Abstract

Apache Camel has over 100 components and each component is highly configurable. This guide describes the settings for each of the components.

Table of Contents

| | |
|-------------------------------------------------------|------------|
| MAKING OPEN SOURCE MORE INCLUSIVE | 91 |
| CHAPTER 1. COMPONENTS OVERVIEW | 92 |
| 1.1. CONTAINER TYPES | 92 |
| 1.2. SUPPORTED COMPONENTS | 92 |
| CHAPTER 2. ACTIVEMQ | 112 |
| ACTIVEMQ COMPONENT | 112 |
| URI FORMAT | 112 |
| OPTIONS | 112 |
| CAMEL ON EAP DEPLOYMENT | 112 |
| CONFIGURING THE CONNECTION FACTORY | 113 |
| CONFIGURING THE CONNECTION FACTORY USING SPRING XML | 113 |
| USING CONNECTION POOLING | 113 |
| INVOKING MESSAGELISTENER POJOS IN A ROUTE | 114 |
| USING ACTIVEMQ DESTINATION OPTIONS | 115 |
| CONSUMING ADVISORY MESSAGES | 115 |
| GETTING COMPONENT JAR | 116 |
| CHAPTER 3. AHC COMPONENT | 117 |
| 3.1. URI FORMAT | 117 |
| 3.2. AHCENDPOINT OPTIONS | 117 |
| 3.2.1. Path Parameters (1 parameters): | 117 |
| 3.2.2. Query Parameters (13 parameters): | 117 |
| 3.3. SPRING BOOT AUTO-CONFIGURATION | 119 |
| 3.4. AHCCOMPONENT OPTIONS | 120 |
| 3.5. MESSAGE HEADERS | 121 |
| 3.6. MESSAGE BODY | 122 |
| 3.7. RESPONSE CODE | 122 |
| 3.8. AHCOPERATIONFAILEDEXCEPTION | 123 |
| 3.9. CALLING USING GET OR POST | 123 |
| 3.10. CONFIGURING URI TO CALL | 123 |
| 3.11. CONFIGURING URI PARAMETERS | 124 |
| 3.12. HOW TO SET THE HTTP METHOD TO THE HTTP PRODUCER | 124 |
| 3.13. CONFIGURING CHARSET | 124 |
| 3.13.1. URI Parameters from the endpoint URI | 124 |
| 3.13.2. URI Parameters from the Message | 125 |
| 3.13.3. Getting the Response Code | 125 |
| 3.14. CONFIGURING ASYNCHTTPCLIENT | 125 |
| 3.15. SSL SUPPORT (HTTPS) | 126 |
| 3.16. SEE ALSO | 126 |
| CHAPTER 4. AHC WEBSOCKET COMPONENT | 128 |
| 4.1. URI FORMAT | 128 |
| 4.2. AHC-WS OPTIONS | 128 |
| 4.2.1. Path Parameters (1 parameters): | 129 |
| 4.2.2. Query Parameters (18 parameters): | 129 |
| 4.3. SPRING BOOT AUTO-CONFIGURATION | 131 |
| 4.4. WRITING AND READING DATA OVER WEBSOCKET | 133 |
| 4.5. CONFIGURING URI TO WRITE OR READ DATA | 133 |
| 4.6. SEE ALSO | 133 |

| | |
|-----------------------------------------------|------------|
| CHAPTER 5. AMQP COMPONENT | 134 |
| 5.1. URI FORMAT | 134 |
| 5.2. AMQP OPTIONS | 134 |
| 5.2.1. Path Parameters (2 parameters): | 146 |
| 5.2.2. Query Parameters (92 parameters): | 147 |
| 5.3. SPRING BOOT AUTO-CONFIGURATION | 161 |
| 5.4. USAGE | 174 |
| 5.5. CONFIGURING AMQP COMPONENT | 174 |
| 5.6. USING TOPICS | 176 |
| 5.7. SEE ALSO | 176 |
| CHAPTER 6. APNS COMPONENT | 177 |
| 6.1. URI FORMAT | 177 |
| 6.2. OPTIONS | 177 |
| 6.2.1. Path Parameters (1 parameters): | 178 |
| 6.2.2. Query Parameters (20 parameters): | 178 |
| 6.3. SPRING BOOT AUTO-CONFIGURATION | 180 |
| 6.3.1. Component | 180 |
| 6.3.1.1. SSL Setting | 180 |
| 6.4. EXCHANGE DATA FORMAT | 181 |
| 6.5. MESSAGE HEADERS | 181 |
| 6.6. APNSSERVICEFACTORY BUILDER CALLBACK | 181 |
| 6.7. SAMPLES | 181 |
| 6.7.1. Camel Xml route | 182 |
| 6.7.2. Camel Java route | 183 |
| 6.8. SEE ALSO | 184 |
| CHAPTER 7. ASN.1 FILE DATAFORMAT | 185 |
| 7.1. ASN.1 DATA FORMAT OPTIONS | 185 |
| 7.2. SPRING BOOT AUTO-CONFIGURATION | 185 |
| 7.3. UNMARSHAL | 186 |
| 7.4. DEPENDENCIES | 187 |
| CHAPTER 8. AS2 COMPONENT | 188 |
| 8.1. URI FORMAT | 188 |
| 8.2. AS2 OPTIONS | 188 |
| 8.2.1. Path Parameters (1 parameters): | 189 |
| 8.2.2. Query Parameters (30 parameters): | 189 |
| 8.3. SPRING BOOT AUTO-CONFIGURATION | 192 |
| 8.4. CLIENT ENDPOINTS: | 195 |
| 8.5. SERVER ENDPOINTS: | 197 |
| CHAPTER 9. ASTERISK COMPONENT | 199 |
| 9.1. URI FORMAT | 199 |
| 9.2. OPTIONS | 199 |
| 9.2.1. Path Parameters (1 parameters): | 199 |
| 9.2.2. Query Parameters (8 parameters): | 199 |
| 9.3. SPRING BOOT AUTO-CONFIGURATION | 200 |
| 9.4. ACTION | 200 |
| CHAPTER 10. ATMOS COMPONENT | 202 |
| 10.1. OPTIONS | 202 |
| 10.1.1. Path Parameters (2 parameters): | 202 |
| 10.1.2. Query Parameters (12 parameters): | 203 |

| | |
|-----------------------------------------------------------------|------------|
| 10.2. SPRING BOOT AUTO-CONFIGURATION | 204 |
| 10.3. DEPENDENCIES | 204 |
| 10.4. INTEGRATIONS | 204 |
| 10.5. EXAMPLES | 205 |
| 10.6. SEE ALSO | 205 |
| CHAPTER 11. ATLASMAP COMPONENT | 206 |
| 11.1. URI FORMAT | 206 |
| 11.2. CONFIGURING OPTIONS | 206 |
| 11.2.1. Configuring Component Level Options | 206 |
| 11.2.2. Component Options | 207 |
| 11.2.3. Configuring Endpoint Level Options | 208 |
| 11.2.4. Endpoint Options | 208 |
| 11.2.4.1. Path Parameters (1 parameters) | 208 |
| 11.2.4.2. Query Parameters (7 parameters) | 209 |
| 11.3. EXAMPLES | 211 |
| 11.3.1. Producer Example | 211 |
| CHAPTER 12. ATMOSPHERE WEBSOCKET COMPONENT | 212 |
| 12.1. ATMOSPHERE-WEBSOCKET OPTIONS | 212 |
| 12.1.1. Path Parameters (1 parameters): | 213 |
| 12.1.2. Query Parameters (38 parameters): | 213 |
| 12.2. SPRING BOOT AUTO-CONFIGURATION | 217 |
| 12.3. URI FORMAT | 219 |
| 12.4. READING AND WRITING DATA OVER WEBSOCKET | 219 |
| 12.5. CONFIGURING URI TO READ OR WRITE DATA | 219 |
| 12.6. SEE ALSO | 220 |
| CHAPTER 13. ATOM COMPONENT | 221 |
| 13.1. URI FORMAT | 221 |
| 13.2. OPTIONS | 221 |
| 13.2.1. Path Parameters (1 parameters): | 221 |
| 13.2.2. Query Parameters (27 parameters): | 221 |
| 13.3. SPRING BOOT AUTO-CONFIGURATION | 224 |
| 13.4. EXCHANGE DATA FORMAT | 224 |
| 13.5. MESSAGE HEADERS | 225 |
| 13.6. SAMPLES | 225 |
| 13.7. SEE ALSO | 225 |
| CHAPTER 14. ATOMIX MAP COMPONENT | 226 |
| 14.1. URI FORMAT | 226 |
| 14.2. OPTIONS | 226 |
| 14.2.1. Path Parameters (1 parameters): | 226 |
| 14.2.2. Query Parameters (18 parameters): | 227 |
| 14.3. SPRING BOOT AUTO-CONFIGURATION | 228 |
| 14.4. HEADERS | 229 |
| 14.5. CONFIGURING THE COMPONENT TO CONNECT TO AN ATOMIX CLUSTER | 231 |
| 14.6. USAGE EXAMPLES: | 231 |
| CHAPTER 15. ATOMIX MESSAGING COMPONENT | 233 |
| 15.1. URI FORMAT | 233 |
| 15.1.1. Path Parameters (1 parameters): | 233 |
| 15.1.2. Query Parameters (19 parameters): | 234 |
| 15.2. SPRING BOOT AUTO-CONFIGURATION | 235 |

| | |
|------------------------------------------------------|------------|
| CHAPTER 16. ATOMIX MULTIMAP COMPONENT | 238 |
| 16.1. URI FORMAT | 238 |
| 16.1.1. Path Parameters (1 parameters): | 238 |
| 16.1.2. Query Parameters (18 parameters): | 239 |
| 16.2. SPRING BOOT AUTO-CONFIGURATION | 240 |
| CHAPTER 17. ATOMIX QUEUE COMPONENT | 242 |
| 17.1. URI FORMAT | 242 |
| 17.1.1. Path Parameters (1 parameters): | 242 |
| 17.1.2. Query Parameters (16 parameters): | 243 |
| 17.2. SPRING BOOT AUTO-CONFIGURATION | 244 |
| CHAPTER 18. ATOMIX SET COMPONENT | 246 |
| 18.1. URI FORMAT | 246 |
| 18.1.1. Path Parameters (1 parameters): | 246 |
| 18.1.2. Query Parameters (17 parameters): | 247 |
| 18.2. SPRING BOOT AUTO-CONFIGURATION | 248 |
| CHAPTER 19. ATOMIX VALUE COMPONENT | 250 |
| 19.1. URI FORMAT | 250 |
| 19.1.1. Path Parameters (1 parameters): | 250 |
| 19.1.2. Query Parameters (17 parameters): | 251 |
| 19.2. SPRING BOOT AUTO-CONFIGURATION | 252 |
| CHAPTER 20. AVRO COMPONENT | 254 |
| 20.1. APACHE AVRO OVERVIEW | 254 |
| 20.2. USING THE AVRO DATA FORMAT | 255 |
| 20.3. USING AVRO RPC IN CAMEL | 255 |
| 20.4. AVRO RPC URI OPTIONS | 256 |
| 20.4.1. Path Parameters (4 parameters): | 256 |
| 20.4.2. Query Parameters (10 parameters): | 257 |
| 20.5. SPRING BOOT AUTO-CONFIGURATION | 258 |
| 20.6. AVRO RPC HEADERS | 259 |
| 20.7. EXAMPLES | 260 |
| CHAPTER 21. AVRO DATAFORMAT | 262 |
| 21.1. APACHE AVRO OVERVIEW | 262 |
| 21.2. USING THE AVRO DATA FORMAT | 263 |
| 21.3. AVRO DATAFORMAT OPTIONS | 263 |
| 21.4. SPRING BOOT AUTO-CONFIGURATION | 264 |
| CHAPTER 22. AWS CLOUDWATCH COMPONENT | 266 |
| 22.1. URI FORMAT | 266 |
| 22.2. URI OPTIONS | 266 |
| 22.2.1. Path Parameters (1 parameters): | 266 |
| 22.2.2. Query Parameters (11 parameters): | 267 |
| 22.3. SPRING BOOT AUTO-CONFIGURATION | 267 |
| 22.4. USAGE | 269 |
| 22.4.1. Message headers evaluated by the CW producer | 269 |
| 22.4.2. Advanced AmazonCloudWatch configuration | 271 |
| 22.5. DEPENDENCIES | 271 |
| 22.6. SEE ALSO | 271 |
| CHAPTER 23. AWS DYNAMODB COMPONENT | 272 |
| 23.1. URI FORMAT | 272 |

