PREFACE

Thank you for your interest in Red Hat Ansible Automation Platform. Ansible Automation Platform is a commercial offering that helps teams manage complex multi-tier deployments by adding control, knowledge, and delegation to Ansible-powered environments.

This guide helps you to understand the installation, migration and upgrade requirements for deploying the Ansible Automation Platform Operator on OpenShift Container Platform.

PROVIDING FEEDBACK ON RED HAT DOCUMENTATION

If you have a suggestion to improve this documentation, or find an error, you can contact technical support at https://access.redhat.com to open a request.

CHAPTER 1. PLANNING YOUR RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR ON RED HAT OPENSHIFT CONTAINER PLATFORM

Red Hat Ansible Automation Platform is supported on both Red Hat Enterprise Linux and Red Hat Openshift.

OpenShift operators help install and automate day-2 operations of complex, distributed software on Red Hat OpenShift Container Platform. The Ansible Automation Platform Operator enables you to deploy and manage Ansible Automation Platform components on Red Hat OpenShift Container Platform.

You can use this section to help plan your Red Hat Ansible Automation Platform installation on your Red Hat OpenShift Container Platform environment. Before installing, review the supported installation scenarios to determine which meets your requirements.

1.1. ABOUT ANSIBLE AUTOMATION PLATFORM OPERATOR

The Ansible Automation Platform Operator provides cloud-native, push-button deployment of new Ansible Automation Platform instances in your OpenShift environment. The Ansible Automation Platform Operator includes resource types to deploy and manage instances of automation controller and private automation hub. It also includes automation controller job resources for defining and launching jobs inside your automation controller deployments.

Deploying Ansible Automation Platform instances with a Kubernetes native operator offers several advantages over launching instances from a playbook deployed on Red Hat OpenShift Container Platform, including upgrades and full lifecycle support for your Red Hat Ansible Automation Platform deployments.

You can install the Ansible Automation Platform Operator from the Red Hat Operators catalog in OperatorHub.

For information about the Ansible Automation Platform Operator infrastructure topology see Container topologies in *Tested deployment models*.

1.2. OPENSHIFT CONTAINER PLATFORM VERSION COMPATIBILITY

The Ansible Automation Platform Operator to install Ansible Automation Platform 2.5 is available on OpenShift Container Platform 4.12 through to 4.17 and later versions.

Additional resources

• See the Red Hat Ansible Automation Platform Life Cycle for the most current compatibility details.

1.3. SUPPORTED INSTALLATION SCENARIOS FOR RED HAT OPENSHIFT CONTAINER PLATFORM

You can use the OperatorHub on the Red Hat OpenShift Container Platform web console to install Ansible Automation Platform Operator.

Alternatively, you can install Ansible Automation Platform Operator from the OpenShift Container Platform command-line interface (CLI), **oc**. See Installing Red Hat Ansible Automation Platform Operator from the OpenShift Container Platform CLI for help with this.

After you have installed Ansible Automation Platform Operator you must create an **Ansible Automation Platform** custom resource (CR). This enables you to manage Ansible Automation Platform components from a single unified interface known as the platform gateway. As of version 2.5, you must create an Ansible Automation Platform CR, even if you have an existing automation controller, automation hub, or Event-Driven Ansible, components.

If existing components have already been deployed, you must specify these components on the Ansible Automation Platform CR. You must create the custom resource in the same namespace as the existing components.

Supported scenarios	Supported scenarios with existing components
 Ansible Automation Platform CR for blank slate install with automation controller, automation hub, and Event-Driven Ansible enabled Ansible Automation Platform CR with just 	• Ansible Automation Platform CR created in the same namespace as an existing automation controller CR with the automation controller name specified on the Ansible Automation Platform CR spec
automation controller enabled	 Same with automation controller and automation hub
 Ansible Automation Platform CR with just automation controller, automation hub enabled 	• Same with automation controller, automation hub, and Event-Driven Ansible
 Ansible Automation Platform CR with just automation controller, Event-Driven Ansible enabled 	 Same with automation controller and Event- Driven Ansible

1.4. CUSTOM RESOURCES

You can define custom resources for each primary installation workflows.

1.5. ADDITIONAL RESOURCES

• See Understanding OperatorHub to learn more about OpenShift Container Platform OperatorHub.

CHAPTER 2. INSTALLING THE RED HAT ANSIBLE AUTOMATION PLATFORM ON RED HAT OPENSHIFT CONTAINER PLATFORM

Prerequisites

- You have installed the Red Hat Ansible Automation Platform catalog in OperatorHub.
- You have created a **StorageClass** object for your platform and a persistent volume claim (PVC) with **ReadWriteMany** access mode. See Dynamic provisioning for details.
- To run Red Hat OpenShift Container Platform clusters on Amazon Web Services (AWS) with **ReadWriteMany** access mode, you must add NFS or other storage.
 - For information about the AWS Elastic Block Store (EBS) or to use the **aws-ebs** storage class, see Persistent storage using AWS Elastic Block Store .
 - To use multi-attach **ReadWriteMany** access mode for AWS EBS, see Attaching a volume to multiple instances with Amazon EBS Multi-Attach.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **OperatorHub**.
- 3. Search for Ansible Automation Platform and click **Install**.
- 4. Select an Update Channel:
 - **stable-2.x**: installs a namespace-scoped operator, which limits deployments of automation hub and automation controller instances to the namespace the operator is installed in. This is suitable for most cases. The stable-2.x channel does not require administrator privileges and utilizes fewer resources because it only monitors a single namespace.
 - **stable-2.x-cluster-scoped**: deploys automation hub and automation controller across multiple namespaces in the cluster and requires administrator privileges for all namespaces in the cluster.
- 5. Select Installation Mode, Installed Namespace, and Approval Strategy.
- 6. Click Install.

The installation process begins. When installation finishes, a modal appears notifying you that the Ansible Automation Platform Operator is installed in the specified namespace.

• Click **View Operator** to view your newly installed Ansible Automation Platform Operator.

IMPORTANT

You can only install a single instance of the Ansible Automation Platform Operator into a single namespace. Installing multiple instances in the same namespace can lead to improper operation for both operator instances.

CHAPTER 3. INSTALLING RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR FROM THE OPENSHIFT CONTAINER PLATFORM CLI

Use these instructions to install the Ansible Automation Platform Operator on Red Hat OpenShift Container Platform from the OpenShift Container Platform command-line interface (CLI) using the **oc** command.

3.1. PREREQUISITES

- Access to Red Hat OpenShift Container Platform using an account with operator installation permissions.
- The OpenShift Container Platform CLI **oc** command is installed on your local system. Refer to Installing the OpenShift CLI in the Red Hat OpenShift Container Platform product documentation for further information.

3.2. SUBSCRIBING A NAMESPACE TO AN OPERATOR USING THE OPENSHIFT CONTAINER PLATFORM CLI

Use this procedure to subscribe a namespace to an operator.

IMPORTANT

You can only subscribe a single instance of the Ansible Automation Platform Operator into a single namespace. Subscribing multiple instances in the same namespace can lead to improper operation for both operator instances.

Procedure

1. Create a project for the operator.

- oc new-project ansible-automation-platform
- 2. Create a file called **sub.yaml**.
- 3. Add the following YAML code to the **sub.yaml** file.

```
apiVersion: v1
kind: Namespace
metadata:
labels:
openshift.io/cluster-monitoring: "true"
name: ansible-automation-platform
----
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
name: ansible-automation-platform-operator
namespace: ansible-automation-platform
```

targetNamespaces: - ansible-automation-platform apiVersion: operators.coreos.com/v1alpha1 kind: Subscription metadata: name: ansible-automation-platform namespace: ansible-automation-platform spec: channel: 'stable-2.5' installPlanApproval: Automatic name: ansible-automation-platform-operator source: redhat-operators sourceNamespace: openshift-marketplace apiVersion: automationcontroller.ansible.com/v1beta1 kind: AutomationController metadata: name: example namespace: ansible-automation-platform spec: replicas: 1

This file creates a **Subscription** object called **ansible-automation-platform** that subscribes the **ansible-automation-platform** namespace to the **ansible-automation-platform-operator** operator.

