Abstract

Review the release notes to understand new features and feature enhancements that have been included with latest build of OpenJDK 17 that is provided by Eclipse Temurin.

Table of Contents

PREFACE	3
PROVIDING FEEDBACK ON RED HAT BUILD OF OPENJDK DOCUMENTATION	4
MAKING OPEN SOURCE MORE INCLUSIVE	5
CHAPTER 1. SUPPORT POLICY FOR ECLIPSE TEMURIN	6
CHAPTER 2. ECLIPSE TEMURIN FEATURES	7
New features and enhancements	7
Disabled cpu.shares parameter	7
SHA-1 Signed JARs	7
SunMSCAPI provider supports new Microsoft Windows keystore types	8
System properties for controlling the keep-alive behavior of HTTPURLConnection	9

PREFACE

Open Java Development Kit (OpenJDK) is a free and open-source implementation of the Java Platform, Standard Edition (Java SE). Eclipse Temurin is available in three LTS versions: OpenJDK 8u, OpenJDK 11u, and OpenJDK 17u.

Packages for Eclipse Temurin are made available on Microsoft Windows and on multiple Linux x86 Operating Systems including Red Hat Enterprise Linux and Ubuntu.

PROVIDING FEEDBACK ON RED HAT BUILD OF OPENJDK DOCUMENTATION

To report an error or to improve our documentation, log in to your Red Hat Jira account and submit an issue. If you do not have a Red Hat Jira account, then you will be prompted to create an account.

Procedure

1. Click the following link to [create a ticket](#).
2. Enter a brief description of the issue in the **Summary**.
3. Provide a detailed description of the issue or enhancement in the **Description**. Include a URL to where the issue occurs in the documentation.
4. Clicking **Submit** creates and routes the issue to the appropriate documentation team.

MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see [our CTO Chris Wright's message](#).

CHAPTER 1. SUPPORT POLICY FOR ECLIPSE TEMURIN

Red Hat will support select major versions of Eclipse Temurin in its products. For consistency, these versions remain similar to Oracle JDK versions that Oracle designates as long-term support (LTS).

A major version of Eclipse Temurin will be supported for a minimum of six years from the time that version is first introduced. For more information, see the [Eclipse Temurin Life Cycle and Support Policy](#).

NOTE

RHEL 6 reached the end of life in November 2020. Because of this, Eclipse Temurin does not support RHEL 6 as a supported configuration.

CHAPTER 2. ECLIPSE TEMURIN FEATURES

Eclipse Temurin does not contain structural changes from the upstream distribution of OpenJDK.

For the list of changes and security fixes included in the latest OpenJDK 17 release of Eclipse Temurin, see [OpenJDK 17.0.5 Released](#).

New features and enhancements

Review the following release notes to understand new features and feature enhancements included with the Eclipse Temurin 17.0.5 release:

Disabled `cpu.shares` parameter

Before the OpenJDK 17.0.5 release, OpenJDK used an incorrect interpretation of the `cpu.shares` parameter, which belongs to Linux control groups, also known as `cgroups`. The parameter might cause a Java Virtual machine (JVM) to use fewer CPUs than available, which can impact the JVM's CPU resources and performance when it operates inside a container.

The OpenJDK 17.0.5 release configures a JVM to no longer use the `cpu.shares` parameter when determining the number of threads for a thread pool. If you want to revert this configuration, pass the `-XX:+UseContainerCpuShares` argument on JVM startup.

NOTE

The `-XX:+UseContainerCpuShares` argument is a deprecated feature and might be removed in a future OpenJDK release.

See [JDK-8281181](#) (JDK Bug System).

SHA-1 Signed JARs

With the OpenJDK 17.0.5 release, JARs signed with **SHA-1** algorithms are restricted by default and treated as if they were unsigned. These restrictions apply to the following algorithms:

- Algorithms used to digest, sign, and optionally timestamp the JAR.
- Signature and digest algorithms of the certificates in the certificate chain of the code signer and the Timestamp Authority, and any Certificate Revocation Lists (CRLs) or Online Certificate Status Protocol (OCSP) responses that are used to verify if those certificates have been revoked.

Additionally, the restrictions apply to signed Java Cryptography Extension (JCE) providers.

To reduce the compatibility risk for JARs that have been previously timestamped, the restriction does not apply to any JAR signed with **SHA-1** algorithms and timestamped prior to **January 01, 2019**. This exception might be removed in a future OpenJDK release.