| | |
|------------------------------------------------------------|------------|
| 23.2. URI OPTIONS | 272 |
| 23.2.1. Path Parameters (1 parameters): | 272 |
| 23.2.2. Query Parameters (13 parameters): | 273 |
| 23.3. SPRING BOOT AUTO-CONFIGURATION | 274 |
| 23.4. USAGE | 276 |
| 23.4.1. Message headers evaluated by the DDB producer | 276 |
| 23.4.2. Message headers set during BatchGetItems operation | 278 |
| 23.4.3. Message headers set during DeleteItem operation | 279 |
| 23.4.4. Message headers set during DeleteTable operation | 279 |
| 23.4.5. Message headers set during DescribeTable operation | 280 |
| 23.4.6. Message headers set during GetItem operation | 281 |
| 23.4.7. Message headers set during PutItem operation | 282 |
| 23.4.8. Message headers set during Query operation | 282 |
| 23.4.9. Message headers set during Scan operation | 283 |
| 23.4.10. Message headers set during UpdateItem operation | 283 |
| 23.4.11. Advanced AmazonDynamoDB configuration | 284 |
| 23.5. DEPENDENCIES | 284 |
| 23.6. SEE ALSO | 284 |
| CHAPTER 24. AWS DYNAMODB STREAMS COMPONENT | 286 |
| 24.1. URI FORMAT | 286 |
| 24.2. URI OPTIONS | 286 |
| 24.2.1. Path Parameters (1 parameters): | 286 |
| 24.2.2. Query Parameters (28 parameters): | 287 |
| 24.3. SPRING BOOT AUTO-CONFIGURATION | 289 |
| 24.4. SEQUENCE NUMBERS | 291 |
| 24.5. BATCH CONSUMER | 292 |
| 24.6. USAGE | 292 |
| 24.6.1. AmazonDynamoDBStreamsClient configuration | 292 |
| 24.6.2. Providing AWS Credentials | 292 |
| 24.7. COPING WITH DOWNTIME | 292 |
| 24.7.1. AWS DynamoDB Streams outage of less than 24 hours | 292 |
| 24.7.2. AWS DynamoDB Streams outage of more than 24 hours | 292 |
| 24.8. DEPENDENCIES | 292 |
| 24.9. SEE ALSO | 293 |

|------------------------------------------------------------|-------------|
| CHAPTER 143. HBASE COMPONENT | 1148 |
| 143.1. APACHE HBASE OVERVIEW | 1148 |
| 143.2. CAMEL AND HBASE | 1148 |
| 143.3. CONFIGURING THE COMPONENT | 1148 |
| 143.4. HBASE PRODUCER | 1149 |
| 143.4.1. Supported URI options | 1149 |
| 143.4.2. Path Parameters (1 parameters): | 1150 |
| 143.4.3. Query Parameters (16 parameters): | 1150 |
| 143.5. SPRING BOOT AUTO-CONFIGURATION | 1151 |
| 143.5.1. Put Operations. | 1152 |
| 143.5.2. Get Operations. | 1153 |
| 143.5.3. Delete Operations. | 1153 |
| 143.5.4. Scan Operations. | 1154 |
| 143.6. HBASE CONSUMER | 1155 |
| 143.7. HBASE IDEMPOTENT REPOSITORY | 1155 |
| 143.8. HBASE MAPPING | 1156 |
| 143.8.1. HBase Header mapping Examples | 1156 |
| 143.8.2. Body mapping Examples | 1157 |
| 143.9. SEE ALSO | 1158 |
| | |
| CHAPTER 144. HDFS COMPONENT (DEPRECATED) | 1159 |
| 144.1. URI FORMAT | 1159 |
| 144.2. OPTIONS | 1159 |
| 144.2.1. Path Parameters (3 parameters): | 1160 |
| 144.2.2. Query Parameters (38 parameters): | 1160 |
| 144.3. SPRING BOOT AUTO-CONFIGURATION | 1163 |
| 144.3.1. KeyType and ValueType | 1164 |
| 144.4. SPLITTING STRATEGY | 1164 |
| 144.5. MESSAGE HEADERS | 1165 |
| 144.5.1. Producer only | 1165 |
| 144.6. CONTROLLING TO CLOSE FILE STREAM | 1165 |
| 144.7. USING THIS COMPONENT IN OSGI | 1165 |
| | |
| CHAPTER 145. HDFS2 COMPONENT | 1166 |
| 145.1. URI FORMAT | 1166 |
| 145.2. OPTIONS | 1166 |
| 145.2.1. Path Parameters (3 parameters): | 1167 |
| 145.2.2. Query Parameters (38 parameters): | 1167 |
| 145.3. SPRING BOOT AUTO-CONFIGURATION | 1170 |
| 145.3.1. KeyType and ValueType | 1171 |
| 145.4. SPLITTING STRATEGY | 1171 |
| 145.5. MESSAGE HEADERS | 1172 |
| 145.5.1. Producer only | 1172 |
| 145.6. CONTROLLING TO CLOSE FILE STREAM | 1172 |
| 145.7. USING THIS COMPONENT IN OSGI | 1172 |
| 145.7.1. Using this component with manually defined routes | 1173 |
| 145.7.2. Using this component with Blueprint container | 1173 |
| | |
| CHAPTER 146. HEADERSMAP | 1174 |
| 146.1. AUTO DETECTION FROM CLASSPATH | 1174 |
| 146.2. MANUAL ENABLING | 1174 |
| | |
| CHAPTER 147. HESSIAN DATAFORMAT (DEPRECATED) | 1175 |
| 147.1. OPTIONS | 1175 |

| | |
|-----------------------------------------------------------------------------------|-------------|
| 147.2. SPRING BOOT AUTO-CONFIGURATION | 1175 |
| 147.3. USING THE HESSIAN DATA FORMAT IN JAVA DSL | 1176 |
| 147.4. USING THE HESSIAN DATA FORMAT IN SPRING DSL | 1176 |
| CHAPTER 148. HIPCHAT COMPONENT | 1177 |
| 148.1. URI FORMAT | 1177 |
| 148.2. URI OPTIONS | 1177 |
| 148.2.1. Path Parameters (3 parameters): | 1177 |
| 148.2.2. Query Parameters (22 parameters): | 1177 |
| 148.3. SPRING BOOT AUTO-CONFIGURATION | 1180 |
| 148.4. SCHEDULED POLL CONSUMER | 1180 |
| 148.4.1. Message headers set by the Hipchat consumer | 1180 |
| 148.5. HIPCHAT PRODUCER | 1181 |
| 148.5.1. Message headers evaluated by the Hipchat producer | 1181 |
| 148.5.2. Message headers set by the Hipchat producer | 1182 |
| 148.5.3. Configuring Http Client | 1182 |
| 148.5.4. Dependencies | 1183 |
| CHAPTER 149. HL7 DATAFORMAT | 1184 |
| 149.1. HL7 MLLP PROTOCOL | 1184 |
| 149.1.1. Exposing an HL7 listener using Mina | 1185 |
| 149.1.2. Exposing an HL7 listener using Netty (available from Camel 2.15 onwards) | 1186 |
| 149.2. HL7 MODEL USING JAVA.LANG.STRING OR BYTE[] | 1186 |
| 149.3. HL7V2 MODEL USING HAPI | 1186 |
| 149.4. HL7 DATAFORMAT | 1187 |
| 149.5. SPRING BOOT AUTO-CONFIGURATION | 1187 |
| 149.5.1. Serializable messages | 1188 |
| 149.5.2. Segment separators | 1188 |
| 149.5.3. Charset | 1188 |
| 149.6. MESSAGE HEADERS | 1189 |
| 149.7. OPTIONS | 1190 |
| 149.8. DEPENDENCIES | 1191 |
| 149.9. TERSER LANGUAGE | 1192 |
| 149.10. HL7 VALIDATION PREDICATE | 1192 |
| 149.11. HL7 VALIDATION PREDICATE USING THE HAPICONTEXT (CAMEL 2.14) | 1193 |
| 149.12. HL7 ACKNOWLEDGEMENT EXPRESSION | 1193 |
| CHAPTER 150. HTTP COMPONENT (DEPRECATED) | 1195 |
| 150.1. URI FORMAT | 1195 |
| 150.2. EXAMPLES | 1195 |
| 150.3. HTTP OPTIONS | 1196 |
| 150.3.1. Path Parameters (1 parameters): | 1197 |
| 150.3.2. Query Parameters (38 parameters): | 1197 |
| 150.4. SPRING BOOT AUTO-CONFIGURATION | 1201 |
| 150.5. MESSAGE HEADERS | 1202 |
| 150.6. MESSAGE BODY | 1204 |
| 150.7. RESPONSE CODE | 1204 |
| 150.8. HTTPOPERATIONFAILEXCEPTION | 1205 |
| 150.9. WHICH HTTP METHOD WILL BE USED | 1205 |
| 150.10. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE | 1205 |
| 150.11. USING CLIENT TIMEOUT - SO_TIMEOUT | 1205 |
| 150.12. MORE EXAMPLES | 1205 |
| 150.12.1. Configuring a Proxy | 1205 |
| 150.12.2. Using proxy settings outside of URI | 1206 |

| | |
|--------------------------------------------------------------------------------------------------------|-------------|
| 150.13. CONFIGURING CHARSET | 1206 |
| 150.14. SAMPLE WITH SCHEDULED POLL | 1206 |
| 150.15. GETTING THE RESPONSE CODE | 1206 |
| 150.16. USING THROWEXCEPTIONONFAILURE=FALSE TO GET ANY RESPONSE BACK | 1206 |
| 150.17. DISABLING COOKIES | 1207 |
| 150.18. ADVANCED USAGE | 1207 |
| 150.18.1. Setting MaxConnectionsPerHost | 1207 |
| 150.18.2. Using preemptive authentication | 1207 |
| 150.18.3. Accepting self signed certificates from remote server | 1207 |
| 150.18.4. Setting up SSL for HTTP Client | 1207 |
| 150.19. SEE ALSO | 1209 |
| CHAPTER 151. HTTP4 COMPONENT | 1210 |
| 151.1. URI FORMAT | 1210 |
| 151.2. HTTP4 COMPONENT OPTIONS | 1210 |
| 151.2.1. Path Parameters (1 parameters): | 1212 |
| 151.2.2. Query Parameters (49 parameters): | 1213 |
| 151.3. SPRING BOOT AUTO-CONFIGURATION | 1217 |
| 151.4. MESSAGE HEADERS | 1220 |
| 151.5. MESSAGE BODY | 1221 |
| 151.6. USING SYSTEM PROPERTIES | 1221 |
| 151.7. RESPONSE CODE | 1222 |
| 151.8. HTTPOPERATIONFAILEDEXCEPTION | 1222 |
| 151.9. WHICH HTTP METHOD WILL BE USED | 1222 |
| 151.10. HOW TO GET ACCESS TO HTTPSERVLETREQUEST AND HTTPSERVLETRESPONSE | 1223 |
| 151.11. CONFIGURING URI TO CALL | 1223 |
| 151.12. CONFIGURING URI PARAMETERS | 1223 |
| 151.13. HOW TO SET THE HTTP METHOD (GET/PATCH/POST/PUT/DELETE/HEAD/OPTIONS/TRACE) TO THE HTTP PRODUCER | 1224 |
| 151.14. USING CLIENT TIMEOUT - SO_TIMEOUT | 1224 |
| 151.15. CONFIGURING A PROXY | 1224 |
| 151.15.1. Using proxy settings outside of URI | 1225 |
| 151.16. CONFIGURING CHARSET | 1225 |
| 151.16.1. Sample with scheduled poll | 1225 |
| 151.16.2. URI Parameters from the endpoint URI | 1225 |
| 151.16.3. URI Parameters from the Message | 1226 |
| 151.16.4. Getting the Response Code | 1226 |
| 151.17. DISABLING COOKIES | 1226 |
| 151.18. ADVANCED USAGE | 1226 |
| 151.18.1. Setting up SSL for HTTP Client | 1226 |
| CHAPTER 152. HYSTRIX COMPONENT | 1230 |
| 152.1. SPRING BOOT AUTO-CONFIGURATION | 1230 |
| CHAPTER 153. ICAL DATAFORMAT | 1231 |
| 153.1. OPTIONS | 1231 |
| 153.2. SPRING BOOT AUTO-CONFIGURATION | 1231 |
| 153.3. BASIC USAGE | 1232 |
| 153.4. SEE ALSO | 1232 |
| CHAPTER 154. IEC 60870 CLIENT COMPONENT | 1233 |
| 154.1. URI FORMAT | 1233 |
| 154.2. URI OPTIONS | 1233 |
| 154.2.1. Path Parameters (1 parameters): | 1233 |

