*
	Allow	elasticloadbalancing:*	*
	Allow	iam:PassRole	*
	Allow	s3:GetObject	*
Worker	Allow	ec2:Describe*	*
Bootstrap	Allow	ec2:Describe*	*
	Allow	ec2:AttachVolume	*
	Allow	ec2:DetachVolume	*

4.12.4.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a control plane machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a compute machine set.

4.12.4.3. Required AWS permissions for the IAM user

**NOTE**

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

Example 4.49. Required EC2 permissions for installation

- **ec2:AttachNetworkInterface**
- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**
- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**

- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroupRules**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**
- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.50. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**

- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**
- **ec2:ModifyVpcAttribute**

NOTE

If you use an existing Virtual Private Cloud (VPC), your account does not require these permissions for creating network resources.

Example 4.51. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**

- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:RegisterTargets**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

IMPORTANT

OpenShift Container Platform uses both the ELB and ELBv2 API services to provision load balancers. The permission list shows permissions required by both services. A known issue exists in the AWS web console where both services use the same **elasticloadbalancing** action prefix but do not recognize the same actions. You can ignore the warnings about the service not recognizing certain **elasticloadbalancing** actions.

Example 4.52. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**

- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

NOTE

If you have not created a load balancer in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

Example 4.53. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 4.54. Required Amazon Simple Storage Service (S3) permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**

- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketPolicy**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.55. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.56. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeletePlacementGroup**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**

- `elasticloadbalancing:DescribeTargetGroups`
- `iam:DeleteAccessKey`
- `iam:DeleteUser`
- `iam:DeleteUserPolicy`
- `iam:ListAttachedRolePolicies`
- `iam:ListInstanceProfiles`
- `iam:ListRolePolicies`
- `iam:ListUserPolicies`
- `s3:DeleteObject`
- `s3:ListBucketVersions`
- `tag:GetResources`

Example 4.57. Required permissions to delete network resources

- `ec2:DeleteDhcpOptions`
- `ec2:DeleteInternetGateway`
- `ec2:DeleteNatGateway`
- `ec2:DeleteRoute`
- `ec2:DeleteRouteTable`
- `ec2:DeleteSubnet`
- `ec2:DeleteVpc`
- `ec2:DeleteVpcEndpoints`
- `ec2:DetachInternetGateway`
- `ec2:DisassociateRouteTable`
- `ec2:ReleaseAddress`
- `ec2:ReplaceRouteTableAssociation`

NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **`tag:UntagResources`** permission to delete network resources.

Example 4.58. Optional permissions for installing a cluster with a custom Key Management Service (KMS) key

- **kms:CreateGrant**
- **kms:Decrypt**
- **kms:DescribeKey**
- **kms:Encrypt**
- **kms:GenerateDataKey**
- **kms:GenerateDataKeyWithoutPlainText**
- **kms:ListGrants**
- **kms:RevokeGrant**

Example 4.59. Required permissions to delete a cluster with shared instance roles

- **iam:UntagRole**

Example 4.60. Additional IAM and S3 permissions that are required to create manifests

- **iam:GetUserPolicy**
- **iam:ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:AbortMultipartUpload**
- **s3:GetBucketPublicAccessBlock**
- **s3:ListBucket**
- **s3:ListBucketMultipartUploads**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**

NOTE

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

Example 4.61. Optional permissions for instance and quota checks for installation

- `ec2:DescribeInstanceTypeOfferings`
- `servicequotas:ListAWSDefaultServiceQuotas`

Example 4.62. Optional permissions for the cluster owner account when installing a cluster on a shared VPC

- `sts:AssumeRole`

4.12.5. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. If you use the CloudFormation template to deploy your worker nodes, you must update the **`worker0.type.properties.ImageID`** parameter with this value.

4.12.6. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

**IMPORTANT**

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

**IMPORTANT**

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

4.12.7. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

**IMPORTANT**

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

**NOTE**

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

Example output

```
Agent pid 31874
```

NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

Example output

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

4.12.8. Creating the installation files for AWS

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

4.12.8.1. Optional: Creating a separate **/var** partition

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
99_openshift-cluster-api_master-machines-2.yaml
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.14.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-var-partition
storage:
  disks:
    - device: /dev/disk/by-id/<device_name> 1
  partitions:
```

```

- label: var
  start_mib: <partition_start_offset> 2
  size_mib: <partition_size> 3
  number: 5
filesystems:
- device: /dev/disk/by-partlabel/var
  path: /var
  format: xfs
  mount_options: [defaults, prjquota] 4
  with_mount_unit: true

```

- 1 The storage device name of the disk that you want to partition.
- 2 When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- 3 The size of the data partition in mebibytes.
- 4 The **prjquota** mount option must be enabled for filesystems used for container storage.

NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

4.12.8.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

Procedure

1. Create the **install-config.yaml** file.
 - a. Change to the directory that contains the installation program and run the following command:

```
$ ./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the directory name to store the files that the installation program creates.

IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
 - i. Optional: Select an SSH key to use to access your cluster machines.

NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to.
 - v. Select the base domain for the Route 53 service that you configured for your cluster.
 - vi. Enter a descriptive name for your cluster.
 - vii. Paste the [pull secret from Red Hat OpenShift Cluster Manager](#).
2. If you are installing a three-node cluster, modify the **install-config.yaml** file by setting the **compute.replicas** parameter to **0**. This ensures that the cluster's control planes are schedulable. For more information, see "Installing a three-node cluster on AWS".
 3. Optional: Back up the **install-config.yaml** file.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

4.12.8.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
  httpProxy: http://<username>:<pswd>@<ip>:<port> 1
  httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
  noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
<aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com 3
  additionalTrustBundle: | 4
    -----BEGIN CERTIFICATE-----
    <MY_TRUSTED_CA_CERT>
    -----END CERTIFICATE-----
  additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use ***** to bypass the proxy for all destinations. If you have added the Amazon **EC2**, **Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$ ./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

4.12.8.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

Prerequisites

- You obtained the OpenShift Container Platform installation program.
- You created the **install-config.yaml** installation configuration file.

Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$ ./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the control plane machine set:

```
$ rm -f <installation_directory>/openshift/99_openshift-machine-api_master-control-plane-machine-set.yaml
```

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

IMPORTANT

If you disabled the **MachineAPI** capability when installing a cluster on user-provisioned infrastructure, you must remove the Kubernetes manifest files that define the worker machines. Otherwise, your cluster fails to install.

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

WARNING

If you are installing a three-node cluster, skip the following step to allow the control plane nodes to be schedulable.

IMPORTANT

When you configure control plane nodes from the default unschedulable to schedulable, additional subscriptions are required. This is because control plane nodes then become compute nodes.

4. Check that the **mastersSchedulable** parameter in the **<installation_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane

machines:

- a. Open the `<installation_directory>/manifests/cluster-scheduler-02-config.yml` file.
 - b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
 - c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the `<installation_directory>/manifests/cluster-dns-02-config.yml` DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
  creationTimestamp: null
  name: cluster
spec:
  baseDomain: example.openshift.com
  privateZone: ❶
    id: mycluster-100419-private-zone
  publicZone: ❷
    id: example.openshift.com
status: {}
```

- ❶ ❷ Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$ ./openshift-install create ignition-configs --dir <installation_directory> ❶
```

- ❶ For `<installation_directory>`, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the `./<installation_directory>/auth` directory:

```
.
├── auth
│   ├── kubeadmin-password
│   └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

4.12.9. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate

AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- 1 For **<installation_directory>**, specify the path to the directory that you stored the installation files in.

Example output

```
openshift-vw9j6 1
```

- 1 The output of this command is your cluster name and a random string.

4.12.10. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
  {
    "ParameterKey": "VpcCidr", 1
    "ParameterValue": "10.0.0.0/16" 2
  },
  {
    "ParameterKey": "AvailabilityZoneCount", 3
    "ParameterValue": "1" 4
  },
  {
    "ParameterKey": "SubnetBits", 5
    "ParameterValue": "12" 6
  }
]
```

- 1** The CIDR block for the VPC.
- 2** Specify a CIDR block in the format **x.x.x.x/16-24**.
- 3** The number of availability zones to deploy the VPC in.
- 4** Specify an integer between **1** and **3**.
- 5** The size of each subnet in each availability zone.
- 6** Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.

2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
  --template-body file://<template>.yaml 2
  --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

- ```
$ aws cloudformation describe-stacks --stack-name <name>
```

|                         |                                     |
|-------------------------|-------------------------------------|
| <b>VpcId</b>            | The ID of your VPC.                 |
| <b>PublicSubnetIds</b>  | The IDs of the new public subnets.  |
| <b>PrivateSubnetIds</b> | The IDs of the new private subnets. |

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

AWSTemplateFormatVersion: 2010-09-09

Description: Template for Best Practice VPC with 1-3 AZs

Parameters:

VpcCidr:

AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\\.){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\\(1[6-9]|2[0-4]))\$

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.

Default: 10.0.0.0/16

Description: CIDR block for VPC.

Type: String

AvailabilityZoneCount:

ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"

MinValue: 1

MaxValue: 3

Default: 1

Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"

Type: Number

SubnetBits:

ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.

MinValue: 5

MaxValue: 13

Default: 12

Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 =

/19)"

Type: Number

## Metadata:

```

#### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

#### 4.12.11. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1 For the **<route53\_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

## Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "ClusterName", 1
 "ParameterValue": "mycluster" 2
 },
]
```

```

{
 "ParameterKey": "InfrastructureName", ❸
 "ParameterValue": "mycluster-<random_string>" ❹
},
{
 "ParameterKey": "HostedZoneId", ❺
 "ParameterValue": "<random_string>" ❻
},
{
 "ParameterKey": "HostedZoneName", ❼
 "ParameterValue": "example.com" ❽
},
{
 "ParameterKey": "PublicSubnets", ❾
 "ParameterValue": "subnet-<random_string>" ❿
},
{
 "ParameterKey": "PrivateSubnets", ⓫
 "ParameterValue": "subnet-<random_string>" ⓬
},
{
 "ParameterKey": "VpcId", ⓭
 "ParameterValue": "vpc-<random_string>" ⓮
}
]

```

- ❶ A short, representative cluster name to use for hostnames, etc.
- ❷ Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
- ❸ The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- ❹ Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- ❺ The Route 53 public zone ID to register the targets with.
- ❻ Specify the Route 53 public zone ID, which as a format similar to **Z21XYZABCZ2A4**. You can obtain this value from the AWS console.
- ❼ The Route 53 zone to register the targets with.
- ❽ Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- ❾ The public subnets that you created for your VPC.
- ❿ Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- ⓫ The private subnets that you created for your VPC.

- 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 13 The VPC that you created for the cluster.
  - 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

### IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml 2
 --parameters file://<parameters>.json 3
 --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                                      |                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------|
| <b>PrivateHostedZoneId</b>           | Hosted zone ID for the private DNS.                                                |
| <b>ExternalApiLoadBalancerName</b>   | Full name of the external API load balancer.                                       |
| <b>InternalApiLoadBalancerName</b>   | Full name of the internal API load balancer.                                       |
| <b>ApiServerDnsName</b>              | Full hostname of the API server.                                                   |
| <b>RegisterNlbIpTargetsLambda</b>    | Lambda ARN useful to help register/deregister IP targets for these load balancers. |
| <b>ExternalApiTargetGroupArn</b>     | ARN of external API target group.                                                  |
| <b>InternalApiTargetGroupArn</b>     | ARN of internal API target group.                                                  |
| <b>InternalServiceTargetGroupArn</b> | ARN of internal service target group.                                              |

#### 4.12.11.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

##### Example 4.64. CloudFormation template for the network and load balancers

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:
 ClusterName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-_]{0,26})$
 MaxLength: 27
 MinLength: 1
```

ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, representative cluster name to use for host names and other identifying names.

Type: String

InfrastructureName:

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-\\_]{0,26})\$

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

HostedZoneld:

Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.

Type: String

HostedZoneName:

Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.

Type: String

Default: "example.com"

PublicSubnets:

Description: The internet-facing subnets.

Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:

Description: The internal subnets.

Type: List<AWS::EC2::Subnet::Id>

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: AWS::EC2::VPC::Id

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- ClusterName

- InfrastructureName

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- PublicSubnets

- PrivateSubnets

- Label:

default: "DNS"

Parameters:

- HostedZoneName

- HostedZoneld

ParameterLabels:

ClusterName:

default: "Cluster Name"

InfrastructureName:

```

 default: "Infrastructure Name"
 VpcId:
 default: "VPC ID"
 PublicSubnets:
 default: "Public Subnets"
 PrivateSubnets:
 default: "Private Subnets"
 HostedZoneName:
 default: "Public Hosted Zone Name"
 HostedZoneId:
 default: "Public Hosted Zone ID"

```

#### Resources:

##### ExtApiElb:

```

Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:
 Name: !Join ["-", [!Ref InfrastructureName, "ext"]]
 IpAddressType: ipv4
 Subnets: !Ref PublicSubnets
 Type: network

```

##### IntApiElb:

```

Type: AWS::ElasticLoadBalancingV2::LoadBalancer
Properties:
 Name: !Join ["-", [!Ref InfrastructureName, "int"]]
 Scheme: internal
 IpAddressType: ipv4
 Subnets: !Ref PrivateSubnets
 Type: network

```

 RegisterNlbTargetsLambda:
 Description: Lambda ARN useful to help register or deregister IP targets for these load

```

balancers.

Value: !GetAtt RegisterNlbTargets.Arn

ExternalApiTargetGroupArn:

Description: ARN of the external API target group.

Value: !Ref ExternalApiTargetGroup

InternalApiTargetGroupArn:

Description: ARN of the internal API target group.

Value: !Ref InternalApiTargetGroup

InternalServiceTargetGroupArn:

Description: ARN of the internal service target group.

Value: !Ref InternalServiceTargetGroup

## IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

Type: CNAME

TTL: 10

ResourceRecords:

- !GetAtt IntApiElb.DNSName

## Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- You can view details about your hosted zones by navigating to the [AWS Route 53 console](#).
- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

## 4.12.12. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.

- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", ❶
 "ParameterValue": "mycluster-<random_string>" ❷
 },
 {
 "ParameterKey": "VpcCidr", ❸
 "ParameterValue": "10.0.0.0/16" ❹
 },
 {
 "ParameterKey": "PrivateSubnets", ❺
 "ParameterValue": "subnet-<random_string>" ❻
 },
 {
 "ParameterKey": "VpcId", ❼
 "ParameterValue": "vpc-<random_string>" ❽
 }
]
```

- ❶ The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- ❷ Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- ❸ The CIDR block for the VPC.
- ❹ Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
- ❺ The private subnets that you created for your VPC.
- ❻ Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
- ❼ The VPC that you created for the cluster.
- ❽ Specify the **VpcId** value from the output of the CloudFormation template for the VPC.

2. Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.

3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
--template-body file://<template>.yaml 2
--parameters file://<parameters>.json 3
--capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                              |                             |
|------------------------------|-----------------------------|
| <b>MasterSecurityGroupID</b> | Master Security Group ID    |
| <b>WorkerSecurityGroupID</b> | Worker Security Group ID    |
| <b>MasterInstanceProfile</b> | Master IAM Instance Profile |

**WorkerInstanceProfile**

Worker IAM Instance Profile

**4.12.12.1. CloudFormation template for security objects**

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

**Example 4.65. CloudFormation template for security objects**

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)

Parameters:
 InfrastructureName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-_]{0,26})$
 MaxLength: 27
 MinLength: 1
 ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
 maximum of 27 characters.
 Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
 used by the cluster.
 Type: String
 VpcCidr:
 AllowedPattern: ^((([0-9]{1-9}[0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]{1-9}[0-9]|1[0-9]{2}|2[0-
 4][0-9]|25[0-5])|(V(1[6-9]|2[0-4]))$
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
 Default: 10.0.0.0/16
 Description: CIDR block for VPC.
 Type: String
 VpcId:
 Description: The VPC-scoped resources will belong to this VPC.
 Type: AWS::EC2::VPC::Id
 PrivateSubnets:
 Description: The internal subnets.
 Type: List<AWS::EC2::Subnet::Id>

Metadata:
 AWS::CloudFormation::Interface:
 ParameterGroups:
 - Label:
 default: "Cluster Information"
 Parameters:
 - InfrastructureName
 - Label:
 default: "Network Configuration"
 Parameters:
 - VpcId
 - VpcCidr
 - PrivateSubnets
 ParameterLabels:
 InfrastructureName:
 default: "Infrastructure Name"

```

VpcId:  
default: "VPC ID"  
VpcCidr:  
default: "VPC CIDR"  
PrivateSubnets:  
default: "Private Subnets"

## Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

### 4.12.13. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

## Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
  - Print the current **x86\_64** or **aarch64** AMI for an AWS region, such as **us-west-1**:

#### For x86\_64

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

#### Example output

```
ami-0d3e625f84626bbda
```

#### For aarch64

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.aarch64.images.aws.regions["us-west-1"].image'
```

#### Example output

```
ami-0af1d3b7fa5be2131
```

The output of this command is the AWS AMI ID for your designated architecture and the **us-west-1** region. The AMI must belong to the same region as the cluster.

### 4.12.14. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.

#### NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 4.17. x86\_64 RHCOS AMIs

| AWS zone       | AWS AMI               |
|----------------|-----------------------|
| af-south-1     | ami-01860370941726bdd |
| ap-east-1      | ami-05bc702cdaf7e4251 |

#### 4.12.14.1. AWS regions without a published RHCOS AMI

You can deploy an OpenShift Container Platform cluster to Amazon Web Services (AWS) regions without native support for a Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) or the AWS software development kit (SDK). If a published AMI is not available for an AWS region, you

can upload a custom AMI prior to installing the cluster.

If you are deploying to a region not supported by the AWS SDK and you do not specify a custom AMI, the installation program copies the **us-east-1** AMI to the user account automatically. Then the installation program creates the control plane machines with encrypted EBS volumes using the default or user-specified Key Management Service (KMS) key. This allows the AMI to follow the same process workflow as published RHCOS AMIs.

A region without native support for an RHCOS AMI is not available to select from the terminal during cluster creation because it is not published. However, you can install to this region by configuring the custom AMI in the **install-config.yaml** file.

#### 4.12.14.2. Uploading a custom RHCOS AMI in AWS

If you are deploying to a custom Amazon Web Services (AWS) region, you must upload a custom Red Hat Enterprise Linux CoreOS (RHCOS) Amazon Machine Image (AMI) that belongs to that region.

##### Prerequisites

- You configured an AWS account.
- You created an Amazon S3 bucket with the required IAM [service role](#).
- You uploaded your RHCOS VMDK file to Amazon S3. The RHCOS VMDK file must be the highest version that is less than or equal to the OpenShift Container Platform version you are installing.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer](#).

##### Procedure

1. Export your AWS profile as an environment variable:

```
$ export AWS_PROFILE=<aws_profile> 1
```

2. Export the region to associate with your custom AMI as an environment variable:

```
$ export AWS_DEFAULT_REGION=<aws_region> 1
```

3. Export the version of RHCOS you uploaded to Amazon S3 as an environment variable:

```
$ export RHCOS_VERSION=<version> 1
```

1 1 1 The RHCOS VMDK version, like **4.14.0**.

4. Export the Amazon S3 bucket name as an environment variable:

```
$ export VMIMPORT_BUCKET_NAME=<s3_bucket_name>
```

5. Create the **containers.json** file and define your RHCOS VMDK file:

```
$ cat <<EOF > containers.json
```

```
{
 "Description": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64",
 "Format": "vmdk",
 "UserBucket": {
 "S3Bucket": "${VMIMPORT_BUCKET_NAME}",
 "S3Key": "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64.vmdk"
 }
}
EOF
```

6. Import the RHCOS disk as an Amazon EBS snapshot:

```
$ aws ec2 import-snapshot --region ${AWS_DEFAULT_REGION} \
 --description "<description>" \ 1
 --disk-container "file://<file_path>/containers.json" 2
```

**1** The description of your RHCOS disk being imported, like **rhcos-\${RHCOS\_VERSION}-x86\_64-aws.x86\_64**.

**2** The file path to the JSON file describing your RHCOS disk. The JSON file should contain your Amazon S3 bucket name and key.

7. Check the status of the image import:

```
$ watch -n 5 aws ec2 describe-import-snapshot-tasks --region ${AWS_DEFAULT_REGION}
```

### Example output

```
{
 "ImportSnapshotTasks": [
 {
 "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
 "ImportTaskId": "import-snap-fh6i8uil",
 "SnapshotTaskDetail": {
 "Description": "rhcos-4.7.0-x86_64-aws.x86_64",
 "DiskImageSize": 819056640.0,
 "Format": "VMDK",
 "SnapshotId": "snap-06331325870076318",
 "Status": "completed",
 "UserBucket": {
 "S3Bucket": "external-images",
 "S3Key": "rhcos-4.7.0-x86_64-aws.x86_64.vmdk"
 }
 }
 }
]
}
```

Copy the **SnapshotId** to register the image.

8. Create a custom RHCOS AMI from the RHCOS snapshot:

```
$ aws ec2 register-image \
```

```
--region ${AWS_DEFAULT_REGION} \
--architecture x86_64 \ ❶
--description "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❷
--ena-support \
--name "rhcos-${RHCOS_VERSION}-x86_64-aws.x86_64" \ ❸
--virtualization-type hvm \
--root-device-name '/dev/xvda' \
--block-device-mappings 'DeviceName=/dev/xvda,Ebs=
{DeleteOnTermination=true,SnapshotId=<snapshot_ID>}' ❹
```

- ❶ The RHCOS VMDK architecture type, like **x86\_64**, **aarch64**, **s390x**, or **ppc64le**.
- ❷ The **Description** from the imported snapshot.
- ❸ The name of the RHCOS AMI.
- ❹ The **SnapshotID** from the imported snapshot.

To learn more about these APIs, see the AWS documentation for [importing snapshots](#) and [creating EBS-backed AMIs](#).

#### 4.12.15. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization. You do this by:

- Providing a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.
- Using the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

#### NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

#### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.

- You created the security groups and roles required for your cluster in AWS.

## Procedure

1. Create the bucket by running the following command:

```
$ aws s3 mb s3://<cluster-name>-infra ❶
```

- ❶ **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

You must use a presigned URL for your S3 bucket, instead of the **s3://** schema, if you are:

- Deploying to a region that has endpoints that differ from the AWS SDK.
- Deploying a proxy.
- Providing your own custom endpoints.

2. Upload the **bootstrap.ign** Ignition config file to the bucket by running the following command:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign ❶
```

- ❶ For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

3. Verify that the file uploaded by running the following command:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

## Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

## NOTE

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

4. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", ❶
 "ParameterValue": "mycluster-<random_string>" ❷
 },
 {
```

```

 "ParameterKey": "RhcosAmi", 3
 "ParameterValue": "ami-<random_string>" 4
 },
 {
 "ParameterKey": "AllowedBootstrapSshCidr", 5
 "ParameterValue": "0.0.0.0/0" 6
 },
 {
 "ParameterKey": "PublicSubnet", 7
 "ParameterValue": "subnet-<random_string>" 8
 },
 {
 "ParameterKey": "MasterSecurityGroupId", 9
 "ParameterValue": "sg-<random_string>" 10
 },
 {
 "ParameterKey": "VpcId", 11
 "ParameterValue": "vpc-<random_string>" 12
 },
 {
 "ParameterKey": "BootstrapIgnitionLocation", 13
 "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
 },
 {
 "ParameterKey": "AutoRegisterELB", 15
 "ParameterValue": "yes" 16
 },
 {
 "ParameterKey": "RegisterNlbTargetsLambdaArn", 17
 "ParameterValue": "arn:aws:lambda:<aws_region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 18
 },
 {
 "ParameterKey": "ExternalApiTargetGroupArn", 19
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
 },
 {
 "ParameterKey": "InternalApiTargetGroupArn", 21
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
 },
 {
 "ParameterKey": "InternalServiceTargetGroupArn", 23
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
 }
]

```

1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.

2

Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.

- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node based on your selected architecture.
- 4 Specify a valid **AWS::EC2::Image::Id** value.
- 5 CIDR block to allow SSH access to the bootstrap node.
- 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
- 7 The public subnet that is associated with your VPC to launch the bootstrap node into.
- 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 9 The master security group ID (for registering temporary rules)
- 10 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 11 The VPC created resources will belong to.
- 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- 13 Location to fetch bootstrap Ignition config file from.
- 14 Specify the S3 bucket and file name in the form **s3://<bucket\_name>/bootstrap.ign**.
- 15 Whether or not to register a network load balancer (NLB).
- 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 17 The ARN for NLB IP target registration lambda group.
- 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 19 The ARN for external API load balancer target group.
- 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 21 The ARN for internal API load balancer target group.
- 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 23 The ARN for internal service load balancer target group.
- 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

- 5. Copy the template from the **CloudFormation template for the bootstrap machine** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
- 6. Optional: If you are deploying the cluster with a proxy, you must update the ignition in the template to add the **ignition.config.proxy** fields. Additionally, If you have added the Amazon EC2, Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 7. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
--template-body file://<template>.yaml 2
--parameters file://<parameters>.json 3
--capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

- 8. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                             |                            |
|-----------------------------|----------------------------|
| <b>Bootstrap InstanceId</b> | The bootstrap Instance ID. |
|-----------------------------|----------------------------|

|                            |                                        |
|----------------------------|----------------------------------------|
| <b>Bootstrap PublicIp</b>  | The bootstrap node public IP address.  |
| <b>Bootstrap PrivateIp</b> | The bootstrap node private IP address. |

#### 4.12.15.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

##### Example 4.66. CloudFormation template for the bootstrap machine

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
 InfrastructureName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})$
 MaxLength: 27
 MinLength: 1
 ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
 maximum of 27 characters.
 Description: A short, unique cluster ID used to tag cloud resources and identify items owned or
 used by the cluster.
 Type: String
 RhcosAmi:
 Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
 Type: AWS::EC2::Image::Id
 AllowedBootstrapSshCidr:
 AllowedPattern: ^((([0-9]{1-9}[0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]{1-9}[0-9]|1[0-9]{2}|2[0-
 4][0-9]|25[0-5])|([0-9]{1-9}[0-9]|2[0-9]|3[0-2]))$
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
 Default: 0.0.0.0/0
 Description: CIDR block to allow SSH access to the bootstrap node.
 Type: String
 PublicSubnet:
 Description: The public subnet to launch the bootstrap node into.
 Type: AWS::EC2::Subnet::Id
 MasterSecurityGroupId:
 Description: The master security group ID for registering temporary rules.
 Type: AWS::EC2::SecurityGroup::Id
 VpcId:
 Description: The VPC-scoped resources will belong to this VPC.
 Type: AWS::EC2::VPC::Id
 BootstrapIgnitionLocation:
 Default: s3://my-s3-bucket/bootstrap.ign
 Description: Ignition config file location.
 Type: String
 AutoRegisterELB:
 Default: "yes"
 AllowedValues:
 - "yes"
 - "no"

```

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group.

Type: String

BootstrapInstanceType:

Description: Instance type for the bootstrap EC2 instance

Default: "i3.large"

Type: String

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- InfrastructureName

- Label:

default: "Host Information"

Parameters:

- RhcosAmi

- BootstrapIgnitionLocation

- MasterSecurityGroupId

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- AllowedBootstrapSshCidr

- PublicSubnet

- Label:

default: "Load Balancer Automation"

Parameters:

- AutoRegisterELB

- RegisterNlbTargetsLambdaArn

- ExternalApiTargetGroupArn

- InternalApiTargetGroupArn

- InternalServiceTargetGroupArn

ParameterLabels:

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

AllowedBootstrapSshCidr:

default: "Allowed SSH Source"

PublicSubnet:

default: "Public Subnet"

RhcosAmi:

```

 default: "Red Hat Enterprise Linux CoreOS AMI ID"
 BootstrapIgnitionLocation:
 default: "Bootstrap Ignition Source"
 MasterSecurityGroupId:
 default: "Master Security Group ID"
 AutoRegisterELB:

Outputs:
 BootstrapInstanceId:
 Description: Bootstrap Instance ID.

```

Value: !Ref BootstrapInstance

BootstrapPublicIp:

Description: The bootstrap node public IP address.

Value: !GetAtt BootstrapInstance.PublicIp

BootstrapPrivateIp:

Description: The bootstrap node private IP address.

Value: !GetAtt BootstrapInstance.PrivateIp

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).
- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

## 4.12.16. Creating the control plane machines in AWS

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

### IMPORTANT

The CloudFormation template creates a stack that represents three control plane nodes.

### NOTE

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

### Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", ❶
 "ParameterValue": "mycluster-<random_string>" ❷
 },
 {
 "ParameterKey": "RhcosAmi", ❸
 "ParameterValue": "ami-<random_string>" ❹
 },
 {
 "ParameterKey": "AutoRegisterDNS", ❺
 "ParameterValue": "yes" ❻
 },
 {
 "ParameterKey": "PrivateHostedZoneId", ❼
 "ParameterValue": "<random_string>" ❽
 },
 {
 "ParameterKey": "PrivateHostedZoneName", ❾
 "ParameterValue": "mycluster.example.com" ❿
 },
 {
 "ParameterKey": "Master0Subnet", ❶❶
 "ParameterValue": "subnet-<random_string>" ❶❷
 },
 {
 "ParameterKey": "Master1Subnet", ❶❸
 "ParameterValue": "subnet-<random_string>" ❶❹
 },
 {
 "ParameterKey": "Master2Subnet", ❶❺
 "ParameterValue": "subnet-<random_string>" ❶❻
 },
 {
 "ParameterKey": "MasterSecurityGroupId", ❶❼
 "ParameterValue": "sg-<random_string>" ❶❽
 },
 {
 "ParameterKey": "IgnitionLocation", ❶❾
 "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
 ❷❶
 },
 {
 "ParameterKey": "CertificateAuthorities", ❷❶
 "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" ❷❷
 },
 {
 "ParameterKey": "MasterInstanceProfileName", ❷❸
 "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" ❷❹
 },
 {

```

```

 "ParameterKey": "MasterInstanceType", 25
 "ParameterValue": "" 26
 },
 {
 "ParameterKey": "AutoRegisterELB", 27
 "ParameterValue": "yes" 28
 },
 {
 "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
 "ParameterValue": "arn:aws:lambda:<aws_region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
 },
 {
 "ParameterKey": "ExternalApiTargetGroupArn", 31
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
 },
 {
 "ParameterKey": "InternalApiTargetGroupArn", 33
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
 },
 {
 "ParameterKey": "InternalServiceTargetGroupArn", 35
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
 }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines based on your selected architecture.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.
- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster\_name>.<domain\_name>** where **<domain\_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.

- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17 The master security group ID to associate with control plane nodes.
- 18 Specify the **MasterSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.
- 19 The location to fetch control plane Ignition config file from.
- 20 Specify the generated Ignition config file location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/master](https://api-int.<cluster_name>.<domain_name>:22623/config/master).
- 21 The base64 encoded certificate authority string to use.
- 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 23 The IAM profile to associate with control plane nodes.
- 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 25 The type of AWS instance to use for the control plane machines based on your selected architecture.
- 26 The instance type value corresponds to the minimum resource requirements for control plane machines. For example **m6i.xlarge** is a type for AMD64 and **m6g.xlarge** is a type for ARM64.
- 27 Whether or not to register a network load balancer (NLB).
- 28 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 29 The ARN for NLB IP target registration lambda group.
- 30 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 31 The ARN for external API load balancer target group.
- 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 33 The ARN for internal API load balancer target group.
- 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 35 The ARN for internal service load balancer target group.

- 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
3. If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml 2
 --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

### NOTE

The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

#### 4.12.16.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

#### Example 4.67. CloudFormation template for control plane machines

—

AWSTemplateFormatVersion: [2010-09-09](#)

Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:

InfrastructureName:

AllowedPattern: `^([a-zA-Z][a-zA-Z0-9\-\_]{0,26})$`

MaxLength: [27](#)

MinLength: [1](#)

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of [27](#) characters.

Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.

Type: String

RhcosAmi:

Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.

Type: `AWS::EC2::Image::Id`

AutoRegisterDNS:

Default: `""`

Description: unused

Type: String

PrivateHostedZoneId:

Default: `""`

Description: unused

Type: String

PrivateHostedZoneName:

Default: `""`

Description: unused

Type: String

Master0Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: `AWS::EC2::Subnet::Id`

Master1Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: `AWS::EC2::Subnet::Id`

Master2Subnet:

Description: The subnets, recommend private, to launch the master nodes into.

Type: `AWS::EC2::Subnet::Id`

MasterSecurityGroupId:

Description: The master security group ID to associate with master nodes.

Type: `AWS::EC2::SecurityGroup::Id`

IgnitionLocation:

Default: `https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master`

Description: Ignition config file location.

Type: String

CertificateAuthorities:

Default: `data:text/plain;charset=utf-8;base64,ABC...xYz==`

Description: Base64 encoded certificate authority string to use.

Type: String

MasterInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

MasterInstanceType:

Default: `m5.xlarge`

Type: String

AutoRegisterELB:

Default: `"yes"`

AllowedValues:

- "yes"
- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

Metadata:

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

## 4.12.17. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

### NOTE

If you are installing a three-node cluster, skip this step. A three-node cluster consists of three control plane machines, which also act as compute machines.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

### IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

## NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

## Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", 1
 "ParameterValue": "mycluster-<random_string>" 2
 },
 {
 "ParameterKey": "RhcocAmi", 3
 "ParameterValue": "ami-<random_string>" 4
 },
 {
 "ParameterKey": "Subnet", 5
 "ParameterValue": "subnet-<random_string>" 6
 },
 {
 "ParameterKey": "WorkerSecurityGroupld", 7
 "ParameterValue": "sg-<random_string>" 8
 },
 {
 "ParameterKey": "IgnitionLocation", 9
 "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
 },
 {
 "ParameterKey": "CertificateAuthorities", 11
 "ParameterValue": "" 12
 }
]
```

```

 },
 {
 "ParameterKey": "WorkerInstanceProfileName", 13
 "ParameterValue": "" 14
 },
 {
 "ParameterKey": "WorkerInstanceType", 15
 "ParameterValue": "" 16
 }
]
}

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes based on your selected architecture.
  - 4 Specify an **AWS::EC2::Image::Id** value.
  - 5 A subnet, preferably private, to start the worker nodes on.
  - 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
  - 7 The worker security group ID to associate with worker nodes.
  - 8 Specify the **WorkerSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
  - 9 The location to fetch the bootstrap Ignition config file from.
  - 10 Specify the generated Ignition config location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/worker](https://api-int.<cluster_name>.<domain_name>:22623/config/worker).
  - 11 Base64 encoded certificate authority string to use.
  - 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
  - 13 The IAM profile to associate with worker nodes.
  - 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
  - 15 The type of AWS instance to use for the compute machines based on your selected architecture.
  - 16 The instance type value corresponds to the minimum resource requirements for compute machines. For example **m6i.large** is a type for AMD64 and **m6g.large** is a type for ARM64.
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

- Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
- Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
- Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
--template-body file://<template>.yaml \ 2
--parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

**NOTE**

The CloudFormation template creates a stack that represents one worker node.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

- Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

#### 4.12.17.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

#### Example 4.68. CloudFormation template for worker machines

```

AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
 InfrastructureName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-_]{0,26})$
 MaxLength: 27
 MinLength: 1
 ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
 maximum of 27 characters.
 Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
 Type: String
 RhcosAmi:
 Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
 Type: AWS::EC2::Image::Id
 Subnet:
 Description: The subnets, recommend private, to launch the worker nodes into.
 Type: AWS::EC2::Subnet::Id
 WorkerSecurityGroupId:
 Description: The worker security group ID to associate with worker nodes.
 Type: AWS::EC2::SecurityGroup::Id
 IgnitionLocation:
 Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
 Description: Ignition config file location.
 Type: String
 CertificateAuthorities:
 Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
 Description: Base64 encoded certificate authority string to use.
 Type: String
 WorkerInstanceProfileName:
 Description: IAM profile to associate with worker nodes.
 Type: String
 WorkerInstanceType:
 Default: m5.large
 Type: String

Metadata:
 AWS::CloudFormation::Interface:
 ParameterGroups:
 - Label:
 default: "Cluster Information"
 Parameters:
 - InfrastructureName
 - Label:
 default: "Host Information"
 Parameters:
 - WorkerInstanceType
 - RhcosAmi
 - IgnitionLocation
 - CertificateAuthorities
 - WorkerSecurityGroupId

```

```

- WorkerInstanceProfileName
- Label:
 default: "Network Configuration"
Parameters:
- Subnet
ParameterLabels:
Subnet:
 default: "Subnet"
InfrastructureName:
 default: "Infrastructure Name"
WorkerInstanceType:
 default: "Worker Instance Type"
WorkerInstanceProfileName:
 default: "Worker Instance Profile Name"
RhcsoAmi:
 default: "Red Hat Enterprise Linux CoreOS AMI ID"
IgnitionLocation:
 default: "Worker Ignition Source"
CertificateAuthorities:
 default: "Ignition CA String"
WorkerSecurityGroupId:
 default: "Worker Security Group ID"

Resources:
Worker0:
 Type: AWS::EC2::Instance
 Properties:
 ImageId: !Ref RhcsoAmi
 BlockDeviceMappings:
 - DeviceName: /dev/xvda
 Ebs:
 VolumeSize: "120"
 VolumeType: "gp2"
 IamInstanceProfile: !Ref WorkerInstanceProfileName
 InstanceType: !Ref WorkerInstanceType
 NetworkInterfaces:
 - AssociatePublicIpAddress: "false"
 DeviceIndex: "0"
 GroupSet:
 - !Ref "WorkerSecurityGroupId"
 SubnetId: !Ref "Subnet"
 UserData:
 Fn::Base64: !Sub
 - '{"ignition":{"config":{"merge":[{"source":"${SOURCE}"}]},"security":{"tls":
{"certificateAuthorities":[{"source":"${CA_BUNDLE}"}]},"version":"3.1.0"}}'
 - {
 SOURCE: !Ref IgnitionLocation,
 CA_BUNDLE: !Ref CertificateAuthorities,
 }
 Tags:
 - Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
 Value: "shared"

Outputs:

```

**PrivateIP:**

Description: The compute node private IP address.

Value: !GetAtt Worker0.PrivateIp

**Additional resources**

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

**4.12.18. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure**

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

**Prerequisites**

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

**Procedure**

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2
```

**1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

**2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

**Example output**

```
INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
```

```
INFO API v1.27.3 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

#### NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

#### Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.
- You can view details about the running instances that are created by using the [AWS EC2 console](#).

### 4.12.19. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

## Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

## Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

## Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

## Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

### NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

### Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

## 4.12.20. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

### Example output

```
system:admin
```

## 4.12.21. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

### Prerequisites

- You added machines to your cluster.

### Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

### Example output

| NAME     | STATUS | ROLES  | AGE | VERSION |
|----------|--------|--------|-----|---------|
| master-0 | Ready  | master | 63m | v1.27.3 |
| master-1 | Ready  | master | 63m | v1.27.3 |
| master-2 | Ready  | master | 64m | v1.27.3 |

The output lists all of the machines that you created.

### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

| NAME      | AGE | REQUESTOR                                                                 | CONDITION |
|-----------|-----|---------------------------------------------------------------------------|-----------|
| csr-8b2br | 15m | system:serviceaccount:openshift-machine-config-operator:node-bootstrapper | Pending   |
| csr-8vnps | 15m | system:serviceaccount:openshift-machine-config-operator:node-bootstrapper | Pending   |
| ...       |     |                                                                           |           |

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

### NOTE

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrap** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

**NOTE**

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

```
NAME AGE REQUESTOR CONDITION
csr-bfd72 5m26s system:node:ip-10-0-50-126.us-east-2.compute.internal
Pending
csr-c57lv 5m26s system:node:ip-10-0-95-157.us-east-2.compute.internal
Pending
...
```

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}
{{end}}{{end}}' | xargs oc adm certificate approve
```

6. After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

### Example output

```
NAME STATUS ROLES AGE VERSION
master-0 Ready master 73m v1.27.3
master-1 Ready master 73m v1.27.3
master-2 Ready master 74m v1.27.3
worker-0 Ready worker 11m v1.27.3
worker-1 Ready worker 11m v1.27.3
```

### NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

## 4.12.22. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

### Prerequisites

- Your control plane has initialized.

### Procedure

1. Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

### Example output

| NAME               | VERSION | AVAILABLE | PROGRESSING | DEGRADED  |
|--------------------|---------|-----------|-------------|-----------|
| SINCE              |         |           |             |           |
| authentication     | 4.14.0  | True      | False       | False 19m |
| baremetal          | 4.14.0  | True      | False       | False 37m |
| cloud-credential   | 4.14.0  | True      | False       | False 40m |
| cluster-autoscaler | 4.14.0  | True      | False       | False 37m |
| config-operator    | 4.14.0  | True      | False       | False 38m |

|                                          |        |      |       |       |     |
|------------------------------------------|--------|------|-------|-------|-----|
| console                                  | 4.14.0 | True | False | False | 26m |
| csi-snapshot-controller                  | 4.14.0 | True | False | False | 37m |
| dns                                      | 4.14.0 | True | False | False | 37m |
| etcd                                     | 4.14.0 | True | False | False | 36m |
| image-registry                           | 4.14.0 | True | False | False | 31m |
| ingress                                  | 4.14.0 | True | False | False | 30m |
| insights                                 | 4.14.0 | True | False | False | 31m |
| kube-apiserver                           | 4.14.0 | True | False | False | 26m |
| kube-controller-manager                  | 4.14.0 | True | False | False | 36m |
| kube-scheduler                           | 4.14.0 | True | False | False | 36m |
| kube-storage-version-migrator            | 4.14.0 | True | False | False | 37m |
| machine-api                              | 4.14.0 | True | False | False | 29m |
| machine-approver                         | 4.14.0 | True | False | False | 37m |
| machine-config                           | 4.14.0 | True | False | False | 36m |
| marketplace                              | 4.14.0 | True | False | False | 37m |
| monitoring                               | 4.14.0 | True | False | False | 29m |
| network                                  | 4.14.0 | True | False | False | 38m |
| node-tuning                              | 4.14.0 | True | False | False | 37m |
| openshift-apiserver                      | 4.14.0 | True | False | False | 32m |
| openshift-controller-manager             | 4.14.0 | True | False | False | 30m |
| openshift-samples                        | 4.14.0 | True | False | False | 32m |
| operator-lifecycle-manager               | 4.14.0 | True | False | False | 37m |
| operator-lifecycle-manager-catalog       | 4.14.0 | True | False | False | 37m |
| operator-lifecycle-manager-packageserver | 4.14.0 | True | False | False | 32m |
| service-ca                               | 4.14.0 | True | False | False | 38m |
| storage                                  | 4.14.0 | True | False | False | 37m |

2. Configure the Operators that are not available.

#### 4.12.22.1. Image registry storage configuration

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

You can configure registry storage for user-provisioned infrastructure in AWS to deploy OpenShift Container Platform to hidden regions. See [Configuring the registry for AWS user-provisioned infrastructure](#) for more information.

##### 4.12.22.1.1. Configuring registry storage for AWS with user-provisioned infrastructure

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

#### Prerequisites

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY\_STORAGE\_S3\_ACCESSKEY**
  - **REGISTRY\_STORAGE\_S3\_SECRETKEY**

## Procedure

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

## Example configuration

```
storage:
 s3:
 bucket: <bucket-name>
 region: <region-name>
```

### WARNING

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

#### 4.12.22.1.2. Configuring storage for the image registry in non-production clusters

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

## Procedure

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}}'
```

### WARNING

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

### 4.12.23. Deleting the bootstrap resources

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

#### Prerequisites

- You completed the initial Operator configuration for your cluster.

#### Procedure

1. Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):

- Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

**1** **<name>** is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

### 4.12.24. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

#### Procedure

1. Determine the routes to create.
  - To create a wildcard record, use **\*.apps.<cluster\_name>.<domain\_name>**, where **<cluster\_name>** is your cluster name, and **<domain\_name>** is the Route 53 base domain for your OpenShift Container Platform cluster.

