Abstract

Red Hat build of Cryostat is a Red Hat offering on OpenShift Container Platform. The Installing Cryostat guide provides an overview of this product and explains how to install the software and start using it.

PREFACE

The Red Hat build of Cryostat is a container-native implementation of JDK Flight Recorder (JFR) that you can use to securely monitor the Java Virtual Machine (JVM) performance in workloads that run on an OpenShift Container Platform cluster. You can use Cryostat 3.0 to start, stop, retrieve, archive, import, and export JFR data for JVMs inside your containerized applications by using a web console or an HTTP API.

Depending on your use case, you can store and analyze your recordings directly on your Red Hat OpenShift cluster by using the built-in tools that Cryostat provides or you can export recordings to an external monitoring application to perform a more in-depth analysis of your recorded data.

IMPORTANT

Red Hat build of Cryostat is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production. These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process.

For more information about the support scope of Red Hat Technology Preview features, see [Technology Preview Features Support Scope](#).

MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see [our CTO Chris Wright's message](#).

CHAPTER 1. OVERVIEW OF CRYOSTAT

Cryostat is a container-native Java application based on JDK Flight Recorder (JFR) that you can use to monitor Java Virtual Machine (JVM) performance for containerized workloads that run on a Red Hat OpenShift cluster.

You can deploy Cryostat in a container in a Red Hat OpenShift project that hosts your containerized Java applications. You can create JVM targets that correspond to the JVM instances that you use to run your containerized workload. You can connect Cryostat to the JVM targets to record and analyze data about heap and non-heap memory usage, thread count, garbage collection, and other performance metrics for each JVM target.

You can use the tools that are included with Cryostat to monitor the performance of your JVMs in real time, capture JDK Flight Recorder (JFR) recordings and snapshots, generate Automated Analysis reports, and visualize your recorded performance data by using a Grafana dashboard.

The Cryostat web console and HTTP API provides a way to analyze your JVM performance data inside the container without having to rely on an external monitoring application. However, you can also export your recordings from Cryostat into an external instance of JDK Mission Control (JMC) when you need to perform a deeper analysis of your data outside of a cluster environment.

Cryostat supports role-based access control (RBAC) as a standard feature of OpenShift Container Platform.

You can install Cryostat inside a Red Hat OpenShift project by using Operator Lifecycle Manager (OLM).

You can also download the latest Cryostat component images from the Red Hat Ecosystem Catalog. The following container images exist for Cryostat 3.0 on the Red Hat Ecosystem Catalog:

- Cryostat
- Red Hat build of Cryostat Operator
- Red Hat build of Cryostat Operator bundle
- Cryostat reports
- Cryostat Grafana dashboard
- Cryostat DB
- Cryostat storage
- JFR data source

Additional resources

- [Operator Lifecycle Manager \(OLM\) \(OpenShift Container Platform\)](#)
- [Container images \(Red Hat Ecosystem Catalog\)](#)

CHAPTER 2. INSTALLING CRYOSTAT

You can install the Red Hat build of Cryostat Operator in a project on Red Hat OpenShift by using Operator Lifecycle Manager (OLM).

With the Red Hat build of Cryostat Operator installed, you can create instances of Cryostat that you can access by using a web console from the Red Hat OpenShift web console.

You can also download the latest Cryostat component images from the Red Hat Ecosystem Catalog.

2.1. INSTALLING CRYOSTAT ON RED HAT OPENSIFT BY USING A RED HAT BUILD OF CRYOSTAT OPERATOR

You can use the Operator Lifecycle Manager (OLM) to install the Red Hat build of Cryostat Operator in a project on your Red Hat OpenShift cluster. You can use the Red Hat build of Cryostat Operator to create single namespace or multi-namespace Cryostat instances. You can control these instances by using a GUI that is accessible from the Red Hat OpenShift web console.

IMPORTANT

If you need to upgrade your Red Hat build of Cryostat Operator subscription from Cryostat 2.0 to Cryostat 3.0, you must change the update channel from **stable-2.0** to **stable**.

Prerequisites

- Created an OpenShift Container Platform 4.12 or later cluster.
- Created a Red Hat OpenShift user account with permissions to install Red Hat build of Cryostat Operator in a project.
- Installed Operator Lifecycle Manager (OLM) on your cluster.
- Installed cert-manager with the cert-manager Operator for Red Hat OpenShift.
 - If you are using OpenShift Container Platform 4.12 or later, you can install the cert-manager Operator for Red Hat OpenShift. For more information, see [cert-manager Operator for Red Hat OpenShift \(OpenShift Container Platform\)](#).
- Logged in to Red Hat OpenShift by using the Red Hat OpenShift web console.