It then creates an **AutomationController** object called *example* in the **ansible-automationplatform** namespace.

To change the automation controller name from **example**, edit the *name* field in the **kind: AutomationController** section of **sub.yaml** and replace *<automation_controller_name>* with the name you want to use:

apiVersion: automationcontroller.ansible.com/v1beta1 kind: AutomationController metadata: name: *<automation_controller_name>* namespace: ansible-automation-platform

4. Run the **oc apply** command to create the objects specified in the **sub.yaml** file:

oc apply -f sub.yaml

To verify that the namespace has been successfully subscribed to the **ansible-automation-platform-operator** operator, run the **oc get subs** command:

\$ oc get subs -n ansible-automation-platform

For further information about subscribing namespaces to operators, see Installing from OperatorHub using the CLI in the Red Hat OpenShift Container Platform *Operators* guide.

You can use the OpenShift Container Platform CLI to fetch the web address and the password of the Automation controller that you created.

3.3. FETCHING PLATFORM GATEWAY LOGIN DETAILS FROM THE OPENSHIFT CONTAINER PLATFORM CLI

To login to the platform gateway, you need the web address and the password.

3.3.1. Fetching the platform gateway web address

A Red Hat OpenShift Container Platform route exposes a service at a host name, so that external clients can reach it by name. When you created the platform gateway instance, a route was created for it. The route inherits the name that you assigned to the platform gateway object in the YAML file.

Use the following command to fetch the routes:

oc get routes -n <platform_namespace>

In the following example, the *example* platform gateway is running in the *ansible-automation-platform* namespace.

\$ oc get routes -n ansible-automation-platform

NAME HOST/PORT PATH SERVICES PORT TERMINATION WILDCARD example example-ansible-automation-platform.apps-crc.testing example-service http edge/Redirect None

The address for the platform gateway instance is **example-ansible-automation-platform.apps-crc.testing**.

3.3.2. Fetching the platform gateway password

The YAML block for the platform gateway instance in **sub.yaml** assigns values to the *name* and *admin_user* keys. Use these values in the following command to fetch the password for the platform gateway instance.

oc get secret/<your instance name>-<admin_user>-password -o yaml

The default value for *admin_user* is *admin*. Modify the command if you changed the admin username in **sub.yaml**.

The following example retrieves the password for a platform gateway object called *example*:

oc get secret/example-admin-password -o yaml

The password for the platform gateway instance is listed in the **metadata** field in the output:

\$ oc get secret/example-admin-password -o yaml

apiVersion: v1 data: kind: Secret metadata: labels:

app.kubernetes.io/component: aap app.kubernetes.io/name: example app.kubernetes.io/operator-version: "" app.kubernetes.io/part-of: example name: example-admin-password namespace: ansible-automation-platform

3.4. ADDITIONAL RESOURCES

• For more information on running operators on OpenShift Container Platform, navigate to the OpenShift Container Platform product documentation and click the Operators - Working with Operators in OpenShift Container Platform guide.

CHAPTER 4. CONFIGURING THE RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR ON RED HAT OPENSHIFT CONTAINER PLATFORM

The platform gateway for Ansible Automation Platform enables you to manage the following Ansible Automation Platform components to form a single user interface:

- Automation controller
- Automation hub
- Event-Driven Ansible
- Red Hat Ansible Lightspeed (This feature is disabled by default, you must opt in to use it.)

Before you can deploy the platform gateway you must have Ansible Automation Platform Operator installed in a namespace. If you have not installed Ansible Automation Platform Operator see Installing the Red Hat Ansible Automation Platform Operator on Red Hat OpenShift Container Platform.

NOTE

Platform gateway is only available under Ansible Automation Platform Operator version 2.5. Every component deployed under Ansible Automation Platform Operator 2.5 will also default to version 2.5.

If you have the Ansible Automation Platform Operator and some or all of the Ansible Automation Platform components installed see Deploying the platform gateway with existing Ansible Automation Platform components for how to proceed.

4.1. LINKING YOUR COMPONENTS TO THE PLATFORM GATEWAY

After installing the Ansible Automation Platform Operator in your namespace you can set up your **Ansible Automation Platform** instance. Then link all the platform components to a single user interface.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the **Details** tab.
- 5. On the Ansible Automation Platform tile click Create instance.
- 6. From the **Create Ansible Automation Platform** page enter a name for your instance in the **Name** field.
- 7. Click **YAML view** and paste the following:

spec: controller: disabled: false eda: disabled: false

hub: disabled: false storage_type: file file_storage_storage_class: <read-write-many-storage-class> file_storage_size: 10Gi

8. Click Create.

Verification

Go to your Ansible Automation Platform Operator deployment and click **All instances** to verify if all instances deployed correctly. You should see the **Ansible Automation Platform** instance and the deployed **AutomationController**, **EDA**, and **AutomationHub** instances here.

Alternatively you can check by the command line, run: oc get route

4.2. ACCESSING THE PLATFORM GATEWAY

You should use the **Ansible Automation Platform** instance as your default. This instance links the automation controller, automation hub, and Event-Driven Ansible deployments to a single interface.

Procedure

To access your Ansible Automation Platform instance:

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Networking** \rightarrow **Routes**
- 3. Click the link under Location for Ansible Automation Platform.
- 4. This redirects you to the Ansible Automation Platform login page. Enter "admin" as your username in the **Username** field.
- 5. For the password you need to:
 - a. Go to to Workloads \rightarrow Secrets.
 - b. Click <your instance name>-admin-password and copy the password.
 - c. Paste the password into the **Password** field.
- 6. Click Login.
- 7. Apply your subscription:
 - a. Click Subscription manifest or Username/password.
 - b. Upload your manifest or enter your username and password.
 - c. Select your subscription from the **Subscription** list.

d. Click Next.

This redirects you to the Analytics page.

- 8. Click Next.
- 9. Select the I agree to the terms of the license agreement checkbox.
- 10. Click Next.

You now have access to the platform gateway user interface. If you cannot access the Ansible Automation Platform see Section 4.4, "Frequently asked questions on platform gateway" for help with troubleshooting and debugging.

4.3. DEPLOYING THE PLATFORM GATEWAY WITH EXISTING ANSIBLE AUTOMATION PLATFORM COMPONENTS

You can link any components of the Ansible Automation Platform, that you have already installed to a new **Ansible Automation Platform** instance.

The following procedure simulates a scenario where you have automation controller as an existing component and want to add automation hub and Event-Driven Ansible.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Click **Subscriptions** and edit your **Update channel** to **stable-2.5**.
- 5. Click **Details** and on the **Ansible Automation Platform** tile click **Create instance**.
- 6. From the **Create Ansible Automation Platform** page enter a name for your instance in the **Name** field.
- 7. Click **YAML view** and copy in the following:

storage_type: file
file_storage_storage_class: <your-read-write-many-storage-class>
file_storage_size: 10Gi

uncomment if using S3 storage for Content pod
storage_type: S3
object_storage_s3_secret: example-galaxy-object-storage

uncomment if using Azure storage for Content pod
storage_type: azure
object_storage_azure_secret: azure-secret-name
lightspeed:
 disabled: true

a. For new components, if you do not specify a name, a default name is generated.

8. Click Create.

9. To access your new instance, see Section 4.2, "Accessing the platform gateway".

NOTE

If you have an existing controller with a managed Postgres pod, after creating the **Ansible Automation Platform** resource your automation controller instance will continue to use that original Postgres pod. If you were to do a fresh install you would have a single Postgres managed pod for all instances.

4.4. FREQUENTLY ASKED QUESTIONS ON PLATFORM GATEWAY

If I delete my Ansible Automation Platform deployment will I still have access to Automation Controller?

No, automation controller, automation hub, and Event-Driven Ansible are nested within the deployment and are also deleted.