- To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
{"\n"}}{end}{end}' routes
```

### Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

### Example output

| NAME           | TYPE         | CLUSTER-IP    | EXTERNAL-IP                          | PORT(S)                    |
|----------------|--------------|---------------|--------------------------------------|----------------------------|
| router-default | LoadBalancer | 172.30.62.215 | ab3...28.us-east-2.elb.amazonaws.com | 80:31499/TCP,443:30693/TCP |
|                |              | 5m            |                                      |                            |

3. Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName ==
"<external_ip>").CanonicalHostedZoneNameId' 1
```

- 1** For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

### Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
 --dns-name "<domain_name>" \ 1
 --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
`<domain_name>.`].Id' 2
 --output text
```

- 1** **2** For **<domain\_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

## Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

5. Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
> "Action": "CREATE",
> "ResourceRecordSet": {
> "Name": "\\052.apps.<cluster_domain>", 2
> "Type": "A",
> "AliasTarget":{
> "HostedZoneId": "<hosted_zone_id>", 3
> "DNSName": "<external_ip>.", 4
> "EvaluateTargetHealth": false
> }
> }
> }
>]
> }'
```

- 1 For **<private\_hosted\_zone\_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
> "Action": "CREATE",
> "ResourceRecordSet": {
> "Name": "\\052.apps.<cluster_domain>", 2
> "Type": "A",
> "AliasTarget":{
> "HostedZoneId": "<hosted_zone_id>", 3
> "DNSName": "<external_ip>.", 4
> "EvaluateTargetHealth": false
```

```
> }
> }
> }
>]
> }'
```

- 1 For **<public\_hosted\_zone\_id>**, specify the public hosted zone for your domain.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

#### 4.12.25. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

##### Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

##### Procedure

- From the directory that contains the installation program, complete the cluster installation:

```
$./openshift-install --dir <installation_directory> wait-for install-complete 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

##### Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 1s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

/validating-an-installation.adoc

### 4.12.26. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

#### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

#### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

#### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/.openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

#### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/.openshift\_install.log** log file on the installation host.

#### Example output

```
-
```

|         |                                                             |         |
|---------|-------------------------------------------------------------|---------|
| console | console-openshift-console.apps.<cluster_name>.<base_domain> | console |
| https   | reencrypt/Redirect                                          | None    |

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.12.27. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.12.28. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

### 4.12.29. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.13. INSTALLING A CLUSTER ON AWS WITH WORKER NODES ON AWS LOCAL ZONES

You can quickly install an OpenShift Container Platform cluster in Amazon Web Services (AWS) Local Zones by setting the zone names in the edge compute pool of the **install-config.yaml** file, or install a cluster in an existing VPC that lists Local Zone subnets.

AWS Local Zones are a type of infrastructure that place Cloud Resources close to metropolitan regions. For more information, see the [AWS Local Zones Documentation](#) .

**IMPORTANT**

The steps for performing an installer-provisioned infrastructure installation are provided for example purposes only. Installing a cluster in an existing VPC requires that you have knowledge of the cloud provider and the installation process of OpenShift Container Platform. You can use a CloudFormation template to assist you with completing these steps or to help model your own cluster installation. Instead of using the CloudFormation template to create resources, you can decide to use other methods for generating these resources.

**4.13.1. Prerequisites**

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.

**IMPORTANT**

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You noted the region and supported [AWS Local Zones locations](#) to create the network resources in.
- You read the [Features](#) for each AWS Local Zones location.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or UNIX\)](#) in the AWS documentation.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

**NOTE**

Be sure to also review this site list if you are configuring a proxy.

- Add permission for the user who creates the cluster to modify the Local Zone group with **ec2:ModifyAvailabilityZoneGroup**. For example:

**An example of a permissive IAM policy to attach to a user or role**

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Action": [
```

```

 "ec2:ModifyAvailabilityZoneGroup"
],
 "Effect": "Allow",
 "Resource": "*"
}
]
}

```

### 4.13.2. Cluster limitations in AWS Local Zones

Some limitations exist when you attempt to deploy a cluster with a default installation configuration in Amazon Web Services (AWS) Local Zones.

#### IMPORTANT

The following list details limitations when deploying a cluster in AWS Local Zones:

- The Maximum Transmission Unit (MTU) between an Amazon EC2 instance in a Local Zone and an Amazon EC2 instance in the Region is **1300**. This causes the cluster-wide network MTU to change according to the network plugin that is used on the deployment.
- Network resources such as Network Load Balancer (NLB), Classic Load Balancer, and Network Address Translation (NAT) Gateways are not globally supported in AWS Local Zones.
- For an OpenShift Container Platform cluster on AWS, the AWS Elastic Block Storage (EBS) **gp3** type volume is the default for node volumes and the default for the storage class. This volume type is not globally available on Local Zone locations. By default, the nodes running in Local Zones are deployed with the **gp2** EBS volume. The **gp2-csi StorageClass** must be set when creating workloads on Local Zone nodes.

If you want the installation program to automatically create Local Zone subnets for your OpenShift Container Platform cluster, specific configuration limitations apply with this method.

#### IMPORTANT

The following configuration limitation applies when you set the installation program to automatically create subnets for your OpenShift Container Platform cluster:

- The private subnets for an AWS Local Zone associate with the route table of the parent zone, so that each private subnet can route egress traffic to the internet. If this route table does not exist during cluster installation, the private subnet associates with the first available private route table in the Virtual Private Cloud (VPC). This approach is valid only for AWS Local Zones subnets in an OpenShift Container Platform cluster.

#### Additional resources

- [Storage classes](#)
- [Ingress Controller sharding](#)

### 4.13.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 4.13.4. Obtaining an AWS Marketplace image

If you are deploying an OpenShift Container Platform cluster using an AWS Marketplace image, you must first subscribe through AWS. Subscribing to the offer provides you with the AMI ID that the installation program uses to deploy worker nodes.

#### Prerequisites

- You have an AWS account to purchase the offer. This account does not have to be the same account that is used to install the cluster.

#### Procedure

1. Complete the OpenShift Container Platform subscription from the [AWS Marketplace](#).
2. Record the AMI ID for your specific region. As part of the installation process, you must update the **install-config.yaml** file with this value before deploying the cluster.

#### Sample install-config.yaml file with AWS Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
 name: worker
 platform:
 aws:
 amiID: ami-06c4d345f7c207239 1
 type: m5.4xlarge
 replicas: 3
metadata:
 name: test-cluster
```

```
platform:
 aws:
 region: us-east-2 2
 sshKey: ssh-ed25519 AAAA...
 pullSecret: '{"auths": ...}'
```

- 1** The AMI ID from your AWS Marketplace subscription.
- 2** Your AMI ID is associated with a specific AWS region. When creating the installation configuration file, ensure that you select the same AWS region that you specified when configuring your subscription.

### 4.13.5. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

#### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

#### NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

### Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

### 4.13.6. Preparing for the installation

Before you extend nodes to local zones, you must prepare certain resources for the cluster installation environment.

#### 4.13.6.1. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

#### 4.13.6.2. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added

to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86\_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**4.13.6.3. Creating the installation files for AWS**

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

**4.13.6.4. Minimum resource requirements for cluster installation**

Each cluster machine must meet the following minimum requirements:

**Table 4.19. Minimum resource requirements**

| Machine       | Operating System              | vCPU [1] | Virtual RAM | Storage | Input/Output Per Second (IOPS)[2] |
|---------------|-------------------------------|----------|-------------|---------|-----------------------------------|
| Bootstrap     | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Control plane | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Compute       | RHCOS, RHEL 8.6 and later [3] | 2        | 8 GB        | 100 GB  | 300                               |

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

## NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### 4.13.6.5. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform for use with AWS Local Zones.

## NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

### Example 4.69. Machine types based on 64-bit x86 architecture for AWS Local Zones

- **c5.\***
- **c5d.\***
- **m6i.\***
- **m5.\***
- **r5.\***
- **t3.\***

### Additional resources

- See [AWS Local Zones features](#) in the AWS documentation for more information about AWS Local Zones and the supported instances types and services.

### 4.13.6.6. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

### Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

**IMPORTANT**

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

**NOTE**

The AWS access key ID and secret access key are stored in `~/.aws/credentials` in the home directory of the current user on the installation host. You are prompted for the credentials by the installation program if the credentials for the exported profile are not present in the file. Any credentials that you provide to the installation program are stored in the file.

- iv. Select the AWS region to deploy the cluster to. The region that you specify must be the same region that contains the Local Zone that you opted in to for your AWS account.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
  - vii. Paste the [pull secret from Red Hat OpenShift Cluster Manager](#).
2. Optional: Back up the **install-config.yaml** file.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### 4.13.6.7. Edge compute pools and AWS Local Zones

Edge worker nodes are tainted worker nodes that run in AWS Local Zones locations.

When deploying a cluster that uses Local Zones, consider the following points:

- Amazon EC2 instances in the Local Zones are more expensive than Amazon EC2 instances in the Availability Zones.
- Latency between applications and end users is lower in Local Zones, and latency might vary by location. A latency impact exists for some workloads if, for example, ingress traffic is mixed between Local Zones and Availability Zones.

## IMPORTANT

Generally, the maximum transmission unit (MTU) between an Amazon EC2 instance in a Local Zone and an Amazon EC2 instance in the Region is 1300. For more information, see [How Local Zones work](#) in the AWS documentation. The cluster network MTU must be always less than the EC2 MTU to account for the overhead. The specific overhead is determined by the network plugin, for example:

- OVN-Kubernetes: **100 bytes**
- OpenShift SDN: **50 bytes**

The network plugin can provide additional features, like IPsec, that also must be decreased the MTU. For additional information, see the documentation.

OpenShift Container Platform 4.12 introduced a new compute pool, *edge*, that is designed for use in remote zones. The edge compute pool configuration is common between AWS Local Zones locations. Because of the type and size limitations of resources like EC2 and EBS on Local Zone resources, the default instance type can vary from the traditional worker pool.

The default Elastic Block Store (EBS) for Local Zone locations is **gp2**, which differs from the regular worker pool. The instance type used for each Local Zone on edge compute pool also might differ from worker pools, depending on the instance offerings on the zone.

The edge compute pool creates new labels that developers can use to deploy applications onto AWS Local Zones nodes. The new labels are:

- **node-role.kubernetes.io/edge=""**
- **machine.openshift.io/zone-type=local-zone**
- **machine.openshift.io/zone-group=\$ZONE\_GROUP\_NAME**

By default, the machine sets for the edge compute pool defines the taint of **NoSchedule** to prevent regular workloads from spreading on Local Zone instances. Users can only run user workloads if they define tolerations in the pod specification.

The following examples show **install-config.yaml** files that use the edge machine pool.

## Configuration that uses an edge pool with a custom instance type

```
apiVersion: v1
baseDomain: devcluster.openshift.com
metadata:
 name: ipi-localzone
compute:
- name: edge
```

```

platform:
 aws:
 type: m5.4xlarge
platform:
 aws:
 region: us-west-2
pullSecret: '{"auths": ...}'
sshKey: ssh-ed25519 AAAA...

```

Instance types differ between locations. To verify availability in the Local Zone in which the cluster runs, see the AWS documentation.

### Configuration that uses an edge pool with a custom EBS type

```

apiVersion: v1
baseDomain: devcluster.openshift.com
metadata:
 name: ipi-localzone
compute:
- name: edge
 platform:
 aws:
 rootVolume:
 type: gp3
 size: 120
platform:
 aws:
 region: us-west-2
pullSecret: '{"auths": ...}'
sshKey: ssh-ed25519 AAAA...

```

EBS types differ between locations. Check the AWS documentation to verify availability in the Local Zone in which the cluster runs.

### Configuration that uses an edge pool with custom security groups

```

apiVersion: v1
baseDomain: devcluster.openshift.com
metadata:
 name: ipi-localzone
compute:
- name: edge
 platform:
 aws:
 additionalSecurityGroupIDs:
 - sg-1 1
 - sg-2
platform:
 aws:
 region: us-west-2
pullSecret: '{"auths": ...}'
sshKey: ssh-ed25519 AAAA...

```

- 1** Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.

## Additional resources

- [Changing the MTU for the cluster network](#)
- [Enabling IPsec encryption](#)
- [Understanding taints and tolerations](#)

### 4.13.7. Opting in to AWS Local Zones

If you plan to create the subnets in AWS Local Zones, you must opt in to each zone group separately.

#### Prerequisites

- You have installed the AWS CLI.
- You have determined an AWS Region for where you want to deploy your OpenShift Container Platform cluster.
- You have attached a permissive IAM policy to a user or role account that opts in to the zone group. Consider the following configuration as an example IAM policy:

```
{
 "Version": "2012-10-17",
 "Statement": [
 {
 "Action": [
 "ec2:ModifyAvailabilityZoneGroup"
],
 "Effect": "Allow",
 "Resource": "*"
 }
]
}
```

#### Procedure

1. List the zones that are available in your AWS Region by running the following command:

```
$ aws --region "<value_of_AWS_Region>" ec2 describe-availability-zones \
 --query 'AvailabilityZones[].[ZoneName: ZoneName, GroupName: GroupName, Status: OptInStatus]]' \
 --filters Name=zone-type,Values=local-zone \
 --all-availability-zones
```

Depending on the AWS Region, the list of available zones can be long. The command returns the following fields:

#### **ZoneName**

The name of the Local Zone.

#### **GroupName**

The group that comprises the zone. To opt in to the region, save the name.

#### **Status**

The status of the Local Zone group. If the status is **not-opted-in**, you must opt in the **GroupName** by running the commands that follow.

2. Opt in to the zone group on your AWS account by running the following command:

```
$ aws ec2 modify-availability-zone-group \
 --group-name "<value_of_GroupName>" \
 --opt-in-status opted-in
```

- 1 For **<value\_of\_GroupName>**, specify the name of the group of the Local Zone where you want to create subnets. For example, specify **us-east-1-nyc-1** to use the zone **us-east-1-nyc-1a** (US East New York).

#### 4.13.8. Cluster installation options for an AWS Local Zones environment

To install an OpenShift Container Platform cluster in an AWS Local Zones environment on AWS infrastructure, choose one of the following installation options:

- Installing a cluster to quickly extend workers to edge compute pools, where the installation program automatically creates resources for the OpenShift Container Platform cluster.
- Installing a cluster on AWS into an existing VPC, where you must add Local Zone subnets to the **install-config.yaml** file.

#### Next steps

Choose one of the following options to install an OpenShift Container Platform cluster in an AWS Local Zones environment:

- [Installing a cluster quickly in AWS Local Zones](#)
- [Installing a cluster in an existing VPC with defined Local Zone subnets](#)

#### 4.13.9. Install a cluster quickly in AWS Local Zones

For OpenShift Container Platform 4.14, you can quickly install a cluster on Amazon Web Services (AWS) to extend compute nodes to Local Zone locations. By using this installation route, the installation program automatically creates network resources and Local Zone subnets for each Local Zone that you defined in your configuration file. To customize the installation, you must modify parameters in the **install-config.yaml** file before you deploy the cluster.

##### 4.13.9.1. Modifying an installation configuration file to use AWS Local Zones

Modify an **install-config.yaml** file to include AWS Local Zones.

#### Prerequisites

- You have configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You have read the configuration limitations that apply when you specify the installation program to automatically create subnets for your OpenShift Container Platform cluster. See the section named "Cluster limitations in AWS Local Zones".

- You opted in to the Local Zone group for each zone.
- You created an **install-config.yaml** file by using the procedure "Creating the installation configuration file".

## Procedure

1. Modify the **install-config.yaml** file by specifying Local Zone names in the **platform.aws.zones** property of the edge compute pool. For example:

```
...
platform:
 aws:
 region: <region_name> ❶
 compute:
 - name: edge
 platform:
 aws:
 zones: ❷
 - <local_zone_name>
#...
```

- ❶ The AWS Region name.
- ❷ The list of Local Zone names that must belong in the same AWS Region.

**Example of a configuration to install a cluster in the `us-west-2` AWS Region that extends edge nodes to Local Zones in Los Angeles and Las Vegas locations.**

```
apiVersion: v1
baseDomain: example.com
metadata:
 name: cluster-name
platform:
 aws:
 region: us-west-2
 compute:
 - name: edge
 platform:
 aws:
 zones:
 - us-west-2-lax-1a
 - us-west-2-lax-1b
 - us-west-2-las-1a
pullSecret: '{"auths": ...}'
sshKey: 'ssh-ed25519 AAAA...'
#...
```

2. Deploy your cluster.

## Additional resources

- [Creating the installation configuration file](#)

- [Cluster limitations in AWS Local Zones](#)

## Next steps

- [Deploying the cluster](#)

### 4.13.10. Installing a cluster in an existing VPC that has Local Zone subnets

You can install a cluster into an existing Amazon Virtual Private Cloud (VPC) on Amazon Web Services (AWS). The installation program provisions the rest of the required infrastructure, which you can further customize. To customize the installation, modify parameters in the **install-config.yaml** file before you install the cluster.

Installing a cluster on AWS into an existing VPC requires extending workers to the edge of the Cloud Infrastructure by using AWS Local Zones.

Local Zone subnets extend regular workers' nodes to edge networks. Each edge worker nodes runs a user workload. After you create an Amazon Web Service (AWS) Local Zone environment, and you deploy your cluster, you can use edge worker nodes to create user workloads in Local Zone subnets.

You can use a provided CloudFormation template to create the VPC and public subnets. Additionally, you can modify a template to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

#### NOTE

If you want to create private subnets, you must either modify the provided CloudFormation template or create your own template.

#### 4.13.10.1. Creating a VPC in AWS

You can create a Virtual Private Cloud (VPC), and subnets for each Local Zone location, in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to extend worker nodes to the edge locations. You can further customize the VPC to meet your requirements, including VPN, route tables, and add new Local Zone subnets that are not included at initial deployment.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You opted in to the AWS Local Zones on your AWS account.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "VpcCidr", ❶
 "ParameterValue": "10.0.0.0/16" ❷
 },
 {
 "ParameterKey": "AvailabilityZoneCount", ❸
 "ParameterValue": "3" ❹
 },
 {
 "ParameterKey": "SubnetBits", ❺
 "ParameterValue": "12" ❻
 }
]
```

- ❶ The CIDR block for the VPC.
  - ❷ Specify a CIDR block in the format **x.x.x.x/16-24**.
  - ❸ The number of availability zones to deploy the VPC in.
  - ❹ Specify an integer between **1** and **3**.
  - ❺ The size of each subnet in each availability zone.
  - ❻ Specify an integer between **5** and **13**, where **5** is /27 and **13** is /19.
2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC by running the following command:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> \ ❶
 --template-body file://<template>.yaml \ ❷
 --parameters file://<parameters>.json ❸
```

- ❶ **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- ❷ **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- ❸

**<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:123456789012:stack/cluster-vpc/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist by running the following command:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                           |                                          |
|---------------------------|------------------------------------------|
| <b>VpcId</b>              | The ID of your VPC.                      |
| <b>PublicSubnetIds</b>    | The IDs of the new public subnets.       |
| <b>PrivateSubnetIds</b>   | The IDs of the new private subnets.      |
| <b>PublicRouteTableId</b> | The ID of the new public route table ID. |

#### 4.13.10.2. Creating a subnet in AWS Local Zones

You must create a subnet in AWS Local Zones before you configure a worker machineset for your OpenShift Container Platform cluster.

You must repeat the following process for each Local Zone you want to deploy worker nodes to.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the subnet.

### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You opted in to the Local Zone group.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "VpcId",
 "ParameterValue": "<value_of_VpcId>" ❶
 },
 {
 "ParameterKey": "PublicRouteTableId",
 "ParameterValue": "<value_of_PublicRouteTableId>" ❷
 },
 {
 "ParameterKey": "ZoneName",
 "ParameterValue": "<value_of_ZoneName>" ❸
 },
 {
 "ParameterKey": "SubnetName",
 "ParameterValue": "<value_of_SubnetName>"
 },
 {
 "ParameterKey": "PublicSubnetCidr",
 "ParameterValue": "10.0.192.0/20" ❹
 }
]
```

- ❶ Specify the VPC ID, which is the value **VpcId** in the output of the CloudFormation template. for the VPC.
- ❷ Specify the Route Table ID, which is the value of the **PublicRouteTableId** in the CloudFormation stack for the VPC.
- ❸ Specify the AWS Local Zone name, which is the value of the **ZoneName** field in the **AvailabilityZones** object that you retrieve in the section "Opting in to AWS Local Zones".
- ❹ Specify a CIDR block that is used to create the Local Zone subnet. This block must be part of the VPC CIDR block **VpcCidr**.

2. Copy the template from the **CloudFormation template for the subnet** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC by running the following command:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <subnet_stack_name> \ ❶
--template-body file://<template>.yaml \ ❷
--parameters file://<parameters>.json ❸
```

- 1 **<subnet\_stack\_name>** is the name for the CloudFormation stack, such as **cluster-lz-local\_zone\_shortcode**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

Example output

```
arn:aws:cloudformation:us-east-1:123456789012:stack/<subnet_stack_name>/dbedae40-2fd3-11eb-820e-12a48460849f
```

4. Confirm that the template components exist by running the following command:

```
$ aws cloudformation describe-stacks --stack-name <subnet_stack_name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                        |                                    |
|------------------------|------------------------------------|
| <b>PublicSubnetIds</b> | The IDs of the new public subnets. |
|------------------------|------------------------------------|

4.13.10.3. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

Example 4.70. CloudFormation template for the VPC

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
 VpcCidr:
 AllowedPattern: ^((([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\\.){3}([0-9]|1[0-9]|2[0-4]|25[0-5])$)
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
 Default: 10.0.0.0/16
 Description: CIDR block for VPC.
 Type: String
 AvailabilityZoneCount:
 ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
 MinValue: 1
 MaxValue: 3
 Default: 1
 Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
 Type: Number
 SubnetBits:
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
```

MinValue: 5  
 MaxValue: 13  
 Default: 12  
 Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"  
 Type: Number

#### Metadata:

AWS::CloudFormation::Interface:  
 ParameterGroups:  
 - Label:  
   default: "Network Configuration"  
 Parameters:

 PublicRouteTableId:
 Description: Public Route table ID
 Value: !Ref PublicRouteTable

```

#### 4.13.10.4. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Edge compute pools and AWS Local Zones".

#### 4.13.10.5. CloudFormation template for the subnet that uses AWS Local Zones

You can use the following CloudFormation template to deploy the subnet that you need for your OpenShift Container Platform cluster that uses AWS Local Zones.

##### Example 4.71. CloudFormation template for the subnet

```
CloudFormation template used to create Local Zone subnets and dependencies
AWSTemplateFormatVersion: 2010-09-09
Description: Template for create Public Local Zone subnets

Parameters:
 VpcId:
 Description: VPC Id
 Type: String
 ZoneName:
 Description: Local Zone Name (Example us-east-1-nyc-1a)
 Type: String
 SubnetName:
 Description: Local Zone Name (Example cluster-public-us-east-1-nyc-1a)
 Type: String
 PublicRouteTableId:
 Description: Public Route Table ID to associate the Local Zone subnet
 Type: String
 PublicSubnetCidr:
 AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\.(1[6-9]|2[0-4]))$
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
 Default: 10.0.128.0/20
 Description: CIDR block for Public Subnet
 Type: String

Resources:
 PublicSubnet:
 Type: "AWS::EC2::Subnet"
 Properties:
 VpcId: !Ref VpcId
 CidrBlock: !Ref PublicSubnetCidr
 AvailabilityZone: !Ref ZoneName
 Tags:
 - Key: Name
 Value: !Ref SubnetName
 - Key: kubernetes.io/cluster/unmanaged
```

```
Value: "true"
```

```
PublicSubnetRouteTableAssociation:
 Type: "AWS::EC2::SubnetRouteTableAssociation"
 Properties:
 SubnetId: !Ref PublicSubnet
 RouteTableId: !Ref PublicRouteTableId
```

```
Outputs:
PublicSubnetIds:
 Description: Subnet IDs of the public subnets.
 Value:
 !Join ["", [!Ref PublicSubnet]]
```

### Additional resources

- You can view details about the CloudFormation stacks that you create by navigating to the [AWS CloudFormation console](#).

#### 4.13.10.6. Modifying an installation configuration file to use AWS Local Zones subnets

Modify an **install-config.yaml** file to include AWS Local Zones subnets.

### Prerequisites

- You created subnets by using the procedure "Creating a subnet in AWS Local Zones".
- You created an **install-config.yaml** file by using the procedure "Creating the installation configuration file".

### Procedure

- Modify the **install-config.yaml** configuration file by specifying Local Zone subnets in the **platform.aws.subnets** property, as demonstrated in the following example:

```
...
platform:
 aws:
 region: us-west-2
 subnets: 1
 - publicSubnetId-1
 - publicSubnetId-2
 - publicSubnetId-3
 - privateSubnetId-1
 - privateSubnetId-2
 - privateSubnetId-3
 - publicSubnetId-LocalZone-1
 ...
```

- 1 List of subnets created in the Availability and Local Zones.

### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

### 4.13.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

#### Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

#### NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

#### Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation\_directory>/openshift\_install.log**.

## IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### Next steps

- [Creating user workloads in AWS Local Zones](#)

### 4.13.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

■

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

### Example output

```
system:admin
```

/validating-an-installation.adoc

## 4.13.13. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

### Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

### Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/openshift\_install.log** log file on the installation host.

### Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.13.14. Verifying nodes that were created with edge compute pool

After you install a cluster that uses AWS Local Zones, check the status of the machine that was created by the machine set manifests created at install time.

1. To check the machine sets created from the subnet you added to the **install-config.yaml** file, run the following command:

```
$ oc get machineset -n openshift-machine-api
```

#### Example output

| NAME                                | DESIRED | CURRENT | READY | AVAILABLE | AGE  |
|-------------------------------------|---------|---------|-------|-----------|------|
| cluster-7xw5g-edge-us-east-1-nyc-1a | 1       | 1       | 1     | 1         | 3h4m |
| cluster-7xw5g-worker-us-east-1a     | 1       | 1       | 1     | 1         | 3h4m |
| cluster-7xw5g-worker-us-east-1b     | 1       | 1       | 1     | 1         | 3h4m |
| cluster-7xw5g-worker-us-east-1c     | 1       | 1       | 1     | 1         | 3h4m |

2. To check the machines that were created from the machine sets, run the following command:

```
$ oc get machines -n openshift-machine-api
```

#### Example output

| NAME                                             | PHASE   | TYPE        | REGION    | ZONE       | AGE  |
|--------------------------------------------------|---------|-------------|-----------|------------|------|
| cluster-7xw5g-edge-us-east-1-nyc-1a-wbclh-nyc-1a | Running | c5d.2xlarge | us-east-1 | us-east-1a | 3h   |
| cluster-7xw5g-master-0                           | Running | m6i.xlarge  | us-east-1 | us-east-1a | 3h4m |
| cluster-7xw5g-master-1                           | Running | m6i.xlarge  | us-east-1 | us-east-1b | 3h4m |
| cluster-7xw5g-master-2                           | Running | m6i.xlarge  | us-east-1 | us-east-1c | 3h4m |
| cluster-7xw5g-worker-us-east-1a-rtp45            | Running | m6i.xlarge  | us-east-1 | us-east-1a | 3h   |
| cluster-7xw5g-worker-us-east-1b-glm7c            | Running | m6i.xlarge  | us-east-1 | us-east-1b | 3h   |
| cluster-7xw5g-worker-us-east-1c-qfvz4            | Running | m6i.xlarge  | us-east-1 | us-east-1c | 3h   |

3. To check nodes with edge roles, run the following command:

```
$ oc get nodes -l node-role.kubernetes.io/edge
```

#### Example output

| NAME                         | STATUS | ROLES       | AGE  | VERSION         |
|------------------------------|--------|-------------|------|-----------------|
| ip-10-0-207-188.ec2.internal | Ready  | edge,worker | 172m | v1.25.2+d2e245f |

-

### 4.13.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.13.16. Next steps

- [Creating user workloads in AWS Local Zones](#) .
- [Validating an installation](#).
- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#) .

## 4.14. INSTALLING A CLUSTER ON AWS IN A RESTRICTED NETWORK WITH USER-PROVISIONED INFRASTRUCTURE

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) using infrastructure that you provide and an internal mirror of the installation release content.

#### IMPORTANT

While you can install an OpenShift Container Platform cluster by using mirrored installation release content, your cluster still requires internet access to use the AWS APIs.

One way to create this infrastructure is to use the provided CloudFormation templates. You can modify the templates to customize your infrastructure or use the information that they contain to create AWS objects according to your company's policies.

#### IMPORTANT

The steps for performing a user-provisioned infrastructure installation are provided as an example only. Installing a cluster with infrastructure you provide requires knowledge of the cloud provider and the installation process of OpenShift Container Platform. Several CloudFormation templates are provided to assist in completing these steps or to help model your own. You are also free to create the required resources through other methods; the templates are just an example.

### 4.14.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [created a mirror registry on your mirror host](#) and obtained the **imageContentSources** data for your version of OpenShift Container Platform.

### IMPORTANT

Because the installation media is on the mirror host, you can use that computer to complete all installation steps.

- You [configured an AWS account](#) to host the cluster.

### IMPORTANT

If you have an AWS profile stored on your computer, it must not use a temporary session token that you generated while using a multi-factor authentication device. The cluster continues to use your current AWS credentials to create AWS resources for the entire life of the cluster, so you must use key-based, long-term credentials. To generate appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You can supply the keys when you run the installation program.

- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#) in the AWS documentation.
- If you use a firewall and plan to use the Telemetry service, you [configured the firewall to allow the sites](#) that your cluster requires access to.

### NOTE

Be sure to also review this site list if you are configuring a proxy.

- If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, you can [manually create and maintain long-term credentials](#).

## 4.14.2. About installations in restricted networks

In OpenShift Container Platform 4.14, you can perform an installation that does not require an active connection to the internet to obtain software components. Restricted network installations can be completed using installer-provisioned infrastructure or user-provisioned infrastructure, depending on the cloud platform to which you are installing the cluster.

If you choose to perform a restricted network installation on a cloud platform, you still require access to its cloud APIs. Some cloud functions, like Amazon Web Service's Route 53 DNS and IAM services, require internet access. Depending on your network, you might require less internet access for an installation on bare metal hardware, Nutanix, or on VMware vSphere.

To complete a restricted network installation, you must create a registry that mirrors the contents of the OpenShift image registry and contains the installation media. You can create this registry on a mirror

host, which can access both the internet and your closed network, or by using other methods that meet your restrictions.

### IMPORTANT

Because of the complexity of the configuration for user-provisioned installations, consider completing a standard user-provisioned infrastructure installation before you attempt a restricted network installation using user-provisioned infrastructure. Completing this test installation might make it easier to isolate and troubleshoot any issues that might arise during your installation in a restricted network.

#### 4.14.2.1. Additional limits

Clusters in restricted networks have the following additional limitations and restrictions:

- The **ClusterVersion** status includes an **Unable to retrieve available updates** error.
- By default, you cannot use the contents of the Developer Catalog because you cannot access the required image stream tags.

#### 4.14.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to obtain the images that are necessary to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### 4.14.4. Requirements for a cluster with user-provisioned infrastructure

For a cluster that contains user-provisioned infrastructure, you must deploy all of the required machines.

This section describes the requirements for deploying OpenShift Container Platform on user-provisioned infrastructure.

##### 4.14.4.1. Required machines for cluster installation

The smallest OpenShift Container Platform clusters require the following hosts:

**Table 4.20. Minimum required hosts**

| Hosts                           | Description                                                                                                                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| One temporary bootstrap machine | The cluster requires the bootstrap machine to deploy the OpenShift Container Platform cluster on the three control plane machines. You can remove the bootstrap machine after you install the cluster. |

| Hosts                                                                   | Description                                                                                                          |
|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Three control plane machines                                            | The control plane machines run the Kubernetes and OpenShift Container Platform services that form the control plane. |
| At least two compute machines, which are also known as worker machines. | The workloads requested by OpenShift Container Platform users run on the compute machines.                           |

## IMPORTANT

To maintain high availability of your cluster, use separate physical hosts for these cluster machines.

The bootstrap and control plane machines must use Red Hat Enterprise Linux CoreOS (RHCOS) as the operating system. However, the compute machines can choose between Red Hat Enterprise Linux CoreOS (RHCOS), Red Hat Enterprise Linux (RHEL) 8.6 and later.

Note that RHCOS is based on Red Hat Enterprise Linux (RHEL) 9.2 and inherits all of its hardware certifications and requirements. See [Red Hat Enterprise Linux technology capabilities and limits](#).

### 4.14.4.2. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.21. Minimum resource requirements**

| Machine       | Operating System              | vCPU [1] | Virtual RAM | Storage | Input/Output Per Second (IOPS)[2] |
|---------------|-------------------------------|----------|-------------|---------|-----------------------------------|
| Bootstrap     | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Control plane | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Compute       | RHCOS, RHEL 8.6 and later [3] | 2        | 8 GB        | 100 GB  | 300                               |

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance,

including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

## NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

## Additional resources

- [Optimizing storage](#)

### 4.14.4.3. Tested instance types for AWS

The following Amazon Web Services (AWS) instance types have been tested with OpenShift Container Platform.

## NOTE

Use the machine types included in the following charts for your AWS instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 4.72. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***

- m6a.\*
- m6i.\*
- r4.\*
- r5.\*
- r5a.\*
- r6i.\*
- t3.\*
- t3a.\*

#### 4.14.4.4. Tested instance types for AWS on 64-bit ARM infrastructures

The following Amazon Web Services (AWS) 64-bit ARM instance types have been tested with OpenShift Container Platform.

#### NOTE

Use the machine types included in the following charts for your AWS ARM instances. If you use an instance type that is not listed in the chart, ensure that the instance size you use matches the minimum resource requirements that are listed in "Minimum resource requirements for cluster installation".

#### Example 4.73. Machine types based on 64-bit ARM architecture

- c6g.\*
- c7g.\*
- m6g.\*
- m7g.\*
- r8g.\*

#### 4.14.4.5. Certificate signing requests management

Because your cluster has limited access to automatic machine management when you use infrastructure that you provision, you must provide a mechanism for approving cluster certificate signing requests (CSRs) after installation. The **kube-controller-manager** only approves the kubelet client CSRs. The **machine-approver** cannot guarantee the validity of a serving certificate that is requested by using kubelet credentials because it cannot confirm that the correct machine issued the request. You must determine and implement a method of verifying the validity of the kubelet serving certificate requests and approving them.

#### 4.14.5. Required AWS infrastructure components

To install OpenShift Container Platform on user-provisioned infrastructure in Amazon Web Services (AWS), you must manually create both the machines and their supporting infrastructure.

For more information about the integration testing for different platforms, see the [OpenShift Container Platform 4.x Tested Integrations](#) page.

By using the provided CloudFormation templates, you can create stacks of AWS resources that represent the following components:

- An AWS Virtual Private Cloud (VPC)
- Networking and load balancing components
- Security groups and roles
- An OpenShift Container Platform bootstrap node
- OpenShift Container Platform control plane nodes
- An OpenShift Container Platform compute node

Alternatively, you can manually create the components or you can reuse existing infrastructure that meets the cluster requirements. Review the CloudFormation templates for more details about how the components interrelate.

#### 4.14.5.1. Other infrastructure components

- A VPC
- DNS entries
- Load balancers (classic or network) and listeners
- A public and a private Route 53 zone
- Security groups
- IAM roles
- S3 buckets

If you are working in a disconnected environment, you are unable to reach the public IP addresses for EC2, ELB, and S3 endpoints. Depending on the level to which you want to restrict internet traffic during the installation, the following configuration options are available:

##### Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws\_region>.amazonaws.com**
- **elasticloadbalancing.<aws\_region>.amazonaws.com**
- **s3.<aws\_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

**Option 2: Create a proxy without VPC endpoints**

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

**Option 3: Create a proxy with VPC endpoints**

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws\_region>.amazonaws.com**
- **elasticloadbalancing.<aws\_region>.amazonaws.com**
- **s3.<aws\_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

**Required VPC components**

You must provide a suitable VPC and subnets that allow communication to your machines.

| Component        | AWS type                                                                                                                                                                                                                                                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                  |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VPC              | <ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>                                                                                                                                                                                                                              | You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.                                                                                                                                             |
| Public subnets   | <ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>                                                                                                                                                                                                           | Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.                                                                                                                                                                                                                  |
| Internet gateway | <ul style="list-style-type: none"> <li>• <b>AWS::EC2::InternetGateway</b></li> <li>• <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>• <b>AWS::EC2::RouteTable</b></li> <li>• <b>AWS::EC2::Route</b></li> <li>• <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>• <b>AWS::EC2::NatGateway</b></li> <li>• <b>AWS::EC2::EIP</b></li> </ul> | You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios. |

| Component              | AWS type                                                                                                                                                               | Description                                                                                                                                                                                                                      |                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Network access control | <ul style="list-style-type: none"><li>● <b>AWS::EC2::NetworkAcl</b></li><li>● <b>AWS::EC2::NetworkAclEntry</b></li></ul>                                               | You must allow the VPC to access the following ports:                                                                                                                                                                            |                            |
|                        |                                                                                                                                                                        | Port                                                                                                                                                                                                                             | Reason                     |

|                        |                                                                                                                                                                        | 443                                                                                                                                                                                                                              | Inbound HTTPS traffic      |
|                        |                                                                                                                                                                        | 22                                                                                                                                                                                                                               | Inbound SSH traffic        |
|                        |                                                                                                                                                                        | 1024 - 65535                                                                                                                                                                                                                     | Inbound ephemeral traffic  |
|                        |                                                                                                                                                                        | 0 - 65535                                                                                                                                                                                                                        | Outbound ephemeral traffic |
| Private subnets        | <ul style="list-style-type: none"><li>● <b>AWS::EC2::Subnet</b></li><li>● <b>AWS::EC2::RouteTable</b></li><li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li></ul> | Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. If you use private subnets, you must provide appropriate routes and tables for them. |                            |

## Required DNS and load balancing components

Your DNS and load balancer configuration needs to use a public hosted zone and can use a private hosted zone similar to the one that the installation program uses if it provisions the cluster's infrastructure. You must create a DNS entry that resolves to your load balancer. An entry for **api.<cluster\_name>.<domain>** must point to the external load balancer, and an entry for **api-int.<cluster\_name>.<domain>** must point to the internal load balancer.

The cluster also requires load balancers and listeners for port 6443, which are required for the Kubernetes API and its extensions, and port 22623, which are required for the Ignition config files for new machines. The targets will be the control plane nodes. Port 6443 must be accessible to both clients external to the cluster and nodes within the cluster. Port 22623 must be accessible to nodes within the cluster.

| Component | AWS type                        | Description                            |
|-----------|---------------------------------|----------------------------------------|
| DNS       | <b>AWS::Route53::HostedZone</b> | The hosted zone for your internal DNS. |

| Component                  | AWS type                                         | Description                                              |
|----------------------------|--------------------------------------------------|----------------------------------------------------------|
| Public load balancer       | <b>AWS::ElasticLoadBalancingV2::LoadBalancer</b> | The load balancer for your public subnets.               |
| External API server record | <b>AWS::Route53::RecordSetGroup</b>              | Alias records for the external API server.               |
| External listener          | <b>AWS::ElasticLoadBalancingV2::Listener</b>     | A listener on port 6443 for the external load balancer.  |
| External target group      | <b>AWS::ElasticLoadBalancingV2::TargetGroup</b>  | The target group for the external load balancer.         |
| Private load balancer      | <b>AWS::ElasticLoadBalancingV2::LoadBalancer</b> | The load balancer for your private subnets.              |
| Internal API server record | <b>AWS::Route53::RecordSetGroup</b>              | Alias records for the internal API server.               |
| Internal listener          | <b>AWS::ElasticLoadBalancingV2::Listener</b>     | A listener on port 22623 for the internal load balancer. |
| Internal target group      | <b>AWS::ElasticLoadBalancingV2::TargetGroup</b>  | The target group for the internal load balancer.         |
| Internal listener          | <b>AWS::ElasticLoadBalancingV2::Listener</b>     | A listener on port 6443 for the internal load balancer.  |
| Internal target group      | <b>AWS::ElasticLoadBalancingV2::TargetGroup</b>  | The target group for the internal load balancer.         |

## Security groups

The control plane and worker machines require access to the following ports:

| Group                         | Type                            | IP Protocol | Port range   |
|-------------------------------|---------------------------------|-------------|--------------|
| <b>MasterSecurityGroup</b>    | <b>AWS::EC2::Security Group</b> | <b>icmp</b> | <b>0</b>     |
|                               |                                 | <b>tcp</b>  | <b>22</b>    |
|                               |                                 | <b>tcp</b>  | <b>6443</b>  |
|                               |                                 | <b>tcp</b>  | <b>22623</b> |
| <b>WorkerSecurityGroup</b>    | <b>AWS::EC2::Security Group</b> | <b>icmp</b> | <b>0</b>     |
|                               |                                 | <b>tcp</b>  | <b>22</b>    |
| <b>BootstrapSecurityGroup</b> | <b>AWS::EC2::Security Group</b> | <b>tcp</b>  | <b>22</b>    |
|                               |                                 | <b>tcp</b>  | <b>19531</b> |

## Control plane Ingress

The control plane machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

| Ingress group                       | Description                                                 | IP protocol | Port range           |
|-------------------------------------|-------------------------------------------------------------|-------------|----------------------|
| <b>MasterIngress Etcd</b>           | etcd                                                        | <b>tcp</b>  | <b>2379- 2380</b>    |
| <b>MasterIngress Vxlan</b>          | Vxlan packets                                               | <b>udp</b>  | <b>4789</b>          |
| <b>MasterIngress WorkerVxlan</b>    | Vxlan packets                                               | <b>udp</b>  | <b>4789</b>          |
| <b>MasterIngress Internal</b>       | Internal cluster communication and Kubernetes proxy metrics | <b>tcp</b>  | <b>9000 - 9999</b>   |
| <b>MasterIngress WorkerInternal</b> | Internal cluster communication                              | <b>tcp</b>  | <b>9000 - 9999</b>   |
| <b>MasterIngress Kube</b>           | Kubernetes kubelet, scheduler and controller manager        | <b>tcp</b>  | <b>10250 - 10259</b> |

| Ingress group                                       | Description                                          | IP protocol | Port range           |
|-----------------------------------------------------|------------------------------------------------------|-------------|----------------------|
| <b>MasterIngress<br/>WorkerKube</b>                 | Kubernetes kubelet, scheduler and controller manager | <b>tcp</b>  | <b>10250 - 10259</b> |
| <b>MasterIngress<br/>IngressServices</b>            | Kubernetes Ingress services                          | <b>tcp</b>  | <b>30000 - 32767</b> |
| <b>MasterIngress<br/>WorkerIngress<br/>Services</b> | Kubernetes Ingress services                          | <b>tcp</b>  | <b>30000 - 32767</b> |
| <b>MasterIngress<br/>Geneve</b>                     | Geneve packets                                       | <b>udp</b>  | <b>6081</b>          |
| <b>MasterIngress<br/>WorkerGeneve</b>               | Geneve packets                                       | <b>udp</b>  | <b>6081</b>          |

| <b>MasterIngress<br/>WorkerInternalUDP</b>          | Internal cluster communication                       | <b>udp</b>  | <b>9000 - 9999</b>   |

| Ingress group                                | Description                 | IP protocol | Port range           |
|----------------------------------------------|-----------------------------|-------------|----------------------|
| <b>MasterIngressIngressServicesUDP</b>       | Kubernetes Ingress services | <b>udp</b>  | <b>30000 - 32767</b> |
| <b>MasterIngressWorkerIngressServicesUDP</b> | Kubernetes Ingress services | <b>udp</b>  | <b>30000 - 32767</b> |

## Worker Ingress

The worker machines require the following Ingress groups. Each Ingress group is a **AWS::EC2::SecurityGroupIngress** resource.

| Ingress group                             | Description                                           | IP protocol | Port range           |
|-------------------------------------------|-------------------------------------------------------|-------------|----------------------|
| <b>WorkerIngressVxlan</b>                 | Vxlan packets                                         | <b>udp</b>  | <b>4789</b>          |
| <b>WorkerIngressWorkerVxlan</b>           | Vxlan packets                                         | <b>udp</b>  | <b>4789</b>          |
| <b>WorkerIngressInternal</b>              | Internal cluster communication                        | <b>tcp</b>  | <b>9000 - 9999</b>   |
| <b>WorkerIngressWorkerInternal</b>        | Internal cluster communication                        | <b>tcp</b>  | <b>9000 - 9999</b>   |
| <b>WorkerIngressKube</b>                  | Kubernetes kubelet, scheduler, and controller manager | <b>tcp</b>  | <b>10250</b>         |
| <b>WorkerIngressWorkerKube</b>            | Kubernetes kubelet, scheduler, and controller manager | <b>tcp</b>  | <b>10250</b>         |
| <b>WorkerIngressIngressServices</b>       | Kubernetes Ingress services                           | <b>tcp</b>  | <b>30000 - 32767</b> |
| <b>WorkerIngressWorkerIngressServices</b> | Kubernetes Ingress services                           | <b>tcp</b>  | <b>30000 - 32767</b> |
| <b>WorkerIngressGeneve</b>                | Geneve packets                                        | <b>udp</b>  | <b>6081</b>          |
| <b>WorkerIngressMasterGeneve</b>          | Geneve packets                                        | <b>udp</b>  | <b>6081</b>          |

| Ingress group                                          | Description                    | IP protocol | Port range           |
|--------------------------------------------------------|--------------------------------|-------------|----------------------|
| <b>WorkerIngress<br/>IpsecIke</b>                      | IPsec IKE packets              | <b>udp</b>  | <b>500</b>           |
| <b>WorkerIngress<br/>MasterIpsecIke</b>                | IPsec IKE packets              | <b>udp</b>  | <b>500</b>           |
| <b>WorkerIngress<br/>IpsecNat</b>                      | IPsec NAT-T packets            | <b>udp</b>  | <b>4500</b>          |
| <b>WorkerIngress<br/>MasterIpsecNat</b>                | IPsec NAT-T packets            | <b>udp</b>  | <b>4500</b>          |
| <b>WorkerIngress<br/>IpsecEsp</b>                      | IPsec ESP packets              | <b>50</b>   | <b>All</b>           |
| <b>WorkerIngress<br/>MasterIpsecEsp</b>                | IPsec ESP packets              | <b>50</b>   | <b>All</b>           |
| <b>WorkerIngress<br/>InternalUDP</b>                   | Internal cluster communication | <b>udp</b>  | <b>9000 - 9999</b>   |
| <b>WorkerIngress<br/>MasterInternal<br/>UDP</b>        | Internal cluster communication | <b>udp</b>  | <b>9000 - 9999</b>   |
| <b>WorkerIngress<br/>IngressServicesUDP</b>            | Kubernetes Ingress services    | <b>udp</b>  | <b>30000 - 32767</b> |
| <b>WorkerIngress<br/>MasterIngress<br/>ServicesUDP</b> | Kubernetes Ingress services    | <b>udp</b>  | <b>30000 - 32767</b> |

## Roles and instance profiles

You must grant the machines permissions in AWS. The provided CloudFormation templates grant the machines **Allow** permissions for the following **AWS::IAM::Role** objects and provide a **AWS::IAM::InstanceProfile** for each set of roles. If you do not use the templates, you can grant the machines the following broad permissions or the following individual permissions.

| Role   | Effect       | Action       | Resource |
|--------|--------------|--------------|----------|
| Master | <b>Allow</b> | <b>ec2:*</b> | <b>*</b> |

| Role      | Effect       | Action                        | Resource |
|-----------|--------------|-------------------------------|----------|
|           | <b>Allow</b> | <b>elasticloadbalancing:*</b> | <b>*</b> |
|           | <b>Allow</b> | <b>iam:PassRole</b>           | <b>*</b> |
|           | <b>Allow</b> | <b>s3:GetObject</b>           | <b>*</b> |
| Worker    | <b>Allow</b> | <b>ec2:Describe*</b>          | <b>*</b> |
| Bootstrap | <b>Allow</b> | <b>ec2:Describe*</b>          | <b>*</b> |
|           | <b>Allow</b> | <b>ec2:AttachVolume</b>       | <b>*</b> |
|           | <b>Allow</b> | <b>ec2:DetachVolume</b>       | <b>*</b> |

#### 4.14.5.2. Cluster machines

You need **AWS::EC2::Instance** objects for the following machines:

- A bootstrap machine. This machine is required during installation, but you can remove it after your cluster deploys.
- Three control plane machines. The control plane machines are not governed by a control plane machine set.
- Compute machines. You must create at least two compute machines, which are also known as worker machines, during installation. These machines are not governed by a compute machine set.

#### 4.14.5.3. Required AWS permissions for the IAM user

##### NOTE

Your IAM user must have the permission **tag:GetResources** in the region **us-east-1** to delete the base cluster resources. As part of the AWS API requirement, the OpenShift Container Platform installation program performs various actions in this region.

When you attach the **AdministratorAccess** policy to the IAM user that you create in Amazon Web Services (AWS), you grant that user all of the required permissions. To deploy all components of an OpenShift Container Platform cluster, the IAM user requires the following permissions:

##### Example 4.74. Required EC2 permissions for installation

- **ec2:AttachNetworkInterface**
- **ec2:AuthorizeSecurityGroupEgress**
- **ec2:AuthorizeSecurityGroupIngress**

- **ec2:CopyImage**
- **ec2:CreateNetworkInterface**
- **ec2:CreateSecurityGroup**
- **ec2:CreateTags**
- **ec2:CreateVolume**
- **ec2>DeleteSecurityGroup**
- **ec2>DeleteSnapshot**
- **ec2>DeleteTags**
- **ec2:DeregisterImage**
- **ec2:DescribeAccountAttributes**
- **ec2:DescribeAddresses**
- **ec2:DescribeAvailabilityZones**
- **ec2:DescribeDhcpOptions**
- **ec2:DescribeImages**
- **ec2:DescribeInstanceAttribute**
- **ec2:DescribeInstanceCreditSpecifications**
- **ec2:DescribeInstances**
- **ec2:DescribeInstanceTypes**
- **ec2:DescribeInternetGateways**
- **ec2:DescribeKeyPairs**
- **ec2:DescribeNatGateways**
- **ec2:DescribeNetworkAcls**
- **ec2:DescribeNetworkInterfaces**
- **ec2:DescribePrefixLists**
- **ec2:DescribeRegions**
- **ec2:DescribeRouteTables**
- **ec2:DescribeSecurityGroupRules**
- **ec2:DescribeSecurityGroups**
- **ec2:DescribeSubnets**

- **ec2:DescribeTags**
- **ec2:DescribeVolumes**
- **ec2:DescribeVpcAttribute**
- **ec2:DescribeVpcClassicLink**
- **ec2:DescribeVpcClassicLinkDnsSupport**
- **ec2:DescribeVpcEndpoints**
- **ec2:DescribeVpcs**
- **ec2:GetEbsDefaultKmsKeyId**
- **ec2:ModifyInstanceAttribute**
- **ec2:ModifyNetworkInterfaceAttribute**
- **ec2:RevokeSecurityGroupEgress**
- **ec2:RevokeSecurityGroupIngress**
- **ec2:RunInstances**
- **ec2:TerminateInstances**

Example 4.75. Required permissions for creating network resources during installation

- **ec2:AllocateAddress**
- **ec2:AssociateAddress**
- **ec2:AssociateDhcpOptions**
- **ec2:AssociateRouteTable**
- **ec2:AttachInternetGateway**
- **ec2:CreateDhcpOptions**
- **ec2:CreateInternetGateway**
- **ec2:CreateNatGateway**
- **ec2:CreateRoute**
- **ec2:CreateRouteTable**
- **ec2:CreateSubnet**
- **ec2:CreateVpc**
- **ec2:CreateVpcEndpoint**
- **ec2:ModifySubnetAttribute**

- **ec2:ModifyVpcAttribute**

#### NOTE

If you use an existing Virtual Private Cloud (VPC), your account does not require these permissions for creating network resources.

#### Example 4.76. Required Elastic Load Balancing permissions (ELB) for installation

- **elasticloadbalancing:AddTags**
- **elasticloadbalancing:ApplySecurityGroupsToLoadBalancer**
- **elasticloadbalancing:AttachLoadBalancerToSubnets**
- **elasticloadbalancing:ConfigureHealthCheck**
- **elasticloadbalancing>CreateListener**
- **elasticloadbalancing>CreateLoadBalancer**
- **elasticloadbalancing>CreateLoadBalancerListeners**
- **elasticloadbalancing>CreateTargetGroup**
- **elasticloadbalancing>DeleteLoadBalancer**
- **elasticloadbalancing:DeregisterInstancesFromLoadBalancer**
- **elasticloadbalancing:DeregisterTargets**
- **elasticloadbalancing:DescribeInstanceHealth**
- **elasticloadbalancing:DescribeListeners**
- **elasticloadbalancing:DescribeLoadBalancerAttributes**
- **elasticloadbalancing:DescribeLoadBalancers**
- **elasticloadbalancing:DescribeTags**
- **elasticloadbalancing:DescribeTargetGroupAttributes**
- **elasticloadbalancing:DescribeTargetHealth**
- **elasticloadbalancing:ModifyLoadBalancerAttributes**
- **elasticloadbalancing:ModifyTargetGroup**
- **elasticloadbalancing:ModifyTargetGroupAttributes**
- **elasticloadbalancing:RegisterInstancesWithLoadBalancer**
- **elasticloadbalancing:RegisterTargets**
- **elasticloadbalancing:SetLoadBalancerPoliciesOfListener**

## IMPORTANT

OpenShift Container Platform uses both the ELB and ELBv2 API services to provision load balancers. The permission list shows permissions required by both services. A known issue exists in the AWS web console where both services use the same **elasticloadbalancing** action prefix but do not recognize the same actions. You can ignore the warnings about the service not recognizing certain **elasticloadbalancing** actions.

### Example 4.77. Required IAM permissions for installation

- **iam:AddRoleToInstanceProfile**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:DeleteInstanceProfile**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetInstanceProfile**
- **iam:GetRole**
- **iam:GetRolePolicy**
- **iam:GetUser**
- **iam:ListInstanceProfilesForRole**
- **iam:ListRoles**
- **iam:ListUsers**
- **iam:PassRole**
- **iam:PutRolePolicy**
- **iam:RemoveRoleFromInstanceProfile**
- **iam:SimulatePrincipalPolicy**
- **iam:TagRole**

## NOTE

If you have not created a load balancer in your AWS account, the IAM user also requires the **iam:CreateServiceLinkedRole** permission.

### Example 4.78. Required Route 53 permissions for installation

- **route53:ChangeResourceRecordSets**
- **route53:ChangeTagsForResource**
- **route53:CreateHostedZone**
- **route53>DeleteHostedZone**
- **route53:GetChange**
- **route53:GetHostedZone**
- **route53:ListHostedZones**
- **route53:ListHostedZonesByName**
- **route53:ListResourceRecordSets**
- **route53:ListTagsForResource**
- **route53:UpdateHostedZoneComment**

Example 4.79. Required Amazon Simple Storage Service (S3) permissions for installation

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3:GetAccelerateConfiguration**
- **s3:GetBucketAcl**
- **s3:GetBucketCors**
- **s3:GetBucketLocation**
- **s3:GetBucketLogging**
- **s3:GetBucketObjectLockConfiguration**
- **s3:GetBucketPolicy**
- **s3:GetBucketRequestPayment**
- **s3:GetBucketTagging**
- **s3:GetBucketVersioning**
- **s3:GetBucketWebsite**
- **s3:GetEncryptionConfiguration**
- **s3:GetLifecycleConfiguration**
- **s3:GetReplicationConfiguration**
- **s3:ListBucket**

- **s3:PutBucketAcl**
- **s3:PutBucketTagging**
- **s3:PutEncryptionConfiguration**

Example 4.80. S3 permissions that cluster Operators require

- **s3:DeleteObject**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:GetObjectVersion**
- **s3:PutObject**
- **s3:PutObjectAcl**
- **s3:PutObjectTagging**

Example 4.81. Required permissions to delete base cluster resources

- **autoscaling:DescribeAutoScalingGroups**
- **ec2:DeleteNetworkInterface**
- **ec2:DeletePlacementGroup**
- **ec2:DeleteVolume**
- **elasticloadbalancing:DeleteTargetGroup**
- **elasticloadbalancing:DescribeTargetGroups**
- **iam:DeleteAccessKey**
- **iam:DeleteUser**
- **iam:DeleteUserPolicy**
- **iam:ListAttachedRolePolicies**
- **iam:ListInstanceProfiles**
- **iam:ListRolePolicies**
- **iam:ListUserPolicies**
- **s3:DeleteObject**
- **s3:ListBucketVersions**

- **tag:GetResources**

#### Example 4.82. Required permissions to delete network resources

- **ec2:DeleteDhcpOptions**
- **ec2:DeleteInternetGateway**
- **ec2:DeleteNatGateway**
- **ec2:DeleteRoute**
- **ec2:DeleteRouteTable**
- **ec2:DeleteSubnet**
- **ec2:DeleteVpc**
- **ec2:DeleteVpcEndpoints**
- **ec2:DetachInternetGateway**
- **ec2:DisassociateRouteTable**
- **ec2:ReleaseAddress**
- **ec2:ReplaceRouteTableAssociation**

#### NOTE

If you use an existing VPC, your account does not require these permissions to delete network resources. Instead, your account only requires the **tag:UntagResources** permission to delete network resources.

#### Example 4.83. Optional permissions for installing a cluster with a custom Key Management Service (KMS) key

- **kms:CreateGrant**
- **kms:Decrypt**
- **kms:DescribeKey**
- **kms:Encrypt**
- **kms:GenerateDataKey**
- **kms:GenerateDataKeyWithoutPlainText**
- **kms:ListGrants**
- **kms:RevokeGrant**

**Example 4.84. Required permissions to delete a cluster with shared instance roles**

- **iam:UntagRole**

**Example 4.85. Additional IAM and S3 permissions that are required to create manifests**

- **iam:GetUserPolicy**
- **iam:ListAccessKeys**
- **iam:PutUserPolicy**
- **iam:TagUser**
- **s3:AbortMultipartUpload**
- **s3:GetBucketPublicAccessBlock**
- **s3:ListBucket**
- **s3:ListBucketMultipartUploads**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutLifecycleConfiguration**

**NOTE**

If you are managing your cloud provider credentials with mint mode, the IAM user also requires the **iam:CreateAccessKey** and **iam:CreateUser** permissions.

**Example 4.86. Optional permissions for instance and quota checks for installation**

- **ec2:DescribeInstanceTypeOfferings**
- **servicequotas:ListAWSDefaultServiceQuotas**

**Example 4.87. Optional permissions for the cluster owner account when installing a cluster on a shared VPC**

- **sts:AssumeRole**

**4.14.6. Generating a key pair for cluster node SSH access**

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **./openshift-install gather** command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86\_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program. If you install a cluster on infrastructure that you provision, you must provide the key to the installation program.

**4.14.7. Creating the installation files for AWS**

To install OpenShift Container Platform on Amazon Web Services (AWS) using user-provisioned infrastructure, you must generate the files that the installation program needs to deploy your cluster and modify them so that the cluster creates only the machines that it will use. You generate and customize the **install-config.yaml** file, Kubernetes manifests, and Ignition config files. You also have the option to first set up a separate **var** partition during the preparation phases of installation.

**4.14.7.1. Optional: Creating a separate /var partition**

It is recommended that disk partitioning for OpenShift Container Platform be left to the installer. However, there are cases where you might want to create separate partitions in a part of the filesystem that you expect to grow.

OpenShift Container Platform supports the addition of a single partition to attach storage to either the **/var** partition or a subdirectory of **/var**. For example:

- **/var/lib/containers**: Holds container-related content that can grow as more images and containers are added to a system.
- **/var/lib/etcd**: Holds data that you might want to keep separate for purposes such as performance optimization of etcd storage.
- **/var**: Holds data that you might want to keep separate for purposes such as auditing.

Storing the contents of a **/var** directory separately makes it easier to grow storage for those areas as needed and reinstall OpenShift Container Platform at a later date and keep that data intact. With this method, you will not have to pull all your containers again, nor will you have to copy massive log files when you update systems.

Because **/var** must be in place before a fresh installation of Red Hat Enterprise Linux CoreOS (RHCOS), the following procedure sets up the separate **/var** partition by creating a machine config manifest that is inserted during the **openshift-install** preparation phases of an OpenShift Container Platform installation.

### IMPORTANT

If you follow the steps to create a separate **/var** partition in this procedure, it is not necessary to create the Kubernetes manifest and Ignition config files again as described later in this section.

### Procedure

1. Create a directory to hold the OpenShift Container Platform installation files:

```
$ mkdir $HOME/clusterconfig
```

2. Run **openshift-install** to create a set of files in the **manifest** and **openshift** subdirectories. Answer the system questions as you are prompted:

```
$ openshift-install create manifests --dir $HOME/clusterconfig
```

### Example output

```
? SSH Public Key ...
INFO Credentials loaded from the "myprofile" profile in file "/home/myuser/.aws/credentials"
INFO Consuming Install Config from target directory
INFO Manifests created in: $HOME/clusterconfig/manifests and
$HOME/clusterconfig/openshift
```

3. Optional: Confirm that the installation program created manifests in the **clusterconfig/openshift** directory:

```
$ ls $HOME/clusterconfig/openshift/
```

### Example output

```
99_kubeadmin-password-secret.yaml
99_openshift-cluster-api_master-machines-0.yaml
99_openshift-cluster-api_master-machines-1.yaml
```

```
99_openshift-cluster-api_master-machines-2.yaml
```

```
...
```

4. Create a Butane config that configures the additional partition. For example, name the file **\$HOME/clusterconfig/98-var-partition.bu**, change the disk device name to the name of the storage device on the **worker** systems, and set the storage size as appropriate. This example places the **/var** directory on a separate partition:

```
variant: openshift
version: 4.14.0
metadata:
 labels:
 machineconfiguration.openshift.io/role: worker
 name: 98-var-partition
storage:
 disks:
 - device: /dev/disk/by-id/<device_name> ❶
 partitions:
 - label: var
 start_mib: <partition_start_offset> ❷
 size_mib: <partition_size> ❸
 number: 5
 filesystems:
 - device: /dev/disk/by-partlabel/var
 path: /var
 format: xfs
 mount_options: [defaults, prjquota] ❹
 with_mount_unit: true
```

- ❶ The storage device name of the disk that you want to partition.
- ❷ When adding a data partition to the boot disk, a minimum value of 25000 MiB (Mebibytes) is recommended. The root file system is automatically resized to fill all available space up to the specified offset. If no value is specified, or if the specified value is smaller than the recommended minimum, the resulting root file system will be too small, and future reinstalls of RHCOS might overwrite the beginning of the data partition.
- ❸ The size of the data partition in mebibytes.
- ❹ The **prjquota** mount option must be enabled for filesystems used for container storage.

## NOTE

When creating a separate **/var** partition, you cannot use different instance types for worker nodes, if the different instance types do not have the same device name.

5. Create a manifest from the Butane config and save it to the **clusterconfig/openshift** directory. For example, run the following command:

```
$ butane $HOME/clusterconfig/98-var-partition.bu -o $HOME/clusterconfig/openshift/98-var-partition.yaml
```

6. Run **openshift-install** again to create Ignition configs from a set of files in the **manifest** and **openshift** subdirectories:

```
$ openshift-install create ignition-configs --dir $HOME/clusterconfig
$ ls $HOME/clusterconfig/
auth bootstrap.ign master.ign metadata.json worker.ign
```

Now you can use the Ignition config files as input to the installation procedures to install Red Hat Enterprise Linux CoreOS (RHCOS) systems.

#### 4.14.7.2. Creating the installation configuration file

Generate and customize the installation configuration file that the installation program needs to deploy your cluster.

##### Prerequisites

- You obtained the OpenShift Container Platform installation program for user-provisioned infrastructure and the pull secret for your cluster. For a restricted network installation, these files are on your mirror host.
- You checked that you are deploying your cluster to a region with an accompanying Red Hat Enterprise Linux CoreOS (RHCOS) AMI published by Red Hat. If you are deploying to a region that requires a custom AMI, such as an AWS GovCloud region, you must create the **install-config.yaml** file manually.

##### Procedure

1. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

##### IMPORTANT

Specify an empty directory. Some installation assets, like bootstrap X.509 certificates have short expiration intervals, so you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

- ii. Select **aws** as the platform to target.
- iii. If you do not have an AWS profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.

- iv. Select the AWS region to deploy the cluster to.
- v. Select the base domain for the Route 53 service that you configured for your cluster.
- vi. Enter a descriptive name for your cluster.
- vii. Paste the [pull secret from Red Hat OpenShift Cluster Manager](#).

- a. Update the **pullSecret** value to contain the authentication information for your registry:

For **<local\_registry>**, specify the registry domain name, and optionally the port, that your mirror registry uses to serve content. For example **registry.example.com** or **registry.example.com:5000**. For **<credentials>**, specify the base64-encoded user name and password for your mirror registry.

- END CERTIFICATE-----

- c. Add the image content resources:

```
imageContentSources:
- mirrors:
 - <local_registry>/<local_repository_name>/release
 source: quay.io/openshift-release-dev/ocp-release
- mirrors:
 - <local_registry>/<local_repository_name>/release
 source: quay.io/openshift-release-dev/ocp-v4.0-art-dev
```

Use the **imageContentSources** section from the output of the command to mirror the repository or the values that you used when you mirrored the content from the media that you brought into your restricted network.

- d. Optional: Set the publishing strategy to **Internal**:

```
publish: Internal
```

By setting this option, you create an internal Ingress Controller and a private load balancer.

3. Optional: Back up the **install-config.yaml** file.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

### Additional resources

- See [Configuration and credential file settings](#) in the AWS documentation for more information about AWS profile and credential configuration.

#### 4.14.7.3. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
 httpProxy: http://<username>:<pswd>@<ip>:<port> 1
 httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
 noProxy: ec2.<aws_region>.amazonaws.com,elasticloadbalancing.
 <aws_region>.amazonaws.com,s3.<aws_region>.amazonaws.com 3
 additionalTrustBundle: | 4
 -----BEGIN CERTIFICATE-----
 <MY_TRUSTED_CA_CERT>
 -----END CERTIFICATE-----
 additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations. If you have added the Amazon **EC2,Elastic Load Balancing**, and **S3** VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

**NOTE**

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

#### 4.14.7.4. Creating the Kubernetes manifest and Ignition config files

Because you must modify some cluster definition files and manually start the cluster machines, you must generate the Kubernetes manifest and Ignition config files that the cluster needs to configure the machines.

The installation configuration file transforms into the Kubernetes manifests. The manifests wrap into the Ignition configuration files, which are later used to configure the cluster machines.

**IMPORTANT**

- The Ignition config files that the OpenShift Container Platform installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### Prerequisites

- You obtained the OpenShift Container Platform installation program. For a restricted network installation, these files are on your mirror host.
- You created the **install-config.yaml** installation configuration file.

## Procedure

1. Change to the directory that contains the OpenShift Container Platform installation program and generate the Kubernetes manifests for the cluster:

```
$./openshift-install create manifests --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the installation directory that contains the **install-config.yaml** file you created.

2. Remove the Kubernetes manifest files that define the control plane machines:

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_master-machines-*.yaml
```

By removing these files, you prevent the cluster from automatically generating control plane machines.

3. Remove the Kubernetes manifest files that define the control plane machine set:

```
$ rm -f <installation_directory>/openshift/99_openshift-machine-api_master-control-plane-machine-set.yaml
```

```
$ rm -f <installation_directory>/openshift/99_openshift-cluster-api_worker-machineset-*.yaml
```

### IMPORTANT

If you disabled the **MachineAPI** capability when installing a cluster on user-provisioned infrastructure, you must remove the Kubernetes manifest files that define the worker machines. Otherwise, your cluster fails to install.

Because you create and manage the worker machines yourself, you do not need to initialize these machines.

4. Check that the **mastersSchedulable** parameter in the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** Kubernetes manifest file is set to **false**. This setting prevents pods from being scheduled on the control plane machines:
  - a. Open the **<installation\_directory>/manifests/cluster-scheduler-02-config.yml** file.
  - b. Locate the **mastersSchedulable** parameter and ensure that it is set to **false**.
  - c. Save and exit the file.
5. Optional: If you do not want [the Ingress Operator](#) to create DNS records on your behalf, remove the **privateZone** and **publicZone** sections from the **<installation\_directory>/manifests/cluster-dns-02-config.yml** DNS configuration file:

```
apiVersion: config.openshift.io/v1
kind: DNS
metadata:
 creationTimestamp: null
name: cluster
```

```
spec:
 baseDomain: example.openshift.com
 privateZone: ❶
 id: mycluster-100419-private-zone
 publicZone: ❷
 id: example.openshift.com
 status: {}
```

- ❶ ❷ Remove this section completely.

If you do so, you must add ingress DNS records manually in a later step.

6. To create the Ignition configuration files, run the following command from the directory that contains the installation program:

```
$./openshift-install create ignition-configs --dir <installation_directory> ❶
```

- ❶ For **<installation\_directory>**, specify the same installation directory.

Ignition config files are created for the bootstrap, control plane, and compute nodes in the installation directory. The **kubeadmin-password** and **kubeconfig** files are created in the **./<installation\_directory>/auth** directory:

```
.
├── auth
│ ├── kubeadmin-password
│ └── kubeconfig
├── bootstrap.ign
├── master.ign
├── metadata.json
└── worker.ign
```

## Additional resources

- [Manually creating long-term credentials](#)

### 4.14.8. Extracting the infrastructure name

The Ignition config files contain a unique cluster identifier that you can use to uniquely identify your cluster in Amazon Web Services (AWS). The infrastructure name is also used to locate the appropriate AWS resources during an OpenShift Container Platform installation. The provided CloudFormation templates contain references to this infrastructure name, so you must extract it.

## Prerequisites

- You obtained the OpenShift Container Platform installation program and the pull secret for your cluster.
- You generated the Ignition config files for your cluster.
- You installed the **jq** package.

## Procedure

- To extract and view the infrastructure name from the Ignition config file metadata, run the following command:

```
$ jq -r .infraID <installation_directory>/metadata.json 1
```

- For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

## Example output

```
openshift-vw9j6 1
```

- The output of this command is your cluster name and a random string.

### 4.14.9. Creating a VPC in AWS

You must create a Virtual Private Cloud (VPC) in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use. You can customize the VPC to meet your requirements, including VPN and route tables.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the VPC.

#### NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.

## Procedure

- Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "VpcCidr", 1
 "ParameterValue": "10.0.0.0/16" 2
 },
 {
 "ParameterKey": "AvailabilityZoneCount", 3
 "ParameterValue": "1" 4
 }
]
```

```

 },
 {
 "ParameterKey": "SubnetBits", 5
 "ParameterValue": "12" 6
 }
]

```

- 1** The CIDR block for the VPC.
  - 2** Specify a CIDR block in the format **x.x.x.x/16-24**.
  - 3** The number of availability zones to deploy the VPC in.
  - 4** Specify an integer between **1** and **3**.
  - 5** The size of each subnet in each availability zone.
  - 6** Specify an integer between **5** and **13**, where **5** is **/27** and **13** is **/19**.
2. Copy the template from the **CloudFormation template for the VPC** section of this topic and save it as a YAML file on your computer. This template describes the VPC that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the VPC:

### IMPORTANT

You must enter the command on a single line.

```

$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml 2
 --parameters file://<parameters>.json 3

```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-vpc**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```

arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-vpc/dbedae40-2fd3-11eb-
820e-12a48460849f

```

4. Confirm that the template components exist:

```

$ aws cloudformation describe-stacks --stack-name <name>

```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                         |                                     |
|-------------------------|-------------------------------------|
| <b>VpcId</b>            | The ID of your VPC.                 |
| <b>PublicSubnetIds</b>  | The IDs of the new public subnets.  |
| <b>PrivateSubnetIds</b> | The IDs of the new private subnets. |

#### 4.14.9.1. CloudFormation template for the VPC

You can use the following CloudFormation template to deploy the VPC that you need for your OpenShift Container Platform cluster.

##### Example 4.88. CloudFormation template for the VPC

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for Best Practice VPC with 1-3 AZs

Parameters:
 VpcCidr:
 AllowedPattern: ^(([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\.(1[6-9]|2[0-4]))?$
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/16-24.
 Default: 10.0.0.0/16
 Description: CIDR block for VPC.
 Type: String
 AvailabilityZoneCount:
 ConstraintDescription: "The number of availability zones. (Min: 1, Max: 3)"
 MinValue: 1
 MaxValue: 3
 Default: 1
 Description: "How many AZs to create VPC subnets for. (Min: 1, Max: 3)"
 Type: Number
 SubnetBits:
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/19-27.
 MinValue: 5
 MaxValue: 13
 Default: 12
 Description: "Size of each subnet to create within the availability zones. (Min: 5 = /27, Max: 13 = /19)"
 Type: Number

Metadata:
 AWS::CloudFormation::Interface:
 ParameterGroups:
 - Label:
 default: "Network Configuration"
 Parameters:
 - VpcCidr
```

- SubnetBits
- Label:
  - default: "Availability Zones"
- Parameters:
  - AvailabilityZoneCount
- ParameterLabels:
  - AvailabilityZoneCount:
    - default: "Availability Zone Count"
  - VpcCidr:
    - default: "VPC CIDR"

#### 4.14.10. Creating networking and load balancing components in AWS

You must configure networking and classic or network load balancing in Amazon Web Services (AWS) that your OpenShift Container Platform cluster can use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the networking and load balancing components that your OpenShift Container Platform cluster requires. The template also creates a hosted zone and subnet tags.

You can run the template multiple times within a single Virtual Private Cloud (VPC).

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Obtain the hosted zone ID for the Route 53 base domain that you specified in the **install-config.yaml** file for your cluster. You can obtain details about your hosted zone by running the following command:

```
$ aws route53 list-hosted-zones-by-name --dns-name <route53_domain> 1
```

- 1 For the **<route53\_domain>**, specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster.

## Example output

```
mycluster.example.com. False 100
HOSTEDZONES 65F8F38E-2268-B835-E15C-AB55336FCBFA
/hostedzone/Z21IXYZABCZ2A4 mycluster.example.com. 10
```

In the example output, the hosted zone ID is **Z21IXYZABCZ2A4**.

2. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "ClusterName", 1
 "ParameterValue": "mycluster" 2
 },
 {
 "ParameterKey": "InfrastructureName", 3
 "ParameterValue": "mycluster-<random_string>" 4
 },
 {
 "ParameterKey": "HostedZoneId", 5
 "ParameterValue": "<random_string>" 6
 },
 {
 "ParameterKey": "HostedZoneName", 7
 }
]
```

```

 "ParameterValue": "example.com" 8
 },
 {
 "ParameterKey": "PublicSubnets", 9
 "ParameterValue": "subnet-<random_string>" 10
 },
 {
 "ParameterKey": "PrivateSubnets", 11
 "ParameterValue": "subnet-<random_string>" 12
 },
 {
 "ParameterKey": "VpcId", 13
 "ParameterValue": "vpc-<random_string>" 14
 }
]

```

- 1 A short, representative cluster name to use for hostnames, etc.
  - 2 Specify the cluster name that you used when you generated the **install-config.yaml** file for the cluster.
  - 3 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 4 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 5 The Route 53 public zone ID to register the targets with.
  - 6 Specify the Route 53 public zone ID, which as a format similar to **Z21IXYZABCZ2A4**. You can obtain this value from the AWS console.
  - 7 The Route 53 zone to register the targets with.
  - 8 Specify the Route 53 base domain that you used when you generated the **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
  - 9 The public subnets that you created for your VPC.
  - 10 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 11 The private subnets that you created for your VPC.
  - 12 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 13 The VPC that you created for the cluster.
  - 14 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
3. Copy the template from the **CloudFormation template for the network and load balancers** section of this topic and save it as a YAML file on your computer. This template describes the networking and load balancing objects that your cluster requires.

IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** in the CloudFormation template to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions.

- 4. Launch the CloudFormation template to create a stack of AWS resources that provide the networking and load balancing components:

IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
--template-body file://<template>.yaml 2
--parameters file://<parameters>.json 3
--capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-dns**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** resources.

Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-dns/cd3e5de0-2fd4-11eb-5cf0-12be5c33a183
```

- 5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                     |                                     |
|---------------------|-------------------------------------|
| PrivateHostedZoneId | Hosted zone ID for the private DNS. |
|---------------------|-------------------------------------|

|                                      |                                                                                    |
|--------------------------------------|------------------------------------------------------------------------------------|
| <b>ExternalApiLoadBalancerName</b>   | Full name of the external API load balancer.                                       |
| <b>InternalApiLoadBalancerName</b>   | Full name of the internal API load balancer.                                       |
| <b>ApiServerDnsName</b>              | Full hostname of the API server.                                                   |
| <b>RegisterNlbTargetLambda</b>       | Lambda ARN useful to help register/deregister IP targets for these load balancers. |
| <b>ExternalApiTargetGroupArn</b>     | ARN of external API target group.                                                  |
| <b>InternalApiTargetGroupArn</b>     | ARN of internal API target group.                                                  |
| <b>InternalServiceTargetGroupArn</b> | ARN of internal service target group.                                              |

#### 4.14.10.1. CloudFormation template for the network and load balancers

You can use the following CloudFormation template to deploy the networking objects and load balancers that you need for your OpenShift Container Platform cluster.

##### Example 4.89. CloudFormation template for the network and load balancers

AWSTemplateFormatVersion: 2010-09-09

Description: Template for OpenShift Cluster Network Elements (Route53 & LBs)

Parameters:

ClusterName:

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})\$

MaxLength: 27

MinLength: 1

ConstraintDescription: Cluster name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, representative cluster name to use for host names and other identifying names.

Type: String

InfrastructureName:

AllowedPattern: ^([a-zA-Z][a-zA-Z0-9-]{0,26})\$

MaxLength: 27

MinLength: 1

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

HostedZoneld:

Description: The Route53 public zone ID to register the targets with, such as Z21IXYZABCZ2A4.

Type: String

HostedZoneName:

Description: The Route53 zone to register the targets with, such as example.com. Omit the trailing period.

Type: String

Default: "example.com"

PublicSubnets:

Description: The internet-facing subnets.

Type: List<AWS::EC2::Subnet::Id>

PrivateSubnets:

Description: The internal subnets.

Type: List<AWS::EC2::Subnet::Id>

VpcId:

Description: The VPC-scoped resources will belong to this VPC.

Type: AWS::EC2::VPC::Id

Metadata:

AWS::CloudFormation::Interface:

ParameterGroups:

- Label:

default: "Cluster Information"

Parameters:

- ClusterName

- InfrastructureName

- Label:

default: "Network Configuration"

Parameters:

- VpcId

- PublicSubnets

- PrivateSubnets

- Label:

default: "DNS"

Parameters:

- HostedZoneName

- HostedZoneld

ParameterLabels:

ClusterName:

default: "Cluster Name"

InfrastructureName:

default: "Infrastructure Name"

VpcId:

default: "VPC ID"

PublicSubnets:

default: "Public Subnets"

PrivateSubnets:

default: "Private Subnets"

HostedZoneName:  
 default: "Public Hosted Zone Name"  
 HostedZoneId:  
 default: "Public Hosted Zone ID"

#### Resources:

##### ExtApiElb:

Type: AWS::ElasticLoadBalancingV2::LoadBalancer  
 Properties:  
 Name: !Join ["-", [!Ref InfrastructureName, "ext"]]  
 IpAddressType: ipv4  
 Subnets: !Ref PublicSubnets  
 Type: network

##### IntApiElb:

Type: AWS::ElasticLoadBalancingV2::LoadBalancer  
 Properties:  
 Name: !Join ["-", [!Ref InfrastructureName, "int"]]  
 Scheme: internal  
 IpAddressType: ipv4  
 Subnets: !Ref PrivateSubnets  
 Type: network

##### IntDns:

Type: "AWS::Route53::HostedZone"  
 Properties:  
 HostedZoneConfig:  
 Comment: "Managed by CloudFormation"  
 Name: !Join [".", [!Ref ClusterName, !Ref HostedZoneName]]  
 HostedZoneTags:  
 - Key: Name  
 Value: !Join ["-", [!Ref InfrastructureName, "int"]]  
 - Key: !Join [ "", ["kubernetes.io/cluster/", !Ref InfrastructureName]]  
 Value: "owned"  
 VPCs:  
 - VPCId: !Ref VpcId  
 VPCRegion: !Ref "AWS::Region"

##### ExternalApiServerRecord:

Type: AWS::Route53::RecordSetGroup  
 Properties:  
 Comment: Alias record for the API server  
 HostedZoneId: !Ref HostedZoneId  
 RecordSets:  
 - Name:  
 !Join [  
 ".",  
 ["api", !Ref ClusterName, !Join [ "", [!Ref HostedZoneName, "."]]],  
 ]  
 Type: A  
 AliasTarget:  
 HostedZoneId: !GetAtt ExtApiElb.CanonicalHostedZoneID  
 DNSName: !GetAtt ExtApiElb.DNSName

##### InternalApiServerRecord:

Type: AWS::Route53::RecordSetGroup

## Properties:

Comment: Alias record for the API server

HostedZoneId: !Ref IntDns

## RecordSets:

- Name:

!Join [

".",

["api", !Ref ClusterName, !Join [ "", [!Ref HostedZoneName, "."] ]],

]

Type: A

## AliasTarget:

HostedZoneId: !GetAtt IntApiElb.CanonicalHostedZoneID

DNSName: !GetAtt IntApiElb.DNSName

- Name:

!Join [

".",

["api-int", !Ref ClusterName, !Join [ "", [!Ref HostedZoneName, "."] ]],

]

Type: A

## AliasTarget:

HostedZoneId: !GetAtt IntApiElb.CanonicalHostedZoneID

DNSName: !GetAtt IntApiElb.DNSName

## ExternalApiListener:

Type: AWS::ElasticLoadBalancingV2::Listener

## Properties:

DefaultActions:

- Type: forward

TargetGroupArn:

Ref: ExternalApiTargetGroup

LoadBalancerArn:

Ref: ExtApiElb

Port: 6443

Protocol: TCP

## ExternalApiTargetGroup:

Type: AWS::ElasticLoadBalancingV2::TargetGroup

## Properties:

HealthCheckIntervalSeconds: 10

HealthCheckPath: "/readyz"

HealthCheckPort: 6443

HealthCheckProtocol: HTTPS

HealthyThresholdCount: 2

UnhealthyThresholdCount: 2

Port: 6443

Protocol: TCP

TargetType: ip

VpcId:

Ref: VpcId

TargetGroupAttributes:

- Key: deregistration\_delay.timeout\_seconds

Value: 60

## InternalApiListener:

Type: AWS::ElasticLoadBalancingV2::Listener

## Properties:

DefaultActions:  
 - Type: forward

Role:

Fn::GetAtt:

- "RegisterSubnetTagsLambdaramRole"

- "Arn"

Code:

```

ZipFile: |
import json
import boto3
import cfnresponse
def handler(event, context):
 ec2_client = boto3.client('ec2')
 if event['RequestType'] == 'Delete':
 for subnet_id in event['ResourceProperties']['Subnets']:
 ec2_client.delete_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
event['ResourceProperties']['InfrastructureName']}]);
 elif event['RequestType'] == 'Create':
 for subnet_id in event['ResourceProperties']['Subnets']:
 ec2_client.create_tags(Resources=[subnet_id], Tags=[{'Key': 'kubernetes.io/cluster/' +
event['ResourceProperties']['InfrastructureName'], 'Value': 'shared'}]);
 responseData = {}
 cfnresponse.send(event, context, cfnresponse.SUCCESS, responseData,
event['ResourceProperties']['InfrastructureName']+event['ResourceProperties']['Subnets'][0])
Runtime: "python3.8"
Timeout: 120

```

```

RegisterPublicSubnetTags:
 Type: Custom::SubnetRegister
 Properties:
 ServiceToken: !GetAtt RegisterSubnetTags.Arn
 InfrastructureName: !Ref InfrastructureName
 Subnets: !Ref PublicSubnets

```

```

RegisterPrivateSubnetTags:
 Type: Custom::SubnetRegister
 Properties:
 ServiceToken: !GetAtt RegisterSubnetTags.Arn
 InfrastructureName: !Ref InfrastructureName
 Subnets: !Ref PrivateSubnets

```

```

Outputs:
PrivateHostedZoneId:
 Description: Hosted zone ID for the private DNS, which is required for private records.
 Value: !Ref IntDns
ExternalApiLoadBalancerName:
 Description: Full name of the external API load balancer.
 Value: !GetAtt ExtApiElb.LoadBalancerFullName
InternalApiLoadBalancerName:
 Description: Full name of the internal API load balancer.
 Value: !GetAtt IntApiElb.LoadBalancerFullName
ApiServerDnsName:
 Description: Full hostname of the API server, which is required for the Ignition config files.
 Value: !Join [".", ["api-int", !Ref ClusterName, !Ref HostedZoneName]]
RegisterNlbIpTargetsLambda:
 Description: Lambda ARN useful to help register or deregister IP targets for these load
balancers.
 Value: !GetAtt RegisterNlbIpTargets.Arn
ExternalApiTargetGroupArn:
 Description: ARN of the external API target group.
 Value: !Ref ExternalApiTargetGroup
InternalApiTargetGroupArn:
 Description: ARN of the internal API target group.

```

```
Value: !Ref InternalApiTargetGroup
InternalServiceTargetGroupArn:
Description: ARN of the internal service target group.
Value: !Ref InternalServiceTargetGroup
```

## IMPORTANT

If you are deploying your cluster to an AWS government or secret region, you must update the **InternalApiServerRecord** to use **CNAME** records. Records of type **ALIAS** are not supported for AWS government regions. For example:

```
Type: CNAME
TTL: 10
ResourceRecords:
- !GetAtt IntApiElb.DNSName
```

## Additional resources

- See [Listing public hosted zones](#) in the AWS documentation for more information about listing public hosted zones.

## 4.14.11. Creating security group and roles in AWS

You must create security groups and roles in Amazon Web Services (AWS) for your OpenShift Container Platform cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the security groups and roles that your OpenShift Container Platform cluster requires.

## NOTE

If you do not use the provided CloudFormation template to create your AWS infrastructure, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
```

```
{
 "ParameterKey": "InfrastructureName", 1
 "ParameterValue": "mycluster-<random_string>" 2
},
{
 "ParameterKey": "VpcCidr", 3
 "ParameterValue": "10.0.0.0/16" 4
},
{
 "ParameterKey": "PrivateSubnets", 5
 "ParameterValue": "subnet-<random_string>" 6
},
{
 "ParameterKey": "VpcId", 7
 "ParameterValue": "vpc-<random_string>" 8
}
]
```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 3 The CIDR block for the VPC.
  - 4 Specify the CIDR block parameter that you used for the VPC that you defined in the form **x.x.x.x/16-24**.
  - 5 The private subnets that you created for your VPC.
  - 6 Specify the **PrivateSubnetIds** value from the output of the CloudFormation template for the VPC.
  - 7 The VPC that you created for the cluster.
  - 8 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
2. Copy the template from the **CloudFormation template for security objects** section of this topic and save it as a YAML file on your computer. This template describes the security groups and roles that your cluster requires.
  3. Launch the CloudFormation template to create a stack of AWS resources that represent the security groups and roles:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml 2
 --parameters file://<parameters>.json 3
 --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-sec**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-sec/03bd4210-2ed7-11eb-6d7a-13fc0b61e9db
```

4. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                              |                             |
|------------------------------|-----------------------------|
| <b>MasterSecurityGroupID</b> | Master Security Group ID    |
| <b>WorkerSecurityGroupID</b> | Worker Security Group ID    |
| <b>MasterInstanceProfile</b> | Master IAM Instance Profile |
| <b>WorkerInstanceProfile</b> | Worker IAM Instance Profile |

#### 4.14.11.1. CloudFormation template for security objects

You can use the following CloudFormation template to deploy the security objects that you need for your OpenShift Container Platform cluster.

##### Example 4.90. CloudFormation template for security objects

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Security Elements (Security Groups & IAM)
```

**Parameters:****InfrastructureName:**AllowedPattern: `^([a-zA-Z][a-zA-Z0-9-]{0,26})$`MaxLength: `27`MinLength: `1`

ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of `27` characters.

Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.

Type: String

**VpcCidr:**AllowedPattern: `^((([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}([0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])|(V(1[6-9]|2[0-4]))$`ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/`16-24`.Default: `10.0.0.0/16`

Description: CIDR block for VPC.

Type: String

**VpcId:**

Description: The VPC-scoped resources will belong to this VPC.

Type: `AWS::EC2::VPC::Id`**PrivateSubnets:**

Description: The internal subnets.

Type: `List<AWS::EC2::Subnet::Id>`**Metadata:****AWS::CloudFormation::Interface:****ParameterGroups:****- Label:**default: `"Cluster Information"`**Parameters:****- InfrastructureName****- Label:**default: `"Network Configuration"`**Parameters:****- VpcId****- VpcCidr****- PrivateSubnets****ParameterLabels:****InfrastructureName:**default: `"Infrastructure Name"`**VpcId:**default: `"VPC ID"`**VpcCidr:**default: `"VPC CIDR"`**PrivateSubnets:**default: `"Private Subnets"`**Resources:****MasterSecurityGroup:**Type: `AWS::EC2::SecurityGroup`**Properties:**

GroupDescription: Cluster Master Security Group

**SecurityGroupIngress:****- IpProtocol:** `icmp`FromPort: `0`

```

 ToPort: 0
 CidrIp: !Ref VpcCidr
 - IpProtocol: tcp
 FromPort: 22
 ToPort: 22
 CidrIp: !Ref VpcCidr
 - IpProtocol: tcp
 ToPort: 6443
 FromPort: 6443

#### 4.14.12. Accessing RHCOS AMIs with stream metadata

In OpenShift Container Platform, *stream metadata* provides standardized metadata about RHCOS in the JSON format and injects the metadata into the cluster. Stream metadata is a stable format that supports multiple architectures and is intended to be self-documenting for maintaining automation.