Procedure

1. In your browser, navigate to **Home > Projects** by using the web console.
2. Select the name of the project in which you want to install the Red Hat build of Cryostat Operator.
3. Install the Red Hat build of Cryostat Operator:
 - a. In the navigation menu of your web console, navigate to **Operators > OperatorHub**.
 - b. Select the **Red Hat build of Cryostat Operator** from the list. You can use the search box in the upper part of the screen to find the Red Hat build of Cryostat Operator.

- c. To install the Red Hat build of Cryostat Operator in your project, click **Install**. The Red Hat OpenShift web console prompts you to create a Cryostat custom resource (CR).

NOTE

From Cryostat 3.0 onward, in the **Installation mode** area, the **All namespaces on the cluster (default)** radio button is the only available option.

You can create the CR either manually or automatically. If you want to create the CR manually, see step 4. If you want to create the CR automatically, see step 5.

4. If you want to create the CR manually, complete the following steps:
- Navigate to **Operators > Installed Operators** by using the web console and select **Red Hat build of Cryostat Operator** from the list of installed operators:

Figure 2.1. Viewing the Red Hat build of Cryostat operator in the list of installed operators

Project: cryostat-test ▾

Installed Operators

Installed Operators are represented by ClusterServiceVersions within this Namespace. For more information, see the [Understanding Operators documentation](#) or create an Operator and ClusterServiceVersion using the [Operator SDK](#).

Name ▾ Search by name... /

Name	Managed Namespaces	Status	Last updated	Provided APIs
 Red Hat build of Cryostat 3.0.0 provided by Red Hat	All Namespaces	✔ Succeeded Up to date	🕒 Jun 11, 2024, 3:29 PM	Cryostat

- Click the **Details** tab.
- To create a Cryostat instance, go to the **Provided APIs** section. Then, under **Cryostat**, click **Create instance**.

NOTE

From Cryostat 3.0 onward, the **Cryostat** API enables you to create both single-namespace and multi-namespace Cryostat instances.

Figure 2.2. Selecting the Cryostat API that is provided by the Red Hat build of Cryostat Operator

[Details](#) [YAML](#) [Subscription](#) [Events](#) [Cryostat](#)

Provided APIs

<p> Cryostat</p> <p>Cryostat allows you to install Cryostat for a single namespace, or multiple namespaces. ---	--

- Click either the **Form view** radio button or the **YAML view** radio button. If you want to enter your information in the YAML configuration file, click **YAML view**.

- e. Specify a unique name for the instance of Cryostat that you want to create.
- f. *Optional:* In the Labels field, specify a label or annotation for the Operand workload you want to deploy.
- g. In the **Target Namespaces** field, select namespaces whose workloads you want to permit this instance of Cryostat to access and work with. Optionally, you can select the same namespace where you installed Cryostat or you can choose a different namespace. To add additional namespaces, click **+Add Target Namespace**.

IMPORTANT

Users who can access the Cryostat instance have access to all target applications in any namespace that is visible to that Cryostat instance. Therefore, when you deploy a multi-namespace Cryostat instance, you must consider which namespaces to select for monitoring, which namespace to install Cryostat into, and which users you want to grant access to.

You can also specify additional configuration options for your deployment:

Figure 2.3. Creating an instance of Cryostat by using a form in the web console

Project: cryostat-test ▾

Create Cryostat

Create by completing the form. Default values may be provided by the Operator authors.

Configure via: Form view YAML view

Note: Some fields may not be represented in this form view. Please select "YAML view" for full control.