| | |
|---------------------------------------------------------|-------------|
| 154.2.2. Query Parameters (19 parameters): | 1234 |
| 154.3. SPRING BOOT AUTO-CONFIGURATION | 1235 |
| CHAPTER 155. IEC 60870 SERVER COMPONENT | 1237 |
| 155.1. URI FORMAT | 1237 |
| 155.2. URI OPTIONS | 1237 |
| 155.2.1. Path Parameters (1 parameters): | 1237 |
| 155.2.2. Query Parameters (20 parameters): | 1238 |
| 155.3. SPRING BOOT AUTO-CONFIGURATION | 1239 |
| CHAPTER 156. IGNITE CACHE COMPONENT | 1241 |
| 156.1. OPTIONS | 1241 |
| 156.1.1. Path Parameters (1 parameters): | 1241 |
| 156.1.2. Query Parameters (16 parameters): | 1241 |
| 156.2. SPRING BOOT AUTO-CONFIGURATION | 1243 |
| 156.2.1. Headers used | 1244 |
| CHAPTER 157. IGNITE COMPUTE COMPONENT | 1246 |
| 157.1. OPTIONS | 1246 |
| 157.1.1. Path Parameters (1 parameters): | 1246 |
| 157.1.2. Query Parameters (8 parameters): | 1247 |
| 157.2. SPRING BOOT AUTO-CONFIGURATION | 1247 |
| 157.2.1. Expected payload types | 1248 |
| 157.2.2. Headers used | 1248 |
| CHAPTER 158. IGNITE EVENTS COMPONENT | 1250 |
| 158.1. OPTIONS | 1250 |
| 158.1.1. Path Parameters (1 parameters): | 1250 |
| 158.1.2. Query Parameters (8 parameters): | 1250 |
| 158.2. SPRING BOOT AUTO-CONFIGURATION | 1251 |
| CHAPTER 159. IGNITE ID GENERATOR COMPONENT | 1253 |
| 159.1. OPTIONS | 1253 |
| 159.1.1. Path Parameters (1 parameters): | 1253 |
| 159.1.2. Query Parameters (6 parameters): | 1253 |
| 159.2. SPRING BOOT AUTO-CONFIGURATION | 1254 |
| CHAPTER 160. IGNITE MESSAGING COMPONENT | 1256 |
| 160.1. OPTIONS | 1256 |
| 160.1.1. Path Parameters (1 parameters): | 1256 |
| 160.1.2. Query Parameters (9 parameters): | 1256 |
| 160.2. SPRING BOOT AUTO-CONFIGURATION | 1257 |
| 160.2.1. Headers used | 1258 |
| CHAPTER 161. IGNITE QUEUES COMPONENT | 1259 |
| 161.1. OPTIONS | 1259 |
| 161.1.1. Path Parameters (1 parameters): | 1259 |
| 161.1.2. Query Parameters (7 parameters): | 1259 |
| 161.2. SPRING BOOT AUTO-CONFIGURATION | 1260 |
| 161.2.1. Headers used | 1261 |
| CHAPTER 162. IGNITE SETS COMPONENT | 1263 |
| 162.1. OPTIONS | 1263 |
| 162.1.1. Path Parameters (1 parameters): | 1263 |
| 162.1.2. Query Parameters (5 parameters): | 1263 |

| | |
|-----------------------------------------------------------------------------------------|-------------|
| 162.2. SPRING BOOT AUTO-CONFIGURATION | 1264 |
| 162.2.1. Headers used | 1265 |
| CHAPTER 163. INFINISPAN COMPONENT | 1266 |
| 163.1. URI FORMAT | 1266 |
| 163.2. URI OPTIONS | 1266 |
| 163.2.1. Path Parameters (1 parameters): | 1267 |
| 163.2.2. Query Parameters (18 parameters): | 1267 |
| 163.3. SPRING BOOT AUTO-CONFIGURATION | 1269 |
| 163.4. MESSAGE HEADERS | 1272 |
| 163.5. EXAMPLES | 1273 |
| 163.6. USING THE INFINISPAN BASED IDEMPOTENT REPOSITORY | 1274 |
| 163.7. USING THE INFINISPAN BASED ROUTE POLICY | 1275 |
| 163.8. SEE ALSO | 1275 |
| CHAPTER 164. INFLUXDB COMPONENT | 1276 |
| 164.1. URI FORMAT | 1276 |
| 164.2. URI OPTIONS | 1276 |
| 164.2.1. Path Parameters (1 parameters): | 1276 |
| 164.2.2. Query Parameters (6 parameters): | 1276 |
| 164.3. SPRING BOOT AUTO-CONFIGURATION | 1277 |
| 164.4. MESSAGE HEADERS | 1277 |
| 164.5. EXAMPLE | 1277 |
| 164.6. SEE ALSO | 1278 |
| CHAPTER 165. IPFS COMPONENT | 1279 |
| 165.1. URI FORMAT | 1279 |
| 165.2. OPTIONS | 1279 |
| 165.2.1. Path Parameters (1 parameters): | 1279 |
| 165.2.2. Query Parameters (2 parameters): | 1279 |
| 165.3. SPRING BOOT AUTO-CONFIGURATION | 1279 |
| 165.4. KARAF SUPPORT | 1280 |
| 165.5. MESSAGE HEADERS | 1280 |
| CHAPTER 166. IRC COMPONENT | 1281 |
| 166.1. URI FORMAT | 1281 |
| 166.2. OPTIONS | 1281 |
| 166.2.1. Path Parameters (2 parameters): | 1281 |
| 166.2.2. Query Parameters (25 parameters): | 1282 |
| 166.3. SPRING BOOT AUTO-CONFIGURATION | 1284 |
| 166.4. SSL SUPPORT | 1284 |
| 166.4.1. Using the JSSE Configuration Utility | 1284 |
| 166.4.2. Using the legacy basic configuration options | 1285 |
| 166.5. USING KEYS | 1285 |
| 166.6. GETTING A LIST OF USERS OF THE CHANNEL | 1285 |
| 166.7. SEE ALSO | 1286 |
| CHAPTER 167. JACKSONXML DATAFORMAT | 1287 |
| 167.1. JACKSONXML OPTIONS | 1287 |
| 167.2. SPRING BOOT AUTO-CONFIGURATION | 1288 |
| 167.2.1. Using Jackson XML in Spring DSL | 1290 |
| 167.3. EXCLUDING POJO FIELDS FROM MARSHALLING | 1291 |
| 167.4. INCLUDE/EXCLUDE FIELDS USING THE JSONVIEW ATTRIBUTE WITH `JACKSONXML` DATAFORMAT | 1291 |

| | |
|---------------------------------------------------------------|-------------|
| 167.5. SETTING SERIALIZATION INCLUDE OPTION | 1292 |
| 167.6. UNMARSHALLING FROM XML TO POJO WITH DYNAMIC CLASS NAME | 1292 |
| 167.7. UNMARSHALLING FROM XML TO LIST<MAP> OR LIST<POJO> | 1292 |
| 167.8. USING CUSTOM JACKSON MODULES | 1293 |
| 167.9. ENABLING OR DISABLE FEATURES USING JACKSON | 1293 |
| 167.10. CONVERTING MAPS TO POJO USING JACKSON | 1294 |
| 167.11. FORMATTED XML MARSHALLING (PRETTY-PRINTING) | 1294 |
| 167.12. DEPENDENCIES | 1294 |
| CHAPTER 168. JASYPT COMPONENT | 1296 |
| 168.1. TOOLING | 1296 |
| 168.2. URI OPTIONS | 1297 |
| 168.3. PROTECTING THE MASTER PASSWORD | 1297 |
| 168.4. EXAMPLE WITH JAVA DSL | 1298 |
| 168.5. EXAMPLE WITH SPRING XML | 1298 |
| 168.6. EXAMPLE WITH BLUEPRINT XML | 1299 |
| 168.7. SEE ALSO | 1300 |
| CHAPTER 169. JAXB DATAFORMAT | 1301 |
| 169.1. OPTIONS | 1301 |
| 169.2. SPRING BOOT AUTO-CONFIGURATION | 1302 |
| 169.3. USING THE JAVA DSL | 1305 |
| 169.4. USING SPRING XML | 1305 |
| 169.5. PARTIAL MARSHALLING/UNMARSHALLING | 1305 |
| 169.6. FRAGMENT | 1306 |
| 169.7. IGNORING THE NONXML CHARACTER | 1306 |
| 169.8. WORKING WITH THE OBJECTFACTORY | 1306 |
| 169.9. SETTING ENCODING | 1307 |
| 169.10. CONTROLLING NAMESPACE PREFIX MAPPING | 1307 |
| 169.11. SCHEMA VALIDATION | 1307 |
| 169.12. SCHEMA LOCATION | 1308 |
| 169.13. MARSHAL DATA THAT IS ALREADY XML | 1308 |
| 169.14. DEPENDENCIES | 1309 |
| CHAPTER 170. JCACHE COMPONENT | 1310 |
| 170.1. URI FORMAT | 1310 |
| 170.2. URI OPTIONS | 1310 |
| 170.2.1. Path Parameters (1 parameters): | 1310 |
| 170.2.2. Query Parameters (22 parameters): | 1310 |
| 170.3. SPRING BOOT AUTO-CONFIGURATION | 1312 |
| CHAPTER 171. JCLOUDS COMPONENT | 1314 |
| 171.1. CONFIGURING THE COMPONENT | 1314 |
| 171.2. JCLOUDS OPTIONS | 1315 |
| 171.3. BLOBSTORE URI OPTIONS | 1315 |
| 171.3.1. Path Parameters (2 parameters): | 1316 |
| 171.3.2. Query Parameters (15 parameters): | 1316 |
| 171.3.3. Message Headers for blobstore | 1317 |
| 171.4. BLOBSTORE USAGE SAMPLES | 1318 |
| 171.4.1. Example 1: Putting to the blob | 1318 |
| 171.4.2. Example 2: Getting/Reading from a blob | 1318 |
| 171.4.3. Example 3: Consuming a blob | 1318 |
| 171.5. COMPUTE USAGE SAMPLES | 1319 |
| 171.5.1. Example 1: Listing the available images. | 1319 |

| | |
|-----------------------------------------------------------------------------------|-------------|
| 171.5.2. Example 2: Create a new node. | 1319 |
| 171.5.3. Example 3: Run a shell script on running node. | 1320 |
| 171.5.4. See also | 1320 |
| CHAPTER 172. JCR COMPONENT | 1321 |
| 172.1. URI FORMAT | 1321 |
| 172.2. USAGE | 1321 |
| 172.2.1. JCR Options | 1321 |
| 172.2.2. Path Parameters (2 parameters): | 1321 |
| 172.2.3. Query Parameters (14 parameters): | 1322 |
| 172.3. SPRING BOOT AUTO-CONFIGURATION | 1323 |
| 172.4. EXAMPLE | 1323 |
| 172.5. SEE ALSO | 1324 |
| CHAPTER 173. JDBC COMPONENT | 1325 |
| 173.1. URI FORMAT | 1325 |
| 173.2. OPTIONS | 1325 |
| 173.2.1. Path Parameters (1 parameters): | 1326 |
| 173.2.2. Query Parameters (13 parameters): | 1326 |
| 173.3. SPRING BOOT AUTO-CONFIGURATION | 1328 |
| 173.4. RESULT | 1328 |
| 173.4.1. Message Headers | 1328 |
| 173.5. GENERATED KEYS | 1329 |
| 173.6. USING NAMED PARAMETERS | 1329 |
| 173.7. SAMPLES | 1330 |
| 173.8. SAMPLE - POLLING THE DATABASE EVERY MINUTE | 1330 |
| 173.9. SAMPLE - MOVE DATA BETWEEN DATA SOURCES | 1330 |
| CHAPTER 174. JETTY 9 COMPONENT | 1332 |
| 174.1. URI FORMAT | 1332 |
| 174.2. OPTIONS | 1332 |
| 174.2.1. Path Parameters (1 parameters): | 1335 |
| 174.2.2. Query Parameters (54 parameters): | 1336 |
| 174.3. SPRING BOOT AUTO-CONFIGURATION | 1342 |
| 174.4. MESSAGE HEADERS | 1345 |
| 174.5. USAGE | 1345 |
| 174.6. PRODUCER EXAMPLE | 1346 |
| 174.7. CONSUMER EXAMPLE | 1346 |
| 174.8. SESSION SUPPORT | 1347 |
| 174.9. SSL SUPPORT (HTTPS) | 1347 |
| 174.9.1. Configuring camel-jetty9 with TLS security on IBM Java | 1350 |
| 174.9.2. Configuring general SSL properties | 1350 |
| 174.9.3. How to obtain reference to the X509Certificate | 1350 |
| 174.9.4. Configuring general HTTP properties | 1351 |
| 174.9.5. Obtaining X-Forwarded-For header with HttpServletRequest.getRemoteAddr() | 1351 |
| 174.10. DEFAULT BEHAVIOR FOR RETURNING HTTP STATUS CODES | 1351 |
| 174.11. CUSTOMIZING HTTPBINDING | 1352 |
| 174.12. JETTY HANDLERS AND SECURITY CONFIGURATION | 1352 |
| 174.13. HOW TO RETURN A CUSTOM HTTP 500 REPLY MESSAGE | 1353 |
| 174.14. MULTI-PART FORM SUPPORT | 1353 |
| 174.15. JETTY JMX SUPPORT | 1354 |
| CHAPTER 175. JGROUPS COMPONENT | 1355 |
| 175.1. URI FORMAT | 1355 |