Something went wrong with my deployment but I'm not sure what, how can I find out?

You can follow along in the command line while the operator is reconciling, this can be helpful for debugging. Alternatively you can click into the deployment instance to see the status conditions being updated as the deployment goes on.

Is it still possible to view individual component logs?

When troubleshooting you should examine the **Ansible Automation Platform** instance for the main logs and then each individual component (**EDA**, **AutomationHub**, **AutomationController**) for more specific information.

Where can I view the condition of an instance?

To display status conditions click into the instance, and look under the **Details** or **Events** tab. Alternatively, to display the status conditions you can run the get command: **oc get automationcontroller <instance-name> -o jsonpath=Pipe "| jq"**

Can I track my migration in real time?

To help track the status of the migration or to understand why migration might have failed you can look at the migration logs as they are running. Use the logs command: **oc logs fresh-install-controller-migration-4.6.0-jwfm6 -f**

CHAPTER 5. CONFIGURING AUTOMATION CONTROLLER ON RED HAT OPENSHIFT CONTAINER PLATFORM WEB CONSOLE

You can use these instructions to configure the automation controller operator on Red Hat OpenShift Container Platform, specify custom resources, and deploy Ansible Automation Platform with an external database.

Automation controller configuration can be done through the automation controller extra_settings or directly in the user interface after deployment. However, it is important to note that configurations made in extra_settings take precedence over settings made in the user interface.

NOTE

When an instance of automation controller is removed, the associated PVCs are not automatically deleted. This can cause issues during migration if the new deployment has the same name as the previous one. Therefore, it is recommended that you manually remove old PVCs before deploying a new automation controller instance in the same namespace. See Finding and deleting PVCs for more information.

5.1. PREREQUISITES

- You have installed the Red Hat Ansible Automation Platform catalog in Operator Hub.
- For automation controller, a default StorageClass must be configured on the cluster for the operator to dynamically create needed PVCs. This is not necessary if an external PostgreSQL database is configured.
- For Hub a StorageClass that supports ReadWriteMany must be available on the cluster to dynamically created the PVC needed for the content, redis and api pods. If it is not the default StorageClass on the cluster, you can specify it when creating your AutomationHub object.

5.1.1. Configuring your controller image pull policy

Use this procedure to configure the image pull policy on your automation controller.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Go to **Operators** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the Automation Controller tab.
- 5. For new instances, click **Create AutomationController**.
 - a. For existing instances, you can edit the YAML view by clicking the : icon and then **Edit AutomationController**.
- 6. Click advanced Configuration. Under Image Pull Policy, click on the radio button to select
 - Always

- Never
- IfNotPresent
- 7. To display the option under Image Pull Secrets, click the arrow.
 - a. Click + beside Add Image Pull Secret and enter a value.
- 8. To display fields under the **Web container resource requirements** drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 9. To display fields under the **Task container resource requirements** drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 10. To display fields under the **EE Control Plane container resource requirements**drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 11. To display fields under the **PostgreSQL init container resource requirements (when using a managed service)** drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 12. To display fields under the **Redis container resource requirements** drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 13. To display fields under the **PostgreSQL container resource requirements (when using a managed instance)*** drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 14. To display the **PostgreSQL container storage requirements (when using a managed instance)** drop-down list, click the arrow.
 - a. Under Limits, and Requests, enter values for CPU cores, Memory, and Storage.
- 15. Under Replicas, enter the number of instance replicas.
- 16. Under **Remove used secrets on instance removal**, select **true** or **false**. The default is false.
- 17. Under Preload instance with data upon creation select true or false. The default is true.

5.1.2. Configuring your controller LDAP security

You can configure your LDAP SSL configuration for automation controller through any of the following options:

- The automation controller user interface.
- The platform gateway user interface. See the Configuring LDAP authentication section of the *Access management and authentication* guide for additional steps.

• The following procedure steps.

Procedure

1. If you do not have a **Idap_cacert_secret**, you can create one with the following command:

\$ oc create secret generic <resourcename>-custom-certs \ --from-file=Idap-ca.crt=<PATH/TO/YOUR/CA/PEM/FILE> \

Modify this to point to where your CA cert is stored.

This will create a secret that looks like this:

\$ oc get secret/mycerts -o yaml apiVersion: v1
data:
ldap-ca.crt: <mysecret> 1</mysecret>
kind: Secret
metadata:
name: mycerts
namespace: awx
type: Opaque

Automation controller looks for the data field **Idap-ca.crt** in the specified secret when using the **Idap_cacert_secret**.

- 2. Under LDAP Certificate Authority Trust Bundle click the drop-down menu and select your **Idap_cacert_secret**.
- 3. Under LDAP Password Secret, click the drop-down menu and select a secret.
- 4. Under **EE Images Pull Credentials Secret**, click the drop-down menu and select a secret.
- 5. Under Bundle Cacert Secret, click the drop-down menu and select a secret.
- 6. Under Service Type, click the drop-down menu and select
 - ClusterIP
 - LoadBalancer
 - NodePort

5.1.3. Configuring your automation controller operator route options

The Red Hat Ansible Automation Platform operator installation form allows you to further configure your automation controller operator route options under **Advanced configuration**.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **Installed Operators**.

- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the Automation Controller tab.
- 5. For new instances, click **Create AutomationController**.
 - a. For existing instances, you can edit the YAML view by clicking the : icon and then **Edit AutomationController**.
- 6. Click Advanced configuration.
- 7. Under Ingress type, click the drop-down menu and select Route.
- 8. Under Route DNS host, enter a common host name that the route answers to.
- 9. Under **Route TLS termination mechanism**, click the drop-down menu and select **Edge** or **Passthrough**. For most instances **Edge** should be selected.
- 10. Under **Route TLS credential secret**, click the drop-down menu and select a secret from the list.
- 11. Under **Enable persistence for/var/lib/projects directory** select either true or false by moving the slider.

5.1.4. Configuring the ingress type for your automation controller operator

The Ansible Automation Platform Operator installation form allows you to further configure your automation controller operator ingress under **Advanced configuration**.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** → **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the Automation Controller tab.
- 5. For new instances, click **Create AutomationController**.
 - a. For existing instances, you can edit the YAML view by clicking the : icon and then **Edit AutomationController**.
- 6. Click Advanced configuration.
- 7. Under Ingress type, click the drop-down menu and select Ingress.
- 8. Under Ingress annotations, enter any annotations to add to the ingress.
- 9. Under Ingress TLS secret, click the drop-down menu and select a secret from the list.

After you have configured your automation controller operator, click **Create** at the bottom of the form view. Red Hat OpenShift Container Platform will now create the pods. This may take a few minutes.

You can view the progress by navigating to **Workloads** → **Pods** and locating the newly created instance.

Verification

Verify that the following operator pods provided by the Ansible Automation Platform Operator installation from automation controller are running:

Operator manager controllers	Automation controller	Automation hub	Event-Driven Ansible (EDA)
The operator manager controllers for each of the three operators, include the following:	After deploying automation controller, you can see the addition of the following pods: • controller- postgres • controller-web • controller-task	After deploying automation hub, you can see the addition of the following pods:	After deploying EDA, you can see the addition of the following pods: • eda-activation- worker • eda-default- worker • eda-event- stream • eda-scheduler

NOTE

A missing pod can indicate the need for a pull secret. Pull secrets are required for protected or private image registries. See Using image pull secrets for more information. You can diagnose this issue further by running **oc describe pod <pod-name>** to see if there is an ImagePullBackOff error on that pod.

5.2. CONFIGURING AN EXTERNAL DATABASE FOR AUTOMATION CONTROLLER ON RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR

For users who prefer to deploy Ansible Automation Platform with an external database, they can do so by configuring a secret with instance credentials and connection information, then applying it to their cluster using the **oc create** command.

By default, the Ansible Automation Platform Operator automatically creates and configures a managed PostgreSQL pod in the same namespace as your Ansible Automation Platform deployment. You can deploy Ansible Automation Platform with an external database instead of the managed PostgreSQL pod that the Ansible Automation Platform Operator automatically creates.