Name *

Labels

Target Namespaces >

List of namespaces whose workloads Cryostat should be permitted to access and profile. Defaults to this Cryostat's namespace. Warning: All Cryostat users will be able to create and manage recordings for workloads in the listed namespaces. See best practices for more information: <https://access.redhat.com/articles/701252>

Enable cert-manager integration

true

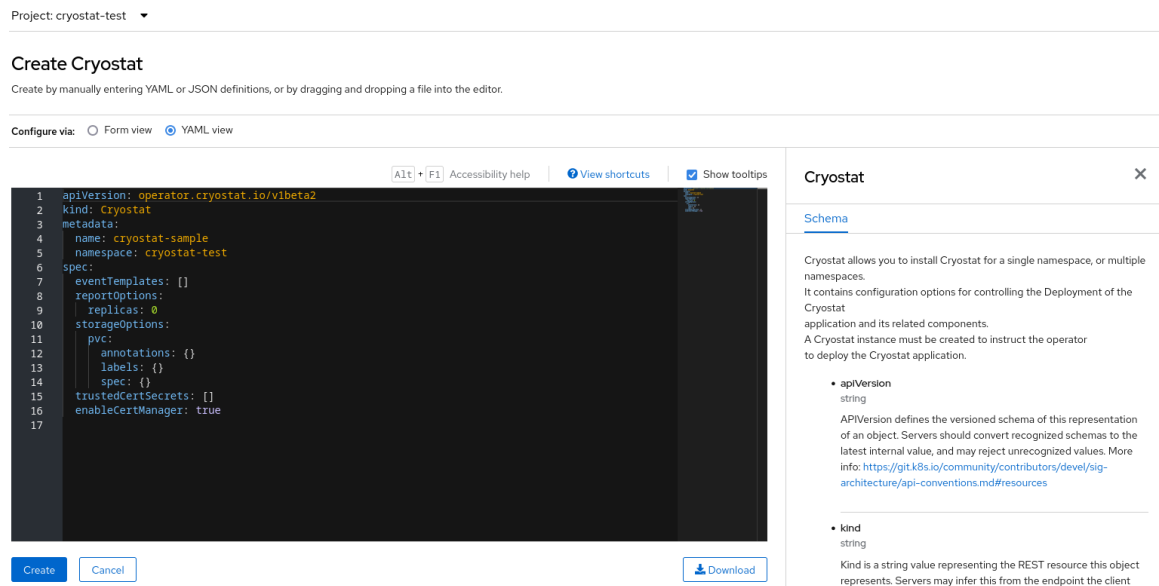

Use cert-manager to secure in-cluster communication between Cryostat components. Requires cert-manager to be installed.

Cryostat
provided by Red Hat

Cryostat allows you to install Cryostat for a single namespace, or multiple namespaces. It contains configuration options for controlling the Deployment of the Cryostat application and its related components. A Cryostat instance must be created to instruct the operator to deploy the Cryostat application.

Alternatively, you can use a YAML template to create your instance and specify additional configuration options instead of using the form:

Figure 2.4. Creating an instance of Cryostat by using a YAML template in the web console

5. If you want to create the CR by using the automatic prompt option, follow the prompt's instructions and then complete the following steps:
 - a. Click either the **Form view** radio button or the **YAML view** radio button. If you want to enter your information in the YAML configuration file, click **YAML view**.
 - b. Specify a unique name for the instance of Cryostat that you want to create.
 - c. *Optional:* In the Labels field, specify a label or annotation for the Operand workload you want to deploy.
 - d. In the **Target Namespaces** field, select namespaces whose workloads you want to permit this instance of Cryostat to access and work with. Optionally, you can select the same namespace where you installed Cryostat or you can choose a different namespace. To add additional namespaces, click **+Add Target Namespace**.

IMPORTANT

Users who can access the Cryostat instance have access to all target applications in any namespace that is visible to that Cryostat instance. Therefore, when you deploy a multi-namespace Cryostat instance, you must consider which namespaces to select for monitoring, which namespace to install Cryostat into, and which users you want to grant access to.

You can also specify additional configuration options for your deployment:

Figure 2.5. Creating an instance of Cryostat by using a form in the web console

Project: cryostat-test ▾

Create Cryostat

Create by completing the form. Default values may be provided by the Operator authors.

Configure via: Form view YAML view

Note: Some fields may not be represented in this form view. Please select "YAML view" for full control.

Name *
cryostat-sample

Labels
app=frontend

Target Namespaces ▸
List of namespaces whose workloads Cryostat should be permitted to access and profile. Defaults to this Cryostat's namespace. Warning: All Cryostat users will be able to create and manage recordings for workloads in the listed namespaces. See best practices for more information: <https://access.redhat.com/articles/7011252>

Enable cert-manager integration
 true
Use cert-manager to secure in-cluster communication between Cryostat components. Requires cert-manager to be installed.

Alternatively, you can use a YAML template to create your instance and specify additional configuration options instead of using the form:

Figure 2.6. Creating an instance of Cryostat by using a YAML template in the web console

Project: cryostat-test ▾

Create Cryostat

Create by manually entering YAML or JSON definitions, or by dragging and dropping a file into the editor.