| | |
|---------------------------------------------------------------------|-------------|
| 175.2. OPTIONS | 1355 |
| 175.2.1. Path Parameters (1 parameters): | 1356 |
| 175.2.2. Query Parameters (6 parameters): | 1356 |
| 175.3. SPRING BOOT AUTO-CONFIGURATION | 1357 |
| 175.4. HEADERS | 1358 |
| 175.5. USAGE | 1359 |
| 175.6. PREDEFINED FILTERS | 1359 |
| 175.7. PREDEFINED EXPRESSIONS | 1359 |
| 175.8. EXAMPLES | 1360 |
| 175.8.1. Sending (receiving) messages to (from) the JGroups cluster | 1360 |
| 175.8.2. Receive cluster view change notifications | 1360 |
| 175.8.3. Keeping singleton route within the cluster | 1361 |
| CHAPTER 176. JIBX DATAFORMAT | 1362 |

| CHAPTER 263. PGP DATAFORMAT | 2079 |
| 263.1. PGPDATAFORMAT OPTIONS | 2079 |
| 263.2. PGPDATAFORMAT MESSAGE HEADERS | 2080 |
| 263.3. ENCRYPTING WITH PGPDATAFORMAT | 2083 |
| 263.3.1. To work with the previous example you need the following | 2083 |
| 263.3.2. Managing your keyring | 2083 |
| 263.4. RESTRICTING THE SIGNER IDENTITIES DURING PGP SIGNATURE VERIFICATION | 2085 |

| | |
|---------------------------------------------------------------------------------------|-------------|
| 263.5. SEVERAL SIGNATURES IN ONE PGP DATA FORMAT | 2085 |
| 263.6. SUPPORT OF SUB-KEYS AND KEY FLAGS IN PGP DATA FORMAT MARSHALER | 2086 |
| 263.7. SUPPORT OF CUSTOM KEY ACCESSORS | 2086 |
| 263.8. DEPENDENCIES | 2086 |
| 263.9. SEE ALSO | 2087 |
| CHAPTER 264. PROPERTIES COMPONENT | 2088 |
| 264.1. URI FORMAT | 2088 |
| 264.2. OPTIONS | 2088 |
| 264.2.1. Path Parameters (1 parameters): | 2089 |
| 264.2.2. Query Parameters (6 parameters): | 2090 |
| 264.3. USING PROPERTYPLACEHOLDER | 2090 |
| 264.4. SYNTAX | 2091 |
| 264.5. PROPERTYRESOLVER | 2091 |
| 264.6. DEFINING LOCATION | 2092 |
| 264.7. USING SYSTEM AND ENVIRONMENT VARIABLES IN LOCATIONS | 2092 |
| 264.8. CONFIGURING IN JAVA DSL | 2093 |
| 264.9. CONFIGURING IN SPRING XML | 2093 |
| 264.10. USING A PROPERTIES FROM THE REGISTRY | 2094 |
| 264.11. EXAMPLES USING PROPERTIES COMPONENT | 2094 |
| 264.12. EXAMPLES | 2095 |
| 264.13. EXAMPLE WITH SIMPLE LANGUAGE | 2095 |
| 264.14. ADDITIONAL PROPERTY PLACEHOLDER SUPPORTED IN SPRING XML | 2096 |
| 264.15. OVERRIDING A PROPERTY SETTING USING A JVM SYSTEM PROPERTY | 2096 |
| 264.16. USING PROPERTY PLACEHOLDERS FOR ANY KIND OF ATTRIBUTE IN THE XML DSL | 2097 |
| 264.17. USING BLUEPRINT PROPERTY PLACEHOLDER WITH CAMEL ROUTES | 2097 |
| 264.17.1. Using OSGi blueprint property placeholders in Camel routes | 2098 |
| 264.17.2. About placeholder syntax | 2098 |
| 264.18. EXPLICIT REFERRING TO A OSGI BLUEPRINT PLACEHOLDER IN CAMEL | 2099 |
| 264.19. OVERRIDING BLUEPRINT PROPERTY PLACEHOLDERS OUTSIDE CAMELCONTEXT | 2099 |
| 264.20. USING .CFG OR .PROPERTIES FILE FOR BLUEPRINT PROPERTY PLACEHOLDERS | 2099 |
| 264.21. USING .CFG FILE AND OVERRIDING PROPERTIES FOR BLUEPRINT PROPERTY PLACEHOLDERS | 2100 |
| 264.22. BRIDGING SPRING AND CAMEL PROPERTY PLACEHOLDERS | 2100 |
| 264.23. CLASHING SPRING PROPERTY PLACEHOLDERS WITH CAMELS SIMPLE LANGUAGE | 2100 |
| 264.24. OVERRIDING PROPERTIES FROM CAMEL TEST KIT | 2101 |
| 264.24.1. Providing properties from within unit test source | 2101 |
| 264.25. USING @PROPERTYINJECT | 2101 |
| 264.26. USING OUT OF THE BOX FUNCTIONS | 2102 |
| 264.27. USING CUSTOM FUNCTIONS | 2103 |
| 264.28. SEE ALSO | 2104 |
| CHAPTER 265. PROTOBUF DATAFORMAT | 2105 |
| CHAPTER 266. PROTOBUF - PROTOCOL BUFFERS | 2106 |
| 266.1. PROTOBUF OPTIONS | 2106 |
| 266.2. SPRING BOOT AUTO-CONFIGURATION | 2106 |
| 266.3. CONTENT TYPE FORMAT (STARTING FROM CAMEL 2.19) | 2107 |
| 266.4. PROTOBUF OVERVIEW | 2107 |
| 266.5. DEFINING THE PROTO FORMAT | 2107 |
| 266.6. GENERATING JAVA CLASSES | 2108 |
| 266.7. JAVA DSL | 2109 |
| 266.8. SPRING DSL | 2109 |
| 266.9. DEPENDENCIES | 2110 |

| | |

| CHAPTER 267. PUBNUB COMPONENT | 2111 |
| 267.1. URI FORMAT | 2111 |
| 267.2. OPTIONS | 2111 |
| 267.2.1. Path Parameters (1 parameters): | 2111 |
| 267.2.2. Query Parameters (14 parameters): | 2112 |
| 267.3. SPRING BOOT AUTO-CONFIGURATION | 2113 |
| 267.4. MESSAGE HEADERS WHEN SUBSCRIBING | 2114 |
| 267.5. MESSAGE BODY | 2114 |
| 267.6. EXAMPLES | 2114 |
| 267.6.1. Publishing events | 2114 |
| 267.6.2. Fire events aka BLOCKS Event Handlers | 2114 |
| 267.6.3. Subscribing to events | 2115 |
| 267.6.4. Performing operations | 2115 |
| 267.7. SEE ALSO | 2116 |
| CHAPTER 268. APACHE PULSAR COMPONENT | 2117 |
| 268.1. URI FORMAT | 2117 |
| 268.2. OPTIONS | 2117 |
| 268.2.1. Path Parameters (1 parameters): | 2117 |
| 268.2.2. Query Parameters (11 parameters): | 2118 |
| 268.3. SPRING BOOT AUTO-CONFIGURATION | 2119 |
| CHAPTER 269. QUARTZ COMPONENT (DEPRECATED) | 2120 |
| 269.1. URI FORMAT | 2120 |
| 269.2. OPTIONS | 2120 |
| 269.2.1. Path Parameters (2 parameters): | 2121 |
| 269.2.2. Query Parameters (13 parameters): | 2121 |
| 269.3. CONFIGURING QUARTZ.PROPERTIES FILE | 2123 |
| 269.4. ENABLING QUARTZ SCHEDULER IN JMX | 2124 |
| 269.5. STARTING THE QUARTZ SCHEDULER | 2124 |
| 269.6. CLUSTERING | 2124 |
| 269.7. MESSAGE HEADERS | 2124 |
| 269.8. USING CRON TRIGGERS | 2124 |
| 269.9. SPECIFYING TIME ZONE | 2125 |
| 269.10. SEE ALSO | 2125 |
| CHAPTER 270. QUARTZ2 COMPONENT | 2126 |
| 270.1. URI FORMAT | 2126 |
| 270.2. OPTIONS | 2126 |
| 270.2.1. Path Parameters (2 parameters): | 2127 |
| 270.2.2. Query Parameters (19 parameters): | 2128 |
| 270.3. SPRING BOOT AUTO-CONFIGURATION | 2130 |
| 270.4. CONFIGURING QUARTZ.PROPERTIES FILE | 2131 |
| 270.5. ENABLING QUARTZ SCHEDULER IN JMX | 2132 |
| 270.6. STARTING THE QUARTZ SCHEDULER | 2132 |
| 270.7. CLUSTERING | 2132 |
| 270.8. MESSAGE HEADERS | 2132 |
| 270.9. USING CRON TRIGGERS | 2132 |
| 270.10. SPECIFYING TIME ZONE | 2133 |
| 270.11. USING QUARTZSCHEDULEDPOLLCONSUMERSCHEDULER | 2133 |
| CHAPTER 271. QUICKFIX COMPONENT | 2135 |

| | |
|--------------------------------------------------------------------------|-------------|
| 271.1. URI FORMAT | 2135 |
| 271.2. ENDPOINTS | 2135 |
| 271.3. OPTIONS | 2136 |
| 271.3.1. Path Parameters (1 parameters): | 2136 |
| 271.3.2. Query Parameters (6 parameters): | 2136 |
| 271.4. SPRING BOOT AUTO-CONFIGURATION | 2137 |
| 271.5. EXCHANGE FORMAT | 2138 |
| 271.6. QUICKFIX/J CONFIGURATION EXTENSIONS | 2139 |
| 271.6.1. Communication Connectors | 2139 |
| 271.6.2. Logging | 2140 |
| 271.6.3. Message Store | 2141 |
| 271.6.4. Message Factory | 2141 |
| 271.6.5. JMX | 2141 |
| 271.6.6. Other Defaults | 2142 |
| 271.6.7. Minimal Initiator Configuration Example | 2142 |
| 271.7. USING THE INOUT MESSAGE EXCHANGE PATTERN | 2142 |
| 271.7.1. Implementing InOut Exchanges for Consumers | 2142 |
| 271.7.2. Implementing InOut Exchanges for Producers | 2142 |
| 271.7.3. Example | 2143 |
| 271.8. SPRING CONFIGURATION | 2143 |
| 271.9. EXCEPTION HANDLING | 2146 |
| 271.10. FIX SEQUENCE NUMBER MANAGEMENT | 2146 |
| 271.11. ROUTE EXAMPLES | 2146 |
| 271.12. QUICKFIX/J COMPONENT PRIOR TO CAMEL 2.5 | 2147 |
| 271.13. URI FORMAT | 2147 |
| 271.14. EXCHANGE DATA FORMAT | 2147 |
| 271.15. LAZY CREATING ENGINES | 2147 |
| 271.16. SAMPLES | 2148 |
| 271.17. SEE ALSO | 2148 |
| CHAPTER 272. RABBITMQ COMPONENT | 2149 |
| 272.1. URI FORMAT | 2149 |
| 272.2. OPTIONS | 2149 |
| 272.2.1. Path Parameters (1 parameters): | 2154 |
| 272.2.2. Query Parameters (62 parameters): | 2154 |
| 272.3. SPRING BOOT AUTO-CONFIGURATION | 2160 |
| 272.4. USING CONNECTION FACTORY | 2165 |
| 272.5. MESSAGE HEADERS | 2165 |