You can use the **coreos print-stream-json** sub-command of **openshift-install** to access information about the boot images in the stream metadata format. This command provides a method for printing stream metadata in a scriptable, machine-readable format.

For user-provisioned installations, the **openshift-install** binary contains references to the version of RHCOS boot images that are tested for use with OpenShift Container Platform, such as the AWS AMI.

#### Procedure

To parse the stream metadata, use one of the following methods:

- From a Go program, use the official **stream-metadata-go** library at <https://github.com/coreos/stream-metadata-go>. You can also view example code in the library.
- From another programming language, such as Python or Ruby, use the JSON library of your preferred programming language.
- From a command-line utility that handles JSON data, such as **jq**:
  - Print the current **x86\_64** or **aarch64** AMI for an AWS region, such as **us-west-1**:

#### For x86\_64

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.x86_64.images.aws.regions["us-west-1"].image'
```

#### Example output

```
ami-0d3e625f84626bbda
```

#### For aarch64

```
$ openshift-install coreos print-stream-json | jq -r
'.architectures.aarch64.images.aws.regions["us-west-1"].image'
```

#### Example output

```
ami-0af1d3b7fa5be2131
```

The output of this command is the AWS AMI ID for your designated architecture and the **us-west-1** region. The AMI must belong to the same region as the cluster.

### 4.14.13. RHCOS AMIs for the AWS infrastructure

Red Hat provides Red Hat Enterprise Linux CoreOS (RHCOS) AMIs that are valid for the various AWS regions and instance architectures that you can manually specify for your OpenShift Container Platform nodes.

#### NOTE

By importing your own AMI, you can also install to regions that do not have a published RHCOS AMI.

Table 4.22. x86\_64 RHCOS AMIs

| AWS zone          | AWS AMI                      |

#### 4.14.14. Creating the bootstrap node in AWS

You must create the bootstrap node in Amazon Web Services (AWS) to use during OpenShift Container Platform cluster initialization. You do this by:

- Providing a location to serve the **bootstrap.ign** Ignition config file to your cluster. This file is located in your installation directory. The provided CloudFormation Template assumes that the Ignition config files for your cluster are served from an S3 bucket. If you choose to serve the files from another location, you must modify the templates.
- Using the provided CloudFormation template and a custom parameter file to create a stack of AWS resources. The stack represents the bootstrap node that your OpenShift Container Platform installation requires.

## NOTE

If you do not use the provided CloudFormation template to create your bootstrap node, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.

## Procedure

1. Create the bucket by running the following command:

```
$ aws s3 mb s3://<cluster-name>-infra 1
```

- 1 **<cluster-name>-infra** is the bucket name. When creating the **install-config.yaml** file, replace **<cluster-name>** with the name specified for the cluster.

You must use a presigned URL for your S3 bucket, instead of the **s3://** schema, if you are:

- Deploying to a region that has endpoints that differ from the AWS SDK.
- Deploying a proxy.
- Providing your own custom endpoints.

2. Upload the **bootstrap.ign** Ignition config file to the bucket by running the following command:

```
$ aws s3 cp <installation_directory>/bootstrap.ign s3://<cluster-name>-infra/bootstrap.ign 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

3. Verify that the file uploaded by running the following command:

```
$ aws s3 ls s3://<cluster-name>-infra/
```

## Example output

```
2019-04-03 16:15:16 314878 bootstrap.ign
```

**NOTE**

The bootstrap Ignition config file does contain secrets, like X.509 keys. The following steps provide basic security for the S3 bucket. To provide additional security, you can enable an S3 bucket policy to allow only certain users, such as the OpenShift IAM user, to access objects that the bucket contains. You can avoid S3 entirely and serve your bootstrap Ignition config file from any address that the bootstrap machine can reach.

4. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", 1
 "ParameterValue": "mycluster-<random_string>" 2
 },
 {
 "ParameterKey": "RhcossAmi", 3
 "ParameterValue": "ami-<random_string>" 4
 },
 {
 "ParameterKey": "AllowedBootstrapSshCidr", 5
 "ParameterValue": "0.0.0.0/0" 6
 },
 {
 "ParameterKey": "PublicSubnet", 7
 "ParameterValue": "subnet-<random_string>" 8
 },
 {
 "ParameterKey": "MasterSecurityGroup", 9
 "ParameterValue": "sg-<random_string>" 10
 },
 {
 "ParameterKey": "VpcId", 11
 "ParameterValue": "vpc-<random_string>" 12
 },
 {
 "ParameterKey": "BootstrapIgnitionLocation", 13
 "ParameterValue": "s3://<bucket_name>/bootstrap.ign" 14
 },
 {
 "ParameterKey": "AutoRegisterELB", 15
 "ParameterValue": "yes" 16
 },
 {
 "ParameterKey": "RegisterNlbPTargetsLambdaArn", 17
 "ParameterValue": "arn:aws:lambda:<aws_region>:<account_number>:function:
<dns_stack_name>-RegisterNlbPTargets-<random_string>" 18
 },
 {
 "ParameterKey": "ExternalApiTargetGroupArn", 19
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 20
 }
]
```

```

 },
 {
 "ParameterKey": "InternalApiTargetGroupArn", 21
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 22
 },
 {
 "ParameterKey": "InternalServiceTargetGroupArn", 23
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 24
 }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the bootstrap node based on your selected architecture.
- 4 Specify a valid **AWS::EC2::Image::Id** value.
- 5 CIDR block to allow SSH access to the bootstrap node.
- 6 Specify a CIDR block in the format **x.x.x.x/16-24**.
- 7 The public subnet that is associated with your VPC to launch the bootstrap node into.
- 8 Specify the **PublicSubnetIds** value from the output of the CloudFormation template for the VPC.
- 9 The master security group ID (for registering temporary rules)
- 10 Specify the **MasterSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
- 11 The VPC created resources will belong to.
- 12 Specify the **VpcId** value from the output of the CloudFormation template for the VPC.
- 13 Location to fetch bootstrap Ignition config file from.
- 14 Specify the S3 bucket and file name in the form **s3://<bucket\_name>/bootstrap.ign**.
- 15 Whether or not to register a network load balancer (NLB).
- 16 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 17 The ARN for NLB IP target registration lambda group.
- 18 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.

- 19 The ARN for external API load balancer target group.
  - 20 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 21 The ARN for internal API load balancer target group.
  - 22 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 23 The ARN for internal service load balancer target group.
  - 24 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
5. Copy the template from the **CloudFormation template for the bootstrap machine** section of this topic and save it as a YAML file on your computer. This template describes the bootstrap machine that your cluster requires.
  6. Optional: If you are deploying the cluster with a proxy, you must update the ignition in the template to add the **ignition.config.proxy** fields. Additionally, If you have added the Amazon EC2, Elastic Load Balancing, and S3 VPC endpoints to your VPC, you must add these endpoints to the **noProxy** field.
  7. Launch the CloudFormation template to create a stack of AWS resources that represent the bootstrap node:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml 2
 --parameters file://<parameters>.json 3
 --capabilities CAPABILITY_NAMED_IAM 4
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-bootstrap**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.
- 4 You must explicitly declare the **CAPABILITY\_NAMED\_IAM** capability because the provided template creates some **AWS::IAM::Role** and **AWS::IAM::InstanceProfile** resources.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-bootstrap/12944486-2add-11eb-9dee-12dace8e3a83
```

8. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

After the **StackStatus** displays **CREATE\_COMPLETE**, the output displays values for the following parameters. You must provide these parameter values to the other CloudFormation templates that you run to create your cluster:

|                             |                                        |
|-----------------------------|----------------------------------------|
| <b>Bootstrap Instanceld</b> | The bootstrap Instance ID.             |
| <b>Bootstrap PublicIp</b>   | The bootstrap node public IP address.  |
| <b>Bootstrap PrivateIp</b>  | The bootstrap node private IP address. |

#### 4.14.14.1. CloudFormation template for the bootstrap machine

You can use the following CloudFormation template to deploy the bootstrap machine that you need for your OpenShift Container Platform cluster.

##### Example 4.91. CloudFormation template for the bootstrap machine

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Bootstrap (EC2 Instance, Security Groups and IAM)

Parameters:
 InfrastructureName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-_]{0,26})$
 MaxLength: 27
 MinLength: 1
 ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a maximum of 27 characters.
 Description: A short, unique cluster ID used to tag cloud resources and identify items owned or used by the cluster.
 Type: String
 RhcosAmi:
 Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
 Type: AWS::EC2::Image::Id
 AllowedBootstrapSshCidr:
 AllowedPattern: ^((([0-9]{1,3}[0-9]{1,3}[0-9]{1,3}[0-9]{1,3})|([0-9]{1,3}[0-9]{1,3}[0-9]{1,3})|([0-9]{1,3}[0-9]{1,3})|([0-9]{1,3})|0)\.)([0-9]{1,3}[0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}|0)\.)([0-9]{1,3}[0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}|0)\.)([0-9]{1,3}[0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}[0-9]{1,3}|[0-9]{1,3}|0)/32$
 ConstraintDescription: CIDR block parameter must be in the form x.x.x.x/0-32.
 Default: 0.0.0.0/0
 Description: CIDR block to allow SSH access to the bootstrap node.
 Type: String
 PublicSubnet:
 Description: The public subnet to launch the bootstrap node into.
```

```

 Type: AWS::EC2::Subnet::Id
MasterSecurityGroupId:
 Description: The master security group ID for registering temporary rules.
 Type: AWS::EC2::SecurityGroup::Id
VpcId:
 Description: The VPC-scoped resources will belong to this VPC.
 Type: AWS::EC2::VPC::Id
BootstrapIgnitionLocation:
 Default: s3://my-s3-bucket/bootstrap.ign
 Description: Ignition config file location.
 Type: String
AutoRegisterELB:
 Default: "yes"
 AllowedValues:
 - "yes"
 - "no"
 Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?
 Type: String
RegisterNlbTargetsLambdaArn:
 Description: ARN for NLB IP target registration lambda.
 Type: String
ExternalApiTargetGroupArn:
 Description: ARN for external API load balancer target group.
 Type: String
InternalApiTargetGroupArn:
 Description: ARN for internal API load balancer target group.
 Type: String
InternalServiceTargetGroupArn:
 Description: ARN for internal service load balancer target group.
 Type: String
BootstrapInstanceType:
 Description: Instance type for the bootstrap EC2 instance
 Default: "i3.large"
 Type: String

Metadata:
AWS::CloudFormation::Interface:
 ParameterGroups:
 - Label:
 default: "Cluster Information"
 Parameters:
 - InfrastructureName
 - Label:
 default: "Host Information"
 Parameters:

Description: The bootstrap node private IP address.

Value: !GetAtt BootstrapInstance.PrivateIp

**Additional resources**

- See [RHCOS AMIs for the AWS infrastructure](#) for details about the Red Hat Enterprise Linux CoreOS (RHCOS) AMIs for the AWS zones.

**4.14.15. Creating the control plane machines in AWS**

You must create the control plane machines in Amazon Web Services (AWS) that your cluster will use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent the control plane nodes.

**IMPORTANT**

The CloudFormation template creates a stack that represents three control plane nodes.

**NOTE**

If you do not use the provided CloudFormation template to create your control plane nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

**Prerequisites**

- You configured an AWS account.

- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.

## Procedure

1. Create a JSON file that contains the parameter values that the template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", 1
 "ParameterValue": "mycluster-<random_string>" 2
 },
 {
 "ParameterKey": "RhcOsAmi", 3
 "ParameterValue": "ami-<random_string>" 4
 },
 {
 "ParameterKey": "AutoRegisterDNS", 5
 "ParameterValue": "yes" 6
 },
 {
 "ParameterKey": "PrivateHostedZoneId", 7
 "ParameterValue": "<random_string>" 8
 },
 {
 "ParameterKey": "PrivateHostedZoneName", 9
 "ParameterValue": "mycluster.example.com" 10
 },
 {
 "ParameterKey": "Master0Subnet", 11
 "ParameterValue": "subnet-<random_string>" 12
 },
 {
 "ParameterKey": "Master1Subnet", 13
 "ParameterValue": "subnet-<random_string>" 14
 },
 {
 "ParameterKey": "Master2Subnet", 15
 "ParameterValue": "subnet-<random_string>" 16
 },
 {
 "ParameterKey": "MasterSecurityGroup", 17
 "ParameterValue": "sg-<random_string>" 18
 },
 {

```

```

 "ParameterKey": "IgnitionLocation", 19
 "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/master"
 },
 {
 "ParameterKey": "CertificateAuthorities", 21
 "ParameterValue": "data:text/plain;charset=utf-8;base64,ABC...xYz==" 22
 },
 {
 "ParameterKey": "MasterInstanceProfileName", 23
 "ParameterValue": "<roles_stack>-MasterInstanceProfile-<random_string>" 24
 },
 {
 "ParameterKey": "MasterInstanceType", 25
 "ParameterValue": "" 26
 },
 {
 "ParameterKey": "AutoRegisterELB", 27
 "ParameterValue": "yes" 28
 },
 {
 "ParameterKey": "RegisterNlbTargetsLambdaArn", 29
 "ParameterValue": "arn:aws:lambda:<aws_region>:<account_number>:function:
<dns_stack_name>-RegisterNlbTargets-<random_string>" 30
 },
 {
 "ParameterKey": "ExternalApiTargetGroupArn", 31
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Exter-<random_string>" 32
 },
 {
 "ParameterKey": "InternalApiTargetGroupArn", 33
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 34
 },
 {
 "ParameterKey": "InternalServiceTargetGroupArn", 35
 "ParameterValue": "arn:aws:elasticloadbalancing:<aws_region>:
<account_number>:targetgroup/<dns_stack_name>-Inter-<random_string>" 36
 }
]

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
- 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
- 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the control plane machines based on your selected architecture.
- 4 Specify an **AWS::EC2::Image::Id** value.
- 5 Whether or not to perform DNS etcd registration.

- 6 Specify **yes** or **no**. If you specify **yes**, you must provide hosted zone information.
- 7 The Route 53 private zone ID to register the etcd targets with.
- 8 Specify the **PrivateHostedZoneId** value from the output of the CloudFormation template for DNS and load balancing.
- 9 The Route 53 zone to register the targets with.
- 10 Specify **<cluster\_name>.<domain\_name>** where **<domain\_name>** is the Route 53 base domain that you used when you generated **install-config.yaml** file for the cluster. Do not include the trailing period (.) that is displayed in the AWS console.
- 11 13 15 A subnet, preferably private, to launch the control plane machines on.
- 12 14 16 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
- 17 The master security group ID to associate with control plane nodes.
- 18 Specify the **MasterSecurityGroupID** value from the output of the CloudFormation template for the security group and roles.
- 19 The location to fetch control plane Ignition config file from.
- 20 Specify the generated Ignition config file location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/master](https://api-int.<cluster_name>.<domain_name>:22623/config/master).
- 21 The base64 encoded certificate authority string to use.
- 22 Specify the value from the **master.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
- 23 The IAM profile to associate with control plane nodes.
- 24 Specify the **MasterInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
- 25 The type of AWS instance to use for the control plane machines based on your selected architecture.
- 26 The instance type value corresponds to the minimum resource requirements for control plane machines. For example **m6i.xlarge** is a type for AMD64 and **m6g.xlarge** is a type for ARM64.
- 27 Whether or not to register a network load balancer (NLB).
- 28 Specify **yes** or **no**. If you specify **yes**, you must provide a Lambda Amazon Resource Name (ARN) value.
- 29 The ARN for NLB IP target registration lambda group.
- 30 Specify the **RegisterNlbTargetsLambda** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
- 31 The ARN for external API load balancer target group.

- 32 Specify the **ExternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an
  - 33 The ARN for internal API load balancer target group.
  - 34 Specify the **InternalApiTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
  - 35 The ARN for internal service load balancer target group.
  - 36 Specify the **InternalServiceTargetGroupArn** value from the output of the CloudFormation template for DNS and load balancing. Use **arn:aws-us-gov** if deploying the cluster to an AWS GovCloud region.
2. Copy the template from the **CloudFormation template for control plane machines** section of this topic and save it as a YAML file on your computer. This template describes the control plane machines that your cluster requires.
  3. If you specified an **m5** instance type as the value for **MasterInstanceType**, add that instance type to the **MasterInstanceType.AllowedValues** parameter in the CloudFormation template.
  4. Launch the CloudFormation template to create a stack of AWS resources that represent the control plane nodes:

### IMPORTANT

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml 2
 --parameters file://<parameters>.json 3
```

- 1 **<name>** is the name for the CloudFormation stack, such as **cluster-control-plane**. You need the name of this stack if you remove the cluster.
- 2 **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3 **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

### Example output

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-control-plane/21c7e2b0-2ee2-11eb-c6f6-0aa34627df4b
```

### NOTE

The CloudFormation template creates a stack that represents three control plane nodes.

5. Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

#### 4.14.15.1. CloudFormation template for control plane machines

You can use the following CloudFormation template to deploy the control plane machines that you need for your OpenShift Container Platform cluster.

##### Example 4.92. CloudFormation template for control plane machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 master instances)

Parameters:
 InfrastructureName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-_]{0,26})$
 MaxLength: 27
 MinLength: 1
 ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
maximum of 27 characters.
 Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
 Type: String
 RhcosAmi:
 Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
 Type: AWS::EC2::Image::Id
 AutoRegisterDNS:
 Default: ""
 Description: unused
 Type: String
 PrivateHostedZoneId:
 Default: ""
 Description: unused
 Type: String
 PrivateHostedZoneName:
 Default: ""
 Description: unused
 Type: String
 Master0Subnet:
 Description: The subnets, recommend private, to launch the master nodes into.
 Type: AWS::EC2::Subnet::Id
 Master1Subnet:
 Description: The subnets, recommend private, to launch the master nodes into.
 Type: AWS::EC2::Subnet::Id
 Master2Subnet:
 Description: The subnets, recommend private, to launch the master nodes into.
 Type: AWS::EC2::Subnet::Id
 MasterSecurityGroupId:
 Description: The master security group ID to associate with master nodes.
 Type: AWS::EC2::SecurityGroup::Id
 IgnitionLocation:
 Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/master
 Description: Ignition config file location.
 Type: String
 CertificateAuthorities:
```

Default: data:text/plain;charset=utf-8;base64,ABC...xYz==

Description: Base64 encoded certificate authority string to use.

Type: String

MasterInstanceProfileName:

Description: IAM profile to associate with master nodes.

Type: String

MasterInstanceType:

Default: m5.xlarge

Type: String

AutoRegisterELB:

Default: "yes"

AllowedValues:

- "yes"

- "no"

Description: Do you want to invoke NLB registration, which requires a Lambda ARN parameter?

Type: String

RegisterNlbTargetsLambdaArn:

Description: ARN for NLB IP target registration lambda. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

ExternalApiTargetGroupArn:

Description: ARN for external API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalApiTargetGroupArn:

Description: ARN for internal API load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

InternalServiceTargetGroupArn:

Description: ARN for internal service load balancer target group. Supply the value from the cluster infrastructure or select "no" for AutoRegisterELB.

Type: String

#### 4.14.16. Creating the worker nodes in AWS

You can create worker nodes in Amazon Web Services (AWS) for your cluster to use.

You can use the provided CloudFormation template and a custom parameter file to create a stack of AWS resources that represent a worker node.

#### IMPORTANT

The CloudFormation template creates a stack that represents one worker node. You must create a stack for each worker node.

## NOTE

If you do not use the provided CloudFormation template to create your worker nodes, you must review the provided information and manually create the infrastructure. If your cluster does not initialize correctly, you might have to contact Red Hat support with your installation logs.

## Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.

## Procedure

1. Create a JSON file that contains the parameter values that the CloudFormation template requires:

```
[
 {
 "ParameterKey": "InfrastructureName", 1
 "ParameterValue": "mycluster-<random_string>" 2
 },
 {
 "ParameterKey": "Rhcami", 3
 "ParameterValue": "ami-<random_string>" 4
 },
 {
 "ParameterKey": "Subnet", 5
 "ParameterValue": "subnet-<random_string>" 6
 },
 {
 "ParameterKey": "WorkerSecurityGroup", 7
 "ParameterValue": "sg-<random_string>" 8
 },
 {
 "ParameterKey": "IgnitionLocation", 9
 "ParameterValue": "https://api-int.<cluster_name>.<domain_name>:22623/config/worker"
 },
 {
 "ParameterKey": "CertificateAuthorities", 11
 "ParameterValue": "" 12
 }
]
```

```

 },
 {
 "ParameterKey": "WorkerInstanceProfileName", 13
 "ParameterValue": "" 14
 },
 {
 "ParameterKey": "WorkerInstanceType", 15
 "ParameterValue": "" 16
 }
]
}

```

- 1 The name for your cluster infrastructure that is encoded in your Ignition config files for the cluster.
  - 2 Specify the infrastructure name that you extracted from the Ignition config file metadata, which has the format **<cluster-name>-<random-string>**.
  - 3 Current Red Hat Enterprise Linux CoreOS (RHCOS) AMI to use for the worker nodes based on your selected architecture.
  - 4 Specify an **AWS::EC2::Image::Id** value.
  - 5 A subnet, preferably private, to start the worker nodes on.
  - 6 Specify a subnet from the **PrivateSubnets** value from the output of the CloudFormation template for DNS and load balancing.
  - 7 The worker security group ID to associate with worker nodes.
  - 8 Specify the **WorkerSecurityGroupId** value from the output of the CloudFormation template for the security group and roles.
  - 9 The location to fetch the bootstrap Ignition config file from.
  - 10 Specify the generated Ignition config location, [https://api-int.<cluster\\_name>.<domain\\_name>:22623/config/worker](https://api-int.<cluster_name>.<domain_name>:22623/config/worker).
  - 11 Base64 encoded certificate authority string to use.
  - 12 Specify the value from the **worker.ign** file that is in the installation directory. This value is the long string with the format **data:text/plain;charset=utf-8;base64,ABC...xYz==**.
  - 13 The IAM profile to associate with worker nodes.
  - 14 Specify the **WorkerInstanceProfile** parameter value from the output of the CloudFormation template for the security group and roles.
  - 15 The type of AWS instance to use for the compute machines based on your selected architecture.
  - 16 The instance type value corresponds to the minimum resource requirements for compute machines. For example **m6i.large** is a type for AMD64 and **m6g.large** is a type for ARM64.
2. Copy the template from the **CloudFormation template for worker machines** section of this topic and save it as a YAML file on your computer. This template describes the networking objects and load balancers that your cluster requires.

- Optional: If you specified an **m5** instance type as the value for **WorkerInstanceType**, add that instance type to the **WorkerInstanceType.AllowedValues** parameter in the CloudFormation template.
- Optional: If you are deploying with an AWS Marketplace image, update the **Worker0.type.properties.ImageID** parameter with the AMI ID that you obtained from your subscription.
- Use the CloudFormation template to create a stack of AWS resources that represent a worker node:

**IMPORTANT**

You must enter the command on a single line.

```
$ aws cloudformation create-stack --stack-name <name> 1
 --template-body file://<template>.yaml \ 2
 --parameters file://<parameters>.json 3
```

- 1** **<name>** is the name for the CloudFormation stack, such as **cluster-worker-1**. You need the name of this stack if you remove the cluster.
- 2** **<template>** is the relative path to and name of the CloudFormation template YAML file that you saved.
- 3** **<parameters>** is the relative path to and name of the CloudFormation parameters JSON file.

**Example output**

```
arn:aws:cloudformation:us-east-1:269333783861:stack/cluster-worker-1/729ee301-1c2a-11eb-348f-sd9888c65b59
```

**NOTE**

The CloudFormation template creates a stack that represents one worker node.

- Confirm that the template components exist:

```
$ aws cloudformation describe-stacks --stack-name <name>
```

- Continue to create worker stacks until you have created enough worker machines for your cluster. You can create additional worker stacks by referencing the same template and parameter files and specifying a different stack name.

**IMPORTANT**

You must create at least two worker machines, so you must create at least two stacks that use this CloudFormation template.

#### 4.14.16.1. CloudFormation template for worker machines

You can use the following CloudFormation template to deploy the worker machines that you need for your OpenShift Container Platform cluster.

#### Example 4.93. CloudFormation template for worker machines

```
AWSTemplateFormatVersion: 2010-09-09
Description: Template for OpenShift Cluster Node Launch (EC2 worker instance)

Parameters:
 InfrastructureName:
 AllowedPattern: ^([a-zA-Z][a-zA-Z0-9\-_]{0,26})$
 MaxLength: 27
 MinLength: 1
 ConstraintDescription: Infrastructure name must be alphanumeric, start with a letter, and have a
 maximum of 27 characters.
 Description: A short, unique cluster ID used to tag nodes for the kubelet cloud provider.
 Type: String
 RhcosAmi:
 Description: Current Red Hat Enterprise Linux CoreOS AMI to use for bootstrap.
 Type: AWS::EC2::Image::Id
 Subnet:
 Description: The subnets, recommend private, to launch the worker nodes into.
 Type: AWS::EC2::Subnet::Id
 WorkerSecurityGroupId:
 Description: The worker security group ID to associate with worker nodes.
 Type: AWS::EC2::SecurityGroup::Id
 IgnitionLocation:
 Default: https://api-int.$CLUSTER_NAME.$DOMAIN:22623/config/worker
 Description: Ignition config file location.
 Type: String
 CertificateAuthorities:
 Default: data:text/plain;charset=utf-8;base64,ABC...xYz==
 Description: Base64 encoded certificate authority string to use.
 Type: String
 WorkerInstanceProfileName:
 Description: IAM profile to associate with worker nodes.
 Type: String
 WorkerInstanceType:
 Default: m5.large
 Type: String

Metadata:
 AWS::CloudFormation::Interface:
 ParameterGroups:
 - Label:
 default: "Cluster Information"
 Parameters:
 - InfrastructureName
 - Label:
 default: "Host Information"
 Parameters:
 - WorkerInstanceType
 - RhcosAmi
 - IgnitionLocation
 - CertificateAuthorities
 - WorkerSecurityGroupId
```

```

- WorkerInstanceProfileName
- Label:
 default: "Network Configuration"
Parameters:
- Subnet
ParameterLabels:
Subnet:
 default: "Subnet"
InfrastructureName:
 default: "Infrastructure Name"
WorkerInstanceType:
 default: "Worker Instance Type"
WorkerInstanceProfileName:
 default: "Worker Instance Profile Name"
RhcsoAmi:
 default: "Red Hat Enterprise Linux CoreOS AMI ID"
IgnitionLocation:
 default: "Worker Ignition Source"
CertificateAuthorities:
 default: "Ignition CA String"
WorkerSecurityGroupId:
 default: "Worker Security Group ID"

Resources:
Worker0:
 Type: AWS::EC2::Instance
 Properties:
 ImageId: !Ref RhcsoAmi
 BlockDeviceMappings:
 - DeviceName: /dev/xvda
 Ebs:
 VolumeSize: "120"
 VolumeType: "gp2"
 IamInstanceProfile: !Ref WorkerInstanceProfileName
 InstanceType: !Ref WorkerInstanceType
 NetworkInterfaces:
 - AssociatePublicIpAddress: "false"
 DeviceIndex: "0"
 GroupSet:
 - !Ref "WorkerSecurityGroupId"
 SubnetId: !Ref "Subnet"
 UserData:
 Fn::Base64: !Sub
 - '{"ignition":{"config":{"merge":[{"source":"${SOURCE}"}]},"security":{"tls":{"certificateAuthorities":[{"source":"${CA_BUNDLE}"}]},"version":"3.1.0"}}}'
 - {
 SOURCE: !Ref IgnitionLocation,
 CA_BUNDLE: !Ref CertificateAuthorities,
 }
 Tags:
 - Key: !Join ["", ["kubernetes.io/cluster/", !Ref InfrastructureName]]
 Value: "shared"

Outputs:

```

PrivateIP:

Description: The compute node private IP address.

Value: !GetAtt Worker0.PrivateIp

#### 4.14.17. Initializing the bootstrap sequence on AWS with user-provisioned infrastructure

After you create all of the required infrastructure in Amazon Web Services (AWS), you can start the bootstrap sequence that initializes the OpenShift Container Platform control plane.

##### Prerequisites

- You configured an AWS account.
- You added your AWS keys and region to your local AWS profile by running **aws configure**.
- You generated the Ignition config files for your cluster.
- You created and configured a VPC and associated subnets in AWS.
- You created and configured DNS, load balancers, and listeners in AWS.
- You created the security groups and roles required for your cluster in AWS.
- You created the bootstrap machine.
- You created the control plane machines.
- You created the worker nodes.

##### Procedure

1. Change to the directory that contains the installation program and start the bootstrap process that initializes the OpenShift Container Platform control plane:

```
$./openshift-install wait-for bootstrap-complete --dir <installation_directory> \ 1
--log-level=info 2
```

1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

##### Example output

```
INFO Waiting up to 20m0s for the Kubernetes API at
https://api.mycluster.example.com:6443...
INFO API v1.27.3 up
INFO Waiting up to 30m0s for bootstrapping to complete...
INFO It is now safe to remove the bootstrap resources
INFO Time elapsed: 1s
```

If the command exits without a **FATAL** warning, your OpenShift Container Platform control plane has initialized.

#### NOTE

After the control plane initializes, it sets up the compute nodes and installs additional services in the form of Operators.

#### Additional resources

- See [Monitoring installation progress](#) for details about monitoring the installation, bootstrap, and control plane logs as an OpenShift Container Platform installation progresses.
- See [Gathering bootstrap node diagnostic data](#) for information about troubleshooting issues related to the bootstrap process.

### 4.14.18. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

### 4.14.19. Approving the certificate signing requests for your machines

When you add machines to a cluster, two pending certificate signing requests (CSRs) are generated for each machine that you added. You must confirm that these CSRs are approved or, if necessary, approve them yourself. The client requests must be approved first, followed by the server requests.

Procedure

## Prerequisites

- You added machines to your cluster.

## Procedure

1. Confirm that the cluster recognizes the machines:

```
$ oc get nodes
```

### Example output

| NAME     | STATUS | ROLES  | AGE | VERSION |
|----------|--------|--------|-----|---------|
| master-0 | Ready  | master | 63m | v1.27.3 |
| master-1 | Ready  | master | 63m | v1.27.3 |
| master-2 | Ready  | master | 64m | v1.27.3 |

The output lists all of the machines that you created.

### NOTE

The preceding output might not include the compute nodes, also known as worker nodes, until some CSRs are approved.

2. Review the pending CSRs and ensure that you see the client requests with the **Pending** or **Approved** status for each machine that you added to the cluster:

```
$ oc get csr
```

### Example output

| NAME      | AGE | REQUESTOR                                                                 | CONDITION |
|-----------|-----|---------------------------------------------------------------------------|-----------|
| csr-8b2br | 15m | system:serviceaccount:openshift-machine-config-operator:node-bootstrapper | Pending   |
| csr-8vnps | 15m | system:serviceaccount:openshift-machine-config-operator:node-bootstrapper | Pending   |
| ...       |     |                                                                           |           |

In this example, two machines are joining the cluster. You might see more approved CSRs in the list.

3. If the CSRs were not approved, after all of the pending CSRs for the machines you added are in **Pending** status, approve the CSRs for your cluster machines:

**NOTE**

Because the CSRs rotate automatically, approve your CSRs within an hour of adding the machines to the cluster. If you do not approve them within an hour, the certificates will rotate, and more than two certificates will be present for each node. You must approve all of these certificates. After the client CSR is approved, the Kubelet creates a secondary CSR for the serving certificate, which requires manual approval. Then, subsequent serving certificate renewal requests are automatically approved by the **machine-approver** if the Kubelet requests a new certificate with identical parameters.

**NOTE**

For clusters running on platforms that are not machine API enabled, such as bare metal and other user-provisioned infrastructure, you must implement a method of automatically approving the kubelet serving certificate requests (CSRs). If a request is not approved, then the **oc exec**, **oc rsh**, and **oc logs** commands cannot succeed, because a serving certificate is required when the API server connects to the kubelet. Any operation that contacts the Kubelet endpoint requires this certificate approval to be in place. The method must watch for new CSRs, confirm that the CSR was submitted by the **node-bootstrap** service account in the **system:node** or **system:admin** groups, and confirm the identity of the node.

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs --no-run-if-empty oc adm certificate approve
```

**NOTE**

Some Operators might not become available until some CSRs are approved.

- Now that your client requests are approved, you must review the server requests for each machine that you added to the cluster:

```
$ oc get csr
```

**Example output**

| NAME      | AGE   | REQUESTOR                                             | CONDITION |
|-----------|-------|-------------------------------------------------------|-----------|
| csr-bfd72 | 5m26s | system:node:ip-10-0-50-126.us-east-2.compute.internal | Pending   |
| csr-c57lv | 5m26s | system:node:ip-10-0-95-157.us-east-2.compute.internal | Pending   |
| ...       |       |                                                       |           |

- If the remaining CSRs are not approved, and are in the **Pending** status, approve the CSRs for your cluster machines:

- To approve them individually, run the following command for each valid CSR:

```
$ oc adm certificate approve <csr_name> 1
```

- 1** **<csr\_name>** is the name of a CSR from the list of current CSRs.

- To approve all pending CSRs, run the following command:

```
$ oc get csr -o go-template='{{range .items}}{{if not .status}}{{.metadata.name}}{{"\n"}}{{end}}{{end}}' | xargs oc adm certificate approve
```

- After all client and server CSRs have been approved, the machines have the **Ready** status. Verify this by running the following command:

```
$ oc get nodes
```

### Example output

```
NAME STATUS ROLES AGE VERSION
master-0 Ready master 73m v1.27.3
master-1 Ready master 73m v1.27.3
master-2 Ready master 74m v1.27.3
worker-0 Ready worker 11m v1.27.3
worker-1 Ready worker 11m v1.27.3
```

### NOTE

It can take a few minutes after approval of the server CSRs for the machines to transition to the **Ready** status.

### Additional information

- For more information on CSRs, see [Certificate Signing Requests](#).

## 4.14.20. Initial Operator configuration

After the control plane initializes, you must immediately configure some Operators so that they all become available.

### Prerequisites

- Your control plane has initialized.

### Procedure

- Watch the cluster components come online:

```
$ watch -n5 oc get clusteroperators
```

## Example output

| NAME                                     | VERSION | AVAILABLE | PROGRESSING | DEGRADED  |
|------------------------------------------|---------|-----------|-------------|-----------|
| SINCE                                    |         |           |             |           |

| storage                                  | 4.14.0  | True      | False       | False 37m |

2. Configure the Operators that are not available.

#### 4.14.20.1. Disabling the default OperatorHub catalog sources

Operator catalogs that source content provided by Red Hat and community projects are configured for OperatorHub by default during an OpenShift Container Platform installation. In a restricted network environment, you must disable the default catalogs as a cluster administrator.

##### Procedure

- Disable the sources for the default catalogs by adding **disableAllDefaultSources: true** to the **OperatorHub** object:

```
$ oc patch OperatorHub cluster --type json \
 -p '[{"op": "add", "path": "/spec/disableAllDefaultSources", "value": true}]'
```

**TIP**

Alternatively, you can use the web console to manage catalog sources. From the **Administration → Cluster Settings → Configuration → OperatorHub** page, click the **Sources** tab, where you can create, update, delete, disable, and enable individual sources.

**4.14.20.2. Image registry storage configuration**

Amazon Web Services provides default storage, which means the Image Registry Operator is available after installation. However, if the Registry Operator cannot create an S3 bucket and automatically configure storage, you must manually configure registry storage.

Instructions are shown for configuring a persistent volume, which is required for production clusters. Where applicable, instructions are shown for configuring an empty directory as the storage location, which is available for only non-production clusters.

Additional instructions are provided for allowing the image registry to use block storage types by using the **Recreate** rollout strategy during upgrades.

**4.14.20.2.1. Configuring registry storage for AWS with user-provisioned infrastructure**

During installation, your cloud credentials are sufficient to create an Amazon S3 bucket and the Registry Operator will automatically configure storage.

If the Registry Operator cannot create an S3 bucket and automatically configure storage, you can create an S3 bucket and configure storage with the following procedure.

**Prerequisites**

- You have a cluster on AWS with user-provisioned infrastructure.
- For Amazon S3 storage, the secret is expected to contain two keys:
  - **REGISTRY\_STORAGE\_S3\_ACCESSKEY**
  - **REGISTRY\_STORAGE\_S3\_SECRETKEY**

**Procedure**

Use the following procedure if the Registry Operator cannot create an S3 bucket and automatically configure storage.

1. Set up a [Bucket Lifecycle Policy](#) to abort incomplete multipart uploads that are one day old.
2. Fill in the storage configuration in **configs.imageregistry.operator.openshift.io/cluster**:

```
$ oc edit configs.imageregistry.operator.openshift.io/cluster
```

**Example configuration**

```
storage:
 s3:
 bucket: <bucket-name>
 region: <region-name>
```

**WARNING**

To secure your registry images in AWS, [block public access](#) to the S3 bucket.

**4.14.20.2.2. Configuring storage for the image registry in non-production clusters**

You must configure storage for the Image Registry Operator. For non-production clusters, you can set the image registry to an empty directory. If you do so, all images are lost if you restart the registry.

**Procedure**

- To set the image registry storage to an empty directory:

```
$ oc patch configs.imageregistry.operator.openshift.io cluster --type merge --patch '{"spec": {"storage":{"emptyDir":{}}}}'
```

**WARNING**

Configure this option for only non-production clusters.

If you run this command before the Image Registry Operator initializes its components, the **oc patch** command fails with the following error:

```
Error from server (NotFound): configs.imageregistry.operator.openshift.io "cluster" not found
```

Wait a few minutes and run the command again.

**4.14.21. Deleting the bootstrap resources**

After you complete the initial Operator configuration for the cluster, remove the bootstrap resources from Amazon Web Services (AWS).

**Prerequisites**

- You completed the initial Operator configuration for your cluster.

**Procedure**

- Delete the bootstrap resources. If you used the CloudFormation template, [delete its stack](#):
  - Delete the stack by using the AWS CLI:

```
$ aws cloudformation delete-stack --stack-name <name> 1
```

**1** `<name>` is the name of your bootstrap stack.

- Delete the stack by using the [AWS CloudFormation console](#).

#### 4.14.22. Creating the Ingress DNS Records

If you removed the DNS Zone configuration, manually create DNS records that point to the Ingress load balancer. You can create either a wildcard record or specific records. While the following procedure uses A records, you can use other record types that you require, such as CNAME or alias.

##### Prerequisites

- You deployed an OpenShift Container Platform cluster on Amazon Web Services (AWS) that uses infrastructure that you provisioned.
- You installed the OpenShift CLI (**oc**).
- You installed the **jq** package.
- You downloaded the AWS CLI and installed it on your computer. See [Install the AWS CLI Using the Bundled Installer \(Linux, macOS, or Unix\)](#).

##### Procedure

1. Determine the routes to create.
  - To create a wildcard record, use `*.apps.<cluster_name>.<domain_name>`, where `<cluster_name>` is your cluster name, and `<domain_name>` is the Route 53 base domain for your OpenShift Container Platform cluster.
  - To create specific records, you must create a record for each route that your cluster uses, as shown in the output of the following command:

```
$ oc get --all-namespaces -o jsonpath='{range .items[*]}{range .status.ingress[*]}{.host}
{"\n"}}{end}{end}' routes
```

##### Example output

```
oauth-openshift.apps.<cluster_name>.<domain_name>
console-openshift-console.apps.<cluster_name>.<domain_name>
downloads-openshift-console.apps.<cluster_name>.<domain_name>
alertmanager-main-openshift-monitoring.apps.<cluster_name>.<domain_name>
prometheus-k8s-openshift-monitoring.apps.<cluster_name>.<domain_name>
```

2. Retrieve the Ingress Operator load balancer status and note the value of the external IP address that it uses, which is shown in the **EXTERNAL-IP** column:

```
$ oc -n openshift-ingress get service router-default
```

##### Example output

| NAME | TYPE | CLUSTER-IP | EXTERNAL-IP | PORT(S) |
|------|------|------------|-------------|---------|
| AGE  |      |            |             |         |

```
router-default LoadBalancer 172.30.62.215 ab3...28.us-east-2.elb.amazonaws.com
80:31499/TCP,443:30693/TCP 5m
```

3. Locate the hosted zone ID for the load balancer:

```
$ aws elb describe-load-balancers | jq -r '.LoadBalancerDescriptions[] | select(.DNSName ==
"<external_ip>").CanonicalHostedZoneNameID' 1
```

- 1** For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer that you obtained.

### Example output

```
Z3AADJGX6KTTL2
```

The output of this command is the load balancer hosted zone ID.

4. Obtain the public hosted zone ID for your cluster's domain:

```
$ aws route53 list-hosted-zones-by-name \
 --dns-name "<domain_name>" 1
 --query 'HostedZones[? Config.PrivateZone != `true` && Name ==
`<domain_name>.`].Id' 2
 --output text
```

- 1** **2** For **<domain\_name>**, specify the Route 53 base domain for your OpenShift Container Platform cluster.

### Example output

```
/hostedzone/Z3URY6TWQ91KVV
```

The public hosted zone ID for your domain is shown in the command output. In this example, it is **Z3URY6TWQ91KVV**.

5. Add the alias records to your private zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<private_hosted_zone_id>" --
change-batch '{ 1
> "Changes": [
> {
> "Action": "CREATE",
> "ResourceRecordSet": {
> "Name": "\\052.apps.<cluster_domain>", 2
> "Type": "A",
> "AliasTarget": {
> "HostedZoneId": "<hosted_zone_id>", 3
> "DNSName": "<external_ip>.", 4
> "EvaluateTargetHealth": false
> }
> }
> }
```

```
> }
>]
> }'
```

- 1 For **<private\_hosted\_zone\_id>**, specify the value from the output of the CloudFormation template for DNS and load balancing.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

6. Add the records to your public zone:

```
$ aws route53 change-resource-record-sets --hosted-zone-id "<public_hosted_zone_id>" --
change-batch '{
> "Changes": [
> {
> "Action": "CREATE",
> "ResourceRecordSet": {
> "Name": "\\052.apps.<cluster_domain>",
> "Type": "A",
> "AliasTarget": {
> "HostedZoneId": "<hosted_zone_id>",
> "DNSName": "<external_ip>.",
> "EvaluateTargetHealth": false
> }
> }
> }
>]
> }'
```

- 1 For **<public\_hosted\_zone\_id>**, specify the public hosted zone for your domain.
- 2 For **<cluster\_domain>**, specify the domain or subdomain that you use with your OpenShift Container Platform cluster.
- 3 For **<hosted\_zone\_id>**, specify the public hosted zone ID for the load balancer that you obtained.
- 4 For **<external\_ip>**, specify the value of the external IP address of the Ingress Operator load balancer. Ensure that you include the trailing period (.) in this parameter value.

#### 4.14.23. Completing an AWS installation on user-provisioned infrastructure

After you start the OpenShift Container Platform installation on Amazon Web Service (AWS) user-provisioned infrastructure, monitor the deployment to completion.

#### Prerequisites

- You removed the bootstrap node for an OpenShift Container Platform cluster on user-provisioned AWS infrastructure.
- You installed the **oc** CLI.

## Procedure

1. From the directory that contains the installation program, complete the cluster installation:

```
$./openshift-install --dir <installation_directory> wait-for install-complete 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

## Example output

```
INFO Waiting up to 40m0s for the cluster at https://api.mycluster.example.com:6443 to
initialize...
INFO Waiting up to 10m0s for the openshift-console route to be created...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 1s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

2. Register your cluster on the [Cluster registration](#) page.

/validating-an-installation.adoc

## 4.14.24. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

## Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

## Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/.openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/.openshift\_install.log** log file on the installation host.

## Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

## Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 4.14.25. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

#### 4.14.26. Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.

#### 4.14.27. Next steps

- [Validate an installation.](#)
- [Customize your cluster.](#)
- [Configure image streams](#) for the Cluster Samples Operator and the **must-gather** tool.
- Learn how to [use Operator Lifecycle Manager \(OLM\) on restricted networks](#) .
- If the mirror registry that you used to install your cluster has a trusted CA, add it to the cluster by [configuring additional trust stores](#).
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, see [Registering your disconnected cluster](#)
- If necessary, you can [remove cloud provider credentials](#).

## 4.15. INSTALLING A CLUSTER ON AWS WITH REMOTE WORKERS ON AWS OUTPOSTS

In OpenShift Container Platform version 4.14, you can install a cluster on Amazon Web Services (AWS) with remote workers running in AWS Outposts. This can be achieved by customizing the default AWS installation and performing some manual steps.

### IMPORTANT

Installing a cluster on AWS with remote workers on AWS Outposts is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#) .

For more info about AWS Outposts see [AWS Outposts Documentation](#) .

### IMPORTANT

In order to install a cluster with remote workers in AWS Outposts, all worker instances must be located within the same Outpost instance and cannot be located in an AWS region. It is not possible for the cluster to have instances in both AWS Outposts and AWS region. In addition, it also follows that control plane nodes mustn't be schedulable.

### 4.15.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update processes](#).
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an AWS account](#) to host the cluster.
- You are familiar with the instance types are supported in the AWS Outpost instance you use. This can be validated with [get-outpost-instance-types AWS CLI command](#)
- You are familiar with the AWS Outpost instance details, such as OutpostArn and AvailabilityZone. This can be validated with [list-outposts AWS CLI command](#)

#### IMPORTANT

Since the cluster uses the provided AWS credentials to create AWS resources for its entire life cycle, the credentials must be key-based and long-term. So, If you have an AWS profile stored on your computer, it must not use a temporary session token, generated while using a multi-factor authentication device. For more information about generating the appropriate keys, see [Managing Access Keys for IAM Users](#) in the AWS documentation. You may supply the keys when you run the installation program.

- You have access to an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). See the section "About using a custom VPC" for more information.
- If a firewall is used, it was [configured to allow the sites](#) that your cluster requires access to.

### 4.15.2. About using a custom VPC

OpenShift Container Platform 4.14 installer cannot automatically deploy AWS Subnets on AWS Outposts, so you will need to manually configure the VPC. Therefore, you have to deploy the cluster into existing subnets in an existing Amazon Virtual Private Cloud (VPC) in Amazon Web Services (AWS). In addition, by deploying OpenShift Container Platform into an existing AWS VPC, you might be able to avoid limit constraints in new accounts or more easily abide by the operational constraints that your company's guidelines set.

Because the installation program cannot know what other components are also in your existing subnets, it cannot choose subnet CIDRs and so forth on your behalf. You must configure networking for the subnets that you install your cluster to yourself.

#### 4.15.2.1. Requirements for using your VPC

The installation program no longer creates the following components:

- Internet gateways
- NAT gateways
- Subnets
- Route tables

- VPCs
- VPC DHCP options
- VPC endpoints

## NOTE

The installation program requires that you use the cloud-provided DNS server. Using a custom DNS server is not supported and causes the installation to fail.

If you use a custom VPC, you must correctly configure it and its subnets for the installation program and the cluster to use. See [Amazon VPC console wizard configurations](#) and [Work with VPCs and subnets](#) in the AWS documentation for more information on creating and managing an AWS VPC.

The installation program cannot:

- Subdivide network ranges for the cluster to use.
- Set route tables for the subnets.
- Set VPC options like DHCP.

You must complete these tasks before you install the cluster. See [VPC networking components](#) and [Route tables for your VPC](#) for more information on configuring networking in an AWS VPC.

Your VPC must meet the following characteristics:

## NOTE

To allow the creation of OpenShift Container Platform with remote workers in the AWS Outposts, you must create at least one private subnet in the AWS Outpost instance for the workload instances creation and one private subnet in an AWS region for the control plane instances creation. If you specify more than one private subnet in the region, the control plane instances will be distributed across these subnets. You will also need to create a public subnet in each of the availability zones used for private subnets, including the Outpost private subnet, as Network Load Balancers will be created in the AWS region for the API server and Ingress network as part of the cluster installation. It is possible to create an AWS region private subnet in the same Availability zone as an Outpost private subnet.

- Create a public and private subnet in the AWS Region for each availability zone that your control plane uses. Each availability zone can contain no more than one public and one private subnet in the AWS region. For an example of this type of configuration, see [VPC with public and private subnets \(NAT\)](#) in the AWS documentation.

To create a private subnet in the AWS Outposts, you need to first ensure that the Outpost instance is located in the desired availability zone. Then, you can create the private subnet within that availability zone within the Outpost instance, by adding the Outpost ARN. Make sure there is another public subnet in the AWS Region created in the same availability zone.

Record each subnet ID. Completing the installation requires that you enter all the subnets IDs, created in the AWS Region, in the **platform** section of the **install-config.yaml** file and changing the workers **machineset** to use the private subnet ID created in the Outpost. See [Finding a subnet ID](#) in the AWS documentation.

## IMPORTANT

In case you need to create a public subnet in the AWS Outposts, verify that this subnet is not used for the Network or Classic LoadBalancer, otherwise the LoadBalancer creation fails. To achieve that, the **kubernetes.io/cluster/\*-outposts: owned** special tag must be included in the subnet.

- The VPC's CIDR block must contain the **Networking.MachineCIDR** range, which is the IP address pool for cluster machines. The subnet CIDR blocks must belong to the machine CIDR that you specify.
- The VPC must have a public internet gateway attached to it. For each availability zone:
  - The public subnet requires a route to the internet gateway.
  - The public subnet requires a NAT gateway with an EIP address.
  - The private subnet requires a route to the NAT gateway in public subnet.

## NOTE

To access your local cluster over your local network, the VPC must be associated with your Outpost's local gateway route table. For more information, see [VPC associations](#) in the AWS Outposts User Guide.

- The VPC must not use the **kubernetes.io/cluster/\*: owned, Name**, and **openshift.io/cluster** tags.  
The installation program modifies your subnets to add the **kubernetes.io/cluster/\*: shared** tag, so your subnets must have at least one free tag slot available for it. See [Tag Restrictions](#) in the AWS documentation to confirm that the installation program can add a tag to each subnet that you specify. You cannot use a **Name** tag, because it overlaps with the EC2 **Name** field and the installation fails.
- You must enable the **enableDnsSupport** and **enableDnsHostnames** attributes in your VPC, so that the cluster can use the Route 53 zones that are attached to the VPC to resolve cluster's internal DNS records. See [DNS Support in Your VPC](#) in the AWS documentation.  
If you prefer to use your own Route 53 hosted private zone, you must associate the existing hosted zone with your VPC prior to installing a cluster. You can define your hosted zone using the **platform.aws.hostedZone** and **platform.aws.hostedZoneRole** fields in the **install-config.yaml** file. You can use a private hosted zone from another account by sharing it with the account where you install the cluster. If you use a private hosted zone from another account, you must use the **Passthrough** or **Manual** credentials mode.

### Option 1: Create VPC endpoints

Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws\_region>.amazonaws.com**
- **elasticloadbalancing.<aws\_region>.amazonaws.com**
- **s3.<aws\_region>.amazonaws.com**

With this option, network traffic remains private between your VPC and the required AWS services.

### Option 2: Create a proxy without VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy. With this option, internet traffic goes through the proxy to reach the required AWS services.

### Option 3: Create a proxy with VPC endpoints

As part of the installation process, you can configure an HTTP or HTTPS proxy with VPC endpoints. Create a VPC endpoint and attach it to the subnets that the clusters are using. Name the endpoints as follows:

- **ec2.<aws\_region>.amazonaws.com**
- **elasticloadbalancing.<aws\_region>.amazonaws.com**
- **s3.<aws\_region>.amazonaws.com**

When configuring the proxy in the **install-config.yaml** file, add these endpoints to the **noProxy** field. With this option, the proxy prevents the cluster from accessing the internet directly. However, network traffic remains private between your VPC and the required AWS services.

### Required VPC components

You must provide a suitable VPC and subnets that allow communication to your machines.

| Component        | AWS type                                                                                                                                                                                                                                                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                  |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VPC              | <ul style="list-style-type: none"> <li>• <b>AWS::EC2::VPC</b></li> <li>• <b>AWS::EC2::VPCEndpoint</b></li> </ul>                                                                                                                                                                                                                              | You must provide a public VPC for the cluster to use. The VPC uses an endpoint that references the route tables for each subnet to improve communication with the registry that is hosted in S3.                                                                                                                                             |
| Public subnets   | <ul style="list-style-type: none"> <li>• <b>AWS::EC2::Subnet</b></li> <li>• <b>AWS::EC2::SubnetNetworkACLAssociation</b></li> </ul>                                                                                                                                                                                                           | Your VPC must have public subnets for between 1 and 3 availability zones and associate them with appropriate Ingress rules.                                                                                                                                                                                                                  |
| Internet gateway | <ul style="list-style-type: none"> <li>• <b>AWS::EC2::InternetGateway</b></li> <li>• <b>AWS::EC2::VPCGatewayAttachment</b></li> <li>• <b>AWS::EC2::RouteTable</b></li> <li>• <b>AWS::EC2::Route</b></li> <li>• <b>AWS::EC2::SubnetRouteTableAssociation</b></li> <li>• <b>AWS::EC2::NatGateway</b></li> <li>• <b>AWS::EC2::EIP</b></li> </ul> | You must have a public internet gateway, with public routes, attached to the VPC. In the provided templates, each public subnet has a NAT gateway with an EIP address. These NAT gateways allow cluster resources, like private subnet instances, to reach the internet and are not required for some restricted network or proxy scenarios. |

|                        |                                                                                                                                                                        | 0 - 65535                                                                                                                                                                                                                                                                                                                                                                                                                                    | Outbound ephemeral traffic |
| Private subnets        | <ul style="list-style-type: none"><li>● <b>AWS::EC2::Subnet</b></li><li>● <b>AWS::EC2::RouteTable</b></li><li>● <b>AWS::EC2::SubnetRouteTableAssociation</b></li></ul> | Your VPC can have private subnets. The provided CloudFormation templates can create private subnets for between 1 and 3 availability zones. To enable remote workers running in the Outpost, the VPC must include a private subnet located within the Outpost instance, in addition to the private subnets located within the corresponding AWS region. If you use private subnets, you must provide appropriate routes and tables for them. |                            |

#### 4.15.2.2. VPC validation

To ensure that the subnets that you provide are suitable, the installation program confirms the following data:

- All the subnets that you specify exist.
- You provide private subnets.
- The subnet CIDRs belong to the machine CIDR that you specified.
- You provide subnets for each availability zone. Each availability zone contains exactly one public and one private subnet in the AWS region (not created in the Outpost instance). The availability zone in which the Outpost instance is installed should include one additional private subnet in the Outpost instance.

- You provide a public subnet for each private subnet availability zone. Machines are not provisioned in availability zones that you do not provide private subnets for.

If you destroy a cluster that uses an existing VPC, the VPC is not deleted. When you remove the OpenShift Container Platform cluster from a VPC, the **kubernetes.io/cluster/.\*: shared** tag is removed from the subnets that it used.

#### 4.15.2.3. Division of permissions

Starting with OpenShift Container Platform 4.3, you do not need all of the permissions that are required for an installation program-provisioned infrastructure cluster to deploy a cluster. This change mimics the division of permissions that you might have at your company: some individuals can create different resource in your clouds than others. For example, you might be able to create application-specific items, like instances, buckets, and load balancers, but not networking-related components such as VPCs, subnets, or ingress rules.

The AWS credentials that you use when you create your cluster do not need the networking permissions that are required to make VPCs and core networking components within the VPC, such as subnets, routing tables, internet gateways, NAT, and VPN. You still need permission to make the application resources that the machines within the cluster require, such as ELBs, security groups, S3 buckets, and nodes.

#### 4.15.2.4. Isolation between clusters

If you deploy OpenShift Container Platform to an existing network, the isolation of cluster services is reduced in the following ways:

- You can install multiple OpenShift Container Platform clusters in the same VPC.
- ICMP ingress is allowed from the entire network.
- TCP 22 ingress (SSH) is allowed to the entire network.
- Control plane TCP 6443 ingress (Kubernetes API) is allowed to the entire network.
- Control plane TCP 22623 ingress (MCS) is allowed to the entire network.

#### 4.15.2.5. AWS security groups

By default, the installation program creates and attaches security groups to control plane and compute machines. The rules associated with the default security groups cannot be modified.

However, you can apply additional existing AWS security groups, which are associated with your existing VPC, to control plane and compute machines. Applying custom security groups can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

As part of the installation process, you apply custom security groups by modifying the **install-config.yaml** file before deploying the cluster.

For more information, see "Applying existing AWS security groups to the cluster".

### 4.15.3. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

#### 4.15.4. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The **`./openshift-install gather`** command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86\_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

#### NOTE

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

#### Example output

```
Agent pid 31874
```

#### NOTE

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

#### Example output

```
-
```

Identity added: /home/<you>/<path>/<file\_name> (<computer\_name>)

### Next steps

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 4.15.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 4.15.6. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 4.24. Minimum resource requirements**

| Machine       | Operating System              | vCPU [1] | Virtual RAM | Storage | Input/Output Per Second (IOPS)[2] |
|---------------|-------------------------------|----------|-------------|---------|-----------------------------------|
| Bootstrap     | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Control plane | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Compute       | RHCOS, RHEL 8.6 and later [3] | 2        | 8 GB        | 100 GB  | 300                               |

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

## NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

## Additional resources

- [Optimizing storage](#)

### 4.15.7. Identifying your AWS Outposts instance types

AWS Outposts rack catalog includes options supporting the latest generation Intel powered EC2 instance types with or without local instance storage. Identify which instance types are configured in your AWS Outpost instance. As part of the installation process, you must update the **install-config.yaml** file with the instance type that the installation program will use to deploy worker nodes.

#### Procedure

Use the AWS CLI to get the list of supported instance types by running the following command:

```
$ aws outposts get-outpost-instance-types --outpost-id <outpost_id> 1
```

- 1 For **<outpost\_id>**, specify the Outpost ID, used in the AWS account for the worker instances

#### IMPORTANT

When you purchase capacity for your AWS Outpost instance, you specify an EC2 capacity layout that each server provides. Each server supports a single family of instance types. A layout can offer a single instance type or multiple instance types. Dedicated Hosts allows you to alter whatever you chose for that initial layout. If you allocate a host to support a single instance type for the entire capacity, you can only start a single instance type from that host.

Supported instance types in AWS Outposts might be changed. For more information, you can check the [Compute and Storage](#) page in AWS Outposts documents.

### 4.15.8. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Amazon Web Services (AWS).

#### Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.

#### Procedure

- Create the **install-config.yaml** file.
  - Change to the directory that contains the installation program and run the following command:

```
$./openshift-install create install-config --dir <installation_directory> 1
```

- 1 For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.

- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

**NOTE**

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **AWS** as the platform to target.
  - iii. If you do not have an Amazon Web Services (AWS) profile stored on your computer, enter the AWS access key ID and secret access key for the user that you configured to run the installation program.
  - iv. Select the AWS region to deploy the cluster to.
  - v. Select the base domain for the Route 53 service that you configured for your cluster.
  - vi. Enter a descriptive name for your cluster.
2. Modify the **install-config.yaml** file. The AWS Outposts installation has the following limitations which require manual modification of the **install-config.yaml** file:
  - Unlike AWS Regions, which offer near-infinite scale, AWS Outposts are limited by their provisioned capacity, EC2 family and generations, configured instance sizes, and availability of compute capacity that is not already consumed by other workloads. Therefore, when creating new OpenShift Container Platform cluster, you need to provide the supported instance type in the **compute.platform.aws.type** section in the configuration file.
  - When deploying OpenShift Container Platform cluster with remote workers running in AWS Outposts, only one Availability Zone can be used for the compute instances - the Availability Zone in which the Outpost instance was created in. Therefore, when creating new OpenShift Container Platform cluster, it recommended to provide the relevant Availability Zone in the **compute.platform.aws.zones** section in the configuration file, in order to limit the compute instances to this Availability Zone.
  - Amazon Elastic Block Store (EBS) gp3 volumes aren't supported by the AWS Outposts service. This volume type is the default type used by the OpenShift Container Platform cluster. Therefore, when creating new OpenShift Container Platform cluster, you must

change the volume type in the **compute.platform.aws.rootVolume.type** section to gp2. You will find more information about how to change these values below.

3. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

#### Additional resources

- [Installation configuration parameters for AWS](#)

#### 4.15.8.1. Sample customized install-config.yaml file for AWS

You can customize the installation configuration file (**install-config.yaml**) to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com 1
credentialsMode: Mint 2
controlPlane: 3 4
 hyperthreading: Enabled 5
 name: master
 platform: {}
 replicas: 3
compute: 6
- hyperthreading: Enabled 7
 name: worker
 platform:
 aws:
 type: m5.large 8
 zones:
 - us-east-1a 9
 rootVolume:
 type: gp2 10
 size: 120
 replicas: 3
 metadata:
 name: test-cluster 11
 networking:
 clusterNetwork:
 - cidr: 10.128.0.0/14
 hostPrefix: 23
 machineNetwork:
 - cidr: 10.0.0.0/16
 networkType: OVNKubernetes 12
```

```

serviceNetwork:
- 172.30.0.0/16
platform:
 aws:
 region: us-west-2 13
 propagateUserTags: true 14
 userTags:
 adminContact: jdoe
 costCenter: 7536
 subnets: 15
 - subnet-1
 - subnet-2
 - subnet-3
 sshKey: ssh-ed25519 AAAA... 16
 pullSecret: '{"auths": ...}' 17

```

- 1 11 13 17 Required. The installation program prompts you for this value.
- 2 Optional: Add this parameter to force the Cloud Credential Operator (CCO) to use the specified mode. By default, the CCO uses the root credentials in the **kube-system** namespace to dynamically try to determine the capabilities of the credentials. For details about CCO modes, see the "About the Cloud Credential Operator" section in the *Authentication and authorization* guide.
- 3 6 14 If you do not provide these parameters and values, the installation program provides the default value.
- 4 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.
- 5 7 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger instance types, such as **m4.2xlarge** or **m5.2xlarge**, for your machines if you disable simultaneous multithreading.

- 8 For compute instances running in an AWS Outpost instance, specify a supported instance type in the AWS Outpost instance.
- 9 For compute instances running in AWS Outpost instance, specify the Availability Zone where the Outpost instance is located.
- 10 For compute instances running in AWS Outpost instance, specify volume type gp2, to avoid using gp3 volume type which is not supported.
- 12 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

- 15 If you provide your own VPC, specify subnets for each availability zone that your cluster uses.
- 16 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

### 4.15.8.2. Applying existing AWS security groups to the cluster

Applying existing AWS security groups to your control plane and compute machines can help you meet the security needs of your organization, in such cases where you need to control the incoming or outgoing traffic of these machines.

#### Prerequisites

- You have created the security groups in AWS. For more information, see the AWS documentation about working with [security groups](#).
- The security groups must be associated with the existing VPC that you are deploying the cluster to. The security groups cannot be associated with another VPC.
- You have an existing **install-config.yaml** file.

#### Procedure

- In the **install-config.yaml** file, edit the **compute.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your compute machines.
- Edit the **controlPlane.platform.aws.additionalSecurityGroupIDs** parameter to specify one or more custom security groups for your control plane machines.
- Save the file and reference it when deploying the cluster.

#### Sample install-config.yaml file that specifies custom security groups

```
...
compute:
 - hyperthreading: Enabled
 name: worker
 platform:
 aws:
 additionalSecurityGroupIDs:
 - sg-1 1
 - sg-2
 replicas: 3
controlPlane:
 hyperthreading: Enabled
 name: master
 platform:
 aws:
```

```

 additionalSecurityGroupIDs:
 - sg-3
 - sg-4
 replicas: 3
 platform:
 aws:
 region: us-east-1
 subnets: 2
 - subnet-1
 - subnet-2
 - subnet-3

```

- 1 Specify the name of the security group as it appears in the Amazon EC2 console, including the **sg** prefix.
- 2 Specify subnets for each availability zone that your cluster uses.

#### 4.15.9. Generating manifest files

Use the installation program to generate a set of manifest files in the assets directory. Manifest files are required to specify the AWS Outposts subnets to use for worker machines, and to specify settings required by the network provider.

If you plan to reuse the **install-config.yaml** file, create a backup file before you generate the manifest files.

##### Procedure

1. Optional: Create a backup copy of the **install-config.yaml** file:

```
$ cp install-config.yaml install-config.yaml.backup
```

2. Generate a set of manifests in your assets directory:

```
$ openshift-install create manifests --dir <installation_directory>
```

This command displays the following messages.

##### Example output

```

INFO Consuming Install Config from target directory
INFO Manifests created in: <installation_directory>/manifests and
 <installation_directory>/openshift

```

The command generates the following manifest files:

##### Example output

```

$ tree
.
├── manifests
│ ├── cluster-config.yaml
│ └── cluster-dns-02-config.yml

```

```

├── cluster-infrastructure-02-config.yml
├── cluster-ingress-02-config.yml
├── cluster-network-01-crd.yml
├── cluster-network-02-config.yml
├── cluster-proxy-01-config.yaml
├── cluster-scheduler-02-config.yml
├── cvo-overrides.yaml

 ├── 99_openshift-machineconfig_99-worker-ssh.yaml
 ├── 99_role-cloud-creds-secret-reader.yaml
 └── openshift-install-manifests.yaml

```

#### 4.15.9.1. Modifying manifest files

##### NOTE

The AWS Outposts environments has the following limitations which require manual modification in the manifest generated files:

- The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The Outpost service link supports a maximum packet size of 1300 bytes. For more information about the service link, see [Outpost connectivity to AWS Regions](#)

You will find more information about how to change these values below.

- Use Outpost Subnet for workers **machineset**  
Modify the following file: <installation\_directory>/openshift/99\_openshift-cluster-api\_worker-machineset-0.yaml Find the subnet ID and replace it with the ID of the private subnet created in the Outpost. As a result, all the worker machines will be created in the Outpost.
- Specify MTU value for the Network Provider  
Outpost service links support a maximum packet size of 1300 bytes. It's required to modify the MTU of the Network Provider to follow this requirement. Create a new file under manifests directory, named cluster-network-03-config.yml

If OpenShift SDN network provider is used, set the MTU value to 1250

```

apiVersion: operator.openshift.io/v1
kind: Network

```

```

metadata:
 name: cluster
spec:
 defaultNetwork:
 openshiftSDNConfig:
 mtu: 1250

```

If OVN-Kubernetes network provider is used, set the MTU value to 1200

```

apiVersion: operator.openshift.io/v1
kind: Network
metadata:
 name: cluster
spec:
 defaultNetwork:
 ovnKubernetesConfig:
 mtu: 1200

```

#### 4.15.10. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

#### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

#### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

#### NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

#### Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

#### 4.15.11. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an AWS cluster to use short-term credentials](#).

##### 4.15.11.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

#### Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

#### Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE\_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
```

```

--from=$RELEASE_IMAGE \
--credentials-requests \
--included \ ❶
--install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \ ❷
--to=<path_to_directory_for_credentials_requests> ❸

```

- ❶ The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- ❷ Specify the location of the **install-config.yaml** file.
- ❸ Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
 name: <component_credentials_request>
 namespace: openshift-cloud-credential-operator
 ...
spec:
 providerSpec:
 apiVersion: cloudcredential.openshift.io/v1
 kind: AWSProviderSpec
 statementEntries:
 - effect: Allow
 action:
 - iam:GetUser
 - iam:GetUserPolicy
 - iam:ListAccessKeys
 resource: "*"
 ...

```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object with secrets

```

apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
 name: <component_credentials_request>
 namespace: openshift-cloud-credential-operator
 ...
spec:
 providerSpec:
 apiVersion: cloudcredential.openshift.io/v1
 kind: AWSProviderSpec
 statementEntries:

```

```

- effect: Allow
 action:
 - s3:CreateBucket
 - s3>DeleteBucket
 resource: "*"
 ...
secretRef:
 name: <component_secret>
 namespace: <component_namespace>
 ...

```

### Sample Secret object

```

apiVersion: v1
kind: Secret
metadata:
 name: <component_secret>
 namespace: <component_namespace>
data:
 aws_access_key_id: <base64_encoded_aws_access_key_id>
 aws_secret_access_key: <base64_encoded_aws_secret_access_key>

```

### IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

## 4.15.11.2. Configuring an AWS cluster to use short-term credentials

To install a cluster that is configured to use the AWS Security Token Service (STS), you must configure the CCO utility and create the required AWS resources for your cluster.

### 4.15.11.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccoctl**) binary.

### NOTE

The **ccoctl** utility is a Linux binary that must run in a Linux environment.

### Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created an AWS account for the **ccoctl** utility to use with the following permissions:

#### Example 4.94. Required AWS permissions

#### Required iam permissions

- **iam:CreateOpenIDConnectProvider**

- **iam:CreateRole**
- **iam>DeleteOpenIDConnectProvider**
- **iam>DeleteRole**
- **iam>DeleteRolePolicy**
- **iam:GetOpenIDConnectProvider**
- **iam:GetRole**
- **iam:GetUser**
- **iam:ListOpenIDConnectProviders**
- **iam:ListRolePolicies**
- **iam:ListRoles**
- **iam:PutRolePolicy**
- **iam:TagOpenIDConnectProvider**
- **iam:TagRole**

**Required s3 permissions**

- **s3:CreateBucket**
- **s3>DeleteBucket**
- **s3>DeleteObject**
- **s3:GetBucketAcl**
- **s3:GetBucketTagging**
- **s3:GetObject**
- **s3:GetObjectAcl**
- **s3:GetObjectTagging**
- **s3:ListBucket**
- **s3:PutBucketAcl**
- **s3:PutBucketPolicy**
- **s3:PutBucketPublicAccessBlock**
- **s3:PutBucketTagging**
- **s3:PutObject**
- **s3:PutObjectAcl**

- **s3:PutObjectTagging**

Required **cloudfront** permissions

- **cloudfront:ListCloudFrontOriginAccessIdentities**
- **cloudfront:ListDistributions**
- **cloudfront:ListTagsForResource**

If you plan to store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL, the AWS account that runs the **ccctl** utility requires the following additional permissions:

**Example 4.95. Additional permissions for a private S3 bucket with CloudFront**

- **cloudfront:CreateCloudFrontOriginAccessIdentity**
- **cloudfront:CreateDistribution**
- **cloudfront>DeleteCloudFrontOriginAccessIdentity**
- **cloudfront>DeleteDistribution**
- **cloudfront:GetCloudFrontOriginAccessIdentity**
- **cloudfront:GetCloudFrontOriginAccessIdentityConfig**
- **cloudfront:GetDistribution**
- **cloudfront:TagResource**
- **cloudfront:UpdateDistribution**

#### NOTE

These additional permissions support the use of the **--create-private-s3-bucket** option when processing credentials requests with the **ccctl aws create-all** command.

## Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

**NOTE**

Ensure that the architecture of the **\$RELEASE\_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

**Verification**

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$./ccoctl.rhel9
```

**Example output**

```
OpenShift credentials provisioning tool
```

```
Usage:
```

```
ccoctl [command]
```

```
Available Commands:
```

```
alibabacloud Manage credentials objects for alibaba cloud
```

```
aws Manage credentials objects for AWS cloud
```

```
azure Manage credentials objects for Azure
```

```
gcp Manage credentials objects for Google cloud
```

```
help Help about any command
```

```
ibmcloud Manage credentials objects for IBM Cloud
```

```
nutanix Manage credentials objects for Nutanix
```

```
Flags:
```

```
-h, --help help for ccoctl
```

```
Use "ccoctl [command] --help" for more information about a command.
```

**4.15.11.2.2. Creating AWS resources with the Cloud Credential Operator utility**

You have the following options when creating AWS resources:

- You can use the **ccoctl aws create-all** command to create the AWS resources automatically. This is the quickest way to create the resources. See [Creating AWS resources with a single command](#).
- If you need to review the JSON files that the **ccoctl** tool creates before modifying AWS resources, or if the process the **ccoctl** tool uses to create AWS resources automatically does not meet the requirements of your organization, you can create the AWS resources individually.

See [Creating AWS resources individually](#).

#### 4.15.11.2.2.1. Creating AWS resources with a single command

If the process the **ccoctl** tool uses to create AWS resources automatically meets the requirements of your organization, you can use the **ccoctl aws create-all** command to automate the creation of AWS resources.

Otherwise, you can create the AWS resources individually. For more information, see "Creating AWS resources individually".

#### NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path\_to\_ccoctl\_output\_dir>** to refer to this directory.

### Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.

### Procedure

1. Set a **\$RELEASE\_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/ {print $3}')
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
 --from=$RELEASE_IMAGE \
 --credentials-requests \
 --included 1 \
 --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml 2 \
 --to=<path_to_directory_for_credentials_requests> 3
```

- 1** The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2** Specify the location of the **install-config.yaml** file.
- 3** Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

#### NOTE

This command might take a few moments to run.

- Use the **ccctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccctl aws create-all \
 --name=<name> \ ❶
 --region=<aws_region> \ ❷
 --credentials-requests-dir=<path_to_credentials_requests_directory> \ ❸
 --output-dir=<path_to_ccctl_output_dir> \ ❹
 --create-private-s3-bucket ❺
```

- ❶ Specify the name used to tag any cloud resources that are created for tracking.
- ❷ Specify the AWS region in which cloud resources will be created.
- ❸ Specify the directory containing the files for the component **CredentialsRequest** objects.
- ❹ Optional: Specify the directory in which you want the **ccctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- ❺ Optional: By default, the **ccctl** utility stores the OpenID Connect (OIDC) configuration files in a public S3 bucket and uses the S3 URL as the public OIDC endpoint. To store the OIDC configuration in a private S3 bucket that is accessed by the IAM identity provider through a public CloudFront distribution URL instead, use the **--create-private-s3-bucket** parameter.

#### NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

#### Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path\_to\_ccctl\_output\_dir>/manifests** directory:

```
$ ls <path_to_ccctl_output_dir>/manifests
```

#### Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

#### 4.15.11.2.2.2. Creating AWS resources individually

You can use the **ccoctl** tool to create AWS resources individually. This option might be useful for an organization that shares the responsibility for creating these resources among different users or departments.

Otherwise, you can use the **ccoctl aws create-all** command to create the AWS resources automatically. For more information, see "Creating AWS resources with a single command".

## NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path\_to\_ccoctl\_output\_dir>** to refer to this directory.

Some **ccoctl** commands make AWS API calls to create or modify AWS resources. You can use the **--dry-run** flag to avoid making API calls. Using this flag creates JSON files on the local file system instead. You can review and modify the JSON files and then apply them with the AWS CLI tool using the **--cli-input-json** parameters.

## Prerequisites

- Extract and prepare the **ccoctl** binary.

## Procedure

1. Generate the public and private RSA key files that are used to set up the OpenID Connect provider for the cluster by running the following command:

```
$ ccoctl aws create-key-pair
```

## Example output

```
2021/04/13 11:01:02 Generating RSA keypair
2021/04/13 11:01:03 Writing private key to /<path_to_ccoctl_output_dir>/serviceaccount-signer.private
2021/04/13 11:01:03 Writing public key to /<path_to_ccoctl_output_dir>/serviceaccount-signer.public
2021/04/13 11:01:03 Copying signing key for use by installer
```

where **serviceaccount-signer.private** and **serviceaccount-signer.public** are the generated key files.

This command also creates a private key that the cluster requires during installation in **/<path\_to\_ccoctl\_output\_dir>/tls/bound-service-account-signing-key.key**.

2. Create an OpenID Connect identity provider and S3 bucket on AWS by running the following command:

```
$ ccoctl aws create-identity-provider \
 --name=<name> ①
 --region=<aws_region> ②
 --public-key-file=<path_to_ccoctl_output_dir>/serviceaccount-signer.public ③
```

① **<name>** is the name used to tag any cloud resources that are created for tracking.

- 2 **<aws-region>** is the AWS region in which cloud resources will be created.
- 3 **<path\_to\_ccoctl\_output\_dir>** is the path to the public key file that the **ccoctl aws create-key-pair** command generated.

### Example output

```
2021/04/13 11:16:09 Bucket <name>-oidc created
2021/04/13 11:16:10 OpenID Connect discovery document in the S3 bucket <name>-oidc at
.well-known/openid-configuration updated
2021/04/13 11:16:10 Reading public key
2021/04/13 11:16:10 JSON web key set (JWKS) in the S3 bucket <name>-oidc at keys.json
updated
2021/04/13 11:16:18 Identity Provider created with ARN: arn:aws:iam::
<aws_account_id>:oidc-provider/<name>-oidc.s3.<aws_region>.amazonaws.com
```

where **openid-configuration** is a discovery document and **keys.json** is a JSON web key set file.

This command also creates a YAML configuration file in **/<path\_to\_ccoctl\_output\_dir>/manifests/cluster-authentication-02-config.yaml**. This file sets the issuer URL field for the service account tokens that the cluster generates, so that the AWS IAM identity provider trusts the tokens.

### 3. Create IAM roles for each component in the cluster:

- a. Set a **\$RELEASE\_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

- b. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image:

```
$ oc adm release extract \
 --from=$RELEASE_IMAGE \
 --credentials-requests \
 --included 1 \
 --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \
 2
 --to=<path_to_directory_for_credentials_requests> 3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

- c. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl aws create-iam-roles \
```

```
--name=<name> \
--region=<aws_region> \
--credentials-requests-dir=<path_to_credentials_requests_directory> \
--identity-provider-arn=arn:aws:iam::<aws_account_id>:oidc-provider/<name>-oidc.s3.
<aws_region>.amazonaws.com
```

## NOTE

For AWS environments that use alternative IAM API endpoints, such as GovCloud, you must also specify your region with the **--region** parameter.

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

For each **CredentialsRequest** object, **ccctl** creates an IAM role with a trust policy that is tied to the specified OIDC identity provider, and a permissions policy as defined in each **CredentialsRequest** object from the OpenShift Container Platform release image.

## Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path\_to\_ccctl\_output\_dir>/manifests** directory:

```
$ ls <path_to_ccctl_output_dir>/manifests
```

## Example output

```
cluster-authentication-02-config.yaml
openshift-cloud-credential-operator-cloud-credential-operator-iam-ro-creds-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capamanager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-ebs-cloud-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-aws-cloud-credentials-credentials.yaml
```

You can verify that the IAM roles are created by querying AWS. For more information, refer to AWS documentation on listing IAM roles.

### 4.15.11.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccctl**) created to the correct directories for the installation program.

## Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccctl**).

- You have created the cloud provider resources that are required for your cluster with the **ccoctl** utility.

## Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

### Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

3. Copy the manifests that the **ccoctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccoctl_output_dir>/manifests/* ./manifests/
```

4. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccoctl_output_dir>/tls .
```

## 4.15.12. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

## Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have verified that the cloud provider account on your host has the correct permissions to deploy the cluster. An account with incorrect permissions causes the installation process to fail with an error message that displays the missing permissions.

## Procedure

1. Change to the directory that contains the installation program and initialize the cluster deployment:

```
$./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

2. Optional: Remove or disable the **AdministratorAccess** policy from the IAM account that you used to install the cluster.

#### NOTE

The elevated permissions provided by the **AdministratorAccess** policy are required only during installation.

## Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation\_directory>/openshift\_install.log**.

#### IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 4.15.13. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1 For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

/validating-an-installation.adoc

### 4.15.14. Logging in to the cluster by using the web console

The **kubeadmin** user exists by default after an OpenShift Container Platform installation. You can log in to your cluster as the **kubeadmin** user by using the OpenShift Container Platform web console.

## Prerequisites

- You have access to the installation host.
- You completed a cluster installation and all cluster Operators are available.

## Procedure

1. Obtain the password for the **kubeadmin** user from the **kubeadmin-password** file on the installation host:

```
$ cat <installation_directory>/auth/kubeadmin-password
```

### NOTE

Alternatively, you can obtain the **kubeadmin** password from the **<installation\_directory>/.openshift\_install.log** log file on the installation host.

2. List the OpenShift Container Platform web console route:

```
$ oc get routes -n openshift-console | grep 'console-openshift'
```

### NOTE

Alternatively, you can obtain the OpenShift Container Platform route from the **<installation\_directory>/.openshift\_install.log** log file on the installation host.

## Example output

```
console console-openshift-console.apps.<cluster_name>.<base_domain> console
https reencrypt/Redirect None
```

3. Navigate to the route detailed in the output of the preceding command in a web browser and log in as the **kubeadmin** user.

## 4.15.15. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

## Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.
- See [About remote health monitoring](#) for more information about the Telemetry service.

### 4.15.16. Cluster Limitations

#### IMPORTANT

Network Load Balancer (NLB) and Classic Load Balancer are not supported on AWS Outposts. After the cluster is created, all the Load Balancers are created in the AWS region. In order to use Load Balancers created inside the Outpost instances, Application Load Balancer should be used. The AWS Load Balancer Operator can be used in order to achieve that goal.

If you want to use a public subnet located in the outpost instance for the ALB, you need to remove the special tag (**kubernetes.io/cluster/.\*-outposts: owned**) that was added earlier during the VPC creation. This will prevent you from creating new Services of type LoadBalancer (Network Load Balancer).

See [Understanding the AWS Load Balancer Operator](#) for more information

#### IMPORTANT

Persistent storage using AWS Elastic Block Store limitations

- AWS Outposts does not support Amazon Elastic Block Store (EBS) gp3 volumes. After installation, the cluster includes two storage classes - gp3-csi and gp2-csi, with gp3-csi being the default storage class. It is important to always use gp2-csi. You can change the default storage class using the following OpenShift CLI (oc) commands:

```
$ oc annotate --overwrite storageclass gp3-csi storageclass.kubernetes.io/is-
default-class=false
$ oc annotate --overwrite storageclass gp2-csi storageclass.kubernetes.io/is-
default-class=true
```

- To create a Volume in the Outpost instance, the CSI driver determines the Outpost ARN based on the topology keys stored on the CSINode objects. To ensure that the CSI driver uses the correct topology values, it is necessary to use the **WaitForConsumer** volume binding mode and avoid setting allowed topologies on any new storage class created.

### 4.15.17. Next steps

- [Validating an installation.](#)
- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .
- If necessary, you can [remove cloud provider credentials](#).

## 4.16. INSTALLING A THREE-NODE CLUSTER ON AWS

In OpenShift Container Platform version 4.14, you can install a three-node cluster on Amazon Web Services (AWS). A three-node cluster consists of three control plane machines, which also act as compute machines. This type of cluster provides a smaller, more resource efficient cluster, for cluster administrators and developers to use for testing, development, and production.

You can install a three-node cluster using either installer-provisioned or user-provisioned infrastructure.

#### NOTE

Deploying a three-node cluster using an AWS Marketplace image is not supported.

### 4.16.1. Configuring a three-node cluster

You configure a three-node cluster by setting the number of worker nodes to **0** in the **install-config.yaml** file before deploying the cluster. Setting the number of worker nodes to **0** ensures that the control plane machines are schedulable. This allows application workloads to be scheduled to run from the control plane nodes.

#### NOTE

Because application workloads run from control plane nodes, additional subscriptions are required, as the control plane nodes are considered to be compute nodes.

#### Prerequisites

- You have an existing **install-config.yaml** file.

#### Procedure

1. Set the number of compute replicas to **0** in your **install-config.yaml** file, as shown in the following **compute** stanza:

#### Example **install-config.yaml** file for a three-node cluster

```
apiVersion: v1
baseDomain: example.com
compute:
- name: worker
 platform: {}
 replicas: 0
...
```

2. If you are deploying a cluster with user-provisioned infrastructure:
  - After you create the Kubernetes manifest files, make sure that the **spec.mastersSchedulable** parameter is set to **true** in **cluster-scheduler-02-config.yml** file. You can locate this file in **<installation\_directory>/manifests**. For more information, see "Creating the Kubernetes manifest and Ignition config files" in "Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates".
  - Do not create additional worker nodes.

#### Example **cluster-scheduler-02-config.yml** file for a three-node cluster

```
apiVersion: config.openshift.io/v1
kind: Scheduler
metadata:
 creationTimestamp: null
 name: cluster
```

```
spec:
 mastersSchedulable: true
 policy:
 name: ""
 status: {}
```

### 4.16.2. Next steps

- [Installing a cluster on AWS with customizations](#)
- [Installing a cluster on user-provisioned infrastructure in AWS by using CloudFormation templates](#)

## 4.17. UNINSTALLING A CLUSTER ON AWS

You can remove a cluster that you deployed to Amazon Web Services (AWS).

### 4.17.1. Removing a cluster that uses installer-provisioned infrastructure

You can remove a cluster that uses installer-provisioned infrastructure from your cloud.

#### NOTE

After uninstallation, check your cloud provider for any resources not removed properly, especially with User Provisioned Infrastructure (UPI) clusters. There might be resources that the installer did not create or that the installer is unable to access.

#### Prerequisites

- You have a copy of the installation program that you used to deploy the cluster.
- You have the files that the installation program generated when you created your cluster.

#### Procedure

1. From the directory that contains the installation program on the computer that you used to install the cluster, run the following command:

```
$./openshift-install destroy cluster \
--dir <installation_directory> --log-level info 1 2
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.
- 2** To view different details, specify **warn**, **debug**, or **error** instead of **info**.

#### NOTE

You must specify the directory that contains the cluster definition files for your cluster. The installation program requires the **metadata.json** file in this directory to delete the cluster.

- Optional: Delete the **<installation\_directory>** directory and the OpenShift Container Platform installation program.

### 4.17.2. Deleting Amazon Web Services resources with the Cloud Credential Operator utility

After uninstalling an OpenShift Container Platform cluster that uses short-term credentials managed outside the cluster, you can use the CCO utility (**ccctl**) to remove the Amazon Web Services (AWS) resources that **ccctl** created during installation.

#### Prerequisites

- Extract and prepare the **ccctl** binary.
- Uninstall an OpenShift Container Platform cluster on AWS that uses short-term credentials.

#### Procedure

- Delete the AWS resources that **ccctl** created by running the following command:

```
$ ccctl aws delete \
 --name=<name> \
 --region=<aws_region>
```

**1** **<name>** matches the name that was originally used to create and tag the cloud resources.

**2** **<aws\_region>** is the AWS region in which to delete cloud resources.

#### Example output

```
2021/04/08 17:50:41 Identity Provider object .well-known/openid-configuration deleted from
the bucket <name>-oidc
2021/04/08 17:50:42 Identity Provider object keys.json deleted from the bucket <name>-oidc
2021/04/08 17:50:43 Identity Provider bucket <name>-oidc deleted
2021/04/08 17:51:05 Policy <name>-openshift-cloud-credential-operator-cloud-credential-o
associated with IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-o
deleted
2021/04/08 17:51:05 IAM Role <name>-openshift-cloud-credential-operator-cloud-credential-
o deleted
2021/04/08 17:51:07 Policy <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
associated with IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials deleted
2021/04/08 17:51:07 IAM Role <name>-openshift-cluster-csi-drivers-ebs-cloud-credentials
deleted
2021/04/08 17:51:08 Policy <name>-openshift-image-registry-installer-cloud-credentials
associated with IAM Role <name>-openshift-image-registry-installer-cloud-credentials
deleted
2021/04/08 17:51:08 IAM Role <name>-openshift-image-registry-installer-cloud-credentials
deleted
2021/04/08 17:51:09 Policy <name>-openshift-ingress-operator-cloud-credentials associated
with IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:10 IAM Role <name>-openshift-ingress-operator-cloud-credentials deleted
2021/04/08 17:51:11 Policy <name>-openshift-machine-api-aws-cloud-credentials associated
with IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
```

```
2021/04/08 17:51:11 IAM Role <name>-openshift-machine-api-aws-cloud-credentials deleted
2021/04/08 17:51:39 Identity Provider with ARN arn:aws:iam::<aws_account_id>:oidc-
provider/<name>-oidc.s3.<aws_region>.amazonaws.com deleted
```

## Verification

- To verify that the resources are deleted, query AWS. For more information, refer to AWS documentation.

### 4.17.3. Deleting a cluster with a configured AWS Local Zone infrastructure

After you install a cluster on Amazon Web Services (AWS) into an existing Virtual Private Cloud (VPC), and you set subnets for each Local Zone location, you can delete the cluster and any AWS resources associated with it.

The example in the procedure assumes that you created a VPC and its subnets by using a CloudFormation template.