Configure via: Form view YAML view

```

1 apiVersion: operator.cryostat.io/v1beta2
2 kind: Cryostat
3 metadata:
4   name: cryostat-sample

14      spec: {}
15  trustedCertSecrets: []
16  enableCertManager: true
17

```

Cryostat

Schema

Cryostat allows you to install Cryostat for a single namespace, or multiple namespaces. It contains configuration options for controlling the Deployment of the Cryostat application and its related components. A Cryostat instance must be created to instruct the operator to deploy the Cryostat application.

- apiVersion**
string
APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources>
- kind**
string
Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client

Create **Cancel** **Download**

- To start the creation process for your Cryostat instance, click **Create**. You must wait for all resources of your Cryostat instance to be ready before you can access it.

Verification

- In the navigation menu of the web console, click **Operators**, then click **Installed Operators**.
- From the table of installed operators, select **Red Hat build of Cryostat Operator**.
- Select the **Cryostat** tab.
Your Cryostat instance opens in the table of instances and lists the following conditions:

- TLSSetupComplete** is set to **true**.
- MainDeploymentAvailable** is set to **true**.

- Optional: If you enabled the reports generator service then **ReportsDeploymentAvailable** is shown and set to **true**.

Figure 2.7. Example of conditions set to True under the Status column for a Cryostat instance on OpenShift

Name	Kind	Namespace	Status	Labels	Last updated
cryostat-sample	Cryostat	cryostat-test	Conditions: TLSSetupComplete, ReportsDeploymentProgressing, ReportsDeploymentAvailable, MainDeploymentAvailable, MainDeploymentProgressing	No labels	Jun 11, 2024, 3:29 PM

4. *Optional:* Select your Cryostat instance from the **Cryostat** table. Go to the **Cryostat Conditions** table, where you can see more information for each condition.

Figure 2.8. Example of a Cryostat Conditions table that lists each condition and its criteria

Type	Status	Updated	Reason	Message
TLSSetupComplete	True	Jun 11, 2024, 3:29 PM	AllCertificatesReady	All certificates for Cryostat components are ready.
ReportsDeploymentProgressing	True	Jun 11, 2024, 3:29 PM	NewReplicaSetAvailable	ReplicaSet "cryostat-sample-reports-68b9fbf54c" has successfully progressed.
ReportsDeploymentAvailable	True	Jun 11, 2024, 3:30 PM	MinimumReplicasAvailable	Deployment has minimum availability.
MainDeploymentAvailable	True	Jun 11, 2024, 3:31 PM	MinimumReplicasAvailable	Deployment has minimum availability.
MainDeploymentProgressing	True	Jun 11, 2024, 3:29 PM	NewReplicaSetAvailable	ReplicaSet "cryostat-sample-5bdc9655ff" has successfully progressed.

Additional resources

- [Best practices for setting up Cryostat in different cluster configurations](#) (Red Hat Knowledgebase)
- [Accessing Cryostat by using the web console](#)

2.1.1. Accessing Cryostat by using the web console

You can access and control Cryostat by using a web console that is accessible from the Red Hat OpenShift web console.

Cryostat integrates with the OAuth server that is built into Red Hat OpenShift. When you attempt to access Cryostat on Red Hat OpenShift, the OAuth server directs you to the Red Hat OpenShift login page, where you can enter your Red Hat OpenShift credentials. After you enter your credentials, the OAuth server directs you to the Cryostat web console.

NOTE

If you want to access all of Cryostat's features on the OpenShift Container Platform, you must request Cryostat-specific Role-Based Access Controls (RBAC) permissions for your Red Hat OpenShift user account.

See [RBAC permissions](#).

Prerequisites

- Created a Cryostat instance in your project.

- Logged in using the Red Hat OpenShift web console.

Procedure

1. On the Red Hat OpenShift web console, navigate to **Installed Operators** and select **Red Hat build of Cryostat Operator** from the list.
2. To select the Cryostat instance that you want to access, click the **Cryostat** tab and select this Cryostat instance from the table.