Using an external database lets you share and reuse resources and manually manage backups, upgrades, and performance optimizations.

NOTE

The same external database (PostgreSQL instance) can be used for both automation hub and automation controller as long as the database names are different. In other words, you can have multiple databases with different names inside a single PostgreSQL instance.

The following section outlines the steps to configure an external database for your automation controller on a Ansible Automation Platform Operator.

Prerequisite

The external database must be a PostgreSQL database that is the version supported by the current release of Ansible Automation Platform.

NOTE

Ansible Automation Platform 2.5 supports PostgreSQL 15.

Procedure

The external postgres instance credentials and connection information must be stored in a secret, which is then set on the automation controller spec.

1. Create a **postgres_configuration_secret** YAML file, following the template below:

apiVersion: v1
kind: Secret
metadata:
name: external-postgres-configuration
namespace: <target_namespace> 1</target_namespace>
stringData:
host: " <external_ip_or_url_resolvable_by_the_cluster>" 2</external_ip_or_url_resolvable_by_the_cluster>
port: " <external_port>" 3</external_port>
database: " <desired_database_name>"</desired_database_name>
username: " <username_to_connect_as>"</username_to_connect_as>
password: " <password_to_connect_with>" 4</password_to_connect_with>
sslmode: "prefer" 5
type: "unmanaged"
type: Opaque

Namespace to create the secret in. This should be the same namespace you want to deploy to.

The resolvable hostname for your database node.

External port defaults to 5432.

Value for variable **password** should not contain single or double quotes (', ") or backslashes (\) to avoid any issues during deployment, backup or restoration.

The variable **ssimode** is valid for **external** databases only. The allowed values are: **prefer**, **disable**, **allow**, **require**, **verify-ca**, and **verify-full**.

2. Apply **external-postgres-configuration-secret.yml** to your cluster using the **oc create** command.

\$ oc create -f external-postgres-configuration-secret.yml

3. When creating your **AutomationController** custom resource object, specify the secret on your spec, following the example below:

```
apiVersion: automationcontroller.ansible.com/v1beta1
kind: AutomationController
metadata:
name: controller-dev
spec:
postgres_configuration_secret: external-postgres-configuration
```

5.3. FINDING AND DELETING PVCS

A persistent volume claim (PVC) is a storage volume used to store data that automation hub and automation controller applications use. These PVCs are independent from the applications and remain even when the application is deleted. If you are confident that you no longer need a PVC, or have backed it up elsewhere, you can manually delete them.

Procedure

1. List the existing PVCs in your deployment namespace:

oc get pvc -n <namespace>

- 2. Identify the PVC associated with your previous deployment by comparing the old deployment name and the PVC name.
- 3. Delete the old PVC:

oc delete pvc -n <namespace> <pvc-name>

5.4. ADDITIONAL RESOURCES

• For more information on running operators on OpenShift Container Platform, navigate to the OpenShift Container Platform product documentation and click the Operators - Working with Operators in OpenShift Container Platform guide.

CHAPTER 6. CONFIGURING AUTOMATION HUB ON RED HAT OPENSHIFT CONTAINER PLATFORM WEB CONSOLE

You can use these instructions to configure the automation hub operator on Red Hat OpenShift Container Platform, specify custom resources, and deploy Ansible Automation Platform with an external database.

Automation hub configuration can be done through the automation hub pulp_settings or directly in the user interface after deployment. However, it is important to note that configurations made in pulp_settings take precedence over settings made in the user interface. Hub settings should always be set as lowercase on the Hub custom resource specification.

NOTE

When an instance of automation hub is removed, the PVCs are not automatically deleted. This can cause issues during migration if the new deployment has the same name as the previous one. Therefore, it is recommended that you manually remove old PVCs before deploying a new automation hub instance in the same namespace. See Finding and deleting PVCs for more information.

6.1. PREREQUISITES

• You have installed the Ansible Automation Platform Operator in Operator Hub.

6.1.1. Storage options for Ansible Automation Platform Operator installation on Red Hat OpenShift Container Platform

Automation hub requires **ReadWriteMany** file-based storage, Azure Blob storage, or Amazon S3compliant storage for operation so that multiple pods can access shared content, such as collections.

The process for configuring object storage on the **AutomationHub** CR is similar for Amazon S3 and Azure Blob Storage.

If you are using file-based storage and your installation scenario includes automation hub, ensure that the storage option for Ansible Automation Platform Operator is set to **ReadWriteMany**. **ReadWriteMany** is the default storage option.

In addition, OpenShift Data Foundation provides a **ReadWriteMany** or S3-compliant implementation. Also, you can set up NFS storage configuration to support **ReadWriteMany**. This, however, introduces the NFS server as a potential, single point of failure.

Additional resources

- Persistent storage using NFS in the OpenShift Container Platform Storage guide
- IBM's How do I create a storage class for NFS dynamic storage provisioning in an OpenShift environment?

6.1.1.1. Provisioning OCP storage with ReadWriteMany access mode

To ensure successful installation of Ansible Automation Platform Operator, you must provision your storage type for automation hub initially to **ReadWriteMany** access mode.

Procedure

- 1. Go to **Storage** \rightarrow **PersistentVolume**.
- 2. Click btn: Create PersistentVolume.
- 3. In the first step, update the **accessModes** from the default **ReadWriteOnce** to **ReadWriteMany**.
 - a. See Provisioning to update the access mode. for a detailed overview.
- 4. Complete the additional steps in this section to create the persistent volume claim (PVC).

6.1.1.2. Configuring object storage on Amazon S3

Red Hat supports Amazon Simple Storage Service (S3) for automation hub. You can configure it when deploying the **AutomationHub** custom resource (CR), or you can configure it for an existing instance.

Prerequisites

- Create an Amazon S3 bucket to store the objects.
- Note the name of the S3 bucket.

Procedure

1. Create a Kubernetes secret containing the AWS credentials and connection details, and the name of your Amazon S3 bucket. The following example creates a secret called **test-s3**:

\$ oc -n \$HUB_NAMESPACE apply -f- <<EOF
apiVersion: v1
kind: Secret
metadata:
 name: 'test-s3'
stringData:
 s3-access-key-id: \$S3_ACCESS_KEY_ID
 s3-secret-access-key: \$S3_SECRET_ACCESS_KEY
 s3-bucket-name: \$S3_BUCKET_NAME
 s3-region: \$S3_REGION
EOF</pre>

2. Add the secret to the automation hub custom resource (CR) **spec**:

```
spec:
object_storage_s3_secret: test-s3
```

3. If you are applying this secret to an existing instance, restart the API pods for the change to take effect. **<hub-name>** is the name of your hub instance.

\$ oc -n \$HUB_NAMESPACE delete pod -l app.kubernetes.io/name=<hub-name>-api

6.1.1.3. Configuring object storage on Azure Blob

Red Hat supports Azure Blob Storage for automation hub. You can configure it when deploying the **AutomationHub** custom resource (CR), or you can configure it for an existing instance.

Prerequisites

- Create an Azure Storage blob container to store the objects.
- Note the name of the blob container.

Procedure

1. Create a Kubernetes secret containing the credentials and connection details for your Azure account, and the name of your Azure Storage blob container. The following example creates a secret called **test-azure**:

```
$ oc -n $HUB_NAMESPACE apply -f- <<EOF
apiVersion: v1
kind: Secret
metadata:
    name: 'test-azure'
stringData:
    azure-account-name: $AZURE_ACCOUNT_NAME
    azure-account-key: $AZURE_ACCOUNT_KEY
    azure-container: $AZURE_CONTAINER
    azure-container-path: $AZURE_CONTAINER_PATH
    azure-connection-string: $AZURE_CONNECTION_STRING
EOF</pre>
```

2. Add the secret to the automation hub custom resource (CR) **spec**:

spec: object_storage_azure_secret: test-azure

3. If you are applying this secret to an existing instance, restart the API pods for the change to take effect. **<hub-name>** is the name of your hub instance.