To determine if your JAR file is impacted by the restriction, you can issue the following command in your CLI:

```
$ jarsigner -verify -verbose -certs
```

From the output of the previous command, search for instance of **SHA1**, **SHA-1**, or **disabled**. Additionally, search for any warning messages that indicate that the JAR will be treated as unsigned. For example:

Signed by "CN="Signer""
 Digest algorithm: SHA-1 (disabled)
 Signature algorithm: SHA1withRSA (disabled), 2048-bit key

WARNING: The jar will be treated as unsigned, because it is signed with a weak algorithm that is now disabled by the security property:

```
jdk.jar.disabledAlgorithms=MD2, MD5, RSA keySize < 1024, DSA keySize < 1024, SHA1 denyAfter 2019-01-01
```

Consider replacing or re-signing any JARs affected by the new restrictions with stronger algorithms.

If your JAR file is impacted by this restriction, you can remove the algorithm and re-sign the file with a stronger algorithm, such as **SHA-256**. If you want to remove the restriction on **SHA-1** signed JARs for OpenJDK 17.0.5, and you accept the security risks, you can complete the following actions:

1. Modify the **java.security** configuration file. Alternatively, you can preserve this file and instead create another file with the required configurations.
2. Remove the **SHA1 usage SignedJAR & denyAfter 2019 01 011** entry from the **jdk.certpath.disabledAlgorithms** security property.
3. Remove the **SHA1 denyAfter 2019-01-01** entry from the **jdk.jar.disabledAlgorithms** security property.

NOTE

The value of **jdk.certpath.disabledAlgorithms** in the **java.security** file might be overridden by the system security policy on RHEL 8 and 9. The values used by the system security policy can be seen in the file **/etc/crypto-policies/back-ends/java.config** and disabled by either setting **security.useSystemPropertiesFile** to false in the **java.security** file or passing **-Djava.security.disableSystemPropertiesFile=true** to the JVM. These values are not modified by this release, so the values remain the same for previous releases of OpenJDK.

For an example of configuring the **java.security** file, see [Overriding java.security properties for JBoss EAP for OpenShift](#) (Red Hat Customer Portal).

See [JDK-8269039](#) (JDK Bug System).

SunMSCAPI provider supports new Microsoft Windows keystore types

The **SunMSCAPI** provider supports the following Microsoft Windows keystore types where you must append your local namespace to *Windows-*:

- **Windows-<local_computer_name>**
- **Windows-<root_local_computer_name>**
- **Windows-<current_username>**
- **Windows-<root_username>**

By specifying any of these types, you can provide access to your local computer's location for the Microsoft Windows keystore. Thereby providing the keystore access to certificates that are stored on your local system.

See [JDK-6782021](#) (JDK Bug System).

System properties for controlling the **keep-alive** behavior of **HTTPURLConnection**

The OpenJDK 17.0.5 release includes the following new system properties that you can use to control the **keep-alive** behavior of **HTTPURLConnection**:

- **http.keepAlive.time.server**, which controls connections to servers.
- **http.keepAlive.time.proxy**, which controls connections to proxies.

Before the OpenJDK 17.0.5 release, a server or a proxy with an unspecified **keep-alive** time might cause an idle connection to remain open for a period defined by a hard-coded default value.

With OpenJDK 17.0.5, you can use system properties to change the default value for the **keep-alive** time. The **keep-alive** properties control this behavior by changing the HTTP **keep-alive** time of either a server or proxy, so that OpenJDK's HTTP protocol handler closes idle connections after a specified number of seconds.

Before the OpenJDK 17.0.5 release, the following use cases would lead to specific **keep-alive** behaviors for **HTTPURLConnection**:

- If the server specifies the **Connection:keep-alive** header and the server's response contains **Keep-alive:timeout=N** then the OpenJDK **keep-alive** cache on the client uses a timeout of **N** seconds, where **N** is an integer value.
- If the server specifies the **Connection:keep-alive** header, but the server's response does not contain an entry for **Keep-alive:timeout=N** then the OpenJDK **keep-alive** cache on the client uses a timeout of **60** seconds for a proxy and **5** seconds for a server.
- If the server does not specify the **Connection:keep-alive** header, the OpenJDK **keep-alive** cache on the client uses a timeout of 5 seconds for all connections.

The OpenJDK 17.0.5 release maintains the previously described behavior, but you can now specify the timeouts in the second and third listed use cases by using the **http.keepAlive.time.server** and **http.keepAlive.time.proxy** properties, rather than having to rely on the default settings.

NOTE

If you set the **keep-alive** property and the server specifies a **keep-alive** time for the **Keep-Alive** response header, the HTTP protocol handler uses the time specified by the server. This situation is identical for a proxy.

See [JDK-8278067](#) (JDK Bug System).