Figure 2.9. Example of selecting a Cryostat instance under the Cryostat tab

Name	Kind	Namespace	Status	Labels	Last updated
cryostat-sample	Cryostat	NS cryostat-test	Conditions: TLSSetupComplete, ReportsDeploymentProgressing, MainDeploymentProgressing, ReportsDeploymentAvailable, MainDeploymentAvailable	No labels	Jun 4, 2024, 3:40 PM

3. To access the Cryostat login screen, click the link in the **Application URL** section. The OAuth server redirects you to an OpenShift Container Platform login page, so that you can obtain OAuth access tokens for authenticating to the Cryostat API.

Figure 2.10. Example of selecting a link under the Application URL section

cryostat-sample Actions

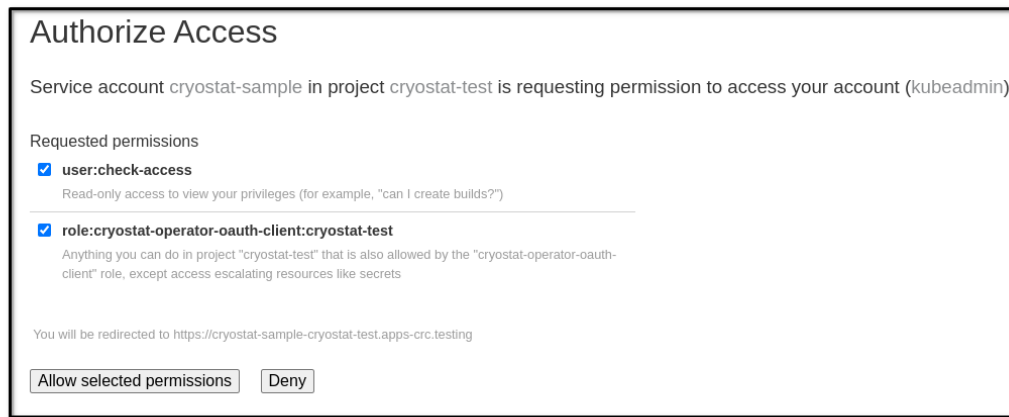

Details | YAML | Resources | Events

Cryostat overview

Name cryostat-sample	Application URL cryostat-sample-cryostat-test.apps.cryostat-dev.prod.upshift.rdu2.redhat.com
Namespace NS cryostat-test	Database Secret cryostat-sample-db
Labels No labels	Storage Secret cryostat-sample-storage
Annotations 0 annotations	Target Namespaces NS cryostat-test
Created at Jun 11, 2024, 3:29 PM	
Owner No owner	

4. Enter your credential details and then click **Login**. When you log in through the OAuth server for the first time, an **Authorize Access** page opens on your web browser.

Figure 2.11. Example of an Authorize Access page that opens in a web browser

5. Review the **Requested permissions** options and then select the required checkboxes. For optimal Cryostat performance, select both checkboxes.
6. Choose one of the following options:
 - If you want to accept the requested permissions that you selected, click the **Allow selected permissions** button.
 - If you want to reject all requested permission options, click the **Deny** button. Your web browser redirects you to the Cryostat web console, where you can monitor Java applications that are running in a Java Virtual Machine (JVM).

2.1.2. RBAC permissions

From Cryostat 3.0 onward, when installing a Cryostat instance, you can use the **.spec.authorizationOptions.openShiftSSO.accessReview** field in the Cryostat CRD to specify the required role-based access control (RBAC) permissions for accessing Cryostat. The default role in the Cryostat application's installation namespace is **create pods/exec**.

Any Red Hat OpenShift user accounts that are assigned the specified RBAC role have full access to the Cryostat console and all Cryostat features. If a Red Hat OpenShift account does not have the required RBAC permissions, this user is blocked from accessing Cryostat.

Figure 2.12. Specifying OpenShift SSO Access Review authorization options

Authorization Options

Additional configuration options for the authorization proxy.

Basic Auth

Reference to a secret and file name containing the Basic authentication htpasswd file. If deploying on OpenShift this defines additional user accounts that can access the Cryostat application, on top of the OpenShift user accounts which pass the OpenShift SSO Roles checks. If not on OpenShift then this defines the only user accounts that have access.

OpenShift SSO

Configuration for OpenShift RBAC to define which OpenShift user accounts may access the Cryostat application.