\$ oc -n \$HUB_NAMESPACE delete pod -l app.kubernetes.io/name=<hub-name>-api

6.1.2. Configure your automation hub operator route options

The Red Hat Ansible Automation Platform operator installation form allows you to further configure your automation hub operator route options under **Advanced configuration**.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the Automation Hub tab.
- 5. For new instances, click **Create AutomationHub**.

- a. For existing instances, you can edit the YAML view by clicking the : icon and then **Edit AutomationHub**.
- 6. Click Advanced configuration.
- 7. Under Ingress type, click the drop-down menu and select Route.
- 8. Under Route DNS host, enter a common host name that the route answers to.
- 9. Under **Route TLS termination mechanism**, click the drop-down menu and select **Edge** or **Passthrough**.
- 10. Under **Route TLS credential secret**, click the drop-down menu and select a secret from the list.

6.1.3. Configuring the ingress type for your automation hub operator

The Ansible Automation Platform Operator installation form allows you to further configure your automation hub operator ingress under **Advanced configuration**.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the Automation Hub tab.
- 5. For new instances, click **Create AutomationHub**.
 - a. For existing instances, you can edit the YAML view by clicking the : icon and then **Edit AutomationHub**.
- 6. Click Advanced Configuration.
- 7. Under Ingress type, click the drop-down menu and select Ingress.
- 8. Under Ingress annotations, enter any annotations to add to the ingress.
- 9. Under Ingress TLS secret, click the drop-down menu and select a secret from the list.

After you have configured your automation hub operator, click **Create** at the bottom of the form view. Red Hat OpenShift Container Platform will now create the pods. This may take a few minutes.

You can view the progress by navigating to **Workloads** → **Pods** and locating the newly created instance.

Verification

Verify that the following operator pods provided by the Ansible Automation Platform Operator installation from automation hub are running:

Operator manager controllers	automation controller	automation hub
The operator manager controllers for each of the 3 operators, include the following:	After deploying automation controller, you will see the addition of these pods:	After deploying automation hub, you will see the addition of these pods:
 automation-controller- operator-controller- manager 	controller	 hub-api hub-content
automation-hub- operator-controller-		hub-postgres
manager		hub-redis
 resource-operator- controller-manager 		 hub-worker

NOTE

A missing pod can indicate the need for a pull secret. Pull secrets are required for protected or private image registries. See Using image pull secrets for more information. You can diagnose this issue further by running **oc describe pod <pod-name>** to see if there is an ImagePullBackOff error on that pod.

6.2. CONFIGURING LDAP AUTHENTICATION FOR ANSIBLE AUTOMATION HUB ON OPENSHIFT CONTAINER PLATFORM

Configure LDAP authentication settings for Ansible Automation Platform on OpenShift Container Platform in the spec section of your Hub instance configuration file.

Procedure

• Use the following example to configure LDAP in your automation hub instance. For any blank fields, enter ``.

spec:
pulp_settings:
auth_ldap_user_attr_map:
email: "mail"
first_name: "givenName"
last_name: "sn"
auth_ldap_group_search_base_dn: 'cn=groups,cn=accounts,dc=example,dc=com'
auth_ldap_bind_dn:''
auth_ldap_bind_password: ' '
auth_ldap_group_search_filter: (objectClass=posixGroup)
auth_ldap_user_search_scope: SUBTREE
auth_ldap_server_uri: 'ldap://ldapserver:389'
authentication_backend_preset: ldap
auth_Idap_mirror_groups: 'True'
auth_ldap_user_search_base_dn: 'cn=users,cn=accounts,dc=example,dc=com'
auth_ldap_bind_password: 'ldappassword'

auth_ldap_user_search_filter: (uid=%(user)s)
auth_ldap_group_search_scope: SUBTREE
auth_ldap_user_flags_by_group: '@json {"is_superuser": "cn=toweradmin,cn=groups,cn=accounts,dc=example,dc=com"}'

NOTE

Do not leave any fields empty. For fields with no variable, enter `` to indicate a default value.

6.3. FINDING THE AUTOMATION HUB ROUTE

You can access the automation hub through the platform gateway or through the following procedure.

Procedure

- 1. Log into Red Hat OpenShift Container Platform.
- 2. Navigate to **Networking** \rightarrow **Routes**.
- 3. Under Location, click on the URL for your automation hub instance.

The automation hub user interface launches where you can sign in with the administrator credentials specified during the operator configuration process.

NOTE

If you did not specify an administrator password during configuration, one was automatically created for you. To locate this password, go to your project, select **Workloads** → **Secrets** and open controller-admin-password. From there you can copy the password and paste it into the Automation hub password field.

6.4. CONFIGURING AN EXTERNAL DATABASE FOR AUTOMATION HUB ON RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR

For users who prefer to deploy Ansible Automation Platform with an external database, they can do so by configuring a secret with instance credentials and connection information, then applying it to their cluster using the **oc create** command.

By default, the Ansible Automation Platform Operator automatically creates and configures a managed PostgreSQL pod in the same namespace as your Ansible Automation Platform deployment.

You can choose to use an external database instead if you prefer to use a dedicated node to ensure dedicated resources or to manually manage backups, upgrades, or performance tweaks.

NOTE

The same external database (PostgreSQL instance) can be used for both automation hub and automation controller as long as the database names are different. In other words, you can have multiple databases with different names inside a single PostgreSQL instance. The following section outlines the steps to configure an external database for your automation hub on a Ansible Automation Platform Operator.

Prerequisite

The external database must be a PostgreSQL database that is the version supported by the current release of Ansible Automation Platform.

NOTE

Ansible Automation Platform 2.5 supports PostgreSQL 15.

Procedure

The external postgres instance credentials and connection information will need to be stored in a secret, which will then be set on the automation hub spec.

1. Create a **postgres_configuration_secret** YAML file, following the template below:

apiVersion: v1
kind: Secret
metadata:
name: external-postgres-configuration
namespace: <target_namespace> 1</target_namespace>
stringData:
host: " <external_ip_or_url_resolvable_by_the_cluster>" 2</external_ip_or_url_resolvable_by_the_cluster>
port: " <external_port>" 3</external_port>
database: " <desired_database_name>"</desired_database_name>
username: " <username_to_connect_as>"</username_to_connect_as>
password: " <password_to_connect_with>" 4</password_to_connect_with>
sslmode: "prefer" 5
type: "unmanaged"
type: Opaque
Namespace to create the secret in. This should be the same

Namespace to create the secret in. This should be the same namespace you want to deploy to.

The resolvable hostname for your database node.

External port defaults to 5432.

4

Value for variable **password** should not contain single or double quotes (', ") or backslashes (\) to avoid any issues during deployment, backup or restoration.

The variable **ssimode** is valid for **external** databases only. The allowed values are: **prefer**, **disable**, **allow**, **require**, **verify-ca**, and **verify-full**.

2. Apply **external-postgres-configuration-secret.yml** to your cluster using the **oc create** command.

\$ oc create -f external-postgres-configuration-secret.yml

- 3. When creating your **AutomationHub** custom resource object, specify the secret on your spec, following the example below:
 - apiVersion: automationhub.ansible.com/v1beta1 kind: AutomationHub metadata: name: hub-dev spec: postgres_configuration_secret: external-postgres-configuration

6.4.1. Enabling the hstore extension for the automation hub PostgreSQL database

Added in Ansible Automation Platform 2.5, the database migration script uses **hstore** fields to store information, therefore the **hstore** extension to the automation hub PostgreSQL database must be enabled.

This process is automatic when using the Ansible Automation Platform installer and a managed PostgreSQL server.

If the PostgreSQL database is external, you must enable the **hstore** extension to the automation hub PostreSQL database manually before automation hub installation.

If the **hstore** extension is not enabled before automation hub installation, a failure is raised during database migration.

