<b>CHAPTER 7. SUPPORTED INTEGRATION PRODUCTS</b> .....	<b>16</b>
<b>CHAPTER 8. IMPORTANT LINKS</b> .....	<b>17</b>

# CHAPTER 1. FEATURES

AMQ Streams version 1.5 is based on Strimzi 0.18.x.

The features added in this release, and that were not in previous releases of AMQ Streams, are outlined below.

## 1.1. KAFKA 2.5.0 SUPPORT

AMQ Streams now supports Apache Kafka version 2.5.0.

AMQ Streams uses Kafka 2.5.0. Only Kafka distributions built by Red Hat are supported.

You must upgrade the Cluster Operator to AMQ Streams version 1.5 before you can upgrade brokers and client applications to Kafka 2.5.0. For upgrade instructions, see [AMQ Streams and Kafka upgrades](#).

Refer to the [Kafka 2.4.0](#) and [Kafka 2.5.0](#) Release Notes for additional information.

### NOTE

Kafka 2.4.x is supported in AMQ Streams 1.5 only for upgrade purposes.

For more information on supported versions, see the [Red Hat AMQ 7 Component Details Page](#) on the Customer Portal.

## 1.2. ZOOKEEPER 3.5.8 SUPPORT

Kafka version 2.5.0 requires ZooKeeper version 3.5.8.

You do **not** need to manually upgrade to ZooKeeper 3.5.8; the Cluster Operator performs the ZooKeeper upgrade when it [upgrades Kafka brokers](#). However, you might notice some additional rolling updates during this procedure.

## 1.3. OPENSIFT 4.X DISCONNECTED INSTALLATION

Support for *disconnected installation* on OpenShift 4.x moves out of Technology Preview to a generally available component of AMQ Streams.

You can perform a disconnected installation of AMQ Streams when your OpenShift cluster is being used as a *disconnected cluster* on a restricted network.

For a disconnected installation, you obtain the required images and push them to your container registry locally. If you are using the Operator Lifecycle Manager (OLM) this means disabling the default sources used by the OperatorHub and creating local mirrors to install AMQ Streams from local sources.

See [Using Operator Lifecycle Manager on restricted networks](#).

## 1.4. MIRRORMAKER 2.0

Support for MirrorMaker 2.0 moves out of Technology Preview to a generally available component of AMQ Streams.

MirrorMaker 2.0 is based on the Kafka Connect framework, with *connectors* managing the transfer of data between clusters.

MirrorMaker 2.0 uses:

- Source cluster configuration to consume data from the source cluster
- Target cluster configuration to output data to the target cluster

MirrorMaker 2.0 introduces an entirely new way of replicating data in clusters. If you choose to use MirrorMaker 2.0, there is currently no legacy support, so any resources must be manually converted into the new format.

See [Using AMQ Streams with MirrorMaker 2.0](#) .

## 1.5. DEBEZIUM FOR CHANGE DATA CAPTURE INTEGRATION

Red Hat Debezium is a distributed change data capture platform. It captures row-level changes in databases, creates change event records, and streams the records to Kafka topics. Debezium is built on Apache Kafka. You can deploy and integrate Debezium with AMQ Streams. Following a deployment of AMQ Streams, you deploy Debezium as a connector configuration through Kafka Connect. Debezium passes change event records to AMQ Streams on OpenShift. Applications can read these *change event streams* and access the change events in the order in which they occurred.

Debezium has multiple uses, including:

- Data replication
- Updating caches and search indexes
- Simplifying monolithic applications
- Data integration
- Enabling streaming queries

Debezium provides connectors (based on Kafka Connect) for the following common databases:

- MySQL
- PostgreSQL
- SQL Server
- MongoDB

For more information on deploying Debezium with AMQ Streams, refer to the [product documentation](#).

## 1.6. SERVICE REGISTRY

You can use Service Registry as a centralized store of service schemas for data streaming. For Kafka, you can use Service Registry to store *Apache Avro* or JSON schema.

Service Registry provides a REST API and a Java REST client to register and query the schemas from client applications through server-side endpoints.

Using Service Registry decouples the process of managing schemas from the configuration of client applications. You enable an application to use a schema from the registry by specifying its URL in the client code.

For example, the schemas to serialize and deserialize messages can be stored in the registry, which are then referenced from the applications that use them to ensure that the messages that they send and receive are compatible with those schemas.

Kafka client applications can push or pull their schemas from Service Registry at runtime.

See [Managing schemas with Service Registry](#).

## CHAPTER 2. ENHANCEMENTS

The enhancements added in this release are outlined below.