## Prerequisites

- You know the name of the CloudFormation stacks, **<local\_zone\_stack\_name>** and **<vpc\_stack\_name>**, that were used during the creation of the network. You need the name of the stack to delete the cluster.
- You have access rights to the directory that contains the installation files that were created by the installation program.
- Your account includes a policy that provides you with permissions to delete the CloudFormation stack.

## Procedure

1. Change to the directory that contains the stored installation program, and delete the cluster by using the **destroy cluster** command:

```
$./openshift-install destroy cluster --dir <installation_directory> \ 1
--log-level=debug 2
```

- 1** For **<installation\_directory>**, specify the directory that stored any files created by the installation program.
- 2** To view different log details, specify **error**, **info**, or **warn** instead of **debug**.

2. Delete the CloudFormation stack for the Local Zone subnet:

```
$ aws cloudformation delete-stack --stack-name <local_zone_stack_name>
```

3. Delete the stack of resources that represent the VPC:

```
$ aws cloudformation delete-stack --stack-name <vpc_stack_name>
```

## Verification

- Check that you removed the stack resources by issuing the following commands in the AWS CLI. The AWS CLI outputs that no template component exists.

```
$ aws cloudformation describe-stacks --stack-name <local_zone_stack_name>
```

```
$ aws cloudformation describe-stacks --stack-name <vpc_stack_name>
```

### Additional resources

- See [Working with stacks](#) in the AWS documentation for more information about AWS CloudFormation stacks.
- [Opt into AWS Local Zones](#)

## 4.18. INSTALLATION CONFIGURATION PARAMETERS FOR AWS

Before you deploy an OpenShift Container Platform cluster on AWS, you provide parameters to customize your cluster and the platform that hosts it. When you create the **install-config.yaml** file, you provide values for the required parameters through the command line. You can then modify the **install-config.yaml** file to customize your cluster further.

### 4.18.1. Available installation configuration parameters for AWS

The following tables specify the required, optional, and AWS-specific installation configuration parameters that you can set as part of the installation process.

#### NOTE

After installation, you cannot modify these parameters in the **install-config.yaml** file.

#### 4.18.1.1. Required configuration parameters

Required installation configuration parameters are described in the following table:

Table 4.25. Required parameters

| Parameter          | Description                                                                                                                                                  | Values |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| <b>apiVersion:</b> | The API version for the <b>install-config.yaml</b> content. The current version is <b>v1</b> . The installation program may also support older API versions. | String |

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                    | Values                                                                          |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>baseDomain:</b>         | The base domain of your cloud provider. The base domain is used to create routes to your OpenShift Container Platform cluster components. The full DNS name for your cluster is a combination of the <b>baseDomain</b> and <b>metadata.name</b> parameter values that uses the <b>&lt;metadata.name&gt;.&lt;baseDomain&gt;</b> format.                                                                                         | A fully-qualified domain or subdomain name, such as <b>example.com</b> .        |
| <b>metadata:</b>           | Kubernetes resource <b>ObjectMeta</b> , from which only the <b>name</b> parameter is consumed.                                                                                                                                                                                                                                                                                                                                 | Object                                                                          |
| <b>metadata:<br/>name:</b> | The name of the cluster. DNS records for the cluster are all subdomains of <b>{{.metadata.name}}</b> . <b>{{.baseDomain}}</b> .                                                                                                                                                                                                                                                                                                | String of lowercase letters, hyphens (-), and periods (.), such as <b>dev</b> . |
| <b>platform:</b>           | The configuration for the specific platform upon which to perform the installation: <b>alibabacloud</b> , <b>aws</b> , <b>baremetal</b> , <b>azure</b> , <b>gcp</b> , <b>ibmcloud</b> , <b>nutanix</b> , <b>openstack</b> , <b>powervs</b> , <b>vsphere</b> , or <b>{}</b> . For additional information about <b>platform</b> . <b>&lt;platform&gt;</b> parameters, consult the table for your specific platform that follows. | Object                                                                          |

| Parameter                                                                                     | Description                                                                                                                                                                                      | Values                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  pullSecret: | Get a <a href="#">pull secret from Red Hat OpenShift Cluster Manager</a> to authenticate downloading container images for OpenShift Container Platform components from services such as Quay.io. |  <pre>{   "auths":{     "cloud.openshift.com":{       "auth":"b3Blb=",       "email":"you@example.com"     },     "quay.io":{       "auth":"b3Blb=",       "email":"you@example.com"     }   } }</pre> |

4.18.1.2. Network configuration parameters

You can customize your installation configuration based on the requirements of your existing network infrastructure. For example, you can expand the IP address block for the cluster network or provide different IP address blocks than the defaults.

Only IPv4 addresses are supported.

**NOTE**

Globalnet is not supported with Red Hat OpenShift Data Foundation disaster recovery solutions. For regional disaster recovery scenarios, ensure that you use a nonoverlapping range of private IP addresses for the cluster and service networks in each cluster.

Table 4.26. Network parameters

| Parameter                                                                                       | Description                                | Values                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  networking: | The configuration for the cluster network. | <div>Object</div> <div></div> <div><b>NOTE</b><br/>You cannot modify parameters specified by the <b>networking</b> object after installation.</div> |

| Parameter                                                    | Description                                                                                                                                                                                                                                                                                                  | Values                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>networking:<br/>networkType:</code>                    | The Red Hat OpenShift Networking network plugin to install.                                                                                                                                                                                                                                                  | Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b> . <b>OpenShiftSDN</b> is a CNI plugin for all-Linux networks. <b>OVNKubernetes</b> is a CNI plugin for Linux networks and hybrid networks that contain both Linux and Windows servers. The default value is <b>OVNKubernetes</b> . |
| <code>networking:<br/>clusterNetwork:</code>                 | <p>The IP address blocks for pods.</p> <p>The default value is <b>10.128.0.0/14</b> with a host prefix of <b>/23</b>.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>                                                                                                     | <p>An array of objects. For example:</p> <pre>networking:   clusterNetwork:     - cidr: 10.128.0.0/14       hostPrefix: 23</pre>                                                                                                                                                      |
| <code>networking:<br/>clusterNetwork:<br/>cidr:</code>       | <p>Required if you use <b>networking.clusterNetwork</b>. An IP address block.</p> <p>An IPv4 network.</p>                                                                                                                                                                                                    | An IP address block in Classless Inter-Domain Routing (CIDR) notation. The prefix length for an IPv4 block is between <b>0</b> and <b>32</b> .                                                                                                                                        |
| <code>networking:<br/>clusterNetwork:<br/>hostPrefix:</code> | <p>The subnet prefix length to assign to each individual node. For example, if <b>hostPrefix</b> is set to <b>23</b> then each node is assigned a <b>/23</b> subnet out of the given <b>cidr</b>. A <b>hostPrefix</b> value of <b>23</b> provides 510 (<math>2^{(32 - 23)} - 2</math>) pod IP addresses.</p> | <p>A subnet prefix.</p> <p>The default value is <b>23</b>.</p>                                                                                                                                                                                                                        |
| <code>networking:<br/>serviceNetwork:</code>                 | <p>The IP address block for services. The default value is <b>172.30.0.0/16</b>.</p> <p>The OpenShift SDN and OVN-Kubernetes network plugins support only a single IP address block for the service network.</p>                                                                                             | <p>An array with an IP address block in CIDR format. For example:</p> <pre>networking:   serviceNetwork:     - 172.30.0.0/16</pre>                                                                                                                                                    |
| <code>networking:<br/>machineNetwork:</code>                 | <p>The IP address blocks for machines.</p> <p>If you specify multiple IP address blocks, the blocks must not overlap.</p>                                                                                                                                                                                    | <p>An array of objects. For example:</p> <pre>networking:   machineNetwork:     - cidr: 10.0.0.0/16</pre>                                                                                                                                                                             |

| Parameter                                              | Description                                                                                                                                                                                                                                                                                                                     | Values                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>networking:<br/>machineNetwork:<br/>cidr:</code> | Required if you use <b>networking.machineNetwork</b> . An IP address block. The default value is <b>10.0.0.0/16</b> for all platforms other than libvirt and IBM Power® Virtual Server. For libvirt, the default value is <b>192.168.126.0/24</b> . For IBM Power® Virtual Server, the default value is <b>192.168.0.0/24</b> . | An IP network block in CIDR notation.<br><br>For example, <b>10.0.0.0/16</b> .<br><br> <b>NOTE</b><br><br>Set the <b>networking.machineNetwork</b> to match the CIDR that the preferred NIC resides in. |

#### 4.18.1.3. Optional configuration parameters

Optional installation configuration parameters are described in the following table:

**Table 4.27. Optional parameters**

| Parameter                                                     | Description                                                                                                                                                                                                                                                 | Values       |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| <code>additionalTrustBundle:</code>                           | A PEM-encoded X.509 certificate bundle that is added to the nodes' trusted certificate store. This trust bundle may also be used when a proxy has been configured.                                                                                          | String       |
| <code>capabilities:</code>                                    | Controls the installation of optional core cluster components. You can reduce the footprint of your OpenShift Container Platform cluster by disabling optional components. For more information, see the "Cluster capabilities" page in <i>Installing</i> . | String array |
| <code>capabilities:<br/>baselineCapabilitySet:</code>         | Selects an initial set of optional capabilities to enable. Valid values are <b>None</b> , <b>v4.11</b> , <b>v4.12</b> and <b>vCurrent</b> . The default value is <b>vCurrent</b> .                                                                          | String       |
| <code>capabilities:<br/>additionalEnabledCapabilities:</code> | Extends the set of optional capabilities beyond what you specify in <b>baselineCapabilitySet</b> . You may specify multiple capabilities in this parameter.                                                                                                 | String array |

| Parameter                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Values                                                             |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| <b>cpuPartitioningMode:</b>       | Enables workload partitioning, which isolates OpenShift Container Platform services, cluster management workloads, and infrastructure pods to run on a reserved set of CPUs. Workload partitioning can only be enabled during installation and cannot be disabled after installation. While this field enables workload partitioning, it does not configure workloads to use specific CPUs. For more information, see the <i>Workload partitioning</i> page in the <i>Scalability and Performance</i> section.                   | <b>None</b> or <b>AllNodes</b> . <b>None</b> is the default value. |
| <b>compute:</b>                   | The configuration for the machines that comprise the compute nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Array of <b>MachinePool</b> objects.                               |
| <b>compute:<br/>architecture:</b> | Determines the instruction set architecture of the machines in the pool. Currently, clusters with varied architectures are not supported. All pools must specify the same architecture. Valid values are <b>amd64</b> and <b>arm64</b> . Not all installation options support the 64-bit ARM architecture. To verify if your installation option is supported on your platform, see <i>Supported installation methods for different platforms</i> in <i>Selecting a cluster installation method and preparing it for users</i> . | String                                                             |

| Parameter                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Values                                                                                      |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>compute:</b><br><b>hyperthreading:</b> | <p>Whether to enable or disable simultaneous multithreading, or <b>hyperthreading</b>, on compute machines. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores.</p> <div>  <p><b>IMPORTANT</b></p> <p>If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance.</p> </div> | <b>Enabled</b> or <b>Disabled</b>                                                           |
| <b>compute:</b><br><b>name:</b>           | Required if you use <b>compute</b> . The name of the machine pool.                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>worker</b>                                                                               |
| <b>compute:</b><br><b>platform:</b>       | Required if you use <b>compute</b> . Use this parameter to specify the cloud provider to host the worker machines. This parameter value must match the <b>controlPlane.platform</b> parameter value.                                                                                                                                                                                                                                                                                              | <b>alibabacloud, aws, azure, gcp, ibmcloud, nutanix, openstack, powervs, vsphere, or {}</b> |
| <b>compute:</b><br><b>replicas:</b>       | The number of compute machines, which are also known as worker machines, to provision.                                                                                                                                                                                                                                                                                                                                                                                                            | A positive integer greater than or equal to <b>2</b> . The default value is <b>3</b> .      |
| <b>featureSet:</b>                        | Enables the cluster for a feature set. A feature set is a collection of OpenShift Container Platform features that are not enabled by default. For more information about enabling a feature set during installation, see "Enabling features using feature gates".                                                                                                                                                                                                                                | String. The name of the feature set to enable, such as <b>TechPreviewNoUpgrade</b> .        |
| <b>controlPlane:</b>                      | The configuration for the machines that comprise the control plane.                                                                                                                                                                                                                                                                                                                                                                                                                               | Array of <b>MachinePool</b> objects.                                                        |

| Parameter                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Values                                                                                              |

| <code>imageContentSources:</code>                                   | Sources and repositories for the release-image content.                                                                                                                                                                                                                                                                                                                                                  |                                                                   | Array of objects. Includes a <b>source</b> and, optionally, <b>mirrors</b> , as described in the following rows of this table.                                                               |
| <code>imageContentSources:</code><br><code>source:</code>           | Required if you use <b>imageContentSources</b> . Specify the repository that users refer to, for example, in image pull specifications.                                                                                                                                                                                                                                                                  |                                                                   | String                                                                                                                                                                                       |
| <code>imageContentSources:</code><br><code>mirrors:</code>          | Specify one or more repositories that may also contain the same images.                                                                                                                                                                                                                                                                                                                                  |                                                                   | Array of strings                                                                                                                                                                             |
| <code>platform:</code><br><code>aws:</code><br><code>lbType:</code> | Required to set the NLB load balancer type in AWS. Valid values are <b>Classic</b> or <b>NLB</b> . If no value is specified, the installation program defaults to <b>Classic</b> . The installation program sets the value provided here in the ingress cluster configuration object. If you do not specify a load balancer type for other Ingress Controllers, they use the type set in this parameter. |                                                                   | <b>Classic</b> or <b>NLB</b> . The default value is <b>Classic</b> .                                                                                                                         |
| <code>publish:</code>                                               | How to publish or expose the user-facing endpoints of your cluster, such as the Kubernetes API, OpenShift routes.                                                                                                                                                                                                                                                                                        |                                                                   | <b>Internal</b> or <b>External</b> . To deploy a private cluster, which cannot be accessed from the internet, set <b>publish</b> to <b>Internal</b> . The default value is <b>External</b> . |

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                     | Values                                          |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| <div>sshKey:</div> | <div>The SSH key to authenticate access to your cluster machines.</div> <div> <b>NOTE</b><br/>For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your <b>ssh-agent</b> process uses.</div> | For example, <b>sshKey: ssh-ed25519 AAAA...</b> |

1. Not all CCO modes are supported for all cloud providers. For more information about CCO modes, see the "Managing cloud provider credentials" entry in the *Authentication and authorization* content.

**NOTE**

If your AWS account has service control policies (SCP) enabled, you must configure the **credentialsMode** parameter to **Mint**, **Passthrough**, or **Manual**.

**IMPORTANT**

Setting this parameter to **Manual** enables alternatives to storing administrator-level secrets in the **kube-system** project, which require additional configuration steps. For more information, see "Alternatives to storing administrator-level secrets in the kube-system project".

4.18.1.4. Optional AWS configuration parameters

Optional AWS configuration parameters are described in the following table:

Table 4.28. Optional AWS parameters

| Parameter                                             | Description                                                                                                              | Values                                                                                                                                    |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <div>compute:<br/>platform:<br/>aws:<br/>amiID:</div> | The AWS AMI used to boot compute machines for the cluster. This is required for regions that require a custom RHCOS AMI. | Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs. |

| Parameter                                                                                                                   | Description                                                                                                                                                                                                                                                          | Values                                                           |
|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>iamRole:</code>                               | A pre-existing AWS IAM role applied to the compute machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role. | The name of a valid AWS IAM role.                                |
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>rootVolume:</code><br><code>iops:</code>      | The Input/Output Operations Per Second (IOPS) that is reserved for the root volume.                                                                                                                                                                                  | Integer, for example <b>4000</b> .                               |
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>rootVolume:</code><br><code>size:</code>      | The size in GiB of the root volume.                                                                                                                                                                                                                                  | Integer, for example <b>500</b> .                                |
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>rootVolume:</code><br><code>type:</code>      | The type of the root volume.                                                                                                                                                                                                                                         | Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> . |
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>rootVolume:</code><br><code>kmsKeyARN:</code> | The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt operating system volumes of worker nodes with a specific KMS key.                                                                                                                       | Valid <a href="#">key ID</a> or the <a href="#">key ARN</a>      |

| Parameter                                                                                        | Description                                                                                                                                                                            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>type:</code>       | The EC2 instance type for the compute machines.                                                                                                                                        | Valid AWS instance type, such as <b>m4.2xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>compute:</code><br><code>platform:</code><br><code>aws:</code><br><code>zones:</code>      | The availability zones where the installation program creates machines for the compute machine pool. If you provide your own VPC, you must provide a subnet in that availability zone. | A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>compute:</code><br><code>aws:</code><br><code>region:</code>                               | The AWS region that the installation program creates compute resources in.                                                                                                             | <p>Any valid <a href="#">AWS region</a>, such as <b>us-east-1</b>. You can use the AWS CLI to access the regions available based on your selected instance type. For example:</p> <pre>aws ec2 describe-instance-type-offerings -- filters Name=instance- type,Values=c7g.xlarge</pre> <div>  <p><b>IMPORTANT</b></p> <p>When running on ARM based AWS instances, ensure that you enter a region where AWS Graviton processors are available. See <a href="#">Global availability</a> map in the AWS documentation. Currently, AWS Graviton3 processors are only available in some regions.</p> </div> |
| <code>controlPlane:</code><br><code>platform:</code><br><code>aws:</code><br><code>amiID:</code> | The AWS AMI used to boot control plane machines for the cluster. This is required for regions that require a custom RHCOS AMI.                                                         | Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                                                                                                  | Description                                                                                                                                                                                                                                                                | Values                                                           |
|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| <b>controlPlane:</b><br><b>platform:</b><br><b>aws:</b><br><b>iamRole:</b>                                 | A pre-existing AWS IAM role applied to the control plane machine pool instance profiles. You can use these fields to match naming schemes and include predefined permissions boundaries for your IAM roles. If undefined, the installation program creates a new IAM role. | The name of a valid AWS IAM role.                                |
| <b>controlPlane:</b><br><b>platform:</b><br><b>aws:</b><br><br><b>rootVolume:</b><br><b>iops:</b>          | The Input/Output Operations Per Second (IOPS) that is reserved for the root volume on control plane machines.                                                                                                                                                              | Integer, for example <b>4000</b> .                               |
| <b>controlPlane:</b><br><b>platform:</b><br><b>aws:</b><br><br><b>rootVolume:</b><br><b>size:</b>          | The size in GiB of the root volume for control plane machines.                                                                                                                                                                                                             | Integer, for example <b>500</b> .                                |
| <b>controlPlane:</b><br><b>platform:</b><br><b>aws:</b><br><br><b>rootVolume:</b><br><b>type:</b>          | The type of the root volume for control plane machines.                                                                                                                                                                                                                    | Valid <a href="#">AWS EBS volume type</a> , such as <b>io1</b> . |
| <b>controlPlane:</b><br><b>platform:</b><br><b>aws:</b><br><br><b>rootVolume:</b><br><br><b>kmsKeyARN:</b> | The Amazon Resource Name (key ARN) of a KMS key. This is required to encrypt operating system volumes of control plane nodes with a specific KMS key.                                                                                                                      | Valid <a href="#">key ID</a> and the <a href="#">key ARN</a>     |

| Parameter                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                            | Values                                                                                                                                    |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <code>controlPlane:<br/>platform:<br/>aws:<br/>type:</code>  | The EC2 instance type for the control plane machines.                                                                                                                                                                                                                                                                                                                                                  | Valid AWS instance type, such as <b>m6i.xlarge</b> . See the <b>Supported AWS machine types</b> table that follows.                       |
| <code>controlPlane:<br/>platform:<br/>aws:<br/>zones:</code> | The availability zones where the installation program creates machines for the control plane machine pool.                                                                                                                                                                                                                                                                                             | A list of valid AWS availability zones, such as <b>us-east-1c</b> , in a <a href="#">YAML sequence</a> .                                  |
| <code>controlPlane:<br/>aws:<br/>region:</code>              | The AWS region that the installation program creates control plane resources in.                                                                                                                                                                                                                                                                                                                       | Valid <a href="#">AWS region</a> , such as <b>us-east-1</b> .                                                                             |
| <code>platform:<br/>aws:<br/>amiID:</code>                   | The AWS AMI used to boot all machines for the cluster. If set, the AMI must belong to the same region as the cluster. This is required for regions that require a custom RHCOS AMI.                                                                                                                                                                                                                    | Any published or custom RHCOS AMI that belongs to the set AWS region. See <i>RHCOS AMIs for AWS infrastructure</i> for available AMI IDs. |
| <code>platform:<br/>aws:<br/>hostedZone:</code>              | An existing Route 53 private hosted zone for the cluster. You can only use a pre-existing hosted zone when also supplying your own VPC. The hosted zone must already be associated with the user-provided VPC before installation. Also, the domain of the hosted zone must be the cluster domain or a parent of the cluster domain. If undefined, the installation program creates a new hosted zone. | String, for example <b>Z3URY6TWQ91KVV</b> .                                                                                               |

| Parameter                                                                         | Description                                                                                                                                                                                                                                                                                                           | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>platform:<br/>aws:<br/><br/>hostedZoneRole:</code>                          | An Amazon Resource Name (ARN) for an existing IAM role in the account containing the specified hosted zone. The installation program and cluster operators will assume this role when performing operations on the hosted zone. This parameter should only be used if you are installing a cluster into a shared VPC. | String, for example <b>arn:aws:iam::1234567890:role/shared-vpc-role</b> .                                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>platform:<br/>aws:<br/><br/>serviceEndpoints:<br/>- name:<br/>  url:</code> | The AWS service endpoint name and URL. Custom endpoints are only required for cases where alternative AWS endpoints, like FIPS, must be used. Custom API endpoints can be specified for EC2, S3, IAM, Elastic Load Balancing, Tagging, Route 53, and STS AWS services.                                                | Valid <a href="#">AWS service endpoint</a> name and valid <a href="#">AWS service endpoint</a> URL.                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>platform:<br/>aws:<br/>  userTags:</code>                                   | A map of keys and values that the installation program adds as tags to all resources that it creates.                                                                                                                                                                                                                 | <p>Any valid YAML map, such as key value pairs in the <b>&lt;key&gt;: &lt;value&gt;</b> format. For more information about AWS tags, see <a href="#">Tagging Your Amazon EC2 Resources</a> in the AWS documentation.</p> <div>  <p><b>NOTE</b></p> <p>You can add up to 25 user defined tags during installation. The remaining 25 tags are reserved for OpenShift Container Platform.</p> </div> |
| <code>platform:<br/>aws:<br/><br/>propagateUserTags:</code>                       | A flag that directs in-cluster Operators to include the specified user tags in the tags of the AWS resources that the Operators create.                                                                                                                                                                               | Boolean values, for example <b>true</b> or <b>false</b> .                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Values                                                                                                          |
|---------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>platform:</code><br><code>aws:</code><br><code>subnets:</code>                                    | <p>If you provide the VPC instead of allowing the installation program to create the VPC for you, specify the subnet for the cluster to use. The subnet must be part of the same <b><code>machineNetwork[].cidr</code></b> ranges that you specify.</p> <p>For a standard cluster, specify a public and a private subnet for each availability zone.</p> <p>For a private cluster, specify a private subnet for each availability zone.</p> <p>For clusters that use AWS Local Zones, you must add AWS Local Zone subnets to this list to ensure edge machine pool creation.</p> | Valid subnet IDs.                                                                                               |
| <code>platform:</code><br><code>aws:</code><br><code>preserveBoots</code><br><code>trapIgnition:</code> | Prevents the S3 bucket from being deleted after completion of bootstrapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>true</b> or <b>false</b> . The default value is <b>false</b> , which results in the S3 bucket being deleted. |

## CHAPTER 5. INSTALLING ON AZURE

### 5.1. PREPARING TO INSTALL ON AZURE

#### 5.1.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).

#### 5.1.2. Requirements for installing OpenShift Container Platform on Azure

Before installing OpenShift Container Platform on Microsoft Azure, you must configure an Azure account. See [Configuring an Azure account](#) for details about account configuration, account limits, public DNS zone configuration, required roles, creating service principals, and supported Azure regions.

If the cloud identity and access management (IAM) APIs are not accessible in your environment, or if you do not want to store an administrator-level credential secret in the **kube-system** namespace, see [Alternatives to storing administrator-level secrets in the kube-system project](#) for other options.

#### 5.1.3. Choosing a method to install OpenShift Container Platform on Azure

You can install OpenShift Container Platform on installer-provisioned or user-provisioned infrastructure. The default installation type uses installer-provisioned infrastructure, where the installation program provisions the underlying infrastructure for the cluster. You can also install OpenShift Container Platform on infrastructure that you provision. If you do not use infrastructure that the installation program provisions, you must manage and maintain the cluster resources yourself.

See [Installation process](#) for more information about installer-provisioned and user-provisioned installation processes.

##### 5.1.3.1. Installing a cluster on installer-provisioned infrastructure

You can install a cluster on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program, by using one of the following methods:

- **Installing a cluster quickly on Azure** You can install OpenShift Container Platform on Azure infrastructure that is provisioned by the OpenShift Container Platform installation program. You can install a cluster quickly by using the default configuration options.
- **Installing a customized cluster on Azure** You can install a customized cluster on Azure infrastructure that the installation program provisions. The installation program allows for some customization to be applied at the installation stage. Many other customization options are available [post-installation](#).
- **Installing a cluster on Azure with network customizations** You can customize your OpenShift Container Platform network configuration during installation, so that your cluster can coexist with your existing IP address allocations and adhere to your network requirements.
- **Installing a cluster on Azure into an existing VNet** You can install OpenShift Container Platform on an existing Azure Virtual Network (VNet) on Azure. You can use this installation method if you have constraints set by the guidelines of your company, such as limits when

creating new accounts or infrastructure.

- **Installing a private cluster on Azure** You can install a private cluster into an existing Azure Virtual Network (VNet) on Azure. You can use this method to deploy OpenShift Container Platform on an internal network that is not visible to the internet.
- **Installing a cluster on Azure into a government region** OpenShift Container Platform can be deployed into Microsoft Azure Government (MAG) regions that are specifically designed for US government agencies at the federal, state, and local level, as well as contractors, educational institutions, and other US customers that must run sensitive workloads on Azure.

### 5.1.3.2. Installing a cluster on user-provisioned infrastructure

You can install a cluster on Azure infrastructure that you provision, by using the following method:

- **Installing a cluster on Azure using ARM templates** You can install OpenShift Container Platform on Azure by using infrastructure that you provide. You can use the provided Azure Resource Manager (ARM) templates to assist with an installation.

### 5.1.4. Next steps

- [Configuring an Azure account](#)

## 5.2. CONFIGURING AN AZURE ACCOUNT

Before you can install OpenShift Container Platform, you must configure a Microsoft Azure account to meet installation requirements.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

### 5.2.1. Azure account limits

The OpenShift Container Platform cluster uses a number of Microsoft Azure components, and the default [Azure subscription and service limits, quotas, and constraints](#) affect your ability to install OpenShift Container Platform clusters.

### IMPORTANT

Default limits vary by offer category types, such as Free Trial and Pay-As-You-Go, and by series, such as Dv2, F, and G. For example, the default for Enterprise Agreement subscriptions is 350 cores.

Check the limits for your subscription type and if necessary, increase quota limits for your account before you install a default cluster on Azure.

The following table summarizes the Azure components whose limits can impact your ability to install and run OpenShift Container Platform clusters.

| Component          | Number of components required by default | Default Azure limit | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| vCPU               | 44                                       | 20 per region       | <p>A default cluster requires 44 vCPUs, so you must increase the account limit.</p> <p>By default, each cluster creates the following instances:</p> <ul style="list-style-type: none"> <li>• One bootstrap machine, which is removed after installation</li> <li>• Three control plane machines</li> <li>• Three compute machines</li> </ul> <p>Because the bootstrap and control plane machines use <b>Standard_D8s_v3</b> virtual machines, which use 8 vCPUs, and the compute machines use <b>Standard_D4s_v3</b> virtual machines, which use 4 vCPUs, a default cluster requires 44 vCPUs. The bootstrap node VM, which uses 8 vCPUs, is used only during installation.</p> <p>To deploy more worker nodes, enable autoscaling, deploy large workloads, or use a different instance type, you must further increase the vCPU limit for your account to ensure that your cluster can deploy the machines that you require.</p> |
| OS Disk            | 7                                        |                     | <p>Each cluster machine must have a minimum of 100 GB of storage and 300 IOPS. While these are the minimum supported values, faster storage is recommended for production clusters and clusters with intensive workloads. For more information about optimizing storage for performance, see the page titled "Optimizing storage" in the "Scalability and performance" section.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| VNet               | 1                                        | 1000 per region     | <p>Each default cluster requires one Virtual Network (VNet), which contains two subnets.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Network interfaces | 7                                        | 65,536 per region   | <p>Each default cluster requires seven network interfaces. If you create more machines or your deployed workloads create load balancers, your cluster uses more network interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Spot VM vCPUs (optional) | 0<br><br>If you configure spot VMs, your cluster must have two spot VM vCPUs for every compute node. | 20 per region       | <p>This is an optional component. To use spot VMs, you must increase the Azure default limit to at least twice the number of compute nodes in your cluster.</p> <div>  <div> <p><b>NOTE</b></p> <p>Using spot VMs for control plane nodes is not recommended.</p> </div> </div> |

### Additional resources

- [Optimizing storage](#).

### 5.2.2. Configuring a public DNS zone in Azure

To install OpenShift Container Platform, the Microsoft Azure account you use must have a dedicated public hosted DNS zone in your account. This zone must be authoritative for the domain. This service provides cluster DNS resolution and name lookup for external connections to the cluster.

#### Procedure

1. Identify your domain, or subdomain, and registrar. You can transfer an existing domain and registrar or obtain a new one through Azure or another source.

#### NOTE

For more information about purchasing domains through Azure, see [Buy a custom domain name for Azure App Service](#) in the Azure documentation.

2. If you are using an existing domain and registrar, migrate its DNS to Azure. See [Migrate an active DNS name to Azure App Service](#) in the Azure documentation.
3. Configure DNS for your domain. Follow the steps in the [Tutorial: Host your domain in Azure DNS](#) in the Azure documentation to create a public hosted zone for your domain or subdomain, extract the new authoritative name servers, and update the registrar records for the name servers that your domain uses.  
Use an appropriate root domain, such as **openshiftcorp.com**, or subdomain, such as **clusters.openshiftcorp.com**.
4. If you use a subdomain, follow your company's procedures to add its delegation records to the parent domain.

### 5.2.3. Increasing Azure account limits

To increase an account limit, file a support request on the Azure portal.

**NOTE**

You can increase only one type of quota per support request.

**Procedure**

1. From the Azure portal, click **Help + support** in the lower left corner.
2. Click **New support request** and then select the required values:
  - a. From the **Issue type** list, select **Service and subscription limits (quotas)**
  - b. From the **Subscription** list, select the subscription to modify.
  - c. From the **Quota type** list, select the quota to increase. For example, select **Compute-VM (cores-vCPUs) subscription limit increases** to increase the number of vCPUs, which is required to install a cluster.
  - d. Click **Next: Solutions**.
3. On the **Problem Details** page, provide the required information for your quota increase:
  - a. Click **Provide details** and provide the required details in the **Quota details** window.
  - b. In the SUPPORT METHOD and CONTACT INFO sections, provide the issue severity and your contact details.
4. Click **Next: Review + create** and then click **Create**.

**5.2.4. Recording the subscription and tenant IDs**

The installation program requires the subscription and tenant IDs that are associated with your Azure account. You can use the Azure CLI to gather this information.

**Prerequisites**

- You have installed or updated the [Azure CLI](#).

**Procedure**

1. Log in to the Azure CLI by running the following command:

```
$ az login
```

2. Ensure that you are using the right subscription:
  - a. View a list of available subscriptions by running the following command:

```
$ az account list --refresh
```

**Example output**

```
[
 {
 "cloudName": "AzureCloud",
```

```

 "id": "8xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "isDefault": true,
 "name": "Subscription Name 1",
 "state": "Enabled",
 "tenantId": "6xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "user": {
 "name": "you@example.com",
 "type": "user"
 }
 },
 {
 "cloudName": "AzureCloud",
 "id": "9xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "isDefault": false,
 "name": "Subscription Name 2",
 "state": "Enabled",
 "tenantId": "7xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "user": {
 "name": "you2@example.com",
 "type": "user"
 }
 }
]

```

- b. View the details of the active account, and confirm that this is the subscription you want to use, by running the following command:

```
$ az account show
```

### Example output

```

{
 "environmentName": "AzureCloud",
 "id": "8xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "isDefault": true,
 "name": "Subscription Name 1",
 "state": "Enabled",
 "tenantId": "6xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "user": {
 "name": "you@example.com",
 "type": "user"
 }
}

```

3. If you are not using the right subscription:
  - a. Change the active subscription by running the following command:

```
$ az account set -s <subscription_id>
```

- b. Verify that you are using the subscription you need by running the following command:

```
$ az account show
```

### Example output

```
{
 "environmentName": "AzureCloud",
 "id": "9xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "isDefault": true,
 "name": "Subscription Name 2",
 "state": "Enabled",
 "tenantId": "7xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "user": {
 "name": "you2@example.com",
 "type": "user"
 }
}
```

- Record the **id** and **tenantId** parameter values from the output. You require these values to install an OpenShift Container Platform cluster.

### 5.2.5. Supported identities to access Azure resources

An OpenShift Container Platform cluster requires an Azure identity to create and manage Azure resources. As such, you need one of the following types of identities to complete the installation:

- A service principal
- A system-assigned managed identity
- A user-assigned managed identity

#### 5.2.5.1. Required Azure roles

An OpenShift Container Platform cluster requires an Azure identity to create and manage Azure resources. Before you create the identity, verify that your environment meets the following requirements:

- The Azure account that you use to create the identity is assigned the **User Access Administrator** and **Contributor** roles. These roles are required when:
  - Creating a service principal or user-assigned managed identity.
  - Enabling a system-assigned managed identity on a virtual machine.
- If you are going to use a service principal to complete the installation, verify that the Azure account that you use to create the identity is assigned the **microsoft.directory/servicePrincipals/createAsOwner** permission in Microsoft Entra ID.

To set roles on the Azure portal, see the [Manage access to Azure resources using RBAC and the Azure portal](#) in the Azure documentation.

#### 5.2.5.2. Required Azure permissions for installer-provisioned infrastructure

The installation program requires access to an Azure service principal or managed identity with the necessary permissions to deploy the cluster and to maintain its daily operation. These permissions must be granted to the Azure subscription that is associated with the identity.

The following options are available to you:

- You can assign the identity the **Contributor** and **User Access Administrator** roles. Assigning these roles is the quickest way to grant all of the required permissions. For more information about assigning roles, see the Azure documentation for [managing access to Azure resources using the Azure portal](#).
- If your organization's security policies require a more restrictive set of permissions, you can create a [custom role](#) with the necessary permissions.

The following permissions are required for creating an OpenShift Container Platform cluster on Microsoft Azure.

#### Example 5.1. Required permissions for creating authorization resources

- **Microsoft.Authorization/policies/audit/action**
- **Microsoft.Authorization/policies/auditIfNotExists/action**
- **Microsoft.Authorization/roleAssignments/read**
- **Microsoft.Authorization/roleAssignments/write**

#### Example 5.2. Required permissions for creating compute resources

- **Microsoft.Compute/availabilitySets/read**
- **Microsoft.Compute/availabilitySets/write**
- **Microsoft.Compute/disks/beginGetAccess/action**
- **Microsoft.Compute/disks/delete**
- **Microsoft.Compute/disks/read**
- **Microsoft.Compute/disks/write**
- **Microsoft.Compute/galleries/images/read**
- **Microsoft.Compute/galleries/images/versions/read**
- **Microsoft.Compute/galleries/images/versions/write**
- **Microsoft.Compute/galleries/images/write**
- **Microsoft.Compute/galleries/read**
- **Microsoft.Compute/galleries/write**
- **Microsoft.Compute/snapshots/read**
- **Microsoft.Compute/snapshots/write**
- **Microsoft.Compute/snapshots/delete**
- **Microsoft.Compute/virtualMachines/delete**

- **Microsoft.Compute/virtualMachines/powerOff/action**
- **Microsoft.Compute/virtualMachines/read**
- **Microsoft.Compute/virtualMachines/write**

Example 5.3. Required permissions for creating identity management resources

- **Microsoft.ManagedIdentity/userAssignedIdentities/assign/action**
- **Microsoft.ManagedIdentity/userAssignedIdentities/read**
- **Microsoft.ManagedIdentity/userAssignedIdentities/write**

Example 5.4. Required permissions for creating network resources

- **Microsoft.Network/dnsZones/A/write**
- **Microsoft.Network/dnsZones/CNAME/write**
- **Microsoft.Network/dnszones/CNAME/read**
- **Microsoft.Network/dnszones/read**
- **Microsoft.Network/loadBalancers/backendAddressPools/join/action**
- **Microsoft.Network/loadBalancers/backendAddressPools/read**
- **Microsoft.Network/loadBalancers/backendAddressPools/write**
- **Microsoft.Network/loadBalancers/read**
- **Microsoft.Network/loadBalancers/write**
- **Microsoft.Network/networkInterfaces/delete**
- **Microsoft.Network/networkInterfaces/join/action**
- **Microsoft.Network/networkInterfaces/read**
- **Microsoft.Network/networkInterfaces/write**
- **Microsoft.Network/networkSecurityGroups/join/action**
- **Microsoft.Network/networkSecurityGroups/read**
- **Microsoft.Network/networkSecurityGroups/securityRules/delete**
- **Microsoft.Network/networkSecurityGroups/securityRules/read**
- **Microsoft.Network/networkSecurityGroups/securityRules/write**
- **Microsoft.Network/networkSecurityGroups/write**
- **Microsoft.Network/privateDnsZones/A/read**

- **Microsoft.Network/privateDnsZones/A/write**
- **Microsoft.Network/privateDnsZones/A/delete**
- **Microsoft.Network/privateDnsZones/SOA/read**
- **Microsoft.Network/privateDnsZones/read**
- **Microsoft.Network/privateDnsZones/virtualNetworkLinks/read**
- **Microsoft.Network/privateDnsZones/virtualNetworkLinks/write**
- **Microsoft.Network/privateDnsZones/write**
- **Microsoft.Network/publicIPAddresses/delete**
- **Microsoft.Network/publicIPAddresses/join/action**
- **Microsoft.Network/publicIPAddresses/read**
- **Microsoft.Network/publicIPAddresses/write**
- **Microsoft.Network/virtualNetworks/join/action**
- **Microsoft.Network/virtualNetworks/read**
- **Microsoft.Network/virtualNetworks/subnets/join/action**
- **Microsoft.Network/virtualNetworks/subnets/read**
- **Microsoft.Network/virtualNetworks/subnets/write**
- **Microsoft.Network/virtualNetworks/write**

## NOTE

The following permissions are not required to create the private OpenShift Container Platform cluster on Azure.

- **Microsoft.Network/dnsZones/A/write**
- **Microsoft.Network/dnsZones/CNAME/write**
- **Microsoft.Network/dnszones/CNAME/read**
- **Microsoft.Network/dnszones/read**

## Example 5.5. Required permissions for checking the health of resources

- **Microsoft.Resourcehealth/healthevent/Activated/action**
- **Microsoft.Resourcehealth/healthevent/InProgress/action**
- **Microsoft.Resourcehealth/healthevent/Pending/action**
- **Microsoft.Resourcehealth/healthevent/Resolved/action**

- **Microsoft.Resourcehealth/healthevent/Updated/action**

Example 5.6. Required permissions for creating a resource group

- **Microsoft.Resources/subscriptions/resourceGroups/read**
- **Microsoft.Resources/subscriptions/resourcegroups/write**

Example 5.7. Required permissions for creating resource tags

- **Microsoft.Resources/tags/write**

Example 5.8. Required permissions for creating storage resources

- **Microsoft.Storage/storageAccounts/blobServices/read**
- **Microsoft.Storage/storageAccounts/blobServices/containers/write**
- **Microsoft.Storage/storageAccounts/fileServices/read**
- **Microsoft.Storage/storageAccounts/fileServices/shares/read**
- **Microsoft.Storage/storageAccounts/fileServices/shares/write**
- **Microsoft.Storage/storageAccounts/fileServices/shares/delete**
- **Microsoft.Storage/storageAccounts/listKeys/action**
- **Microsoft.Storage/storageAccounts/read**
- **Microsoft.Storage/storageAccounts/write**

Example 5.9. Optional permissions for creating marketplace virtual machine resources

- **Microsoft.MarketplaceOrdering/offertypes/publishers/offers/plans/agreements/read**
- **Microsoft.MarketplaceOrdering/offertypes/publishers/offers/plans/agreements/write**

Example 5.10. Optional permissions for creating compute resources

- **Microsoft.Compute/availabilitySets/delete**
- **Microsoft.Compute/images/read**
- **Microsoft.Compute/images/write**
- **Microsoft.Compute/images/delete**

Example 5.11. Optional permissions for enabling user-managed encryption

- **Microsoft.Compute/diskEncryptionSets/read**
- **Microsoft.Compute/diskEncryptionSets/write**
- **Microsoft.Compute/diskEncryptionSets/delete**
- **Microsoft.KeyVault/vaults/read**
- **Microsoft.KeyVault/vaults/write**
- **Microsoft.KeyVault/vaults/delete**
- **Microsoft.KeyVault/vaults/deploy/action**
- **Microsoft.KeyVault/vaults/keys/read**
- **Microsoft.KeyVault/vaults/keys/write**
- **Microsoft.Features/providers/features/register/action**

Example 5.12. Optional permissions for installing a cluster using the **NatGateway** outbound type

- **Microsoft.Network/natGateways/read**
- **Microsoft.Network/natGateways/write**

Example 5.13. Optional permissions for installing a private cluster with Azure Network Address Translation (NAT)

- **Microsoft.Network/natGateways/join/action**
- **Microsoft.Network/natGateways/read**
- **Microsoft.Network/natGateways/write**

Example 5.14. Optional permissions for installing a private cluster with Azure firewall

- **Microsoft.Network/azureFirewalls/applicationRuleCollections/write**
- **Microsoft.Network/azureFirewalls/read**
- **Microsoft.Network/azureFirewalls/write**
- **Microsoft.Network/routeTables/join/action**
- **Microsoft.Network/routeTables/read**
- **Microsoft.Network/routeTables/routes/read**
- **Microsoft.Network/routeTables/routes/write**
- **Microsoft.Network/routeTables/write**

- **Microsoft.Network/virtualNetworks/peer/action**
- **Microsoft.Network/virtualNetworks/virtualNetworkPeerings/read**
- **Microsoft.Network/virtualNetworks/virtualNetworkPeerings/write**

Example 5.15. Optional permission for running gather bootstrap

- **Microsoft.Compute/virtualMachines/retrieveBootDiagnosticsData/action**

The following permissions are required for deleting an OpenShift Container Platform cluster on Microsoft Azure. You can use the same permissions to delete a private OpenShift Container Platform cluster on Azure.

Example 5.16. Required permissions for deleting authorization resources

- **Microsoft.Authorization/roleAssignments/delete**

Example 5.17. Required permissions for deleting compute resources

- **Microsoft.Compute/disks/delete**
- **Microsoft.Compute/galleries/delete**
- **Microsoft.Compute/galleries/images/delete**
- **Microsoft.Compute/galleries/images/versions/delete**
- **Microsoft.Compute/virtualMachines/delete**

Example 5.18. Required permissions for deleting identity management resources

- **Microsoft.ManagedIdentity/userAssignedIdentities/delete**

Example 5.19. Required permissions for deleting network resources

- **Microsoft.Network/dnszones/read**
- **Microsoft.Network/dnsZones/A/read**
- **Microsoft.Network/dnsZones/A/delete**
- **Microsoft.Network/dnsZones/CNAME/read**
- **Microsoft.Network/dnsZones/CNAME/delete**
- **Microsoft.Network/loadBalancers/delete**
- **Microsoft.Network/networkInterfaces/delete**

- **Microsoft.Network/networkSecurityGroups/delete**
- **Microsoft.Network/privateDnsZones/read**
- **Microsoft.Network/privateDnsZones/A/read**
- **Microsoft.Network/privateDnsZones/delete**
- **Microsoft.Network/privateDnsZones/virtualNetworkLinks/delete**
- **Microsoft.Network/publicIPAddresses/delete**
- **Microsoft.Network/virtualNetworks/delete**

## NOTE

The following permissions are not required to delete a private OpenShift Container Platform cluster on Azure.