Procedure

1. Check if the extension is available on the PostgreSQL server (automation hub database).

\$ psql -d <automation hub database> -c "SELECT * FROM pg_available_extensions WHERE name='hstore'"

2. Where the default value for **<automation hub database>** is **automationhub**. **Example output withhstore** available:

Example output with hstore not available:

3. On a RHEL based server, the **hstore** extension is included in the **postgresql-contrib** RPM package, which is not installed automatically when installing the PostgreSQL server RPM package.

To install the RPM package, use the following command:

dnf install postgresql-contrib

4. Create the **hstore** PostgreSQL extension on the automation hub database with the following command:

\$ psql -d <automation hub database> -c "CREATE EXTENSION hstore;"

The output of which is:

CREATE EXTENSION

In the following output, the **installed_version** field contains the **hstore** extension used, indicating that **hstore** is enabled.

6.5. FINDING AND DELETING PVCS

A persistent volume claim (PVC) is a storage volume used to store data that automation hub and automation controller applications use. These PVCs are independent from the applications and remain even when the application is deleted. If you are confident that you no longer need a PVC, or have backed it up elsewhere, you can manually delete them.

Procedure

1. List the existing PVCs in your deployment namespace:

oc get pvc -n <namespace>

- 2. Identify the PVC associated with your previous deployment by comparing the old deployment name and the PVC name.
- 3. Delete the old PVC:

oc delete pvc -n <namespace> <pvc-name>

6.6. ADDITIONAL CONFIGURATIONS

A collection download count can help you understand collection usage. To add a collection download count to automation hub, set the following configuration:

spec:
 pulp_settings:
 ansible_collect_download_count: true

When **ansible_collect_download_count** is enabled, automation hub will display a download count by the collection.

6.7. ADDITIONAL RESOURCES

• For more information on running operators on OpenShift Container Platform, navigate to the OpenShift Container Platform product documentation and click the Operators - Working with Operators in OpenShift Container Platform guide.

CHAPTER 7. DEPLOYING CLUSTERED REDIS ON RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR

When you create an Ansible Automation Platform instance through the Ansible Automation Platform Operator, standalone Redis is assigned by default. To deploy clustered Redis, use the following procedure.

For more information about Redis, refer to Caching and queueing system in the *Planning your installation* guide.

Prerequisites

• You have installed an Ansible Automation Platform Operator deployment.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operators** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the **Details** tab.
- 5. On the Ansible Automation Platform tile click Create instance.
 - a. For existing instances, you can edit the YAML view by clicking the : icon and then **Edit AnsibleAutomationPlatform**.
 - b. Change the **redis_mode** value to "clustered".
 - c. Click Reload, then Save.
- 6. Click to expand Advanced configuration.
- 7. For the **Redis Mode**list, select **Cluster**.
- 8. Configure the rest of your instance as necessary, then click **Create**.

Your instance will deploy with a cluster Redis with 6 Redis replicas as default.

CHAPTER 8. USING RED HAT SINGLE SIGN-ON OPERATOR WITH AUTOMATION HUB

Private automation hub uses Red Hat Single Sign-On for authentication.

The Red Hat Single Sign-On Operator creates and manages resources. Use this operator to create custom resources to automate Red Hat Single Sign-On administration in OpenShift.

- When installing Ansible Automation Platform on *Virtual Machines* (VMs) the installer can automatically install and configure Red Hat Single Sign-On for use with private automation hub.
- When installing Ansible Automation Platform on Red Hat OpenShift Container Platform you must install Single Sign-On separately.

This chapter describes the process to configure Red Hat Single Sign-On and integrate it with private automation hub when Ansible Automation Platform is installed on OpenShift Container Platform.

Prerequisites

- You have access to Red Hat OpenShift Container Platform using an account with operator installation permissions.
- You have installed the catalog containing the Red Hat Ansible Automation Platform operators.
- You have installed the Red Hat Single Sign-On Operator. To install the Red Hat Single Sign-On Operator, follow the procedure in Installing Red Hat Single Sign-On using a custom resource in the Red Hat Single Sign-On documentation.

8.1. CREATING A KEYCLOAK INSTANCE

After you install the Red Hat Single Sign-On Operator, you can create a Keycloak instance for use with Ansible Automation Platform.

From here you provide an external Postgres or one will be created for you.

Procedure

/ Log in to Red Hat OpenShift Container Platform. . Navigate to **Operator** → **Installed Operators**. . Select the **RH-SSO** project. . Select the **Red Hat Single Sign-On Operator**. . On the Red Hat Single Sign-On Operator details page select **Keycloak**. . Click **Create instance**. . Click **YAML view**.

+ The default Keycloak custom resource is as follows:

```
+
```

```
apiVersion: keycloak.org/v1alpha1
kind: Keycloak
metadata:
name: example-keycloak
labels:
app: sso
namespace: aap
spec:
```

externalAccess: enabled: true instances: 1

- + . Click Create.
 - 1. When deployment is complete, you can use this credential to login to the administrative console.
 - 2. You can find the credentials for the administrator in the **credential-<custom-resource>** (example keycloak) secret in the namespace.

8.2. CREATING A KEYCLOAK REALM FOR ANSIBLE AUTOMATION PLATFORM

Create a realm to manage a set of users, credentials, roles, and groups. A user belongs to and logs into a realm. Realms are isolated from one another and can only manage and authenticate the users that they control.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operator** \rightarrow **Installed Operators**.
- 3. Select the Red Hat Single Sign-On Operator project.
- 4. Select the Keycloak Realm tab and click Create Keycloak Realm.
- 5. On the Keycloak Realm form, select YAML view. Edit the YAML file as follows:

kind: KeycloakRealm apiVersion: keycloak.org/v1alpha1 metadata: name: ansible-automation-platform-keycloakrealm namespace: rh-sso labels: app: sso realm: ansible-automation-platform spec: realm: id: ansible-automation-platform realm: ansible-automation-platform enabled: true displayName: Ansible Automation Platform instanceSelector: matchLabels: app: sso

Field	Description
metadata.name	Set a unique value in metadata for the name of the configuration resource (CR).

metadata.namespace	Set a unique value in metadata for the name of the configuration resource (CR).
metadata.labels.app	Set labels to a unique value. This is used when creating the client CR.
metadata.labels.realm	Set labels to a unique value. This is used when creating the client CR.
spec.realm.id	Set the realm name and id. These must be the same.
spec.realm.realm	Set the realm name and id. These must be the same.
spec.realm.displayname	Set the name to display.

6. Click **Create** and wait for the process to complete.

8.3. CREATING A KEYCLOAK CLIENT

Keycloak clients authenticate hub users with Red Hat Single Sign-On. When a user authenticates the request goes through the Keycloak client. When Single Sign-On validates or issues the **OAuth** token, the client provides the response to automation hub and the user can log in.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operator** \rightarrow **Installed Operators**.
- 3. Select the Red Hat Single Sign-On Operator project.
- 4. Select the Keycloak Client tab and click Create Keycloak Client.
- 5. On the Keycloak Realm form, select **YAML view**.
- 6. Replace the default YAML file with the following:

```
kind: KeycloakClient
apiVersion: keycloak.org/v1alpha1
metadata:
name: automation-hub-client-secret
labels:
app: sso
realm: ansible-automation-platform
namespace: rh-sso
spec:
realmSelector:
matchLabels:
app: sso
realm: ansible-automation-platform
```

client: name: Automation Hub clientId: automation-hub secret: <client-secret> clientAuthenticatorType: client-secret description: Client for automation hub attributes: user.info.response.signature.alg: RS256 request.object.signature.alg: RS256 directAccessGrantsEnabled: true publicClient: true protocol: openid-connect standardFlowEnabled: true protocolMappers: - config: access.token.claim: "true" claim.name: "family name" id.token.claim: "true" jsonType.label: String user.attribute: lastName userinfo.token.claim: "true" consentRequired: false name: family name protocol: openid-connect protocolMapper: oidc-usermodel-property-mapper - config: userinfo.token.claim: "true" user.attribute: email id.token.claim: "true" access.token.claim: "true" claim.name: email jsonType.label: String name: email protocol: openid-connect protocolMapper: oidc-usermodel-property-mapper consentRequired: false - config: multivalued: "true" access.token.claim: "true" claim.name: "resource access.\${client id}.roles" jsonType.label: String name: client roles protocol: openid-connect protocolMapper: oidc-usermodel-client-role-mapper consentRequired: false - config: userinfo.token.claim: "true" user.attribute: firstName id.token.claim: "true" access.token.claim: "true" claim.name: given name jsonType.label: String name: given name protocol: openid-connect protocolMapper: oidc-usermodel-property-mapper consentRequired: false