Access Review

The SubjectAccessReview or TokenAccessReview that all clients (users visiting the application via web browser as well as CLI utilities and other programs presenting Bearer auth tokens) must pass in order to access the application. If not specified, the default role required is "create pods/exec" in the Cryostat application's installation namespace.

group

Group is the API Group of the Resource. "*" means all.

name

Name is the name of the resource being requested for a "get" or deleted for a "delete". "" (empty) means all.

namespace

Namespace is the namespace of the action being requested. Currently, there is no distinction between no namespace and all namespaces "" (empty) is defaulted for LocalSubjectAccessReviews "" (empty) is empty for cluster-scoped resources "" (empty) means "all" for namespace scoped resources from a SubjectAccessReview or SelfSubjectAccessReview

resource

You can use the following fields to specify any customized RBAC settings that are required for accessing Cryostat:

Field	Details
group	API group of the resource Specifying a * value means all groups.
name	Name of the resource being requested for a get command or deleted for a delete command Specifying an empty value means all names.

Field	Details
namespace	<p>Namespace of the action being requested</p> <p>Currently, there is no distinction between no namespace and all namespaces. Consider the following guidelines:</p> <ul style="list-style-type: none"> • An empty value is defaulted for LocalSubjectAccessReviews. • An empty value means no cluster-scoped resources. • An empty value means all namespace-scoped resources from a SubjectAccessReview or SelfSubjectAccessReview.
resource	<p>An existing resource type</p> <p>Specifying a * value means all resource types.</p>
subresource	<p>An existing resource type</p> <p>Specifying an empty value means no resource types.</p>
verb	<p>A kubernetes resource API verb (for example, get, list, watch, create, update, delete, proxy)</p> <p>Specifying a * value means all verbs.</p>
version	<p>API version of the resource</p> <p>Specifying a * value means all versions.</p>

Additional resources

- [Using RBAC to define and apply permissions \(Red Hat OpenShift documentation\)](#)

2.2. HELM CHARTS

Instead of using the Red Hat build of Cryostat Operator on Red Hat OpenShift to install Cryostat, you can use a Helm chart. The Red Hat build of Cryostat Operator is the preferred way to install Cryostat, but if you require a flexible installation method that requires fewer cluster permissions, you can install Cryostat with a Helm chart.

Helm is a package manager on Red Hat OpenShift that provides the following benefits:

- Applies regular application updates by using custom hooks.
- Manages the installation of complex applications.
- Provides charts that you can host on public or private servers. If sharing charts on a public server, ensure you're aware of the security risks.
- Supports rolling back to previous application versions.

By default, Red Hat OpenShift 4.12 includes the Helm chart package manager.

Before you install Cryostat with a Cryostat Helm chart, consider the following supported functions for the Cryostat Helm chart and the Red Hat build of Cryostat Operator:

Function ↓	Cryostat Helm chart	Red Hat build of Cryostat Operator
Access Cryostat by using Services	✓	✓
Access Cryostat by using Routes	✓	✓
Basic authentication	✓	
OpenShift OAuth authentication		✓
End-to-end encryption		✓
Grafana integration	✓	✓
Persistent storage	✓	✓
Sidecar report generator		✓

The previous table shows that the Cryostat Helm chart does not support the same level of functionality as the Red Hat build of Cryostat Operator.

Additional resources

- [Overview Red Hat build of Cryostat Operator \(Using the Red Hat build of Cryostat Operator to configure Cryostat\)](#)

2.2.1. Installing Cryostat by using a Helm chart

By default, Red Hat OpenShift 4.12 includes the Helm chart package manager. You can use this package manager to install a Cryostat Helm chart on Red Hat OpenShift. In turn, you can use this Helm chart to install a Cryostat instance on Red Hat OpenShift.

After you install the Cryostat Helm chart, the Helm chart creates the following objects:

- **Deployment**, which contains Cryostat, Grafana, and a data source for Grafana.
- **Routes** that exposes the Cryostat and Grafana services outside a Red Hat OpenShift cluster. This object is enabled by default on Red Hat OpenShift.
- **Services** for Cryostat and Grafana.
- **Service Account**, **Role**, and **Role Binding** for Cryostat, so that Cryostat Helm chart can use these objects to discover your applications.

Prerequisites

- Logged in to the OpenShift Container Platform by using the Red Hat OpenShift web console.
- Configured appropriate roles and permissions in a project to create applications and other workloads in OpenShift Container Platform.

Procedure

1. Switch to **Developer** mode on your Red Hat OpenShift web console.
2. Click the **+Add** menu.
3. From the **Developer Catalog** panel, click **Helm Chart**.
4. Click the Cryostat tile. A window displays on your Red Hat OpenShift web console.