### 2.1. KAFKA 2.5.0 ENHANCEMENTS

For an overview of the enhancements introduced with Kafka 2.5.0, refer to the [Kafka 2.5.0 Release Notes](#).

### 2.2. ZOOKEEPER ENHANCEMENTS

Moving to support for ZooKeeper 3.5.\* versions means that it is no longer necessary to use TLS sidecars in ZooKeeper pods. The sidecars were removed, and native ZooKeeper support for TLS is now used.

### 2.3. EXPANDED OAUTH 2.0 AUTHENTICATION CONFIGURATION OPTIONS

New configuration options make it possible to integrate with a wider set of authorization servers.

Depending on how you apply OAuth 2.0 authentication, and the type of authorization server, there are additional (optional) configuration settings you can use.

#### Additional configuration options for Kafka brokers

```
# ...
authentication:
  type: oauth
  # ...
  checkIssuer: false 1
  fallbackUserNameClaim: client_id 2
  fallbackUserNamePrefix: client-account- 3
  validTokenType: bearer 4
  userInfoEndpointUri: https://AUTH-SERVER-ADDRESS/auth/realms/external/protocol/openid-
connect/userinfo 5
```

- 1** If your authorization server does not provide an **iss** claim, it is not possible to perform an issuer check. In this situation, set **checkIssuer** to **false** and do not specify a **validIssuerUri**. Default is **true**.
- 2** An authorization server may not provide a single attribute to identify both regular users and clients. A client authenticating in its own name might provide a *client ID*. But a user authenticating using a username and password, to obtain a refresh token or an access token, might provide a *username* attribute in addition to a client ID. Use this fallback option to specify the username claim (attribute) to use if a primary user ID attribute is not available.
- 3** In situations where **fallbackUserNameClaim** is applicable, it may also be necessary to prevent name collisions between the values of the username claim, and those of the fallback username claim. Consider a situation where a client called **producer** exists, but also a regular user called **producer** exists. In order to differentiate between the two, you can use this property to add a prefix to the user ID of the client.
- 4** (Only applicable when using an introspection endpoint URI) Depending on the authorization server you are using, the introspection endpoint may or may not return the *token type* attribute, or it may

contain different values. You can specify a valid token type value that the response from the introspection endpoint has to contain.

- 5 (Only applicable when using an introspection endpoint URI) The authorization server may be configured or implemented in such a way to not provide any identifiable information in an Introspection Endpoint response. In order to obtain the user ID, you can configure the URI of the **userinfo** endpoint as a fallback. The **userNameClaim**, **fallbackUserNameClaim**, and **fallbackUserNamePrefix** settings are applied to the response of **userinfo** endpoint.

### Additional configuration options for Kafka components

```
# ...
spec:
  # ...
  authentication:
    # ...
    disableTlsHostnameVerification: true
    checkAccessTokenType: false
    accessTokensJwt: false
    scope: any 1
```

- 1 The **scope** for requesting the token from the token endpoint. An authorization server may require a client to specify the scope.

See [Configuring OAuth 2.0 support for Kafka brokers](#) and [Configuring OAuth 2.0 for Kafka components](#).

## 2.4. METRICS FOR THE CLUSTER OPERATOR, TOPIC OPERATOR AND USER OPERATOR

The Prometheus server is not supported as part of the AMQ Streams distribution. However, the Prometheus endpoint and JMX exporter used to expose the metrics are supported.

As well as monitoring Kafka components, you can now add metrics configuration to monitor the Cluster Operator, Topic Operator and User Operator.

An example Grafana dashboard is provided, which allows you to view the following operator metrics exposed by Prometheus:

- The number of custom resources being processed
- The number of reconciliations being processed
- JVM metrics

See [Introducing Metrics to Kafka](#).

## 2.5. SSL CONFIGURATION OPTIONS

You can now run external listeners on specific ciphers for a TLS version.

For Kafka components running on AMQ Streams, you can use the three allowed **ssl** configuration options to run external listeners with a specific cipher suite for a TLS version. A cipher suite combines algorithms for secure connection and data transfer.

The example here shows the configuration for a Kafka resource:

```
apiVersion: kafka.strimzi.io/v1beta1
kind: Kafka
metadata:
  name: my-cluster
spec:
  # ...
  config: ❶
  # ...
  ssl.cipher.suites: "TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384" ❷
  ssl.enabled.protocols: "TLSv1.2" ❸
  ssl.protocol: "TLSv1.2" ❹
```

❷ The cipher suite for TLS using a combination of **ECDHE** key exchange mechanism, **RSA** authentication algorithm, **AES** bulk encryption algorithm and **SHA384** MAC algorithm.

❸ The SSL protocol **TLSv1.2** is enabled.