- config: id.token.claim: "true" access.token.claim: "true" userinfo.token.claim: "true" name: full name protocol: openid-connect protocolMapper: oidc-full-name-mapper consentRequired: false - config: userinfo.token.claim: "true" user.attribute: username id.token.claim: "true" access.token.claim: "true" claim.name: preferred_username jsonType.label: String name: <username> protocol: openid-connect protocolMapper: oidc-usermodel-property-mapper consentRequired: false - config: access.token.claim: "true" claim.name: "group" full.path: "true" id.token.claim: "true" userinfo.token.claim: "true" consentRequired: false name: group protocol: openid-connect protocolMapper: oidc-group-membership-mapper - config: multivalued: 'true' id.token.claim: 'true' access.token.claim: 'true' userinfo.token.claim: 'true' usermodel.clientRoleMapping.clientId: 'automation-hub' claim.name: client_roles jsonType.label: String name: client roles protocolMapper: oidc-usermodel-client-role-mapper protocol: openid-connect - config: id.token.claim: "true" access.token.claim: "true" included.client.audience: 'automation-hub' protocol: openid-connect name: audience mapper protocolMapper: oidc-audience-mapper roles: - name: "hubadmin" description: "An administrator role for automation hub"

Replace this with a unique value.

7. Click **Create** and wait for the process to complete.

After you deploy automation hub, you must update the client with the "Valid Redirect URIs" and "Web Origins" as described in Updating the Red Hat Single Sign-On client Additionally, the client comes preconfigured with token mappers, however, if your authentication provider does not provide group data to Red Hat SSO, then the group mapping must be updated to reflect how that information is passed. This is commonly by user attribute.

8.4. CREATING A KEYCLOAK USER

This procedure creates a Keycloak user, with the **hubadmin** role, that can log in to automation hub with Super Administration privileges.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operator** \rightarrow **Installed Operators**.
- 3. Select the Red Hat Single Sign-On Operator project.
- 4. Select the Keycloak Realm tab and click Create Keycloak User.
- 5. On the Keycloak User form, select YAML view.
- 6. Replace the default YAML file with the following:

apiVersion: keycloak.org/v1alpha1 kind: KeycloakUser
metadata:
name: hubadmin-user
labels:
app: sso
realm: ansible-automation-platform
namespace: rh-sso
spec:
realmSelector:
matchLabels:
app: sso
realm: ansible-automation-platform
user:
username: hub_admin
firstName: Hub
lastName: Admin
email: hub_admin@example.com
enabled: true
emailVerified: false
credentials:
- type: password
value: <ch8ngeme></ch8ngeme>
clientRoles:
automation-hub:
- hubadmin

7. Click **Create** and wait for the process to complete.

When a user is created, the Operator creates a Secret containing both the username and password

using the following naming pattern: **credential-<realm name>-<username>-<namespace>**. In this example the credential is called **credential-ansible-automation-platform-hub-admin-rh-sso**. When a user is created the Operator does not update the user's password. Password changes are not reflected in the Secret.

8.5. INSTALLING THE ANSIBLE AUTOMATION PLATFORM OPERATOR

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operator** \rightarrow **Operator Hub**.
- 3. Search for the Ansible Automation Platform Operator.
- 4. Select the Ansible Automation Platform Operator project.
- 5. Click on the Operator tile.
- 6. Click Install.
- 7. Select a Project to install the Operator into. Red Hat recommends using the Operator recommended Namespace name.
 - a. If you want to install the Operator into a project other than the recommended one, select **Create Project** from the drop down menu.
 - b. Enter the Project name.
 - c. Click Create.
- 8. Click Install.
- 9. When the Operator has been installed, click **View Operator**.

8.6. CREATING A RED HAT SINGLE SIGN-ON CONNECTION SECRET

Use this procedure to create a connection secret for Red Hat Single Sign-On.

Procedure

- 1. Navigate to https://<sso_host>/auth/realms/ansible-automation-platform.
- 2. Copy the **public_key** value.
- 3. In the OpenShift Web UI, navigate to Workloads → Secrets.
- 4. Select the ansible-automation-platform project.
- 5. Click Create, and select From YAML.
- 6. Edit the following YAML to create the secret

apiVersion: v1 kind: Secret

	metadata: name: automation-hub-sso
	namespace: ansible-automation-platform
	stringData:
	keycloak_host: "keycloak-rh-sso.apps-crc.testing"
	keycloak_port: "443"
	keycloak_protocol: "https"
	keycloak_realm: "ansible-automation-platform"
	keycloak_admin_role: "hubadmin"
	social_auth_keycloak_key: "automation-hub"
	social_auth_keycloak_secret: "client-secret"
	social_auth_keycloak_public_key: >-
	This name is used in the next step when creating the automation hub instance.
2	If the secret was changed when creating the Keycloak client for automation hub be sure to change this value to match.

3 E

Enter the value of the **public_key** copied in Installing the Ansible Automation Platform Operator.

7. Click **Create** and wait for the process to complete.

8.7. INSTALLING AUTOMATION HUB USING THE ANSIBLE AUTOMATION PLATFORM OPERATOR

Use the following procedure to install automation hub using the Ansible Automation Platform Operator.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operator** \rightarrow **Installed Operators**.
- 3. Select your Ansible Automation Platform Operator deployment.
- 4. Select the Automation hub tab.
- 5. Click Create Automation hub.
- 6. Select **YAML view**. The YAML should be similar to:

apiVersion: automationhub.ansible.com/v1 kind: AutomationHub	beta1
metadata:	
name: private-ah 1	
namespace: aap	
spec:	_
sso_secret: automation-hub-sso	2
pulp_settings:	
verify_ssl: false	
route_tls_termination_mechanism: Edge	
ingress_type: Route	

loadbalancer_port: 80 file_storage_size: 100Gi image_pull_policy: IfNotPresent replicas: 1 3 web_replicas: N task replicas: N file_storage_access_mode: ReadWriteMany content: log_level: INFO replicas: 2 postgres_storage_requirements: limits: storage: 50Gi requests: storage: 8Gi api: log level: INFO replicas: 1 postgres_resource_requirements: limits: cpu: 1000m memory: 8Gi requests: cpu: 500m memory: 2Gi loadbalancer_protocol: http resource_manager: replicas: 1 worker: replicas: 2

3

Set metadata.name to the name to use for the instance.

Set spec.sso_secret to the name of the secret created in Creating a Secret to hold the Red Hat Single Sign On connection details.

Scale replicas up or down for each deployment by using the web_replicas or
task_replicas respectively, where N represents the number of replicas you want to create.
Alternatively, you can scale all pods across both deployments by using replicas. See
Scaling the Web and Task Pods independently for details.

NOTE

This YAML turns off SSL verification (**ssl_verify: false**). If you are not using self-signed certificates for OpenShift this setting can be removed.

7. Click **Create** and wait for the process to complete.

8.8. DETERMINING THE AUTOMATION HUB ROUTE

Use the following procedure to determine the hub route.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Networking** \rightarrow **Routes**.
- 3. Select the project you used for the install.
- 4. Copy the location of the **private-ah-web-svc** service. The name of the service is different if you used a different name when creating the automation hub instance. This is used later to update the Red Hat Single Sign-On client.

8.9. UPDATING THE RED HAT SINGLE SIGN-ON CLIENT

After you install automation hub and you know the URL of the instance, you must update the Red Hat Single Sign-On to set the Valid Redirect URIs and Web Origins settings.