- **Microsoft.Network/dnszones/read**
- **Microsoft.Network/dnsZones/A/read**
- **Microsoft.Network/dnsZones/A/delete**
- **Microsoft.Network/dnsZones/CNAME/read**
- **Microsoft.Network/dnsZones/CNAME/delete**

Example 5.20. Required permissions for checking the health of resources

- **Microsoft.Resourcehealth/healthevent/Activated/action**
- **Microsoft.Resourcehealth/healthevent/Resolved/action**
- **Microsoft.Resourcehealth/healthevent/Updated/action**

Example 5.21. Required permissions for deleting a resource group

- **Microsoft.Resources/subscriptions/resourcegroups/delete**

Example 5.22. Required permissions for deleting storage resources

- **Microsoft.Storage/storageAccounts/delete**
- **Microsoft.Storage/storageAccounts/listKeys/action**

## NOTE

To install OpenShift Container Platform on Azure, you must scope the permissions to your subscription. Later, you can re-scope these permissions to the installer created resource group. If the public DNS zone is present in a different resource group, then the network DNS zone related permissions must always be applied to your subscription. By default, the OpenShift Container Platform installation program assigns the Azure identity the **Contributor** role.

You can scope all the permissions to your subscription when deleting an OpenShift Container Platform cluster.

### 5.2.5.3. Using Azure managed identities

The installation program requires an Azure identity to complete the installation. You can use either a system-assigned or user-assigned managed identity.

If you are unable to use a managed identity, you can use a service principal.

#### Procedure

1. If you are using a system-assigned managed identity, enable it on the virtual machine that you will run the installation program from.
2. If you are using a user-assigned managed identity:
  - a. Assign it to the virtual machine that you will run the installation program from.
  - b. Record its client ID. You require this value when installing the cluster.  
For more information about viewing the details of a user-assigned managed identity, see the Microsoft Azure documentation for [listing user-assigned managed identities](#).
3. Verify that the required permissions are assigned to the managed identity.

### 5.2.5.4. Creating a service principal

The installation program requires an Azure identity to complete the installation. You can use a service principal.

If you are unable to use a service principal, you can use a managed identity.

#### Prerequisites

- You have installed or updated the [Azure CLI](#).
- You have an Azure subscription ID.
- If you are not going to assign the **Contributor** and **User Administrator Access** roles to the service principal, you have created a custom role with the required Azure permissions.

#### Procedure

1. Create the service principal for your account by running the following command:

```
$ az ad sp create-for-rbac --role <role_name> \ ❶
--name <service_principal> \ ❷
--scopes /subscriptions/<subscription_id> ❸
```

- ❶ Defines the role name. You can use the **Contributor** role, or you can specify a custom role which contains the necessary permissions.
- ❷ Defines the service principal name.
- ❸ Specifies the subscription ID.

### Example output

```
Creating 'Contributor' role assignment under scope '/subscriptions/<subscription_id>'
The output includes credentials that you must protect. Be sure that you do not
include these credentials in your code or check the credentials into your source
control. For more information, see https://aka.ms/azadsp-cli
{
 "appId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx",
 "displayName": <service_principal>,
 "password": "00000000-0000-0000-0000-000000000000",
 "tenantId": "8xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
}
```

2. Record the values of the **appId** and **password** parameters from the output. You require these values when installing the cluster.
3. If you applied the **Contributor** role to your service principal, assign the **User Administrator Access** role by running the following command:

```
$ az role assignment create --role "User Access Administrator" \
--assignee-object-id $(az ad sp show --id <appId> --query id -o tsv) ❶
--scope /subscriptions/<subscription_id> ❷
```

- ❶ Specify the **appId** parameter value for your service principal.
- ❷ Specifies the subscription ID.

### Additional resources

- [About the Cloud Credential Operator](#)

## 5.2.6. Supported Azure Marketplace regions

Installing a cluster using the Azure Marketplace image is available to customers who purchase the offer in North America and EMEA.

While the offer must be purchased in North America or EMEA, you can deploy the cluster to any of the Azure public partitions that OpenShift Container Platform supports.

**NOTE**

Deploying a cluster using the Azure Marketplace image is not supported for the Azure Government regions.

### 5.2.7. Supported Azure regions

The installation program dynamically generates the list of available Microsoft Azure regions based on your subscription.

#### Supported Azure public regions

- **australiacentral** (Australia Central)
- **australiaeast** (Australia East)
- **australiasoutheast** (Australia South East)
- **brazilsouth** (Brazil South)
- **canadacentral** (Canada Central)
- **canadaeast** (Canada East)
- **centralindia** (Central India)
- **centralus** (Central US)
- **eastasia** (East Asia)
- **eastus** (East US)
- **eastus2** (East US 2)
- **francecentral** (France Central)
- **germanywestcentral** (Germany West Central)
- **israelcentral** (Israel Central)
- **italynorth** (Italy North)
- **japaneast** (Japan East)
- **japanwest** (Japan West)
- **koreacentral** (Korea Central)
- **koreasouth** (Korea South)
- **mexicocentral** (Mexico Central)
- **northcentralus** (North Central US)
- **northeurope** (North Europe)
- **norwayeast** (Norway East)

- **polandcentral** (Poland Central)
- **qatarcentral** (Qatar Central)
- **southafricanorth** (South Africa North)
- **southcentralus** (South Central US)
- **southeastasia** (Southeast Asia)
- **southindia** (South India)
- **spaincentral** (Spain Central)
- **swedencentral** (Sweden Central)
- **switzerlandnorth** (Switzerland North)
- **uaenorth** (UAE North)
- **uksouth** (UK South)
- **ukwest** (UK West)
- **westcentralus** (West Central US)
- **westeurope** (West Europe)
- **westindia** (West India)
- **westus** (West US)
- **westus2** (West US 2)
- **westus3** (West US 3)

#### Supported Azure Government regions

Support for the following Microsoft Azure Government (MAG) regions was added in OpenShift Container Platform version 4.6:

- **usgovtexas** (US Gov Texas)
- **usgovvirginia** (US Gov Virginia)

You can reference all available MAG regions in the [Azure documentation](#). Other provided MAG regions are expected to work with OpenShift Container Platform, but have not been tested.

### 5.2.8. Next steps

- Install an OpenShift Container Platform cluster on Azure. You can [install a customized cluster](#) or [quickly install a cluster](#) with default options.

## 5.3. ENABLING USER-MANAGED ENCRYPTION FOR AZURE

In OpenShift Container Platform version 4.14, you can install a cluster with a user-managed encryption key in Azure. To enable this feature, you can prepare an Azure DiskEncryptionSet before installation, modify the **install-config.yaml** file, and then complete the installation.

### 5.3.1. Preparing an Azure Disk Encryption Set

The OpenShift Container Platform installer can use an existing Disk Encryption Set with a user-managed key. To enable this feature, you can create a Disk Encryption Set in Azure and provide the key to the installer.

#### Procedure

1. Set the following environment variables for the Azure resource group by running the following command:

```
$ export RESOURCEGROUP="<resource_group>" 1
LOCATION="<location>" 2
```

- 1** Specifies the name of the Azure resource group where you will create the Disk Encryption Set and encryption key. To avoid losing access to your keys after destroying the cluster, you should create the Disk Encryption Set in a different resource group than the resource group where you install the cluster.

- 2** Specifies the Azure location where you will create the resource group.

2. Set the following environment variables for the Azure Key Vault and Disk Encryption Set by running the following command:

```
$ export KEYVAULT_NAME="<keyvault_name>" 1
KEYVAULT_KEY_NAME="<keyvault_key_name>" 2
DISK_ENCRYPTION_SET_NAME="<disk_encryption_set_name>" 3
```

- 1** Specifies the name of the Azure Key Vault you will create.

- 2** Specifies the name of the encryption key you will create.

- 3** Specifies the name of the disk encryption set you will create.

3. Set the environment variable for the ID of your Azure Service Principal by running the following command:

```
$ export CLUSTER_SP_ID="<service_principal_id>" 1
```

- 1** Specifies the ID of the service principal you will use for this installation.

4. Enable host-level encryption in Azure by running the following commands:

```
$ az feature register --namespace "Microsoft.Compute" --name "EncryptionAtHost"
```

```
$ az feature show --namespace Microsoft.Compute --name EncryptionAtHost
```

```
$ az provider register -n Microsoft.Compute
```

5. Create an Azure Resource Group to hold the disk encryption set and associated resources by running the following command:

```
$ az group create --name $RESOURCEGROUP --location $LOCATION
```

6. Create an Azure key vault by running the following command:

```
$ az keyvault create -n $KEYVAULT_NAME -g $RESOURCEGROUP -l $LOCATION \
--enable-purge-protection true
```

7. Create an encryption key in the key vault by running the following command:

```
$ az keyvault key create --vault-name $KEYVAULT_NAME -n $KEYVAULT_KEY_NAME \
--protection software
```

8. Capture the ID of the key vault by running the following command:

```
$ KEYVAULT_ID=$(az keyvault show --name $KEYVAULT_NAME --query "[id]" -o tsv)
```

9. Capture the key URL in the key vault by running the following command:

```
$ KEYVAULT_KEY_URL=$(az keyvault key show --vault-name $KEYVAULT_NAME --name \
$KEYVAULT_KEY_NAME --query "[key.kid]" -o tsv)
```

10. Create a disk encryption set by running the following command:

```
$ az disk-encryption-set create -n $DISK_ENCRYPTION_SET_NAME -l $LOCATION -g \
$RESOURCEGROUP --source-vault $KEYVAULT_ID --key-url $KEYVAULT_KEY_URL
```

11. Grant the DiskEncryptionSet resource access to the key vault by running the following commands:

```
$ DES_IDENTITY=$(az disk-encryption-set show -n $DISK_ENCRYPTION_SET_NAME -g \
$RESOURCEGROUP --query "[identity.principalId]" -o tsv)
```

```
$ az keyvault set-policy -n $KEYVAULT_NAME -g $RESOURCEGROUP --object-id \
$DES_IDENTITY --key-permissions wrapkey unwrapkey get
```

12. Grant the Azure Service Principal permission to read the DiskEncryptionSet by running the following commands:

```
$ DES_RESOURCE_ID=$(az disk-encryption-set show -n \
$DISK_ENCRYPTION_SET_NAME -g \
$RESOURCEGROUP --query "[id]" -o tsv)
```

```
$ az role assignment create --assignee $CLUSTER_SP_ID --role "<reader_role>" ❶ \
--scope $DES_RESOURCE_ID -o jsonc
```

❶

Specifies an Azure role with read permissions to the disk encryption set. You can use the **Owner** role or a custom role with the necessary permissions.

### 5.3.2. Next steps

- Install an OpenShift Container Platform cluster:
  - [Install a cluster with customizations on installer-provisioned infrastructure](#)
  - [Install a cluster with network customizations on installer-provisioned infrastructure](#)
  - [Install a cluster into an existing VNet on installer-provisioned infrastructure](#)
  - [Install a private cluster on installer-provisioned infrastructure](#)
  - [Install a cluster into an government region on installer-provisioned infrastructure](#)

## 5.4. INSTALLING A CLUSTER QUICKLY ON AZURE

In OpenShift Container Platform version 4.14, you can install a cluster on Microsoft Azure that uses the default configuration options.

### 5.4.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.

### 5.4.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.4.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

#### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

#### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

#### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

#### NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86\_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the **./openshift-install gather** command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.4.4. Obtaining the installation program**

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

**Prerequisites**

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

**Procedure**

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#). This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.4.5. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

#### Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have an Azure subscription ID and tenant ID.
- You have the application ID and password of a service principal.

#### Procedure

- Optional: If you have run the installation program on this computer before, and want to use an alternative service principal, go to the `~/azure/` directory and delete the **osServicePrincipal.json** configuration file.  
Deleting this file prevents the installation program from automatically reusing subscription and authentication values from a previous installation.
- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.
- 2** To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

- Provide values at the prompts:

- Optional: Select an SSH key to use to access your cluster machines.

#### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- Select **azure** as the platform to target.  
If the installation program cannot locate the **osServicePrincipal.json** configuration file from a previous installation, you are prompted for Azure subscription and authentication values.
- Specify the following Azure parameter values for your subscription and service principal:
  - azure subscription id** Enter the subscription ID to use for the cluster.
  - azure tenant id** Enter the tenant ID.
  - azure service principal client id** Enter its application ID.
  - azure service principal client secret** Enter its password.
- Select the region to deploy the cluster to.

- e. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- f. Enter a descriptive name for your cluster.

### IMPORTANT

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

- g. Paste the [pull secret from Red Hat OpenShift Cluster Manager](#) .

If previously not detected, the installation program creates an **osServicePrincipal.json** configuration file and stores this file in the `~/.azure/` directory on your computer. This ensures that the installation program can load the profile when it is creating an OpenShift Container Platform cluster on the target platform.

### Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to `<installation_directory>/openshift_install.log`.

### IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

### Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 5.4.6. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

## IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

#### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

## Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

## Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

#### NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

### Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

### 5.4.7. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.4.8. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

#### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.4.9. Next steps

- [Customize your cluster.](#)
- If necessary, you can [opt out of remote health reporting](#) .

## 5.5. INSTALLING A CLUSTER ON AZURE WITH CUSTOMIZATIONS

In OpenShift Container Platform version 4.14, you can install a customized cluster on infrastructure that the installation program provisions on Microsoft Azure. To customize the installation, you modify parameters in the **install-config.yaml** file before you install the cluster.

### 5.5.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If you use customer-managed encryption keys, you [prepared your Azure environment for encryption](#).

### 5.5.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.
- Access [Quay.io](#) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

#### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.5.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes

through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

## Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

### NOTE

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86\_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1 Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

**5.5.4. Using the Azure Marketplace offering**

Using the Azure Marketplace offering lets you deploy an OpenShift Container Platform cluster, which is billed on pay-per-use basis (hourly, per core) through Azure, while still being supported directly by Red Hat.

To deploy an OpenShift Container Platform cluster using the Azure Marketplace offering, you must first obtain the Azure Marketplace image. The installation program uses this image to deploy worker nodes. When obtaining your image, consider the following:

- While the images are the same, the Azure Marketplace publisher is different depending on your region. If you are located in North America, specify **redhat** as the publisher. If you are located in EMEA, specify **redhat-limited** as the publisher.
- The offer includes a **rh-ocp-worker** SKU and a **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker** SKU represents a Hyper-V generation version 2 VM image. The default instance types used in OpenShift Container Platform are version 2 compatible. If you plan to use an instance type that

is only version 1 compatible, use the image associated with the **rh-ocp-worker-gen1** SKU. The **rh-ocp-worker-gen1** SKU represents a Hyper-V version 1 VM image.

IMPORTANT

Installing images with the Azure marketplace is not supported on clusters with 64-bit ARM instances.

Prerequisites

- You have installed the Azure CLI client (**az**).
- Your Azure account is entitled for the offer and you have logged into this account with the Azure CLI client.

Procedure

1. Display all of the available OpenShift Container Platform images by running one of the following commands:

- North America:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat -o table
```

Example output

| Offer                    | Publisher | Sku                | Urn                                 | Version |
|--------------------------|-----------|--------------------|-------------------------------------|---------|
| -----                    |           |                    |                                     |         |
| ----                     |           |                    |                                     |         |
| rh-ocp-worker            | RedHat    | rh-ocp-worker      | RedHat:rh-ocp-worker:rh-ocp-        |         |
| worker:413.92.2023101700 |           |                    | 413.92.2023101700                   |         |
| rh-ocp-worker            | RedHat    | rh-ocp-worker-gen1 | RedHat:rh-ocp-worker:rh-ocp-worker- |         |
| gen1:413.92.2023101700   |           |                    | 413.92.2023101700                   |         |

- EMEA:

```
$ az vm image list --all --offer rh-ocp-worker --publisher redhat-limited -o table
```

Example output

| Offer                         | Publisher      | Sku                | Urn                                  | Version |
|-------------------------------|----------------|--------------------|--------------------------------------|---------|
| -----                         |                |                    |                                      |         |
| ----                          |                |                    |                                      |         |
| rh-ocp-worker                 | redhat-limited | rh-ocp-worker      | redhat-limited:rh-ocp-worker:rh-ocp- |         |
| worker:413.92.2023101700      |                |                    | 413.92.2023101700                    |         |
| rh-ocp-worker                 | redhat-limited | rh-ocp-worker-gen1 | redhat-limited:rh-ocp-worker:rh-ocp- |         |
| worker-gen1:413.92.2023101700 |                |                    | 413.92.2023101700                    |         |

**NOTE**

Regardless of the version of OpenShift Container Platform that you install, the correct version of the Azure Marketplace image to use is 4.13. If required, your VMs are automatically upgraded as part of the installation process.

2. Inspect the image for your offer by running one of the following commands:

- North America:

```
$ az vm image show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

3. Review the terms of the offer by running one of the following commands:

- North America:

```
$ az vm image terms show --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms show --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

4. Accept the terms of the offering by running one of the following commands:

- North America:

```
$ az vm image terms accept --urn redhat:rh-ocp-worker:rh-ocp-worker:<version>
```

- EMEA:

```
$ az vm image terms accept --urn redhat-limited:rh-ocp-worker:rh-ocp-worker:<version>
```

5. Record the image details of your offer. You must update the **compute** section in the **install-config.yaml** file with values for **publisher**, **offer**, **sku**, and **version** before deploying the cluster.

### Sample install-config.yaml file with the Azure Marketplace worker nodes

```
apiVersion: v1
baseDomain: example.com
compute:
- hyperthreading: Enabled
 name: worker
 platform:
 azure:
 type: Standard_D4s_v5
 osImage:
 publisher: redhat
 offer: rh-ocp-worker
```

```
sku: rh-ocp-worker
version: 413.92.2023101700
replicas: 3
```

### 5.5.5. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.5.6. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have an Azure subscription ID and tenant ID.
- If you are installing the cluster using a service principal, you have its application ID and password.
- If you are installing the cluster using a system-assigned managed identity, you have enabled it on the virtual machine that you will run the installation program from.
- If you are installing the cluster using a user-assigned managed identity, you have met these prerequisites:
  - You have its client ID.
  - You have assigned it to the virtual machine that you will run the installation program from.

## Procedure

1. Optional: If you have run the installation program on this computer before, and want to use an alternative service principal or managed identity, go to the `~/.azure/` directory and delete the **osServicePrincipal.json** configuration file.  
Deleting this file prevents the installation program from automatically reusing subscription and authentication values from a previous installation.
2. Create the **install-config.yaml** file.

- a. Change to the directory that contains the installation program and run the following command:

```
$./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

### NOTE

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.  
If the installation program cannot locate the **osServicePrincipal.json** configuration file from a previous installation, you are prompted for Azure subscription and authentication values.
- iii. Enter the following Azure parameter values for your subscription:
  - **azure subscription id** Enter the subscription ID to use for the cluster.
  - **azure tenant id** Enter the tenant ID.
- iv. Depending on the Azure identity you are using to deploy the cluster, do one of the following when prompted for the **azure service principal client id**
  - If you are using a service principal, enter its application ID.
  - If you are using a system-assigned managed identity, leave this value blank.
  - If you are using a user-assigned managed identity, specify its client ID.
- v. Depending on the Azure identity you are using to deploy the cluster, do one of the following when prompted for the **azure service principal client secret**
  - If you are using a service principal, enter its password.
  - If you are using a system-assigned managed identity, leave this value blank.
  - If you are using a user-assigned managed identity, leave this value blank.
- vi. Select the region to deploy the cluster to.
- vii. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- viii. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

3. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

**NOTE**

If you are installing a three-node cluster, be sure to set the **compute.replicas** parameter to **0**. This ensures that the cluster's control planes are schedulable. For more information, see "Installing a three-node cluster on Azure".

4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

**IMPORTANT**

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

If previously not detected, the installation program creates an **osServicePrincipal.json** configuration file and stores this file in the **~/.azure/** directory on your computer. This ensures that the installation program can load the profile when it is creating an OpenShift Container Platform cluster on the target platform.

**Additional resources**

- [Installation configuration parameters for Azure](#)

**5.5.6.1. Minimum resource requirements for cluster installation**

Each cluster machine must meet the following minimum requirements:

**Table 5.1. Minimum resource requirements**

| Machine       | Operating System              | vCPU [1] | Virtual RAM | Storage | Input/Output Per Second (IOPS)[2] |
|---------------|-------------------------------|----------|-------------|---------|-----------------------------------|
| Bootstrap     | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Control plane | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Compute       | RHCOS, RHEL 8.6 and later [3] | 2        | 8 GB        | 100 GB  | 300                               |

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio: (threads per core × cores) × sockets = vCPUs.
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks.

Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

## NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

## IMPORTANT

You are required to use Azure virtual machines that have the **premiumIO** parameter set to **true**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### Additional resources

- [Optimizing storage](#)

### 5.5.6.2. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

#### Example 5.23. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6a.\***
- **m6i.\***

- **r4.\***
- **r5.\***
- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

### 5.5.6.3. Tested instance types for Azure on 64-bit ARM infrastructures

The following Microsoft Azure ARM64 instance types have been tested with OpenShift Container Platform.

#### Example 5.24. Machine types based on 64-bit ARM architecture

- **c6g.\***
- **c7g.\***
- **m6g.\***
- **m7g.\***
- **r8g.\***

### 5.5.6.4. Enabling trusted launch for Azure VMs

You can enable two trusted launch features when installing your cluster on Azure: [secure boot](#) and [virtualized Trusted Platform Modules](#).

See the Azure documentation about [virtual machine sizes](#) to learn what sizes of virtual machines support these features.

#### IMPORTANT

Trusted launch is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

#### Prerequisites

- You have created an **install-config.yaml** file.

#### Procedure

- Use a text editor to edit the **install-config.yaml** file prior to deploying your cluster and add the following stanza:

```
controlPlane: ❶
 platform:
 azure:
 settings:
 securityType: TrustedLaunch ❷
 trustedLaunch:
 uefiSettings:
 secureBoot: Enabled ❸
 virtualizedTrustedPlatformModule: Enabled ❹
```

- ❶ Specify **controlPlane.platform.azure** or **compute.platform.azure** to enable trusted launch on only control plane or compute nodes respectively. Specify **platform.azure.defaultMachinePlatform** to enable trusted launch on all nodes.
- ❷ Enable trusted launch features.
- ❸ Enable secure boot. For more information, see the Azure documentation about [secure boot](#).
- ❹ Enable the virtualized Trusted Platform Module. For more information, see the Azure documentation about [virtualized Trusted Platform Modules](#).

#### 5.5.6.5. Enabling confidential VMs

You can enable confidential VMs when installing your cluster. You can enable confidential VMs for compute nodes, control plane nodes, or all nodes.

#### IMPORTANT

Using confidential VMs is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

You can use confidential VMs with the following VM sizes:

- DCasv5-series
- DCadsv5-series
- ECasv5-series
- ECadsv5-series

**IMPORTANT**

Confidential VMs are currently not supported on 64-bit ARM architectures.

**Prerequisites**

- You have created an **install-config.yaml** file.

**Procedure**

- Use a text editor to edit the **install-config.yaml** file prior to deploying your cluster and add the following stanza:

```
controlPlane: ❶
 platform:
 azure:
 settings:
 securityType: ConfidentialVM ❷
 confidentialVM:
 uefiSettings:
 secureBoot: Enabled ❸
 virtualizedTrustedPlatformModule: Enabled ❹
 osDisk:
 securityProfile:
 securityEncryptionType: VMGuestStateOnly ❺
```

- ❶ Specify **controlPlane.platform.azure** or **compute.platform.azure** to deploy confidential VMs on only control plane or compute nodes respectively. Specify **platform.azure.defaultMachinePlatform** to deploy confidential VMs on all nodes.
- ❷ Enable confidential VMs.
- ❸ Enable secure boot. For more information, see the Azure documentation about [secure boot](#).
- ❹ Enable the virtualized Trusted Platform Module. For more information, see the Azure documentation about [virtualized Trusted Platform Modules](#).
- ❺ Specify **VMGuestStateOnly** to encrypt the VM guest state.

**5.5.6.6. Sample customized install-config.yaml file for Azure**

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

**IMPORTANT**

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com ❶
controlPlane: ❷
```

```

hyperthreading: Enabled 3 4
name: master
platform:
 azure:
 encryptionAtHost: true
 ultraSSDCapability: Enabled
 osDisk:
 diskSizeGB: 1024 5
 diskType: Premium_LRS
 diskEncryptionSet:
 resourceGroup: disk_encryption_set_resource_group
 name: disk_encryption_set_name
 subscriptionId: secondary_subscription_id
 osImage:
 publisher: example_publisher_name
 offer: example_image_offer
 sku: example_offer_sku
 version: example_image_version
 type: Standard_D8s_v3
 replicas: 3
compute: 6
- hyperthreading: Enabled 7
 name: worker
 platform:
 azure:
 ultraSSDCapability: Enabled
 type: Standard_D2s_v3
 encryptionAtHost: true
 osDisk:
 diskSizeGB: 512 8
 diskType: Standard_LRS
 diskEncryptionSet:
 resourceGroup: disk_encryption_set_resource_group
 name: disk_encryption_set_name
 subscriptionId: secondary_subscription_id
 osImage:

 offer: example_image_offer
 sku: example_offer_sku
 version: example_image_version
 zones: 9
 - "1"
 - "2"
 - "3"
 replicas: 5
metadata:
 name: test-cluster 10
networking:
 clusterNetwork:
 - cidr: 10.128.0.0/14
 hostPrefix: 23
 machineNetwork:
 - cidr: 10.0.0.0/16
 networkType: OVNKubernetes 11
 serviceNetwork:

```

```

- 172.30.0.0/16
platform:
 azure:
 defaultMachinePlatform:
 osImage: 12
 publisher: example_publisher_name
 offer: example_image_offer
 sku: example_offer_sku
 version: example_image_version
 ultraSSDCapability: Enabled
 baseDomainResourceGroupName: resource_group 13
 region: centralus 14
 resourceGroupName: existing_resource_group 15
 outboundType: Loadbalancer
 cloudName: AzurePublicCloud
 pullSecret: '{"auths": ...}' 16
 fips: false 17
 sshKey: ssh-ed25519 AAAA... 18

```

1 10 14 16 Required. The installation program prompts you for this value.

2 6 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

## IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

11 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

12 Optional: A custom Red Hat Enterprise Linux CoreOS (RHCOS) image that should be used to boot control plane and compute machines. The **publisher**, **offer**, **sku**, and **version** parameters under **platform.azure.defaultMachinePlatform.osImage** apply to both control plane and compute machines. If the parameters under **controlPlane.platform.azure.osImage** or **compute.platform.azure.osImage** are set, they override the **platform.azure.defaultMachinePlatform.osImage** parameters.

- 13 Specify the name of the resource group that contains the DNS zone for your base domain.
- 15 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.
- 17 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container Platform runs on bypass the default Kubernetes cryptography suite and use the cryptography modules that are provided with RHCOS instead.

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86\_64, ppc64le, and s390x architectures.

- 18 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 5.5.6.7. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

## NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

## Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```
apiVersion: v1
baseDomain: my.domain.com
proxy:
 httpProxy: http://<username>:<pswd>@<ip>:<port> 1
 httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
 noProxy: example.com 3
 additionalTrustBundle: | 4
 -----BEGIN CERTIFICATE-----
 <MY_TRUSTED_CA_CERT>
 -----END CERTIFICATE-----
 additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5
```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

## NOTE

The installation program does not support the proxy **readinessEndpoints** field.

**NOTE**

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

**Additional resources**

- For more details about Accelerated Networking, see [Accelerated Networking for Microsoft Azure VMs](#).

### 5.5.7. Configuring user-defined tags for Azure

In OpenShift Container Platform, you can use the tags for grouping resources and for managing resource access and cost. You can define the tags on the Azure resources in the **install-config.yaml** file only during OpenShift Container Platform cluster creation. You cannot modify the user-defined tags after cluster creation.

Support for user-defined tags is available only for the resources created in the Azure Public Cloud. User-defined tags are not supported for the OpenShift Container Platform clusters upgraded to OpenShift Container Platform 4.14.

User-defined and OpenShift Container Platform specific tags are applied only to the resources created by the OpenShift Container Platform installer and its core operators such as Machine api provider azure Operator, Cluster Ingress Operator, Cluster Image Registry Operator.

By default, OpenShift Container Platform installer attaches the OpenShift Container Platform tags to the Azure resources. These OpenShift Container Platform tags are not accessible for the users.

You can use the **.platform.azure.userTags** field in the **install-config.yaml** file to define the list of user-defined tags as shown in the following **install-config.yaml** file.

**Sample install-config.yaml file**

```
additionalTrustBundlePolicy: Proxyonly ❶
apiVersion: v1
baseDomain: catchall.azure.devcluster.openshift.com ❷
compute: ❸
- architecture: amd64
 hyperthreading: Enabled ❹
 name: worker
 platform: {}
```

```

replicas: 3
controlPlane: 5
 architecture: amd64
 hyperthreading: Enabled 6
 name: master
 platform: {}
 replicas: 3
metadata:
 creationTimestamp: null
 name: user 7
networking:
 clusterNetwork:
 - cidr: 10.128.0.0/14
 hostPrefix: 23
 machineNetwork:
 - cidr: 10.0.0.0/16
 networkType: OVNKubernetes 8
 serviceNetwork:
 - 172.30.0.0/16
platform:
 azure:
 baseDomainResourceGroupName: os4-common 9
 cloudName: AzurePublicCloud 10
 outboundType: Loadbalancer
 region: southindia 11
 userTags: 12
 createdBy: user
 environment: dev

```

- 1 Defines the trust bundle policy.
- 2 Required. The **baseDomain** parameter specifies the base domain of your cloud provider. The installation program prompts you for this value.
- 3 The configuration for the machines that comprise compute. The **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -. If you do not provide these parameters and values, the installation program provides the default value.
- 4 To enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
- 5 The configuration for the machines that comprise the control plane. The **controlPlane** section is a single mapping. The first line of the **controlPlane** section must not begin with a hyphen, -. You can use only one control plane pool. If you do not provide these parameters and values, the installation program provides the default value.
- 6 To enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.
- 7 The installation program prompts you for this value.

- 8 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.
- 9 Specifies the resource group for the base domain of the Azure DNS zone.
- 10 Specifies the name of the Azure cloud environment. You can use the **cloudName** field to configure the Azure SDK with the Azure API endpoints. If you do not provide value, the default value is Azure Public Cloud.
- 11 Required. Specifies the name of the Azure region that hosts your cluster. The installation program prompts you for this value.
- 12 Defines the additional keys and values that the installation program adds as tags to all Azure resources that it creates.

The user-defined tags have the following limitations:

- A tag key can have a maximum of 128 characters.
- A tag key must begin with a letter, end with a letter, number or underscore, and can contain only letters, numbers, underscores, periods, and hyphens.
- Tag keys are case-insensitive.
- Tag keys cannot be **name**. It cannot have prefixes such as **kubernetes.io**, **openshift.io**, **microsoft**, **azure**, and **windows**.
- A tag value can have a maximum of 256 characters.
- You can configure a maximum of 10 tags for resource group and resources.

For more information about Azure tags, see [Azure user-defined tags](#)

### 5.5.8. Querying user-defined tags for Azure

After creating the OpenShift Container Platform cluster, you can access the list of defined tags for the Azure resources. The format of the OpenShift Container Platform tags is **kubernetes.io\_cluster.<cluster\_id>:owned**. The **cluster\_id** parameter is the value of **.status.infrastructureName** present in **config.openshift.io/Infrastructure**.

- Query the tags defined for Azure resources by running the following command:

```
$ oc get infrastructures.config.openshift.io cluster -o=jsonpath-as-
json='{.status.platformStatus.azure.resourceTags}'
```

#### Example output

```
[
 [
 {
 "key": "createdBy",
 "value": "user"
 },
 {
 "key": "environment",
```

```

 "value": "dev"
 }
]

```

### 5.5.9. Installing the OpenShift CLI by downloading the binary

You can install the OpenShift CLI (**oc**) to interact with OpenShift Container Platform from a command-line interface. You can install **oc** on Linux, Windows, or macOS.

#### IMPORTANT

If you installed an earlier version of **oc**, you cannot use it to complete all of the commands in OpenShift Container Platform 4.14. Download and install the new version of **oc**.

#### Installing the OpenShift CLI on Linux

You can install the OpenShift CLI (**oc**) binary on Linux by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the architecture from the **Product Variant** drop-down list.
3. Select the appropriate version from the **Version** drop-down list.
4. Click **Download Now** next to the **OpenShift v4.14 Linux Client** entry and save the file.
5. Unpack the archive:

```
$ tar xvf <file>
```

6. Place the **oc** binary in a directory that is on your **PATH**.  
To check your **PATH**, execute the following command:

```
$ echo $PATH
```

##### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
$ oc <command>
```

#### Installing the OpenShift CLI on Windows

You can install the OpenShift CLI (**oc**) binary on Windows by using the following procedure.

##### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.

3. Click **Download Now** next to the **OpenShift v4.14 Windows Client** entry and save the file.
4. Unzip the archive with a ZIP program.
5. Move the **oc** binary to a directory that is on your **PATH**.  
To check your **PATH**, open the command prompt and execute the following command:

```
C:\> path
```

### Verification

- After you install the OpenShift CLI, it is available using the **oc** command:

```
C:\> oc <command>
```

### Installing the OpenShift CLI on macOS

You can install the OpenShift CLI (**oc**) binary on macOS by using the following procedure.

#### Procedure

1. Navigate to the [OpenShift Container Platform downloads page](#) on the Red Hat Customer Portal.
2. Select the appropriate version from the **Version** drop-down list.
3. Click **Download Now** next to the **OpenShift v4.14 macOS Client** entry and save the file.

#### NOTE

For macOS arm64, choose the **OpenShift v4.14 macOS arm64 Client** entry.

4. Unpack and unzip the archive.
5. Move the **oc** binary to a directory on your PATH.  
To check your **PATH**, open a terminal and execute the following command:

```
$ echo $PATH
```

### Verification

- Verify your installation by using an **oc** command:

```
$ oc <command>
```

### 5.5.10. Alternatives to storing administrator-level secrets in the kube-system project

By default, administrator secrets are stored in the **kube-system** project. If you configured the **credentialsMode** parameter in the **install-config.yaml** file to **Manual**, you must use one of the following alternatives:

- To manage long-term cloud credentials manually, follow the procedure in [Manually creating long-term credentials](#).
- To implement short-term credentials that are managed outside the cluster for individual components, follow the procedures in [Configuring an Azure cluster to use short-term credentials](#).

### 5.5.10.1. Manually creating long-term credentials

The Cloud Credential Operator (CCO) can be put into manual mode prior to installation in environments where the cloud identity and access management (IAM) APIs are not reachable, or the administrator prefers not to store an administrator-level credential secret in the cluster **kube-system** namespace.

#### Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

#### Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
...
```

2. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

3. Set a **\$RELEASE\_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

4. Extract the list of **CredentialsRequest** custom resources (CRs) from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
 --from=$RELEASE_IMAGE \
 --credentials-requests \
 --included \1
 --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
 --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

objects. If the specified directory does not exist, this command creates it.

This command creates a YAML file for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
 name: <component_credentials_request>
 namespace: openshift-cloud-credential-operator
 ...
spec:
 providerSpec:
 apiVersion: cloudcredential.openshift.io/v1
 kind: AzureProviderSpec
 roleBindings:
 - role: Contributor
 ...
```

5. Create YAML files for secrets in the **openshift-install** manifests directory that you generated previously. The secrets must be stored using the namespace and secret name defined in the **spec.secretRef** for each **CredentialsRequest** object.

### Sample **CredentialsRequest** object with secrets

```
apiVersion: cloudcredential.openshift.io/v1
kind: CredentialsRequest
metadata:
 name: <component_credentials_request>
 namespace: openshift-cloud-credential-operator
 ...
spec:
 providerSpec:
 apiVersion: cloudcredential.openshift.io/v1
 kind: AzureProviderSpec
 roleBindings:
 - role: Contributor
 ...
 secretRef:
 name: <component_secret>
 namespace: <component_namespace>
 ...
```

### Sample **Secret** object

```
apiVersion: v1
kind: Secret
metadata:
 name: <component_secret>
 namespace: <component_namespace>
data:
 azure_subscription_id: <base64_encoded_azure_subscription_id>
 azure_client_id: <base64_encoded_azure_client_id>
```

```

azure_client_secret: <base64_encoded_azure_client_secret>
azure_tenant_id: <base64_encoded_azure_tenant_id>
azure_resource_prefix: <base64_encoded_azure_resource_prefix>
azure_resourcegroup: <base64_encoded_azure_resourcegroup>
azure_region: <base64_encoded_azure_region>

```

## IMPORTANT

Before upgrading a cluster that uses manually maintained credentials, you must ensure that the CCO is in an upgradeable state.

### 5.5.10.2. Configuring an Azure cluster to use short-term credentials

To install a cluster that uses Microsoft Entra Workload ID, you must configure the Cloud Credential Operator utility and create the required Azure resources for your cluster.

#### 5.5.10.2.1. Configuring the Cloud Credential Operator utility

To create and manage cloud credentials from outside of the cluster when the Cloud Credential Operator (CCO) is operating in manual mode, extract and prepare the CCO utility (**ccocli**) binary.

## NOTE

The **ccocli** utility is a Linux binary that must run in a Linux environment.

### Prerequisites

- You have access to an OpenShift Container Platform account with cluster administrator access.
- You have installed the OpenShift CLI (**oc**).
- You have created a global Microsoft Azure account for the **ccocli** utility to use with the following permissions:

#### Example 5.25. Required Azure permissions

- Microsoft.Resources/subscriptions/resourceGroups/read
- Microsoft.Resources/subscriptions/resourceGroups/write
- Microsoft.Resources/subscriptions/resourceGroups/delete
- Microsoft.Authorization/roleAssignments/read
- Microsoft.Authorization/roleAssignments/delete
- Microsoft.Authorization/roleAssignments/write
- Microsoft.Authorization/roleDefinitions/read
- Microsoft.Authorization/roleDefinitions/write
- Microsoft.Authorization/roleDefinitions/delete
- Microsoft.Storage/storageAccounts/listkeys/action

- Microsoft.Storage/storageAccounts/delete
- Microsoft.Storage/storageAccounts/read
- Microsoft.Storage/storageAccounts/write
- Microsoft.Storage/storageAccounts/blobServices/containers/write
- Microsoft.Storage/storageAccounts/blobServices/containers/delete
- Microsoft.Storage/storageAccounts/blobServices/containers/read
- Microsoft.ManagedIdentity/userAssignedIdentities/delete
- Microsoft.ManagedIdentity/userAssignedIdentities/read
- Microsoft.ManagedIdentity/userAssignedIdentities/write
- Microsoft.ManagedIdentity/userAssignedIdentities/federatedIdentityCredentials/read
- Microsoft.ManagedIdentity/userAssignedIdentities/federatedIdentityCredentials/write
- Microsoft.ManagedIdentity/userAssignedIdentities/federatedIdentityCredentials/delete
- Microsoft.Storage/register/action
- Microsoft.ManagedIdentity/register/action

## Procedure

1. Set a variable for the OpenShift Container Platform release image by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk '/release image/ {print $3}')
```

2. Obtain the CCO container image from the OpenShift Container Platform release image by running the following command:

```
$ CCO_IMAGE=$(oc adm release info --image-for='cloud-credential-operator'
$RELEASE_IMAGE -a ~/.pull-secret)
```

### NOTE

Ensure that the architecture of the **\$RELEASE\_IMAGE** matches the architecture of the environment in which you will use the **ccoctl** tool.

3. Extract the **ccoctl** binary from the CCO container image within the OpenShift Container Platform release image by running the following command:

```
$ oc image extract $CCO_IMAGE --file="/usr/bin/ccoctl" -a ~/.pull-secret
```

4. Change the permissions to make **ccoctl** executable by running the following command:

```
$ chmod 775 ccoctl
```

## Verification

- To verify that **ccoctl** is ready to use, display the help file. Use a relative file name when you run the command, for example:

```
$./ccoctl.rhel9
```

## Example output

OpenShift credentials provisioning tool

Usage:

ccoctl [command]

Available Commands:

alibabacloud Manage credentials objects for alibaba cloud

aws Manage credentials objects for AWS cloud

azure Manage credentials objects for Azure

gcp Manage credentials objects for Google cloud

help Help about any command

ibmcloud Manage credentials objects for IBM Cloud

nutanix Manage credentials objects for Nutanix

Flags:

-h, --help help for ccoctl

Use "ccoctl [command] --help" for more information about a command.

### 5.5.10.2.2. Creating Azure resources with the Cloud Credential Operator utility

You can use the **ccoctl azure create-all** command to automate the creation of Azure resources.

## NOTE

By default, **ccoctl** creates objects in the directory in which the commands are run. To create the objects in a different directory, use the **--output-dir** flag. This procedure uses **<path\_to\_ccoctl\_output\_dir>** to refer to this directory.

## Prerequisites

You must have:

- Extracted and prepared the **ccoctl** binary.
- Access to your Microsoft Azure account by using the Azure CLI.

## Procedure

- Set a **\$RELEASE\_IMAGE** variable with the release image from your installation file by running the following command:

```
$ RELEASE_IMAGE=$(./openshift-install version | awk 'release image/' {print $3})
```

2. Extract the list of **CredentialsRequest** objects from the OpenShift Container Platform release image by running the following command:

```
$ oc adm release extract \
 --from=$RELEASE_IMAGE \
 --credentials-requests \
 --included \1
 --install-config=<path_to_directory_with_installation_configuration>/install-config.yaml \2
 --to=<path_to_directory_for_credentials_requests> \3
```

- 1 The **--included** parameter includes only the manifests that your specific cluster configuration requires.
- 2 Specify the location of the **install-config.yaml** file.
- 3 Specify the path to the directory where you want to store the **CredentialsRequest** objects. If the specified directory does not exist, this command creates it.

#### NOTE

This command might take a few moments to run.

3. To enable the **ccoctl** utility to detect your Azure credentials automatically, log in to the Azure CLI by running the following command:

```
$ az login
```

4. Use the **ccoctl** tool to process all **CredentialsRequest** objects by running the following command:

```
$ ccoctl azure create-all \
 --name=<azure_infra_name> \1
 --output-dir=<ccoctl_output_dir> \2
 --region=<azure_region> \3
 --subscription-id=<azure_subscription_id> \4
 --credentials-requests-dir=<path_to_credentials_requests_directory> \5
 --dnszone-resource-group-name=<azure_dns_zone_resource_group_name> \6
 --tenant-id=<azure_tenant_id> \7
```

- 1 Specify the user-defined name for all created Azure resources used for tracking.
- 2 Optional: Specify the directory in which you want the **ccoctl** utility to create objects. By default, the utility creates objects in the directory in which the commands are run.
- 3 Specify the Azure region in which cloud resources will be created.
- 4 Specify the Azure subscription ID to use.
- 5 Specify the directory containing the files for the component **CredentialsRequest** objects.

- 6 Specify the name of the resource group containing the cluster's base domain Azure DNS zone.
- 7 Specify the Azure tenant ID to use.

#### NOTE

If your cluster uses Technology Preview features that are enabled by the **TechPreviewNoUpgrade** feature set, you must include the **--enable-tech-preview** parameter.

To see additional optional parameters and explanations of how to use them, run the **azure create-all --help** command.

#### Verification

- To verify that the OpenShift Container Platform secrets are created, list the files in the **<path\_to\_ccoctl\_output\_dir>/manifests** directory:

```
$ ls <path_to_ccoctl_output_dir>/manifests
```

#### Example output

```
azure-ad-pod-identity-webhook-config.yaml
cluster-authentication-02-config.yaml
openshift-cloud-controller-manager-azure-cloud-credentials-credentials.yaml
openshift-cloud-network-config-controller-cloud-credentials-credentials.yaml
openshift-cluster-api-capz-manager-bootstrap-credentials-credentials.yaml
openshift-cluster-csi-drivers-azure-disk-credentials-credentials.yaml
openshift-cluster-csi-drivers-azure-file-credentials-credentials.yaml
openshift-image-registry-installer-cloud-credentials-credentials.yaml
openshift-ingress-operator-cloud-credentials-credentials.yaml
openshift-machine-api-azure-cloud-credentials-credentials.yaml
```

You can verify that the Microsoft Entra ID service accounts are created by querying Azure. For more information, refer to Azure documentation on listing Entra ID service accounts.

#### 5.5.10.2.3. Incorporating the Cloud Credential Operator utility manifests

To implement short-term security credentials managed outside the cluster for individual components, you must move the manifest files that the Cloud Credential Operator utility (**ccoctl**) created to the correct directories for the installation program.

#### Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have configured the Cloud Credential Operator utility (**ccoctl**).
- You have created the cloud provider resources that are required for your cluster with the **ccoctl** utility.

#### Procedure

1. If you did not set the **credentialsMode** parameter in the **install-config.yaml** configuration file to **Manual**, modify the value as shown:

#### Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
credentialsMode: Manual
...
```

2. If you used the **ccocctl** utility to create a new Azure resource group instead of using an existing resource group, modify the **resourceGroupName** parameter in the **install-config.yaml** as shown:

#### Sample configuration file snippet

```
apiVersion: v1
baseDomain: example.com
...
platform:
 azure:
 resourceGroupName: <azure_infra_name> 1
...
```

- 1** This value must match the user-defined name for Azure resources that was specified with the **--name** argument of the **ccocctl azure create-all** command.

3. If you have not previously created installation manifest files, do so by running the following command:

```
$ openshift-install create manifests --dir <installation_directory>
```

where **<installation\_directory>** is the directory in which the installation program creates files.

4. Copy the manifests that the **ccocctl** utility generated to the **manifests** directory that the installation program created by running the following command:

```
$ cp /<path_to_ccocctl_output_dir>/manifests/* ./manifests/
```

5. Copy the **tls** directory that contains the private key to the installation directory:

```
$ cp -a /<path_to_ccocctl_output_dir>/tls .
```

### 5.5.11. Deploying the cluster

You can install OpenShift Container Platform on a compatible cloud platform.

#### IMPORTANT

You can run the **create cluster** command of the installation program only once, during initial installation.

## Prerequisites

- You have configured an account with the cloud platform that hosts your cluster.
- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have an Azure subscription ID and tenant ID.

## Procedure

- Change to the directory that contains the installation program and initialize the cluster deployment:

```
$./openshift-install create cluster --dir <installation_directory> \ 1
--log-level=info 2
```

- 1 For **<installation\_directory>**, specify the location of your customized **./install-config.yaml** file.
- 2 To view different installation details, specify **warn**, **debug**, or **error** instead of **info**.

## Verification

When the cluster deployment completes successfully:

- The terminal displays directions for accessing your cluster, including a link to the web console and credentials for the **kubeadmin** user.
- Credential information also outputs to **<installation\_directory>/openshift\_install.log**.

### IMPORTANT

Do not delete the installation program or the files that the installation program creates. Both are required to delete the cluster.

## Example output

```
...
INFO Install complete!
INFO To access the cluster as the system:admin user when using 'oc', run 'export
KUBECONFIG=/home/myuser/install_dir/auth/kubeconfig'
INFO Access the OpenShift web-console here: https://console-openshift-
console.apps.mycluster.example.com
INFO Login to the console with user: "kubeadmin", and password: "password"
INFO Time elapsed: 36m22s
```

## IMPORTANT

- The Ignition config files that the installation program generates contain certificates that expire after 24 hours, which are then renewed at that time. If the cluster is shut down before renewing the certificates and the cluster is later restarted after the 24 hours have elapsed, the cluster automatically recovers the expired certificates. The exception is that you must manually approve the pending **node-bootstrapper** certificate signing requests (CSRs) to recover kubelet certificates. See the documentation for *Recovering from expired control plane certificates* for more information.
- It is recommended that you use Ignition config files within 12 hours after they are generated because the 24-hour certificate rotates from 16 to 22 hours after the cluster is installed. By using the Ignition config files within 12 hours, you can avoid installation failure if the certificate update runs during installation.

### 5.5.12. Logging in to the cluster by using the CLI

You can log in to your cluster as a default system user by exporting the cluster **kubeconfig** file. The **kubeconfig** file contains information about the cluster that is used by the CLI to connect a client to the correct cluster and API server. The file is specific to a cluster and is created during OpenShift Container Platform installation.

#### Prerequisites

- You deployed an OpenShift Container Platform cluster.
- You installed the **oc** CLI.

#### Procedure

1. Export the **kubeadmin** credentials:

```
$ export KUBECONFIG=<installation_directory>/auth/kubeconfig 1
```

- 1** For **<installation\_directory>**, specify the path to the directory that you stored the installation files in.

2. Verify you can run **oc** commands successfully using the exported configuration:

```
$ oc whoami
```

#### Example output

```
system:admin
```

#### Additional resources

- See [Accessing the web console](#) for more details about accessing and understanding the OpenShift Container Platform web console.

### 5.5.13. Telemetry access for OpenShift Container Platform

In OpenShift Container Platform 4.14, the Telemetry service, which runs by default to provide metrics about cluster health and the success of updates, requires internet access. If your cluster is connected to the internet, Telemetry runs automatically, and your cluster is registered to [OpenShift Cluster Manager](#).

After you confirm that your [OpenShift Cluster Manager](#) inventory is correct, either maintained automatically by Telemetry or manually by using OpenShift Cluster Manager, [use subscription watch](#) to track your OpenShift Container Platform subscriptions at the account or multi-cluster level.

### Additional resources

- See [About remote health monitoring](#) for more information about the Telemetry service

### 5.5.14. Next steps

- [Customize your cluster](#).
- If necessary, you can [opt out of remote health reporting](#).

## 5.6. INSTALLING A CLUSTER ON AZURE WITH NETWORK CUSTOMIZATIONS

In OpenShift Container Platform version 4.14, you can install a cluster with a customized network configuration on infrastructure that the installation program provisions on Microsoft Azure. By customizing your network configuration, your cluster can coexist with existing IP address allocations in your environment and integrate with existing MTU and VXLAN configurations.

You must set most of the network configuration parameters during installation, and you can modify only **kubeProxy** configuration parameters in a running cluster.

### 5.6.1. Prerequisites

- You reviewed details about the [OpenShift Container Platform installation and update](#) processes.
- You read the documentation on [selecting a cluster installation method and preparing it for users](#).
- You [configured an Azure account](#) to host the cluster and determined the tested and validated region to deploy the cluster to.
- If you use a firewall, you [configured it to allow the sites](#) that your cluster requires access to.
- If you use customer-managed encryption keys, you [prepared your Azure environment for encryption](#).

### 5.6.2. Internet access for OpenShift Container Platform

In OpenShift Container Platform 4.14, you require access to the internet to install your cluster.

You must have internet access to:

- Access [OpenShift Cluster Manager](#) to download the installation program and perform subscription management. If the cluster has internet access and you do not disable Telemetry, that service automatically entitles your cluster.

- Access [Quay.io](https://quay.io) to obtain the packages that are required to install your cluster.
- Obtain the packages that are required to perform cluster updates.

### IMPORTANT

If your cluster cannot have direct internet access, you can perform a restricted network installation on some types of infrastructure that you provision. During that process, you download the required content and use it to populate a mirror registry with the installation packages. With some installation types, the environment that you install your cluster in will not require internet access. Before you update the cluster, you update the content of the mirror registry.

### 5.6.3. Generating a key pair for cluster node SSH access

During an OpenShift Container Platform installation, you can provide an SSH public key to the installation program. The key is passed to the Red Hat Enterprise Linux CoreOS (RHCOS) nodes through their Ignition config files and is used to authenticate SSH access to the nodes. The key is added to the `~/.ssh/authorized_keys` list for the **core** user on each node, which enables password-less authentication.

After the key is passed to the nodes, you can use the key pair to SSH in to the RHCOS nodes as the user **core**. To access the nodes through SSH, the private key identity must be managed by SSH for your local user.

If you want to SSH in to your cluster nodes to perform installation debugging or disaster recovery, you must provide the SSH public key during the installation process. The `./openshift-install gather` command also requires the SSH public key to be in place on the cluster nodes.

### IMPORTANT

Do not skip this procedure in production environments, where disaster recovery and debugging is required.

### NOTE

You must use a local key, not one that you configured with platform-specific approaches such as [AWS key pairs](#).

### Procedure

1. If you do not have an existing SSH key pair on your local machine to use for authentication onto your cluster nodes, create one. For example, on a computer that uses a Linux operating system, run the following command:

```
$ ssh-keygen -t ed25519 -N "" -f <path>/<file_name> 1
```

- 1 Specify the path and file name, such as `~/.ssh/id_ed25519`, of the new SSH key. If you have an existing key pair, ensure your public key is in the your `~/.ssh` directory.

**NOTE**

If you plan to install an OpenShift Container Platform cluster that uses the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the **x86\_64**, **ppc64le**, and **s390x** architectures, do not create a key that uses the **ed25519** algorithm. Instead, create a key that uses the **rsa** or **ecdsa** algorithm.

2. View the public SSH key:

```
$ cat <path>/<file_name>.pub
```

For example, run the following to view the `~/.ssh/id_ed25519.pub` public key:

```
$ cat ~/.ssh/id_ed25519.pub
```

3. Add the SSH private key identity to the SSH agent for your local user, if it has not already been added. SSH agent management of the key is required for password-less SSH authentication onto your cluster nodes, or if you want to use the `./openshift-install gather` command.

**NOTE**

On some distributions, default SSH private key identities such as `~/.ssh/id_rsa` and `~/.ssh/id_dsa` are managed automatically.

- a. If the **ssh-agent** process is not already running for your local user, start it as a background task:

```
$ eval "$(ssh-agent -s)"
```

**Example output**

```
Agent pid 31874
```

**NOTE**

If your cluster is in FIPS mode, only use FIPS-compliant algorithms to generate the SSH key. The key must be either RSA or ECDSA.

4. Add your SSH private key to the **ssh-agent**:

```
$ ssh-add <path>/<file_name> 1
```

- 1** Specify the path and file name for your SSH private key, such as `~/.ssh/id_ed25519`

**Example output**

```
Identity added: /home/<you>/<path>/<file_name> (<computer_name>)
```

**Next steps**

- When you install OpenShift Container Platform, provide the SSH public key to the installation program.

### 5.6.4. Obtaining the installation program

Before you install OpenShift Container Platform, download the installation file on the host you are using for installation.

#### Prerequisites

- You have a computer that runs Linux or macOS, with 500 MB of local disk space.

#### Procedure

1. Access the [Infrastructure Provider](#) page on the OpenShift Cluster Manager site. If you have a Red Hat account, log in with your credentials. If you do not, create an account.
2. Select your infrastructure provider.
3. Navigate to the page for your installation type, download the installation program that corresponds with your host operating system and architecture, and place the file in the directory where you will store the installation configuration files.

#### IMPORTANT

The installation program creates several files on the computer that you use to install your cluster. You must keep the installation program and the files that the installation program creates after you finish installing the cluster. Both files are required to delete the cluster.

#### IMPORTANT

Deleting the files created by the installation program does not remove your cluster, even if the cluster failed during installation. To remove your cluster, complete the OpenShift Container Platform uninstallation procedures for your specific cloud provider.

4. Extract the installation program. For example, on a computer that uses a Linux operating system, run the following command:

```
$ tar -xvf openshift-install-linux.tar.gz
```

5. Download your installation [pull secret from Red Hat OpenShift Cluster Manager](#) . This pull secret allows you to authenticate with the services that are provided by the included authorities, including Quay.io, which serves the container images for OpenShift Container Platform components.

### 5.6.5. Creating the installation configuration file

You can customize the OpenShift Container Platform cluster you install on Microsoft Azure.

#### Prerequisites

- You have the OpenShift Container Platform installation program and the pull secret for your cluster.
- You have an Azure subscription ID and tenant ID.
- If you are installing the cluster using a service principal, you have its application ID and password.
- If you are installing the cluster using a system-assigned managed identity, you have enabled it on the virtual machine that you will run the installation program from.
- If you are installing the cluster using a user-assigned managed identity, you have met these prerequisites:
  - You have its client ID.
  - You have assigned it to the virtual machine that you will run the installation program from.

## Procedure

1. Optional: If you have run the installation program on this computer before, and want to use an alternative service principal or managed identity, go to the `~/.azure/` directory and delete the **osServicePrincipal.json** configuration file.  
Deleting this file prevents the installation program from automatically reusing subscription and authentication values from a previous installation.
2. Create the **install-config.yaml** file.
  - a. Change to the directory that contains the installation program and run the following command:

```
$./openshift-install create install-config --dir <installation_directory> 1
```

- 1** For **<installation\_directory>**, specify the directory name to store the files that the installation program creates.

When specifying the directory:

- Verify that the directory has the **execute** permission. This permission is required to run Terraform binaries under the installation directory.
- Use an empty directory. Some installation assets, such as bootstrap X.509 certificates, have short expiration intervals, therefore you must not reuse an installation directory. If you want to reuse individual files from another cluster installation, you can copy them into your directory. However, the file names for the installation assets might change between releases. Use caution when copying installation files from an earlier OpenShift Container Platform version.

### NOTE

Always delete the `~/.powervs` directory to avoid reusing a stale configuration. Run the following command:

```
$ rm -rf ~/.powervs
```

- b. At the prompts, provide the configuration details for your cloud:
  - i. Optional: Select an SSH key to use to access your cluster machines.

**NOTE**

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

- ii. Select **azure** as the platform to target.  
If the installation program cannot locate the **osServicePrincipal.json** configuration file from a previous installation, you are prompted for Azure subscription and authentication values.
- iii. Enter the following Azure parameter values for your subscription:
  - **azure subscription id** Enter the subscription ID to use for the cluster.
  - **azure tenant id** Enter the tenant ID.
- iv. Depending on the Azure identity you are using to deploy the cluster, do one of the following when prompted for the **azure service principal client id**
  - If you are using a service principal, enter its application ID.
  - If you are using a system-assigned managed identity, leave this value blank.
  - If you are using a user-assigned managed identity, specify its client ID.
- v. Depending on the Azure identity you are using to deploy the cluster, do one of the following when prompted for the **azure service principal client secret**
  - If you are using a service principal, enter its password.
  - If you are using a system-assigned managed identity, leave this value blank.
  - If you are using a user-assigned managed identity, leave this value blank.
- vi. Select the region to deploy the cluster to.
- vii. Select the base domain to deploy the cluster to. The base domain corresponds to the Azure DNS Zone that you created for your cluster.
- viii. Enter a descriptive name for your cluster.

**IMPORTANT**

All Azure resources that are available through public endpoints are subject to resource name restrictions, and you cannot create resources that use certain terms. For a list of terms that Azure restricts, see [Resolve reserved resource name errors](#) in the Azure documentation.

3. Modify the **install-config.yaml** file. You can find more information about the available parameters in the "Installation configuration parameters" section.

4. Back up the **install-config.yaml** file so that you can use it to install multiple clusters.

### IMPORTANT

The **install-config.yaml** file is consumed during the installation process. If you want to reuse the file, you must back it up now.

If previously not detected, the installation program creates an **osServicePrincipal.json** configuration file and stores this file in the `~/.azure/` directory on your computer. This ensures that the installation program can load the profile when it is creating an OpenShift Container Platform cluster on the target platform.

### Additional resources

- [Installation configuration parameters for Azure](#)

#### 5.6.5.1. Minimum resource requirements for cluster installation

Each cluster machine must meet the following minimum requirements:

**Table 5.2. Minimum resource requirements**

| Machine       | Operating System              | vCPU [1] | Virtual RAM | Storage | Input/Output Per Second (IOPS)[2] |
|---------------|-------------------------------|----------|-------------|---------|-----------------------------------|
| Bootstrap     | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Control plane | RHCOS                         | 4        | 16 GB       | 100 GB  | 300                               |
| Compute       | RHCOS, RHEL 8.6 and later [3] | 2        | 8 GB        | 100 GB  | 300                               |

1. One vCPU is equivalent to one physical core when simultaneous multithreading (SMT), or Hyper-Threading, is not enabled. When enabled, use the following formula to calculate the corresponding ratio:  $(\text{threads per core} \times \text{cores}) \times \text{sockets} = \text{vCPUs}$ .
2. OpenShift Container Platform and Kubernetes are sensitive to disk performance, and faster storage is recommended, particularly for etcd on the control plane nodes which require a 10 ms p99 fsync duration. Note that on many cloud platforms, storage size and IOPS scale together, so you might need to over-allocate storage volume to obtain sufficient performance.
3. As with all user-provisioned installations, if you choose to use RHEL compute machines in your cluster, you take responsibility for all operating system life cycle management and maintenance, including performing system updates, applying patches, and completing all other required tasks. Use of RHEL 7 compute machines is deprecated and has been removed in OpenShift Container Platform 4.10 and later.

## NOTE

As of OpenShift Container Platform version 4.13, RHCOS is based on RHEL version 9.2, which updates the micro-architecture requirements. The following list contains the minimum instruction set architectures (ISA) that each architecture requires:

- x86-64 architecture requires x86-64-v2 ISA
- ARM64 architecture requires ARMv8.0-A ISA
- IBM Power architecture requires Power 9 ISA
- s390x architecture requires z14 ISA

For more information, see [RHEL Architectures](#).

## IMPORTANT

You are required to use Azure virtual machines that have the **premiumIO** parameter set to **true**.

If an instance type for your platform meets the minimum requirements for cluster machines, it is supported to use in OpenShift Container Platform.

### Additional resources

- [Optimizing storage](#)

### 5.6.5.2. Tested instance types for Azure

The following Microsoft Azure instance types have been tested with OpenShift Container Platform.

#### Example 5.26. Machine types based on 64-bit x86 architecture

- **c4.\***
- **c5.\***
- **c5a.\***
- **i3.\***
- **m4.\***
- **m5.\***
- **m5a.\***
- **m6a.\***
- **m6i.\***
- **r4.\***
- **r5.\***

- **r5a.\***
- **r6i.\***
- **t3.\***
- **t3a.\***

#### 5.6.5.3. Tested instance types for Azure on 64-bit ARM infrastructures

The following Microsoft Azure ARM64 instance types have been tested with OpenShift Container Platform.

##### Example 5.27. Machine types based on 64-bit ARM architecture

- **c6g.\***
- **c7g.\***
- **m6g.\***
- **m7g.\***
- **r8g.\***

#### 5.6.5.4. Enabling trusted launch for Azure VMs

You can enable two trusted launch features when installing your cluster on Azure: [secure boot](#) and [virtualized Trusted Platform Modules](#).

See the Azure documentation about [virtual machine sizes](#) to learn what sizes of virtual machines support these features.

#### IMPORTANT

Trusted launch is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

#### Prerequisites

- You have created an **install-config.yaml** file.

#### Procedure

- Use a text editor to edit the **install-config.yaml** file prior to deploying your cluster and add the following stanza:

```

controlPlane: ❶
platform:
 azure:
 settings:
 securityType: TrustedLaunch ❷
 trustedLaunch:
 uefiSettings:
 secureBoot: Enabled ❸
 virtualizedTrustedPlatformModule: Enabled ❹

```

- ❶ Specify **controlPlane.platform.azure** or **compute.platform.azure** to enable trusted launch on only control plane or compute nodes respectively. Specify **platform.azure.defaultMachinePlatform** to enable trusted launch on all nodes.
- ❷ Enable trusted launch features.
- ❸ Enable secure boot. For more information, see the Azure documentation about [secure boot](#).
- ❹ Enable the virtualized Trusted Platform Module. For more information, see the Azure documentation about [virtualized Trusted Platform Modules](#).

#### 5.6.5.5. Enabling confidential VMs

You can enable confidential VMs when installing your cluster. You can enable confidential VMs for compute nodes, control plane nodes, or all nodes.

#### IMPORTANT

Using confidential VMs is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

You can use confidential VMs with the following VM sizes:

- DCasv5-series
- DCadsv5-series
- ECasv5-series
- ECadsv5-series

#### IMPORTANT

Confidential VMs are currently not supported on 64-bit ARM architectures.

#### Prerequisites

- You have created an **install-config.yaml** file.

## Procedure

- Use a text editor to edit the **install-config.yaml** file prior to deploying your cluster and add the following stanza:

```
controlPlane: ❶
 platform:
 azure:
 settings:
 securityType: ConfidentialVM ❷
 confidentialVM:
 uefiSettings:
 secureBoot: Enabled ❸
 virtualizedTrustedPlatformModule: Enabled ❹
 osDisk:
 securityProfile:
 securityEncryptionType: VMGuestStateOnly ❺
```

- ❶ Specify **controlPlane.platform.azure** or **compute.platform.azure** to deploy confidential VMs on only control plane or compute nodes respectively. Specify **platform.azure.defaultMachinePlatform** to deploy confidential VMs on all nodes.
- ❷ Enable confidential VMs.
- ❸ Enable secure boot. For more information, see the Azure documentation about [secure boot](#).
- ❹ Enable the virtualized Trusted Platform Module. For more information, see the Azure documentation about [virtualized Trusted Platform Modules](#).
- ❺ Specify **VMGuestStateOnly** to encrypt the VM guest state.

### 5.6.5.6. Sample customized install-config.yaml file for Azure

You can customize the **install-config.yaml** file to specify more details about your OpenShift Container Platform cluster's platform or modify the values of the required parameters.

#### IMPORTANT

This sample YAML file is provided for reference only. You must obtain your **install-config.yaml** file by using the installation program and modify it.

```
apiVersion: v1
baseDomain: example.com ❶
controlPlane: ❷
 hyperthreading: Enabled ❸ ❹
 name: master
 platform:
 azure:
 encryptionAtHost: true
```

```

ultraSSDCapability: Enabled
osDisk:
 diskSizeGB: 1024 5
 diskType: Premium_LRS
 diskEncryptionSet:
 resourceGroup: disk_encryption_set_resource_group
 name: disk_encryption_set_name
 subscriptionId: secondary_subscription_id
osImage:
 publisher: example_publisher_name
 offer: example_image_offer
 sku: example_offer_sku
 version: example_image_version
 type: Standard_D8s_v3
replicas: 3
compute: 6
- hyperthreading: Enabled 7
 name: worker
 platform:
 azure:
 ultraSSDCapability: Enabled
 type: Standard_D2s_v3
 encryptionAtHost: true
 osDisk:
 diskSizeGB: 512 8
 diskType: Standard_LRS
 diskEncryptionSet:
 resourceGroup: disk_encryption_set_resource_group
 name: disk_encryption_set_name
 subscriptionId: secondary_subscription_id
 osImage:
 publisher: example_publisher_name
 offer: example_image_offer
 sku: example_offer_sku
 version: example_image_version
 zones: 9
 - "1"
 - "2"
 - "3"
 replicas: 5
metadata:
 name: test-cluster 10
networking: 11
 clusterNetwork:
 - cidr: 10.128.0.0/14
 hostPrefix: 23
 machineNetwork:
 - cidr: 10.0.0.0/16
 networkType: OVNKubernetes 12

version: example_image_version
ultraSSDCapability: Enabled
baseDomainResourceGroupName: resource_group 14
region: centralus 15
resourceGroupName: existing_resource_group 16
outboundType: Loadbalancer
cloudName: AzurePublicCloud
pullSecret: '{"auths": ...}' 17
fips: false 18
sshKey: ssh-ed25519 AAAA... 19

```

1 10 15 17 Required. The installation program prompts you for this value.

2 6 11 If you do not provide these parameters and values, the installation program provides the default value.

3 7 The **controlPlane** section is a single mapping, but the **compute** section is a sequence of mappings. To meet the requirements of the different data structures, the first line of the **compute** section must begin with a hyphen, -, and the first line of the **controlPlane** section must not. Only one control plane pool is used.

4 Whether to enable or disable simultaneous multithreading, or **hyperthreading**. By default, simultaneous multithreading is enabled to increase the performance of your machines' cores. You can disable it by setting the parameter value to **Disabled**. If you disable simultaneous multithreading in some cluster machines, you must disable it in all cluster machines.

### IMPORTANT

If you disable simultaneous multithreading, ensure that your capacity planning accounts for the dramatically decreased machine performance. Use larger virtual machine types, such as **Standard\_D8s\_v3**, for your machines if you disable simultaneous multithreading.

5 8 You can specify the size of the disk to use in GB. Minimum recommendation for control plane nodes is 1024 GB.

9 Specify a list of zones to deploy your machines to. For high availability, specify at least two zones.

12 The cluster network plugin to install. The supported values are **OVNKubernetes** and **OpenShiftSDN**. The default value is **OVNKubernetes**.

13 Optional: A custom Red Hat Enterprise Linux CoreOS (RHCOS) image that should be used to boot control plane and compute machines. The **publisher**, **offer**, **sku**, and **version** parameters under **platform.azure.defaultMachinePlatform.osImage** apply to both control plane and compute machines. If the parameters under **controlPlane.platform.azure.osImage** or **compute.platform.azure.osImage** are set, they override the **platform.azure.defaultMachinePlatform.osImage** parameters.

14 Specify the name of the resource group that contains the DNS zone for your base domain.

16 Specify the name of an already existing resource group to install your cluster to. If undefined, a new resource group is created for the cluster.

- 18 Whether to enable or disable FIPS mode. By default, FIPS mode is not enabled. If FIPS mode is enabled, the Red Hat Enterprise Linux CoreOS (RHCOS) machines that OpenShift Container

### IMPORTANT

To enable FIPS mode for your cluster, you must run the installation program from a Red Hat Enterprise Linux (RHEL) computer configured to operate in FIPS mode. For more information about configuring FIPS mode on RHEL, see [Installing the system in FIPS mode](#). When running Red Hat Enterprise Linux (RHEL) or Red Hat Enterprise Linux CoreOS (RHCOS) booted in FIPS mode, OpenShift Container Platform core components use the RHEL cryptographic libraries that have been submitted to NIST for FIPS 140-2/140-3 Validation on only the x86\_64, ppc64le, and s390x architectures.

- 19 You can optionally provide the **sshKey** value that you use to access the machines in your cluster.

### NOTE

For production OpenShift Container Platform clusters on which you want to perform installation debugging or disaster recovery, specify an SSH key that your **ssh-agent** process uses.

#### 5.6.5.7. Configuring the cluster-wide proxy during installation

Production environments can deny direct access to the internet and instead have an HTTP or HTTPS proxy available. You can configure a new OpenShift Container Platform cluster to use a proxy by configuring the proxy settings in the **install-config.yaml** file.

#### Prerequisites

- You have an existing **install-config.yaml** file.
- You reviewed the sites that your cluster requires access to and determined whether any of them need to bypass the proxy. By default, all cluster egress traffic is proxied, including calls to hosting cloud provider APIs. You added sites to the **Proxy** object's **spec.noProxy** field to bypass the proxy if necessary.

### NOTE

The **Proxy** object **status.noProxy** field is populated with the values of the **networking.machineNetwork[].cidr**, **networking.clusterNetwork[].cidr**, and **networking.serviceNetwork[]** fields from your installation configuration.

For installations on Amazon Web Services (AWS), Google Cloud Platform (GCP), Microsoft Azure, and Red Hat OpenStack Platform (RHOSP), the **Proxy** object **status.noProxy** field is also populated with the instance metadata endpoint (**169.254.169.254**).

#### Procedure

1. Edit your **install-config.yaml** file and add the proxy settings. For example:

```

apiVersion: v1
baseDomain: my.domain.com
proxy:
 httpProxy: http://<username>:<pswd>@<ip>:<port> 1
 httpsProxy: https://<username>:<pswd>@<ip>:<port> 2
 noProxy: example.com 3
additionalTrustBundle: | 4
 -----BEGIN CERTIFICATE-----
 <MY_TRUSTED_CA_CERT>
 -----END CERTIFICATE-----
additionalTrustBundlePolicy: <policy_to_add_additionalTrustBundle> 5

```

- 1 A proxy URL to use for creating HTTP connections outside the cluster. The URL scheme must be **http**.
- 2 A proxy URL to use for creating HTTPS connections outside the cluster.
- 3 A comma-separated list of destination domain names, IP addresses, or other network CIDRs to exclude from proxying. Preface a domain with **.** to match subdomains only. For example, **.y.com** matches **x.y.com**, but not **y.com**. Use **\*** to bypass the proxy for all destinations.
- 4 If provided, the installation program generates a config map that is named **user-ca-bundle** in the **openshift-config** namespace that contains one or more additional CA certificates that are required for proxying HTTPS connections. The Cluster Network Operator then creates a **trusted-ca-bundle** config map that merges these contents with the Red Hat Enterprise Linux CoreOS (RHCOS) trust bundle, and this config map is referenced in the **trustedCA** field of the **Proxy** object. The **additionalTrustBundle** field is required unless the proxy's identity certificate is signed by an authority from the RHCOS trust bundle.
- 5 Optional: The policy to determine the configuration of the **Proxy** object to reference the **user-ca-bundle** config map in the **trustedCA** field. The allowed values are **Proxyonly** and **Always**. Use **Proxyonly** to reference the **user-ca-bundle** config map only when **http/https** proxy is configured. Use **Always** to always reference the **user-ca-bundle** config map. The default value is **Proxyonly**.

#### NOTE

The installation program does not support the proxy **readinessEndpoints** field.

#### NOTE

If the installer times out, restart and then complete the deployment by using the **wait-for** command of the installer. For example:

```
$./openshift-install wait-for install-complete --log-level debug
```

2. Save the file and reference it when installing OpenShift Container Platform.

The installation program creates a cluster-wide proxy that is named **cluster** that uses the proxy settings in the provided **install-config.yaml** file. If no proxy settings are provided, a **cluster Proxy** object is still created, but it will have a nil **spec**.

**NOTE**

Only the **Proxy** object named **cluster** is supported, and no additional proxies can be created.

### 5.6.6. Network configuration phases

There are two phases prior to OpenShift Container Platform installation where you can customize the network configuration.

#### Phase 1

You can customize the following network-related fields in the **install-config.yaml** file before you create the manifest files:

- **networking.networkType**
- **networking.clusterNetwork**
- **networking.serviceNetwork**
- **networking.machineNetwork**

For more information on these fields, refer to *Installation configuration parameters*.

**NOTE**

Set the **networking.machineNetwork** to match the CIDR that the preferred NIC resides in.

**IMPORTANT**

The CIDR range **172.17.0.0/16** is reserved by libVirt. You cannot use this range or any range that overlaps with this range for any networks in your cluster.

#### Phase 2

After creating the manifest files by running **openshift-install create manifests**, you can define a customized Cluster Network Operator manifest with only the fields you want to modify. You can use the manifest to specify advanced network configuration.

You cannot override the values specified in phase 1 in the **install-config.yaml** file during phase 2. However, you can further customize the network plugin during phase 2.

### 5.6.7. Specifying advanced network configuration

You can use advanced network configuration for your network plugin to integrate your cluster into your existing network environment. You can specify advanced network configuration only before you install the cluster.

**IMPORTANT**

Customizing your network configuration by modifying the OpenShift Container Platform manifest files created by the installation program is not supported. Applying a manifest file that you create, as in the following procedure, is supported.

## Prerequisites

- You have created the **install-config.yaml** file and completed any modifications to it.

## Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$./openshift-install create manifests --dir <installation_directory> 1
```

- 1** **<installation\_directory>** specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
 name: cluster
spec:
```

3. Specify the advanced network configuration for your cluster in the **cluster-network-03-config.yml** file, such as in the following examples:

### Specify a different VXLAN port for the OpenShift SDN network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
 name: cluster
spec:
 defaultNetwork:
 openshiftSDNConfig:
 vxlanPort: 4800
```

### Enable IPsec for the OVN-Kubernetes network provider

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
 name: cluster
spec:
 defaultNetwork:
 ovnKubernetesConfig:
 ipsecConfig: {}
```

4. Optional: Back up the **manifests/cluster-network-03-config.yml** file. The installation program consumes the **manifests/** directory when you create the Ignition config files.

## 5.6.8. Cluster Network Operator configuration

The configuration for the cluster network is specified as part of the Cluster Network Operator (CNO) configuration and stored in a custom resource (CR) object that is named **cluster**. The CR specifies the fields for the **Network** API in the **operator.openshift.io** API group.

The CNO configuration inherits the following fields during cluster installation from the **Network** API in the **Network.config.openshift.io** API group:

#### **clusterNetwork**

IP address pools from which pod IP addresses are allocated.

#### **serviceNetwork**

IP address pool for services.

#### **defaultNetwork.type**

Cluster network plugin, such as OpenShift SDN or OVN-Kubernetes.

You can specify the cluster network plugin configuration for your cluster by setting the fields for the **defaultNetwork** object in the CNO object named **cluster**.

### 5.6.8.1. Cluster Network Operator configuration object

The fields for the Cluster Network Operator (CNO) are described in the following table:

**Table 5.3. Cluster Network Operator configuration object**

| Field                      | Type          | Description                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>metadata.name</b>       | <b>string</b> | The name of the CNO object. This name is always <b>cluster</b> .                                                                                                                                                                                                                                                                                                                                    |
| <b>spec.clusterNetwork</b> | <b>array</b>  | <p>A list specifying the blocks of IP addresses from which pod IP addresses are allocated and the subnet prefix length assigned to each individual node in the cluster. For example:</p> <pre>spec:   clusterNetwork:     - cidr: 10.128.0.0/19       hostPrefix: 23     - cidr: 10.128.32.0/19       hostPrefix: 23</pre>                                                                          |
| <b>spec.serviceNetwork</b> | <b>array</b>  | <p>A block of IP addresses for services. The OpenShift SDN and OVN-Kubernetes network plugins support only a single IP address block for the service network. For example:</p> <pre>spec:   serviceNetwork:     - 172.30.0.0/14</pre> <p>You can customize this field only in the <b>install-config.yaml</b> file before you create the manifests. The value is read-only in the manifest file.</p> |

| Field                       | Type          | Description                                                                                                                                                              |
|-----------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>spec.defaultNetwork</b>  | <b>object</b> | Configures the network plugin for the cluster network.                                                                                                                   |
| <b>spec.kubeProxyConfig</b> | <b>object</b> | The fields for this object specify the kube-proxy configuration. If you are using the OVN-Kubernetes cluster network plugin, the kube-proxy configuration has no effect. |

### defaultNetwork object configuration

The values for the **defaultNetwork** object are defined in the following table:

Table 5.4. **defaultNetwork** object

| Field                      | Type          | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>type</b>                | <b>string</b> | <p>Either <b>OpenShiftSDN</b> or <b>OVNKubernetes</b>. The Red Hat OpenShift Networking network plugin is selected during installation. You can change this value by migrating from OpenShift SDN to OVN-Kubernetes.</p> <div>  <div> <b>NOTE</b><br/> OpenShift Container Platform uses the OVN-Kubernetes network plugin by default. </div> </div> |
| <b>openshiftSDNConfig</b>  | <b>object</b> | This object is only valid for the OpenShift SDN network plugin.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ovnKubernetesConfig</b> | <b>object</b> | This object is only valid for the OVN-Kubernetes network plugin.                                                                                                                                                                                                                                                                                                                                                                        |

### Configuration for the OpenShift SDN network plugin

The following table describes the configuration fields for the OpenShift SDN network plugin:

Table 5.5. **openshiftSDNConfig** object

| Field       | Type          | Description                                                                                                                                                                                                                                                                                                                         |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mode</b> | <b>string</b> | <p>Configures the network isolation mode for OpenShift SDN. The default value is <b>NetworkPolicy</b>.</p> <p>The values <b>Multitenant</b> and <b>Subnet</b> are available for backwards compatibility with OpenShift Container Platform 3.x but are not recommended. This value cannot be changed after cluster installation.</p> |

| Field            | Type           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mtu</b>       | <b>integer</b> | <p>The maximum transmission unit (MTU) for the VXLAN overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>50</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1450</b>.</p> <p>This value cannot be changed after cluster installation.</p> |
| <b>vxlanPort</b> | <b>integer</b> | <p>The port to use for all VXLAN packets. The default value is <b>4789</b>. This value cannot be changed after cluster installation.</p> <p>If you are running in a virtualized environment with existing nodes that are part of another VXLAN network, then you might be required to change this. For example, when running an OpenShift SDN overlay on top of VMware NSX-T, you must select an alternate port for the VXLAN, because both SDNs use the same default VXLAN port number.</p> <p>On Amazon Web Services (AWS), you can select an alternate port for the VXLAN between port <b>9000</b> and port <b>9999</b>.</p>                                                                                                                                                                                                                            |

## Example OpenShift SDN configuration

```
defaultNetwork:
 type: OpenShiftSDN
 openshiftSDNConfig:
 mode: NetworkPolicy
 mtu: 1450
 vxlanPort: 4789
```

## Configuration for the OVN-Kubernetes network plugin

The following table describes the configuration fields for the OVN-Kubernetes network plugin:

**Table 5.6. ovnKubernetesConfig object**

| Field | Type | Description |
|-------|------|-------------|
|-------|------|-------------|

| Field                    | Type           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mtu</b>               | <b>integer</b> | <p>The maximum transmission unit (MTU) for the Geneve (Generic Network Virtualization Encapsulation) overlay network. This is detected automatically based on the MTU of the primary network interface. You do not normally need to override the detected MTU.</p> <p>If the auto-detected value is not what you expect it to be, confirm that the MTU on the primary network interface on your nodes is correct. You cannot use this option to change the MTU value of the primary network interface on the nodes.</p> <p>If your cluster requires different MTU values for different nodes, you must set this value to <b>100</b> less than the lowest MTU value in your cluster. For example, if some nodes in your cluster have an MTU of <b>9001</b>, and some have an MTU of <b>1500</b>, you must set this value to <b>1400</b>.</p> |
| <b>genevePort</b>        | <b>integer</b> | The port to use for all Geneve packets. The default value is <b>6081</b> . This value cannot be changed after cluster installation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ipsecConfig</b>       | <b>object</b>  | Specify an empty object to enable IPsec encryption.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>policyAuditConfig</b> | <b>object</b>  | Specify a configuration object for customizing network policy audit logging. If unset, the defaults audit log settings are used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>gatewayConfig</b>     | <b>object</b>  | <p>Optional: Specify a configuration object for customizing how egress traffic is sent to the node gateway.</p> <div>  <div> <p><b>NOTE</b></p> <p>While migrating egress traffic, you can expect some disruption to workloads and service traffic until the Cluster Network Operator (CNO) successfully rolls out the changes.</p> </div> </div>                                                                                                                                                                                                                                                                                                                                                                                                        |

| Field                   | Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Description                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <b>v4InternalSubnet</b> | <p>If your existing network infrastructure overlaps with the <b>100.64.0.0/16</b> IPv4 subnet, you can specify a different IP address range for internal use by OVN-Kubernetes. You must ensure that the IP address range does not overlap with any other subnet used by your OpenShift Container Platform installation. The IP address range must be larger than the maximum number of nodes that can be added to the cluster. For example, if the <b>clusterNetwork.cidr</b> value is <b>10.128.0.0/14</b> and the <b>clusterNetwork.hostPrefix</b> value is <b>/23</b>, then the maximum number of nodes is <b><math>2^{(23-14)}=512</math></b>.</p> <p>This field cannot be changed after installation.</p> | The default value is <b>100.64.0.0/16</b> . |

| Field                   | Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Description                             |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| <b>v6InternalSubnet</b> | <p>If your existing network infrastructure overlaps with the <b>fd98::/48</b> IPv6 subnet, you can specify a different IP address range for internal use by OVN-Kubernetes. You must ensure that the IP address range does not overlap with any other subnet used by your OpenShift Container Platform installation. The IP address range must be larger than the maximum number of nodes that can be added to the cluster.</p> <p>This field cannot be changed after installation.</p> | The default value is <b>fd98::/48</b> . |

Table 5.7. **policyAuditConfig** object

| Field              | Type    | Description                                                                                                           |
|--------------------|---------|-----------------------------------------------------------------------------------------------------------------------|
| <b>rateLimit</b>   | integer | The maximum number of messages to generate every second per node. The default value is <b>20</b> messages per second. |
| <b>maxFileSize</b> | integer | The maximum size for the audit log in bytes. The default value is <b>50000000</b> or 50 MB.                           |
| <b>maxLogFiles</b> | integer | The maximum number of log files that are retained.                                                                    |

| Field                 | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination</b>    | string | <p>One of the following additional audit log targets:</p> <p><b>libc</b><br/>The libc <b>syslog()</b> function of the journald process on the host.</p> <p><b>udp:&lt;host&gt;:&lt;port&gt;</b><br/>A syslog server. Replace <b>&lt;host&gt;:&lt;port&gt;</b> with the host and port of the syslog server.</p> <p><b>unix:&lt;file&gt;</b><br/>A Unix Domain Socket file specified by <b>&lt;file&gt;</b>.</p> <p><b>null</b><br/>Do not send the audit logs to any additional target.</p> |
| <b>syslogFacility</b> | string | The syslog facility, such as <b>kern</b> , as defined by RFC5424. The default value is <b>local0</b> .                                                                                                                                                                                                                                                                                                                                                                                     |

Table 5.8. gatewayConfig object

| Field                 | Type           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>routingViaHost</b> | <b>boolean</b> | <p>Set this field to <b>true</b> to send egress traffic from pods to the host networking stack. For highly-specialized installations and applications that rely on manually configured routes in the kernel routing table, you might want to route egress traffic to the host networking stack. By default, egress traffic is processed in OVN to exit the cluster and is not affected by specialized routes in the kernel routing table. The default value is <b>false</b>.</p> <p>This field has an interaction with the Open vSwitch hardware offloading feature. If you set this field to <b>true</b>, you do not receive the performance benefits of the offloading because egress traffic is processed by the host networking stack.</p> |
| <b>ipForwarding</b>   | <b>object</b>  | You can control IP forwarding for all traffic on OVN-Kubernetes managed interfaces by using the <b>ipForwarding</b> specification in the <b>Network</b> resource. Specify <b>Restricted</b> to only allow IP forwarding for Kubernetes related traffic. Specify <b>Global</b> to allow forwarding of all IP traffic. For new installations, the default is <b>Restricted</b> . For updates to OpenShift Container Platform 4.14, the default is <b>Global</b> .                                                                                                                                                                                                                                                                                |

### Example OVN-Kubernetes configuration with IPsec enabled

```
defaultNetwork:
 type: OVNKubernetes
 ovnKubernetesConfig:
 mtu: 1400
 genevePort: 6081
 ipsecConfig: {}
```

### kubeProxyConfig object configuration (OpenShiftSDN container network interface only)

The values for the **kubeProxyConfig** object are defined in the following table:

Table 5.9. kubeProxyConfig object

| Field                                          | Type          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>iptablesSyncPeriod</b>                      | <b>string</b> | <p>The refresh period for <b>iptables</b> rules. The default value is <b>30s</b>. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a> documentation.</p> <div>  <div> <p><b>NOTE</b></p> <p>Because of performance improvements introduced in OpenShift Container Platform 4.3 and greater, adjusting the <b>iptablesSyncPeriod</b> parameter is no longer necessary.</p> </div> </div> |
| <b>proxyArguments.iptables-min-sync-period</b> | <b>array</b>  | <p>The minimum duration before refreshing <b>iptables</b> rules. This field ensures that the refresh does not happen too frequently. Valid suffixes include <b>s</b>, <b>m</b>, and <b>h</b> and are described in the <a href="#">Go time package</a>. The default value is:</p> <pre>kubeProxyConfig:   proxyArguments:     iptables-min-sync-period:       - 0s</pre>                                                                                                                                                               |

### 5.6.9. Configuring hybrid networking with OVN-Kubernetes

You can configure your cluster to use hybrid networking with the OVN-Kubernetes network plugin. This allows a hybrid cluster that supports different node networking configurations.

#### NOTE

This configuration is necessary to run both Linux and Windows nodes in the same cluster.

#### Prerequisites

- You defined **OVNKubernetes** for the **networking.networkType** parameter in the **install-config.yaml** file. See the installation documentation for configuring OpenShift Container Platform network customizations on your chosen cloud provider for more information.

#### Procedure

1. Change to the directory that contains the installation program and create the manifests:

```
$./openshift-install create manifests --dir <installation_directory>
```

where:

**<installation\_directory>**

Specifies the name of the directory that contains the **install-config.yaml** file for your cluster.

2. Create a stub manifest file for the advanced network configuration that is named **cluster-network-03-config.yml** in the **<installation\_directory>/manifests/** directory:

```
$ cat <<EOF > <installation_directory>/manifests/cluster-network-03-config.yml
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
 name: cluster
spec:
EOF
```

where:

**<installation\_directory>**

Specifies the directory name that contains the **manifests/** directory for your cluster.

3. Open the **cluster-network-03-config.yml** file in an editor and configure OVN-Kubernetes with hybrid networking, such as in the following example:

### Specify a hybrid networking configuration

```
apiVersion: operator.openshift.io/v1
kind: Network
metadata:
 name: cluster
spec:
 defaultNetwork:
 ovnKubernetesConfig:
 hybridOverlayConfig:
 hybridClusterNetwork: 1
 - cidr: 10.132.0.0/14
 hostPrefix: 23
 hybridOverlayVXLANPort: 9898 2
```