| 290.6. CONFIGURATION | 2285 |

| | |
|---------------------------------------------|------|
| 290.6.1. Configuration Overview | 2286 |
| Overview | 2286 |
| Example | 2286 |
| 290.6.2. Destination Configuration | 2287 |
| Overview | 2287 |
| Sample destination configuration | 2287 |
| Interceptor for tRFC and qRFC destinations | 2288 |
| Log-in and authentication options | 2288 |
| Connection options | 2289 |
| Connection pool options | 2291 |
| Secure network connection options | 2292 |
| Repository options | 2293 |
| Trace configuration options | 2294 |
| 290.6.3. Server Configuration | 2295 |
| Overview | 2295 |
| Sample server configuration | 2295 |
| Required options | 2296 |
| Secure network connection options | 2297 |
| Other options | 2297 |
| 290.6.4. Repository Configuration | 2298 |
| Overview | 2298 |
| Repository data example | 2298 |
| Function template properties | 2299 |
| Function template example | 2300 |
| List field metadata properties | 2301 |
| Elementary list field metadata example | 2302 |
| Complex list field metadata example | 2302 |
| Record metadata properties | 2303 |
| Record metadata example | 2303 |
| Record field metadata properties | 2303 |
| Elementary record field metadata example | 2305 |
| Complex record field metadata example | 2305 |
| 290.7. MESSAGE HEADERS | 2305 |
| 290.8. EXCHANGE PROPERTIES | 2306 |
| 290.9. MESSAGE BODY FOR RFC | 2307 |
| Request and response objects | 2307 |
| Structure objects | 2307 |
| Field types | 2308 |
| Elementary field types | 2308 |
| Character field types | 2310 |
| Numeric field types | 2310 |
| Hexadecimal field types | 2311 |
| String field types | 2311 |
| Complex field types | 2312 |
| Structure field types | 2312 |
| Table field types | 2312 |
| Table objects | 2312 |
| 290.10. MESSAGE BODY FOR IDOC | 2313 |
| IDoc message type | 2313 |
| The IDoc document model | 2313 |
| How an IDoc is related to a Document object | 2315 |
| Example of creating a Document instance | 2316 |
| Document attributes | 2317 |

| | |
|---------------------------------------------------|-------------|
| Setting document attributes in Java | 2319 |
| Setting document attributes in XML | 2319 |
| 290.11. TRANSACTION SUPPORT | 2319 |
| BAPI transaction model | 2319 |
| RFC transaction model | 2320 |
| Which transaction model to use? | 2320 |
| Transactional RFC destination endpoints | 2320 |
| Transactional RFC server endpoints | 2320 |
| 290.12. XML SERIALIZATION FOR RFC | 2321 |
| Overview | 2321 |
| XML namespace | 2321 |
| Request and response XML documents | 2321 |
| Structure fields | 2321 |
| Table fields | 2322 |
| Elementary fields | 2323 |
| Date and time formats | 2323 |
| 290.13. XML SERIALIZATION FOR IDOC | 2323 |
| Overview | 2324 |
| XML namespace | 2324 |
| Built-in type converter | 2324 |
| Sample IDoc message body in XML format | 2324 |
| 290.14. SAP EXAMPLES | 2325 |
| 290.14.1. Example 1: Reading Data from SAP | 2325 |
| Overview | 2325 |
| Java DSL for route | 2325 |
| XML DSL for route | 2325 |
| createFlightCustomerGetListRequest bean | 2326 |
| returnFlightCustomerInfo bean | 2326 |
| 290.14.2. Example 2: Writing Data to SAP | 2327 |
| Overview | 2327 |
| Java DSL for route | 2327 |
| XML DSL for route | 2328 |
| Transaction support | 2328 |
| Populating request parameters | 2328 |
| 290.14.3. Example 3: Handling Requests from SAP | 2328 |
| Overview | 2328 |
| Java DSL for route | 2328 |
| XML DSL for route | 2329 |
| BookFlightRequest bean | 2329 |
| BookFlightResponse bean | 2330 |
| FlightInfo bean | 2331 |
| ConnectionInfoTable bean | 2331 |
| ConnectionInfo bean | 2332 |
| CHAPTER 291. SAP NETWEAVER COMPONENT | 2334 |
| 291.1. URI FORMAT | 2334 |
| 291.2. PREREQUISITES | 2334 |
| 291.3. SAPNETWEAVER OPTIONS | 2334 |
| 291.3.1. Path Parameters (1 parameters): | 2334 |
| 291.3.2. Query Parameters (6 parameters): | 2334 |
| 291.4. SPRING BOOT AUTO-CONFIGURATION | 2335 |
| 291.5. MESSAGE HEADERS | 2335 |
| 291.6. EXAMPLES | 2336 |

| CHAPTER 298. JAVA OBJECT SERIALIZATION DATAFORMAT | 2374 |
| 298.1. OPTIONS | 2374 |
| 298.2. DEPENDENCIES | 2374 |
| CHAPTER 299. SERVICE COMPONENT | 2375 |
| 299.1. USING THE SERVICE ENDPOINT | 2375 |
| 299.2. URI FORMAT | 2375 |
| 299.3. OPTIONS | 2375 |
| 299.3.1. Path Parameters (1 parameters): | 2375 |
| 299.3.2. Query Parameters (4 parameters): | 2375 |
| 299.4. SPRING BOOT AUTO-CONFIGURATION | 2376 |
| 299.5. IMPLEMENTATIONS | 2377 |
| 299.6. SEE ALSO | 2377 |
| CHAPTER 300. SERVICENOW COMPONENT | 2378 |
| 300.1. URI FORMAT | 2378 |
| 300.2. OPTIONS | 2378 |
| 300.2.1. Path Parameters (1 parameters): | 2379 |
| 300.2.2. Query Parameters (44 parameters): | 2379 |
| 300.3. SPRING BOOT AUTO-CONFIGURATION | 2383 |
| 300.4. HEADERS | 2389 |
| 300.5. USAGE EXAMPLES: | 2401 |
| CHAPTER 301. SERVLET COMPONENT | 2402 |
| 301.1. URI FORMAT | 2402 |
| 301.2. OPTIONS | 2402 |
| 301.2.1. Path Parameters (1 parameters): | 2403 |
| 301.2.2. Query Parameters (22 parameters): | 2404 |
| 301.3. SPRING BOOT AUTO-CONFIGURATION | 2406 |
| 301.4. MESSAGE HEADERS | 2408 |
| 301.5. USAGE | 2408 |
| 301.6. PUTTING CAMEL JARS IN THE APP SERVER BOOT CLASSPATH | 2408 |
| 301.7. SAMPLE | 2409 |
| 301.7.1. Sample when using Spring 3.x | 2410 |
| 301.7.2. Sample when using Spring 2.x | 2410 |
| 301.7.3. Sample when using OSGi | 2411 |

| | |
|----------------------------------------------------------------------------------------------------------|-------------|
| 301.7.4. Usage with Spring-Boot | 2413 |
| 301.8. SEE ALSO | 2414 |
| 301.9. SERVLETLISTENER COMPONENT | 2414 |
| 301.9.1. Using | 2415 |
| 301.9.2. Options | 2415 |
| 301.9.3. Examples | 2416 |
| 301.9.4. Accessing the created CamelContext | 2416 |
| 301.9.5. Configuring routes | 2417 |
| 301.9.5.1. Using a RouteBuilder class | 2417 |
| 301.9.5.2. Using package scanning | 2417 |
| 301.9.5.3. Using a XML file | 2417 |
| 301.9.5.4. Configuring proptert placeholders | 2418 |
| 301.9.5.5. Configuring JMX | 2418 |
| 301.9.5.6. Using custom CamelContextLifecycle | 2419 |
| 301.9.6. See Also | 2419 |
| CHAPTER 302. SFTP COMPONENT | 2420 |
| 302.1. URI OPTIONS | 2420 |
| 302.1.1. Path Parameters (3 parameters): | 2420 |
| 302.1.2. Query Parameters (117 parameters): | 2420 |
| CHAPTER 303. SHIRO SECURITY COMPONENT | 2439 |
| 303.1. SHIRO SECURITY BASICS | 2439 |
| 303.2. INSTANTIATING A SHIROSECURITYPOLICY OBJECT | 2440 |
| 303.3. SHIROSECURITYPOLICY OPTIONS | 2440 |
| 303.4. APPLYING SHIRO AUTHENTICATION ON A CAMEL ROUTE | 2441 |
| 303.5. APPLYING SHIRO AUTHORIZATION ON A CAMEL ROUTE | 2442 |
| 303.6. CREATING A SHIROSECURITYTOKEN AND INJECTING IT INTO A MESSAGE EXCHANGE | 2443 |
| 303.7. SENDING MESSAGES TO ROUTES SECURED BY A SHIROSECURITYPOLICY | 2443 |
| 303.8. SENDING MESSAGES TO ROUTES SECURED BY A SHIROSECURITYPOLICY (MUCH EASIER FROM CAMEL 2.12 ONWARDS) | 2443 |
| 303.8.1. Using ShiroSecurityToken | 2443 |
| CHAPTER 304. SIMPLE LANGUAGE | 2445 |
| 304.1. SIMPLE LANGUAGE CHANGES IN CAMEL 2.9 ONWARDS | 2445 |
| 304.2. SIMPLE LANGUAGE OPTIONS | 2446 |
| 304.3. VARIABLES | 2446 |
| 304.4. OGNL EXPRESSION SUPPORT | 2451 |
| 304.5. OPERATOR SUPPORT | 2453 |
| 304.5.1. Comparing with different types | 2456 |
| 304.5.2. Using Spring XML | 2458 |
| 304.6. USING AND / OR | 2458 |
| 304.7. SAMPLES | 2458 |
| 304.8. REFERRING TO CONSTANTS OR ENUMS | 2460 |
| 304.9. USING NEW LINES OR TABS IN XML DSLS | 2460 |
| 304.10. LEADING AND TRAILING WHITESPACE HANDLING | 2460 |
| 304.11. SETTING RESULT TYPE | 2461 |
| 304.12. CHANGING FUNCTION START AND END TOKENS | 2461 |
| 304.13. LOADING SCRIPT FROM EXTERNAL RESOURCE | 2461 |
| 304.14. SETTING SPRING BEANS TO EXCHANGE PROPERTIES | 2462 |
| 304.15. DEPENDENCIES | 2462 |
| CHAPTER 305. SIP COMPONENT | 2463 |
| 305.1. URI FORMAT | 2463 |