TIP

To quickly find the Cryostat tile, enter **Cryostat** in the search field.

5. Click **Create**.
6. From the **Create Helm Release** window, complete the following actions:
 - a. In the **Release name** field, enter a name for your Cryostat Helm chart.
 - b. From the **Chart version** drop-down list, ensure a version of Cryostat is selected.
 - c. Optional: From **Form view**, click **Chart Values**, and then configure options for your Cryostat Helm chart.
 - d. Optional: To access more configuration options, switch to the **YAML View** and then edit the parameters to meet your needs.

Figure 2.13. OpenShift Create Helm Release window

Create Helm Release

The Helm Release can be created by completing the form. Default values may be provided by the Helm chart authors. For more information on the chart, refer to this [README](#)

Release name * Chart version *

A unique name for the Helm Release.

Configure via: Form view YAML view

Note: Some fields may not be represented in this form view. Please select "YAML view" for full control.

Redhat Cryostat
0.4.0+1 provided by The Cryostat Community
Securely manage JFR recordings for your containerized Java workloads

Chart Values >

7. Click **Create**.
A window with tabs might open in your web console where you can view information for the Cryostat Helm chart. From the **Release notes** tab, you can view post-installation steps that you must perform. To perform these steps, you must use the **oc** CLI for your Red Hat OpenShift cluster. By default, Cryostat Helm chart uses **Routes** for networking. If you have disabled **Routes**, the instructions might differ depending on the kind of networking that you selected.

IMPORTANT

If you set **core.route.enabled** or **grafana.route.enabled** to **false** for your CrioStat Helm chart, which disables the **Routes** resource, port-forwarding **oc** instructions display in the web console.

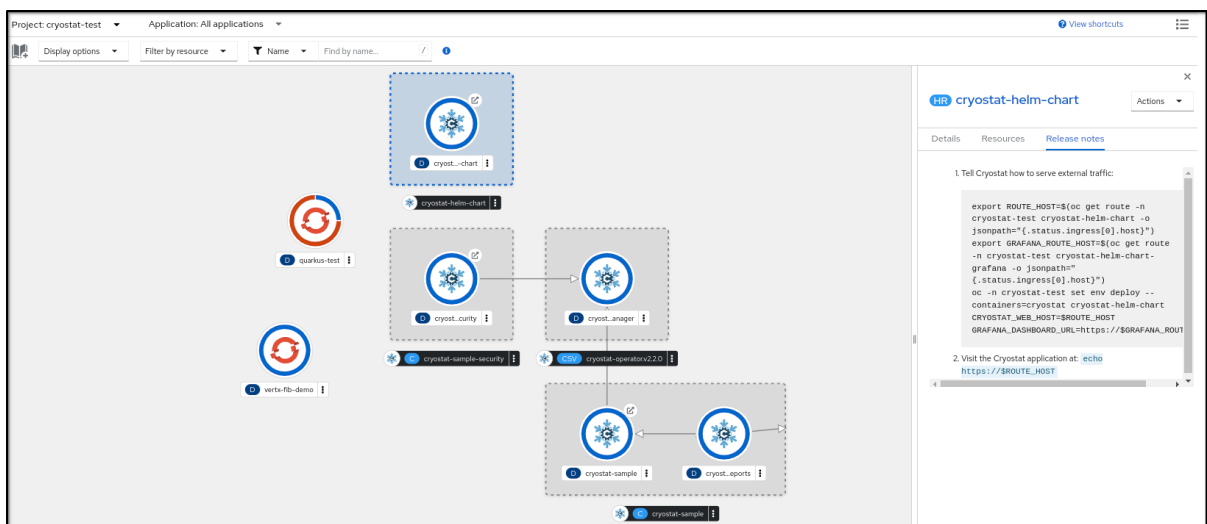

- Optional: From the topology window, click a pod icon and then go to either the **Details** tab or the **Resources** tab to view more information about the pod.

TIP

If you need to quickly find a pod, consider using the filter toolbar, where you can display options, filter by resource, or enter a name of a pod.

When you completed the post-installation steps that are outlined on the **Release notes** tab, you can use CrioStat with your applications.

Figure 2.14. OpenShift pod topology window

Verification

- In the same terminal where you completed the post-installation steps, go to the "Visit the CrioStat application at ..." step to view the URL with which you can access the CrioStat application.

NOTE

The URL to access the CrioStat application URL varies depending on the configuration parameters that you chose.