Procedure

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. Navigate to **Operator** \rightarrow **Installed Operators**.
- 3. Select the **RH-SSO** project.
- 4. Click Red Hat Single Sign-On Operator.
- 5. Select Keycloak Client.
- 6. Click on the automation-hub-client-secret client.
- 7. Select YAML.
- 8. Update the Client YAML to add the Valid Redirect URIs and Web Origins settings.

redirectUris: - 'https://private-ah-ansible-automation-platform.apps-crc.testing/*' webOrigins:

- 'https://private-ah-ansible-automation-platform.apps-crc.testing'

Field	Description
redirectURIs	This is the location determined in Determine Automation Hub Route. Be sure to add the /* to the end of the redirectUris setting.
webOrigins	This is the location determined in Determine Automation Hub Route.

NOTE

Ensure the indentation is correct when entering these settings.

9. Click Save.

To verify connectivity

- 1. Navigate to the automation hub route.
- 2. Enter the **hub_admin** user credentials and sign in.
- 3. Red Hat Single Sign-On processes the authentication and redirects back to automation hub.

8.10. ADDITIONAL RESOURCES

• For more information on running operators on OpenShift Container Platform, see Working with Operators in OpenShift Container Platform in the OpenShift Container Platform product documentation.

CHAPTER 9. ADDING EXECUTION NODES TO RED HAT ANSIBLE AUTOMATION PLATFORM OPERATOR

You can enable the Ansible Automation Platform Operator with execution nodes by downloading and installing the install bundle.

Prerequisites

- An automation controller instance.
- The receptor collection package is installed.
- AAP Repository ansible-automation-platform-2.4-for-rhel-{RHEL-RELEASE-NUMBER}x86_64-rpms is enabled.

Procedure

- 1. Log in to Red Hat Ansible Automation Platform.
- 2. In the navigation panel, select **Automation Execution** → **Infrastructure** → **Instances**.
- 3. Click Add.
- 4. Input the Execution Node domain name or IP in the Host Name field.
- 5. Optional: Input the port number in the Listener Port field.
- 6. Click Save.
- 7. Click the download icon an ext to Install Bundle. This starts a download, take note of where you save the file
- 8. Untar the gz file.

NOTE

To run the **install_receptor.yml** playbook you need to install the receptor collection from Ansible Galaxy: **Ansible-galaxy collection install -r requirements.yml**

9. Update the playbook with your user name and SSH private key file. Note that **ansible_host** pre-populates with the hostname you input earlier.

all: hosts: remote-execution: ansible_host: example_host_name # Same with configured in AAP WebUI ansible_user: <username> #user provided Ansible_ssh_private_key_file: ~/.ssh/id_example

- 10. Open your terminal, and navigate to the directory where you saved the playbook.
- 11. To install the bundle run:

12. When installed you can now upgrade your execution node by downloading and re-running the playbook for the instance you created.

Verification

To verify receptor service status run the following command:

sudo systemctl status receptor.service

Make sure the service is in active (running) state

To verify if your playbook runs correctly on your new node run the following command:

watch podman ps

Additional resources

• For more information about managing instance groups see the Managing Instance Groups section of the Automation Controller User Guide.

CHAPTER 10. ANSIBLE AUTOMATION PLATFORM RESOURCE OPERATOR

10.1. RESOURCE OPERATOR OVERVIEW

Resource Operator is a custom resource (CR) that you can deploy after you have created your platform gateway deployment. With Resource Operator you can define projects, job templates, and inventories through the use of YAML files. These YAML files are then used by automation controller to create these resources. You can create the YAML through the **Form view** that prompts you for keys and values for your YAML code. Alternatively, to work with YAML directly, you can select **YAML view**.

There are currently two custom resources provided by the Resource Operator:

- AnsibleJob: launches a job in the automation controller instance specified in the Kubernetes secret (automation controller host URL, token).
- JobTemplate: creates a job template in the automation controller instance specified.

10.2. USING RESOURCE OPERATOR

The Resource Operator itself does not do anything until the user creates an object. As soon as the user creates an **AutomationControllerProject** or **AnsibleJob** resource, the Resource Operator will start processing that object.

Prerequisites

- Install the Kubernetes-based cluster of your choice.
- Deploy automation controller using the **automation-controller-operator**.

After installing the **automation-controller-resource-operator** in your cluster, you must create a Kubernetes (k8s) secret with the connection information for your automation controller instance. Then you can use Resource Operator to create a k8s resource to manage your automation controller instance.

10.3. CONNECTING RESOURCE OPERATOR TO PLATFORM GATEWAY

To connect Resource Operator with platform gateway you need to create a k8s secret with the connection information for your automation controller instance.

NOTE

You can only create OAuth 2 Tokens for your own user through the API or UI, which means you can only configure or view tokens from your own user profile.

Procedure

To create an OAuth2 token for your user in the platform gateway UI:

- 1. Log in to Red Hat OpenShift Container Platform.
- 2. In the navigation panel, select Access Management \rightarrow Users.

- 3. Select the username you want to create a token for.
- 4. Select Tokens → Automation Execution
- 5. Click Create Token.
- 6. You can leave **Applications** empty. Add a description and select **Read** or **Write** for the **Scope**.

NOTE

Make sure you provide a valid user when creating tokens. Otherwise, you will get an error message that you tried to issue the command without specifying a user, or supplying a username that does not exist.

10.4. CREATING A AUTOMATION CONTROLLER CONNECTION SECRET FOR RESOURCE OPERATOR

To make your connection information available to the Resource Operator, create a k8s secret with the token and host value.

Procedure

1. The following is an example of the YAML for the connection secret. Save the following example to a file, for example, **automation-controller-connection-secret.yml**.

apiVersion: v1
kind: Secret
metadata:
name: controller-access
type: Opaque
stringData:
token: <generated-token></generated-token>
host: https://my-controller-host.example.com/

- 2. Edit the file with your host and token value.
- 3. Apply it to your cluster by running the **kubectl create** command:

kubectl create -f controller-connection-secret.yml

10.5. CREATING AN ANSIBLEJOB

Launch an automation job on automation controller by creating an AnsibleJob resource.

Procedure

1. Specify the connection secret and job template you want to launch.

apiVersion: tower.ansible.com/v1alpha1 kind: AnsibleJob metadata: generateName: demo-job-1 # generate a unique suffix per 'kubectl create'

spec:

connection_secret: controller-access job_template_name: Demo Job Template

2. Configure features such as, inventory, extra variables, and time to live for the job.

spec: connection_secret: controller-access job_template_name: Demo Job Template inventory: Demo Inventory # Inventory prompt on launch needs to be enabled runner_image: quay.io/ansible/controller-resource-runner runner_version: latest job_ttl: 100 extra_vars: # Extra variables prompt on launch needs to be enabled test_var: test job_tags: "provision,install,configuration" # Specify tags to run skip_tags: "configuration,restart" # Skip tasks with a given tag

NOTE

You must enable prompt on launch for inventories and extra variables if you are configuring those. To enable **Prompt on launch**, within the automation controller UI: From the **Resources** \rightarrow **Templates** page, select your template and select the **Prompt on launch** checkbox next to **Inventory** and **Variables** sections.

3. Launch a workflow job template with an AnsibleJob object by specifying the **workflow_template_name** instead of **job_template_name**:

apiVersion: tower.ansible.com/v1alpha1 kind: AnsibleJob metadata: generateName: demo-job-1 # generate a unique suffix per 'kubectl create' spec: connection_secret: controller-access workflow_template_name: Demo Workflow Template

10.6. CREATING A JOBTEMPLATE

• Create a job template on automation controller by creating a JobTemplate resource:

apiVersion: tower.ansible.com/v1alpha1
kind: JobTemplate
metadata:
name: jobtemplate-4
spec:
connection_secret: controller-access
job_template_name: ExampleJobTemplate4
job_template_project: Demo Project
job_template_playbook: hello_world.yml
job_template_inventory: Demo Inventory