| | |
|-----------------------------------------------------------------------------------|-------------|
| 305.2. OPTIONS | 2463 |
| 305.2.1. Path Parameters (1 parameters): | 2464 |
| 305.2.2. Query Parameters (44 parameters): | 2464 |
| 305.3. SPRING BOOT AUTO-CONFIGURATION | 2468 |
| 305.4. SENDING MESSAGES TO/FROM A SIP ENDPOINT | 2468 |
| 305.4.1. Creating a Camel SIP Publisher | 2468 |
| 305.4.2. Creating a Camel SIP Subscriber | 2469 |
| CHAPTER 306. SIMPLE JMS BATCH COMPONENT | 2470 |
| 306.1. URI FORMAT | 2471 |
| 306.2. COMPONENT OPTIONS AND CONFIGURATIONS | 2471 |
| 306.2.1. Path Parameters (1 parameters): | 2472 |
| 306.2.2. Query Parameters (23 parameters): | 2472 |
| 306.3. SPRING BOOT AUTO-CONFIGURATION | 2475 |
| CHAPTER 307. SIMPLE JMS COMPONENT | 2477 |
| 307.1. URI FORMAT | 2477 |
| 307.2. COMPONENT OPTIONS AND CONFIGURATIONS | 2478 |
| 307.2.1. Path Parameters (2 parameters): | 2480 |
| 307.2.2. Query Parameters (34 parameters): | 2480 |
| 307.3. SPRING BOOT AUTO-CONFIGURATION | 2483 |
| 307.4. PRODUCER USAGE | 2486 |
| 307.4.1. InOnly Producer - (Default) | 2486 |
| 307.4.2. InOut Producer | 2486 |
| 307.5. CONSUMER USAGE | 2486 |
| 307.5.1. InOnly Consumer - (Default) | 2486 |
| 307.5.2. InOut Consumer | 2486 |
| 307.6. ADVANCED USAGE NOTES | 2486 |
| 307.6.1. Pluggable Connection Resource Management | 2486 |
| 307.6.2. Batch Message Support | 2488 |
| 307.6.3. Customizable Transaction Commit Strategies (Local JMS Transactions only) | 2488 |
| 307.6.4. Transacted Batch Consumers & Producers | 2488 |
| 307.7. ADDITIONAL NOTES | 2489 |
| 307.7.1. Message Header Format | 2489 |
| 307.7.2. Message Content | 2490 |
| 307.7.3. Clustering | 2490 |
| 307.8. TRANSACTION SUPPORT | 2490 |
| 307.8.1. Does Springless Mean I Can't Use Spring? | 2490 |
| CHAPTER 308. SIMPLE JMS2 COMPONENT | 2491 |
| 308.1. URI FORMAT | 2491 |
| 308.2. COMPONENT OPTIONS AND CONFIGURATIONS | 2492 |
| 308.2.1. Path Parameters (2 parameters): | 2494 |
| 308.2.2. Query Parameters (37 parameters): | 2494 |
| 308.3. SPRING BOOT AUTO-CONFIGURATION | 2497 |
| 308.4. PRODUCER USAGE | 2500 |
| 308.4.1. InOnly Producer - (Default) | 2500 |
| 308.4.2. InOut Producer | 2500 |
| 308.5. CONSUMER USAGE | 2500 |
| 308.5.1. Durable Shared Subscription | 2500 |
| 308.5.2. InOnly Consumer - (Default) | 2500 |
| 308.5.3. InOut Consumer | 2501 |
| 308.6. ADVANCED USAGE NOTES | 2501 |
| 308.6.1. Pluggable Connection Resource Management | 2501 |

| | |
|-----------------------------------------------------------------------------------|-------------|
| 308.6.2. Session, Consumer, & Producer Pooling & Caching Management | 2502 |
| 308.6.3. Batch Message Support | 2502 |
| 308.6.4. Customizable Transaction Commit Strategies (Local JMS Transactions only) | 2502 |
| 308.6.5. Transacted Batch Consumers & Producers | 2503 |
| 308.7. ADDITIONAL NOTES | 2504 |
| 308.7.1. Message Header Format | 2504 |
| 308.7.2. Message Content | 2504 |
| 308.7.3. Clustering | 2504 |

| 349.1. OPTIONS | 2735 |
| 349.1.1. Path Parameters (1 parameters): | 2735 |
| 349.1.2. Query Parameters (5 parameters): | 2735 |
| 349.2. SPRING BOOT AUTO-CONFIGURATION | 2736 |
| 349.3. TO DETECT A FILE'S MIME TYPE | 2736 |
| 349.4. TO PARSE A FILE | 2736 |
| CHAPTER 350. TIMER COMPONENT | 2737 |
| 350.1. URI FORMAT | 2737 |
| 350.2. OPTIONS | 2737 |
| 350.2.1. Path Parameters (1 parameters): | 2737 |
| 350.2.2. Query Parameters (12 parameters): | 2737 |
| 350.3. EXCHANGE PROPERTIES | 2739 |
| 350.4. SAMPLE | 2739 |
| 350.5. FIRING AS SOON AS POSSIBLE | 2740 |
| 350.6. FIRING ONLY ONCE | 2740 |
| 350.7. SEE ALSO | 2740 |
| CHAPTER 351. TWILIO COMPONENT | 2742 |
| 351.1. TWILIO OPTIONS | 2742 |
| 351.1.1. Path Parameters (2 parameters): | 2742 |
| 351.1.2. Query Parameters (5 parameters): | 2743 |
| 351.2. SPRING BOOT AUTO-CONFIGURATION | 2743 |
| 351.3. URI FORMAT | 2744 |
| 351.4. PRODUCER ENDPOINTS: | 2746 |
| 351.5. CONSUMER ENDPOINTS: | 2747 |
| 351.6. MESSAGE HEADER | 2747 |
| 351.7. MESSAGE BODY | 2747 |
| CHAPTER 352. TWITTER COMPONENTS | 2748 |
| 352.1. CONSUMER ENDPOINTS | 2748 |
| 352.2. PRODUCER ENDPOINTS | 2749 |
| 352.3. MESSAGE HEADERS | 2749 |
| 352.4. MESSAGE BODY | 2749 |
| 352.5. USE CASES | 2749 |
| 352.5.1. To create a status update within your Twitter profile, send this producer a String body: | 2750 |
| 352.5.2. To poll, every 60 sec., all statuses on your home timeline: | 2750 |
| 352.5.3. To search for all statuses with the keyword 'camel' only once: | 2750 |
| 352.5.4. Searching using a producer with static keywords: | 2750 |
| 352.5.5. Searching using a producer with dynamic keywords from header: | 2750 |
| 352.6. EXAMPLE | 2750 |
| 352.7. SEE ALSO | 2750 |
| CHAPTER 353. TWITTER DIRECT MESSAGE COMPONENT | 2752 |
| 353.1. COMPONENT OPTIONS | 2752 |
| 353.2. ENDPOINT OPTIONS | 2752 |
| 353.2.1. Path Parameters (1 parameters): | 2753 |
| 353.2.2. Query Parameters (42 parameters): | 2753 |
| 353.3. SPRING BOOT AUTO-CONFIGURATION | 2756 |

| 357.1. URI FORMAT | 2780 |
| 357.2. TWITTER COMPONENT | 2780 |
| 357.3. CONSUMER ENDPOINTS | 2781 |
| 357.4. PRODUCER ENDPOINTS | 2782 |
| 357.5. URI OPTIONS | 2783 |
| 357.5.1. Path Parameters (1 parameters): | 2783 |
| 357.5.2. Query Parameters (44 parameters): | 2783 |
| 357.6. SPRING BOOT AUTO-CONFIGURATION | 2787 |
| 357.7. MESSAGE HEADERS | 2788 |
| 357.8. MESSAGE BODY | 2788 |
| 357.9. USE CASES | 2788 |
| 357.9.1. To create a status update within your Twitter profile, send this producer a String body: | 2789 |
| 357.9.2. To poll, every 60 sec., all statuses on your home timeline: | 2789 |
| 357.9.3. To search for all statuses with the keyword 'camel' only once: | 2789 |
| 357.9.4. Searching using a producer with static keywords: | 2789 |
| 357.9.5. Searching using a producer with dynamic keywords from header: | 2789 |
| 357.10. EXAMPLE | 2789 |
| 357.11. SEE ALSO | 2789 |
| CHAPTER 358. UNDERTOW COMPONENT | 2790 |
| 358.1. URI FORMAT | 2790 |
| 358.2. OPTIONS | 2790 |
| 358.2.1. Path Parameters (1 parameters): | 2791 |
| 358.2.2. Query Parameters (22 parameters): | 2791 |
| 358.3. SPRING BOOT AUTO-CONFIGURATION | 2794 |
| 358.4. MESSAGE HEADERS | 2795 |
| 358.5. HTTP PRODUCER EXAMPLE | 2795 |
| 358.6. HTTP CONSUMER EXAMPLE | 2795 |
| 358.7. WEBSOCKET EXAMPLE | 2795 |
| 358.8. HTTP/2 EXAMPLE | 2796 |
| 358.9. USING LOCALHOST AS HOST | 2798 |
| 358.10. UNDERTOW CONSUMERS ON WILDFLY | 2798 |

| | |
|-------------------------------------------------------------------------------------|-------------|
| 358.10.1. Configuring alternative ports | 2799 |
| 358.10.2. Ignored camel-undertow consumer configuration options on WildFly | 2799 |
| CHAPTER 359. UNIVOCITY CSV DATAFORMAT | 2801 |
| 359.1. OPTIONS | 2801 |
| 359.2. OPTIONS | 2801 |
| 359.3. SPRING BOOT AUTO-CONFIGURATION | 2802 |
| 359.4. MARSHALLING USAGES | 2804 |
| 359.4.1. Usage example: marshalling a Map into CSV format | 2805 |
| 359.4.2. Usage example: marshalling a Map into fixed-width format | 2805 |
| 359.4.3. Usage example: marshalling a Map into TSV format | 2805 |
| 359.5. UNMARSHALLING USAGES | 2805 |
| 359.5.1. Usage example: unmarshalling a CSV format into maps with automatic headers | 2806 |
| 359.5.2. Usage example: unmarshalling a fixed-width format into lists | 2806 |
| CHAPTER 360. UNIVOCITY FIXED LENGTH DATAFORMAT | 2807 |
| 360.1. OPTIONS | 2807 |
| 360.2. OPTIONS | 2807 |
| 360.3. SPRING BOOT AUTO-CONFIGURATION | 2808 |
| 360.4. MARSHALLING USAGES | 2810 |
| 360.4.1. Usage example: marshalling a Map into CSV format | 2811 |
| 360.4.2. Usage example: marshalling a Map into fixed-width format | 2811 |
| 360.4.3. Usage example: marshalling a Map into TSV format | 2811 |
| 360.5. UNMARSHALLING USAGES | 2811 |
| 360.5.1. Usage example: unmarshalling a CSV format into maps with automatic headers | 2812 |
| 360.5.2. Usage example: unmarshalling a fixed-width format into lists | 2812 |

MAKING OPEN SOURCE MORE INCLUSIVE

Red Hat is committed to replacing problematic language in our code, documentation, and web properties. We are beginning with these four terms: master, slave, blacklist, and whitelist. Because of the enormity of this endeavor, these changes will be implemented gradually over several upcoming releases. For more details, see our [CTO Chris Wright's message](#).

CHAPTER 1. COMPONENTS OVERVIEW

This chapter provides a summary of all the components available for Apache Camel.

1.1. CONTAINER TYPES

Red Hat Fuse provides a variety of container types, into which you can deploy your Camel applications:

- Spring Boot
- Apache Karaf
- JBoss Enterprise Application Platform (JBoss EAP)

In addition, a Camel application can run as *containerless*: that is, where a Camel application runs directly in the JVM, without any special container.

In some cases, Fuse might support a Camel component in one container, but not in the others. There are various reasons for this, but in some cases a component is not suitable for all container types. For example, the **camel-ejb** component is designed specifically for Java EE (that is, JBoss EAP), and cannot be supported in the other container types.

NOTE

The **camel-test** component and extended components such as **camel-test-blueprint**, **camel-test-karaf**, and **camel-test-spring** are supported and can be used to run JUnit tests for each runtime. However, these components are not executed on the runtimes themselves but inside JUnit.

1.2. SUPPORTED COMPONENTS

Note the following key:

| Symbol | Description |
|-------------------|------------------------------------------|
| ✓ | Supported |
| ■ | Unsupported or not yet supported |
| <i>Deprecated</i> | Likely to be removed in a future release |

Table 1.1, “[Apache Camel Component Support Matrix](#)” provides comprehensive details about which Camel components are supported in which containers.

Table 1.1. Apache Camel Component Support Matrix

| Component | Containerless | Spring Boot 2.x | Karaf | JBoss EAP | IBM Power / Spring Boot 2 | IBM Z / Spring Boot 2 |

CHAPTER 2. ACTIVEMQ

ACTIVEMQ COMPONENT

Using the ActiveMQ component, you can send messages to a [JMS Queue](#) or Topic or consume messages from a JMS Queue or Topic using [Apache ActiveMQ](#).

This component is based on [JMS component](#) and uses Spring's JMS support for declarative transactions, using Spring's **JmsTemplate** for sending and a **MessageListenerContainer** for consuming. All [JMS component options](#) also apply to the ActiveMQ Component.

To use this component, make sure you have the **activemq.jar** or **activemq-core.jar** on your classpath along with any Apache Camel dependencies such as **camel-core.jar**, **camel-spring.jar** and **camel-jms.jar**.