❹ Specifies the **TLSv1.2** protocol to generate the SSL context.

See [Custom Resource API Reference](#).

## 2.6. CROSS-ORIGIN RESOURCE SHARING (CORS) FOR KAFKA BRIDGE

You can now enable and define access control for the Kafka Bridge through Cross-Origin Resource Sharing (CORS). CORS is a HTTP mechanism that allows browser access to selected resources from more than one origin. To configure CORS, you define a list of allowed resource origins and HTTP methods to access them. Additional HTTP headers in requests [describe the origins that are permitted access to the Kafka cluster](#).

### HTTP configuration for the Kafka Bridge

```
apiVersion: kafka.strimzi.io/v1alpha1
kind: KafkaBridge
metadata:
  name: my-bridge
spec:
  # ...
  http:
    port: 8080
    cors:
      allowedOrigins: "https://strimzi.io" ❶
      allowedMethods: "GET,POST,PUT,DELETE,OPTIONS,PATCH" ❷
  # ...
```

❶ Comma-separated list of allowed CORS origins. You can use a URL or a Java regular expression.

❷ Comma-separated list of allowed HTTP methods for CORS.

See [Kafka Bridge HTTP configuration](#).

## CHAPTER 3. TECHNOLOGY PREVIEWS

### IMPORTANT

Technology Preview features are not supported with Red Hat production service-level agreements (SLAs) and might not be functionally complete; therefore, Red Hat does not recommend implementing any Technology Preview features in production environments. This Technology Preview feature provides early access to upcoming product innovations, enabling you to test functionality and provide feedback during the development process. For more information about support scope, see [Technology Preview Features Support Scope](#).

### 3.1. CLUSTER REBALANCING WITH CRUISE CONTROL

#### NOTE

This is a Technology Preview feature.

You can now deploy [Cruise Control](#) to your AMQ Streams cluster and use it to rebalance the Kafka cluster. Cruise Control helps to reduce the time and effort involved in running an efficient and balanced Kafka cluster.

Cruise Control is deployed as part of the configuration of a **Kafka** resource. Example YAML configuration files for Cruise Control are provided in [examples/cruise-control/](#).

By deploying an instance of Cruise Control to each Kafka cluster, you can:

- Generate optimization proposals from multiple optimization goals
- Rebalance a Kafka cluster based on an optimization proposal

Other Cruise Control features are not currently supported, including anomaly detection, notifications, write-your-own goals, and changing the topic replication factor.

See [Cruise Control](#).

There is a known issue related to setting user-provided optimization goals. See [Chapter 6, Known issues](#).

### 3.2. OAUTH 2.0 AUTHORIZATION

#### NOTE

This is a Technology Preview feature.

If you are using OAuth 2.0 for token-based authentication, you can now also use OAuth 2.0 authorization rules to constrain client access to Kafka brokers.

AMQ Streams supports the use of OAuth 2.0 token-based authorization through Red Hat Single Sign-On [Authorization Services](#), which allows you to manage security policies and permissions centrally.

Security policies and permissions defined in Red Hat Single Sign-On are used to grant access to resources on Kafka brokers. Users and clients are matched against policies that permit access to perform specific actions on Kafka brokers.

See [Using OAuth 2.0 token-based authorization](#) .

## CHAPTER 4. DEPRECATED FEATURES

The features deprecated in this release, and that were supported in previous releases of AMQ Streams, are outlined below.

### 4.1. API VERSIONS

In the AMQ Streams 1.2 release, the **v1alpha1** versions of the following resources were deprecated and replaced by **v1beta1**:

- **Kafka**
- **KafkaConnect**
- **KafkaConnectS2I**
- **KafkaMirrorMaker**
- **KafkaTopic**
- **KafkaUser**

In the next release, the **v1alpha1** versions of these resources will be removed. For guidance on upgrading the resources, see [AMQ Streams resource upgrades](#).

## CHAPTER 5. FIXED ISSUES

The following table lists the issues fixed in AMQ Streams 1.5.

Issue Number	Description
<a href="#">ENTMQST-622</a>	Refactor <b>SimpleAclOperator</b> to make use of Admin Client API
<a href="#">ENTMQST-643</a>	Fix to generate new cluster or client secret/key when CA key deleted
<a href="#">ENTMQST-1337</a>	StorageDiff should handle scaling nodes up and down
<a href="#">ENTMQST-1556</a>	Exponential backoff in KafkaRoller sometimes takes 20+ minutes
<a href="#">ENTMQST-1557</a>	Improve the logging in KafkaRoller class
<a href="#">ENTMQST-1691</a>	KafkaConnectS2I doesn't do rolling update after resources edit
<a href="#">ENTMQST-1740</a>	Automate ZooKeeper scaling
<a href="#">ENTMQST-1835</a>	Propagate all labels from template
<a href="#">ENTMQST-1839</a>	When KafkaConnect is scaled to 0 the reconciliation always timeouts
<a href="#">ENTMQST-1859</a>	Increase Cluster Operator memory limits from install YAMLS
<a href="#">ENTMQST-1877</a>	The CR of a topic returns the wrong status after decreasing partitions
<a href="#">ENTMQST-1888</a>	The CR of a topic returns the wrong status after changing the value of <b>min.insync.replicas</b>
<a href="#">ENTMQST-1889</a>	Kafka Entity Operator has plain-text passwords in logs
<a href="#">ENTMQST-1922</a>	KafkaRoller blocks rolling update when topic with RF=1 and MIN-ISR=2 exists
<a href="#">ENTMQST-1927</a>	Cluster Operator fails to start on OCP
<a href="#">ENTMQST-1980</a>	Fix parsing of forbidden configuration options and their exceptions

Issue Number	Description
<a href="#">ENTMQST-2019</a>	Fix the namespaces in RBAC files for installing the Cluster Operator to watch all namespaces
<a href="#">ENTMQST-2022</a>	Kafka cluster is ending up with duplicate kafkaTopic after upgrade from 1.3 to 1.4

## CHAPTER 6. KNOWN ISSUES

This section lists the known issues for AMQ Streams 1.5.

### Issue Number

[ENTMQST-2079](#) - OperatorHub CSV does not expose port for metrics

### Description and workaround

The ports to collect Cluster Operator metrics are not exposed in the deployment configuration.

As a workaround, edit the ClusterServiceVersion (CSV) file of the AMQ Streams operator installed in OpenShift by adding this to **.spec.install.spec.deployments.spec.template.spec.containers**:

```
# ...
ports:
- containerPort: 8080
  name: http
# ...
```

### Issue Number

[ENTMQST-2060](#) - Cruise Control default **hard.goals** still include unsupported goals

### Description and workaround

If you create a **KafkaRebalance** custom resource containing one or more *supported* optimization goals in the **goals** field, Cruise Control returns the following error:

```
Missing hard goals [NetworkInboundCapacityGoal, DiskCapacityGoal, RackAwareGoal,
NetworkOutboundCapacityGoal, CpuCapacityGoal, ReplicaCapacityGoal] in the provided goals...
```

To workaround this error, do one of the following:

- Add **skipHardGoalCheck: true** to the **KafkaRebalance** custom resource:

```
apiVersion: kafka.strimzi.io/v1alpha1
kind: KafkaRebalance
metadata:
  name: my-rebalance
  labels:
    strimzi.io/cluster: my-cluster
spec:
  goals:
  - NetworkInboundCapacityGoal
  - DiskCapacityGoal
  - RackAwareGoal
  - NetworkOutboundCapacityGoal
  - ReplicaCapacityGoal
  skipHardGoalCheck: true
```

- Specify the following hard goals in the the **cruiseControl** property in the **Kafka** resource:

```
apiVersion: kafka.strimzi.io/v1beta1
kind: Kafka
```

```
metadata:  
  name: my-cluster  
spec:  
  cruiseControl:  
    config:  
      hard.goals: >  
        com.linkedin.kafka.cruisecontrol.analyzer.goals.RackAwareGoal,  
        com.linkedin.kafka.cruisecontrol.analyzer.goals.ReplicaCapacityGoal,  
        com.linkedin.kafka.cruisecontrol.analyzer.goals.DiskCapacityGoal,  
        com.linkedin.kafka.cruisecontrol.analyzer.goals.NetworkInboundCapacityGoal,  
        com.linkedin.kafka.cruisecontrol.analyzer.goals.NetworkOutboundCapacityGoal
```

## CHAPTER 7. SUPPORTED INTEGRATION PRODUCTS

AMQ Streams 1.5 supports integration with the following Red Hat products.

- **Red Hat Single Sign-On 7.4 and later** for OAuth 2.0 authentication and OAuth 2.0 authorization (as a Technology Preview)
- **Red Hat 3scale API Management 2.6 and later** to secure the Kafka Bridge and provide additional API management features
- **Red Hat Debezium 1.0 and later** for monitoring databases and creating event streams
- **Service Registry 2020-04 and later** as a centralized store of service schemas for data streaming

For information on the functionality these products can introduce to your AMQ Streams deployment, refer to the AMQ Streams 1.5 documentation.

## CHAPTER 8. IMPORTANT LINKS