TRANSACTIONED AND CACHING

See section **Transactions and Cache Levels** below on JMS page if you are using transactions with JMS as it can impact performance.

URI FORMAT

```
activemq:[queue:|topic:]destinationName
```

Where **destinationName** is an ActiveMQ queue or topic name. By default, the **destinationName** is interpreted as a queue name. For example, to connect to the queue, **FOO.BAR**, use:

```
activemq:FOO.BAR
```

You can include the optional **queue:** prefix, if you prefer:

```
activemq:queue:FOO.BAR
```

To connect to a topic, you must include the **topic:** prefix. For example, to connect to the topic, **Stocks.Prices**, use:

```
activemq:topic:Stocks.Prices
```

OPTIONS

All [JMS component options](#) also apply to the ActiveMQ Component.

CAMEL ON EAP DEPLOYMENT

This component is supported by the Camel on EAP (Wildfly Camel) framework, which offers a simplified deployment model on the Red Hat JBoss Enterprise Application Platform (JBoss EAP) container.

You can configure the ActiveMQ Camel component to work either with an embedded broker or an external broker. To embed a broker in the JBoss EAP container, configure the ActiveMQ Resource Adapter in the EAP container configuration file – for details, see [ActiveMQ Resource Adapter Configuration](#).

CONFIGURING THE CONNECTION FACTORY

The following [test case](#) shows how to add an `ActiveMQComponent` to the `CamelContext` using the `activeMQComponent()` method while specifying the `brokerURL` used to connect to ActiveMQ.

```
camelContext.addComponent("activemq", activeMQComponent("vm://localhost?
broker.persistent=false"));
```

CONFIGURING THE CONNECTION FACTORY USING SPRING XML

You can configure the ActiveMQ broker URL on the `ActiveMQComponent` as follows

```
<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-
    spring.xsd">

  <camelContext xmlns="http://camel.apache.org/schema/spring">
  </camelContext>

  <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
    <property name="brokerURL" value="tcp://somehost:61616"/>
  </bean>

</beans>
```

USING CONNECTION POOLING

When sending to an ActiveMQ broker using Camel it is best practice to use a pooled connection factory to handle efficient pooling of JMS connections, sessions, and producers. See [ActiveMQ Spring Support](#) for more information.

1. Add the AMQ pool with Maven:

```
<dependency>
  <groupId>org.apache.activemq</groupId>
  <artifactId>activemq-pool</artifactId>
  <version>5.11.0.redhat-630516</version>
</dependency>
```

2. Set up the `activemq` component as follows:

```
<bean id="jmsConnectionFactory" class="org.apache.activemq.ActiveMQConnectionFactory">
  <property name="brokerURL" value="tcp://localhost:61616" />
</bean>

<bean id="pooledConnectionFactory"
class="org.apache.activemq.pool.PooledConnectionFactory" init-method="start" destroy-
method="stop">
  <property name="maxConnections" value="8" />
```

```

    <property name="connectionFactory" ref="jmsConnectionFactory" />
  </bean>

  <bean id="jmsConfig" class="org.apache.camel.component.jms.JmsConfiguration">
    <property name="connectionFactory" ref="pooledConnectionFactory"/>
    <property name="concurrentConsumers" value="10"/>
  </bean>

  <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
    <property name="configuration" ref="jmsConfig"/>
  </bean>

```

NOTE

Notice the **init** and **destroy** methods on the pooled connection factory. These methods are important to ensure the connection pool is properly started and shut down.

The **PooledConnectionFactory** will then create a connection pool with up to 8 connections in use at the same time. Each connection can be shared by many sessions.

There is an option named **maxActive** you can use to configure the maximum number of sessions per connection; the default value is **500**.

From **ActiveMQ 5.7** onwards, the option has been renamed to **maxActiveSessionPerConnection** to reflect its purpose better.

Note that the **concurrentConsumers** is set to a higher value than **maxConnections** is. This is permitted, as each consumer is using a session, and as a session can share the same connection, this will work. In this example, we can have $8 * 500 = 4000$ active sessions simultaneously.

INVOKING MESSAGELISTENER POJOS IN A ROUTE

The ActiveMQ component also provides a helper [Type Converter](#) from a JMS MessageListener to a [Processor](#). This means that the [Bean component](#) can invoke any JMS MessageListener bean directly inside any route.

You can create a MessageListener in JMS as follows:

Example

```

public class MyListener implements MessageListener {
    public void onMessage(Message jmsMessage) {
        // ...
    }
}

```

Then use it in your route as follows

Example

```

from("file://foo/bar").
    bean(MyListener.class);

```

That is, you can reuse any of the Apache Camel components and easily integrate them into your JMS **MessageListener** POJO!

USING ACTIVEMQ DESTINATION OPTIONS

Available as of ActiveMQ 5.6

You can configure the [Destination Options](#) in the endpoint uri, using the "destination." prefix. For example, to mark a consumer as exclusive, and set its prefetch size to 50, you can do as follows:
.Example

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="file://src/test/data?noop=true"/>
    <to uri="activemq:queue:foo"/>
  </route>
  <route>
    <!-- use consumer.exclusive ActiveMQ destination option, notice we have to prefix with destination.
-->
    <from uri="activemq:foo?
destination.consumer.exclusive=true&destination.consumer.prefetchSize=50"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

CONSUMING ADVISORY MESSAGES

ActiveMQ can generate [Advisory messages](#), which are put in topics you can consume. Such messages can help you send alerts in case you detect slow consumers or to build statistics (number of messages/produced per day, etc.) The following Spring DSL example shows you how to read messages from a topic.

Example

```
<route>
  <from uri="activemq:topic:ActiveMQ.Advisory.Connection?mapJmsMessage=false" />
  <convertBodyTo type="java.lang.String"/>
  <transform>
    <simple>${in.body}&#13;</simple>
  </transform>
  <to uri="file://data/activemq/?fileExist=Append&fileName=advisoryConnection-
${date:now:yyyyMMdd}.txt" />
</route>
```

If you consume a message on a queue, you should see the following files under the data/activemq folder :

```
advisoryConnection-20100312.txt
advisoryProducer-20100312.txt
```

and containing string:

Example

```

ActiveMQMessage {commandId = 0, responseRequired = false, messageId = ID:dell-charles-
3258-1268399815140
-1:0:0:0:221, originalDestination = null, originalTransactionId = null, producerId = ID:dell-charles-
3258-1268399815140-1:0:0:0, destination = topic://ActiveMQ.Advisory.Connection, transactionId
= null,
expiration = 0, timestamp = 0, arrival = 0, brokerInTime = 1268403383468, brokerOutTime =
1268403383468,
correlationId = null, replyTo = null, persistent = false, type = Advisory, priority = 0, groupId = null,
groupSequence = 0, targetConsumerId = null, compressed = false, userId = null, content = null,
marshalledProperties = org.apache.activemq.util.ByteSequence@17e2705, dataStructure =
ConnectionInfo
{commandId = 1, responseRequired = true, connectionId = ID:dell-charles-3258-1268399815140-
2:50,
clientId = ID:dell-charles-3258-1268399815140-14:0, userName = , password = *****,
brokerPath = null, brokerMasterConnector = false, manageable = true, clientMaster = true},
redeliveryCounter = 0, size = 0, properties = {originBrokerName=master, originBrokerId=ID:dell-
charles-
3258-1268399815140-0:0, originBrokerURL=vm://master}, readOnlyProperties = true,
readOnlyBody = true,
droppable = false}

```

GETTING COMPONENT JAR

You need this dependency:

- **camel-activemq**

ActiveMQ is an extension of the [JMS component](#) released with the [ActiveMQ project](#).

```

<dependency>
  <groupId>org.fusesource</groupId>
  <artifactId>camel-activemq</artifactId>
  <version>7.11.0.fuse-sb2-7_11_0-00035-redhat-00001</version>
</dependency>

```

CHAPTER 3. AHC COMPONENT

Available as of Camel version 2.8

The **ahc**: component provides HTTP based endpoints for consuming external HTTP resources (as a client to call external servers using HTTP).

The component uses the [Async Http Client](#) library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ahc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

3.1. URI FORMAT

```
ahc:http://hostname[:port][/resourceUri][?options]
ahc:https://hostname[:port][/resourceUri][?options]
```

Will by default use port 80 for HTTP and 443 for HTTPS.

You can append query options to the URI in the following format, **?option=value&option=value&...**

3.2. AHCENDPOINT OPTIONS

The AHC endpoint is configured using URI syntax:

```
ahc:httpUri
```

with the following path and query parameters:

3.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------|----------------------------------------------------------------------------------|---------|------|
| httpUri | Required The URI to use such as http://hostname:port/path | | URI |

3.2.2. Query Parameters (13 parameters):

| Name | Description | Default | Type |
|------|-------------|---------|------|
|------|-------------|---------|------|

| Name | Description | Default | Type |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| bridgeEndpoint (producer) | If the option is true, then the Exchange.HTTP_URI header is ignored, and use the endpoint's URI for request. You may also set the <code>throwExceptionOnFailure</code> to be false to let the <code>AhcProducer</code> send all the fault response back. | false | boolean |
| bufferSize (producer) | The initial in-memory buffer size used when transferring data between Camel and AHC Client. | 4096 | int |
| connectionClose (producer) | Define if the Connection Close header has to be added to HTTP Request. This parameter is false by default | false | boolean |
| cookieHandler (producer) | Configure a cookie handler to maintain a HTTP session | | CookieHandler |
| headerFilterStrategy (producer) | To use a custom HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| throwExceptionOnFailure (producer) | Option to disable throwing the <code>AhcOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code. | true | boolean |
| transferException (producer) | If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a <code>application/x-java-serialized-object</code> content type (for example using Jetty or Servlet Camel components). On the producer side the exception will be deserialized and thrown as is, instead of the <code>AhcOperationFailedException</code> . The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | boolean |
| binding (advanced) | To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel. | | AhcBinding |
| clientConfig (advanced) | To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. | | AsyncHttpClientConfig |
| clientConfigOptions (advanced) | To configure the <code>AsyncHttpClientConfig</code> using the key/values from the Map. | | Map |

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| clientConfigRealmOptions (security) | To configure the AsyncHttpClientConfig Realm using the key/values from the Map. | | Map |
| sslContextParameters (security) | Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. This reference overrides any configured <code>SSLContextParameters</code> at the component level. See Using the JSSE Configuration Utility . Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. | | <code>SSLContextParameters</code> |

3.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component. .ahc.allow-java- serialized-object | Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | Boolean |
| camel.component. .ahc.binding | To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel. The option is a <code>org.apache.camel.component.ahc.AhcBinding</code> type. | | String |
| camel.component. .ahc.client | To use a custom <code>AsyncHttpClient</code> . The option is a <code>org.asynchttpclient.AsyncHttpClient</code> type. | | String |
| camel.component. .ahc.client-config | To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. The option is a <code>org.asynchttpclient.AsyncHttpClientConfig</code> type. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.ahc.enabled</code> | Enable ahc component | true | Boolean |
| <code>camel.component.ahc.header-filter-strategy</code> | To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type. | | String |
| <code>camel.component.ahc.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.ahc.ssl-context-parameters</code> | Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type. | | String |
| <code>camel.component.ahc.use-global-ssl-context-parameters</code> | Enable usage of global SSL context parameters. | false | Boolean |

3.4. AHCCOMPONENT OPTIONS

The AHC component supports 8 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------------|
| <code>client</code> (advanced) | To use a custom <code>AsyncHttpClient</code> | | <code>AsyncHttpClient</code> |
| <code>binding</code> (advanced) | To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel. | | <code>AhcBinding</code> |
| <code>clientConfig</code> (advanced) | To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. | | <code>AsyncHttpClientConfig</code> |

| Name | Description | Default | Type |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------------|
| sslContextParameters (security) | Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. | | <code>SSLContextParameters</code> |
| allowJavaSerialized Object (advanced) | Whether to allow java serialization when a request uses <code>context-type=application/x-java-serialized-object</code> . This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | boolean |
| useGlobalSslContext Parameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| headerFilterStrategy (filter) | To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. | | <code>HeaderFilterStrategy</code> |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

Notice that setting any of the options on the **AhcComponent** will propagate those options to **AhcEndpoints** being created. However the **AhcEndpoint** can also configure/override a custom option. Options set on endpoints will always take precedence over options from the **AhcComponent**.

3.5. MESSAGE HEADERS

| Name | Type | Description |
|---------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exchange.HTTP_URI | String | URI to call. Will override existing URI set directly on the endpoint. |
| Exchange.HTTP_PATH | String | Request URI's path, the header will be used to build the request URI with the <code>HTTP_URI</code> . If the path is start with <code>"/"</code> , http producer will try to find the relative path based on the <code>Exchange.HTTP_BASE_URI</code> header or the <code>exchange.getFromEndpoint().getEndpointUri()</code> ; |

| Name | Type | Description |
|-----------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------|
| Exchange.HTTP_QUERY | String | Camel 2.11 onwards: URI parameters. Will override existing URI parameters set directly on the endpoint. |
| Exchange.HTTP_RESPONSE_CODE | int | The HTTP response code from the external server. Is 200 for OK. |
| Exchange.HTTP_CHARACTER_ENCODING | String | Character encoding. |
| Exchange.CONTENT_TYPE | String | The HTTP content type. Is set on both the IN and OUT message to provide a content type, such as text/html . |
| Exchange.CONTENT_ENCODING | String | The HTTP content encoding. Is set on both the IN and OUT message to provide a content encoding, such as gzip . |

3.6. MESSAGE BODY

Camel will store the HTTP response from the external server on the OUT body. All headers from the IN message will be copied to the OUT message, so headers are preserved during routing. Additionally Camel will add the HTTP response headers as well to the OUT message headers.

3.7. RESPONSE CODE

Camel will handle according to the HTTP response code:

- Response code is in the range 100..299, Camel regards it as a success response.
- Response code is in the range 300..399, Camel regards it as a redirection response and will throw a **AhcOperationFailedException** with the information.

- Response code is 400+, Camel regards it as an external server failure and will throw a **AhcOperationFailedException** with the information.
throwExceptionOnFailure

The option, **throwExceptionOnFailure**, can be set to **false** to prevent the **AhcOperationFailedException** from being thrown for failed response codes. This allows you to get any response from the remote server.

3.8. AHCOPERATIONFAILEDEXCEPTION

This exception contains the following information:

- The HTTP status code
- The HTTP status line (text of the status code)
- Redirect location, if server returned a redirect
- Response body as a **java.lang.String**, if server provided a body as response

3.9. CALLING USING GET OR POST

The following algorithm is used to determine if either **GET** or **POST** HTTP method should be used:

1. Use method provided in header.
2. **GET** if query string is provided in header.
3. **GET** if endpoint is configured with a query string.
4. **POST** if there is data to send (body is not null).
5. **GET** otherwise.

3.10. CONFIGURING URI TO CALL

You can set the HTTP producer's URI directly from the endpoint URI. In the route below, Camel will call out to the external server, **oldhost**, using HTTP.

```
from("direct:start")
    .to("ahc:http://oldhost");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ahc:http://oldhost"/>
  </route>
</camelContext>
```

You can override the HTTP endpoint URI by adding a header with the key, **Exchange.HTTP_URI**, on the message.

```
from("direct:start")
    .setHeader(Exchange.HTTP_URI, constant("http://newhost"))
    .to("ahc:http://oldhost");
```

3.11. CONFIGURING URI PARAMETERS

The **ahc** producer supports URI parameters to be sent to the HTTP server. The URI parameters can either be set directly on the endpoint URI or as a header with the key **Exchange.HTTP_QUERY** on the message.

```
from("direct:start")
    .to("ahc:http://oldhost?order=123&detail=short");
```

Or options provided in a header:

```
from("direct:start")
    .setHeader(Exchange.HTTP_QUERY, constant("order=123&detail=short"))
    .to("ahc:http://oldhost");
```

3.12. HOW TO SET THE HTTP METHOD TO THE HTTP PRODUCER

The HTTP component provides a way to set the HTTP request method by setting the message header. Here is an example;

```
from("direct:start")
    .setHeader(Exchange.HTTP_METHOD, constant("POST"))
    .to("ahc:http://www.google.com")
    .to("mock:results");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:start"/>
    <setHeader headerName="CamelHttpMethod">
      <constant>POST</constant>
    </setHeader>
    <to uri="ahc:http://www.google.com"/>
    <to uri="mock:results"/>
  </route>
</camelContext>
```

3.13. CONFIGURING CHARSET

If you are using **POST** to send data you can configure the **charset** using the **Exchange** property:

```
exchange.setProperty(Exchange.CHARSET_NAME, "iso-8859-1");
```

3.13.1. URI Parameters from the endpoint URI

In this sample we have the complete URI endpoint that is just what you would have typed in a web browser. Multiple URI parameters can of course be set using the **&** character as separator, just as you would in the web browser. Camel does no tricks here.

```
// we query for Camel at the Google page
template.sendBody("ahc:http://www.google.com/search?q=Camel", null);
```

3.13.2. URI Parameters from the Message

```
Map headers = new HashMap();
headers.put(Exchange.HTTP_QUERY, "q=Camel&lr=lang_en");
// we query for Camel and English language at Google
template.sendBody("ahc:http://www.google.com/search", null, headers);
```

In the header value above notice that it should **not** be prefixed with **?** and you can separate parameters as usual with the **&** char.

3.13.3. Getting the Response Code

You can get the HTTP response code from the AHC component by getting the value from the Out message header with **Exchange.HTTP_RESPONSE_CODE**.

```
Exchange exchange = template.send("ahc:http://www.google.com/search", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.getIn().setHeader(Exchange.HTTP_QUERY, constant("hl=en&q=activemq"));
    }
});
Message out = exchange.getOut();
int responseCode = out.getHeader(Exchange.HTTP_RESPONSE_CODE, Integer.class);
```

3.14. CONFIGURING ASYNCHTTPCLIENT

The **AsyncHttpClient** client uses a **AsyncHttpClientConfig** to configure the client. See the documentation at [Async Http Client](#) for more details.

In Camel 2.8, configuration is limited to using the builder pattern provided by **AsyncHttpClientConfig.Builder**. In Camel 2.8, the **AsyncHttpClientConfig** doesn't support getters/setters so its not easy to create/configure using a Spring bean style (eg the <bean> tag in the XML file).

The example below shows how to use a builder to create the **AsyncHttpClientConfig** which we configure on the **AhcComponent**.

In Camel 2.9, the AHC component uses Async HTTP library 1.6.4. This newer version provides added support for plain bean style configuration. The **AsyncHttpClientConfigBean** class provides getters and setters for the configuration options available in **AsyncHttpClientConfig**. An instance of **AsyncHttpClientConfigBean** may be passed directly to the AHC component or referenced in an endpoint URI using the **clientConfig** URI parameter.

Also available in Camel 2.9 is the ability to set configuration options directly in the URI. URI parameters starting with "clientConfig." can be used to set the various configurable properties of **AsyncHttpClientConfig**. The properties specified in the endpoint URI are merged with those specified in the configuration referenced by the "clientConfig" URI parameter with those being set using the "clientConfig." parameter taking priority. The **AsyncHttpClientConfig** instance referenced is always

copied for each endpoint such that settings on one endpoint will remain independent of settings on any previously created endpoints. The example below shows how to configure the AHC component using the "clientConfig." type URI parameters.

```
from("direct:start")
  .to("ahc:http://localhost:8080/foo?
    clientConfig.maxRequestRetry=3&clientConfig.followRedirects=true")
```

3.15. SSL SUPPORT (HTTPS)

Using the JSSE Configuration Utility

As of Camel 2.9, the AHC component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the AHC component.

Programmatic configuration of the component

```
KeyStoreParameters ksp = new KeyStoreParameters();
ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);

AhcComponent component = context.getComponent("ahc", AhcComponent.class);
component.setSslContextParameters(scp);
```

Spring DSL based configuration of endpoint

```
...
<camel:sslContextParameters
  id="sslContextParameters">
  <camel:keyManagers
    keyPassword="keyPassword">
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  </camel:sslContextParameters>...
...
<to uri="ahc:https://localhost/foo?sslContextParameters=#sslContextParameters"/>
...

```

- [HTTP4](#)

CHAPTER 4. AHC WEBSOCKET COMPONENT

Available as of Camel version 2.14

The `ahc-ws` component provides Websocket based endpoints for a client communicating with external servers over Websocket (as a client opening a websocket connection to an external server). The component uses the [AHC](#) component that in turn uses the [Async Http Client](#) library.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ahc-ws</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

4.1. URI FORMAT

```
ahc-ws://hostname[:port]/resourceUri[?options]
ahc-wss://hostname[:port]/resourceUri[?options]
```

Will by default use port 80 for `ahc-ws` and 443 for `ahc-wss`.

4.2. AHC-WS OPTIONS

As the AHC-WS component is based on the AHC component, you can use the various configuration options of the AHC component.

The AHC Websocket component supports 8 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------------|
| <code>client</code> (advanced) | To use a custom <code>AsyncHttpClient</code> | | <code>AsyncHttpClient</code> |
| <code>binding</code> (advanced) | To use a custom <code>AhcBinding</code> which allows to control how to bind between AHC and Camel. | | <code>AhcBinding</code> |
| <code>clientConfig</code> (advanced) | To configure the <code>AsyncHttpClient</code> to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. | | <code>AsyncHttpClientConfig</code> |
| <code>sslContextParameters</code> (security) | Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. | | <code>SSLContextParameters</code> |

| Name | Description | Default | Type |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| allowJavaSerialized Object (advanced) | Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | boolean |
| useGlobalSslContext Parameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| headerFilterStrategy (filter) | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AHC Websocket endpoint is configured using URI syntax:

```
ahc-ws:httpUri
```

with the following path and query parameters:

4.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------|----------------------------------------------------------------------------------------------------------|---------|------|
| httpUri | Required The URI to use such as http://hostname:port/path | | URI |

4.2.2. Query Parameters (18 parameters):

| Name | Description | Default | Type |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| bridgeEndpoint (common) | If the option is true, then the Exchange.HTTP_URI header is ignored, and use the endpoint's URI for request. You may also set the <code>throwExceptionOnFailure</code> to be false to let the <code>AhcProducer</code> send all the fault response back. | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| bufferSize (common) | The initial in-memory buffer size used when transferring data between Camel and AHC Client. | 4096 | int |
| headerFilterStrategy (common) | To use a custom HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| throwExceptionOnFailure (common) | Option to disable throwing the AhcOperationFailedException in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code. | true | boolean |
| transferException (common) | If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type (for example using Jetty or Servlet Camel components). On the producer side the exception will be deserialized and thrown as is, instead of the AhcOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| sendMessageOnError (consumer) | Whether to send an message if the web-socket listener received an error. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| connectionClose (producer) | Define if the Connection Close header has to be added to HTTP Request. This parameter is false by default | false | boolean |
| cookieHandler (producer) | Configure a cookie handler to maintain a HTTP session | | CookieHandler |
| useStreaming (producer) | To enable streaming to send data as multiple text fragments. | false | boolean |
| binding (advanced) | To use a custom AhcBinding which allows to control how to bind between AHC and Camel. | | AhcBinding |
| clientConfig (advanced) | To configure the AsyncHttpClient to use a custom com.ning.http.client.AsyncHttpClientConfig instance. | | AsyncHttpClientConfig |
| clientConfigOptions (advanced) | To configure the AsyncHttpClientConfig using the key/values from the Map. | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| clientConfigRealmOptions (security) | To configure the AsyncHttpClientConfig Realm using the key/values from the Map. | | Map |
| sslContextParameters (security) | Reference to a org.apache.camel.util.jsse.SSLContextParameters in the Registry. This reference overrides any configured SSLContextParameters at the component level. See Using the JSSE Configuration Utility. Note that configuring this option will override any SSL/TLS configuration options provided through the clientConfig option at the endpoint or component level. | | SSLContextParameters |

4.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.ahc-ws.allow-java-serialized-object</code> | Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | Boolean |
| <code>camel.component.ahc-ws.binding</code> | To use a custom AhcBinding which allows to control how to bind between AHC and Camel. The option is a <code>org.apache.camel.component.ahc.AhcBinding</code> type. | | String |
| <code>camel.component.ahc-ws.client</code> | To use a custom AsyncHttpClient. The option is a <code>org.asynchttpclient.AsyncHttpClient</code> type. | | String |
| <code>camel.component.ahc-ws.client-config</code> | To configure the AsyncHttpClient to use a custom <code>com.ning.http.client.AsyncHttpClientConfig</code> instance. The option is a <code>org.asynchttpclient.AsyncHttpClientConfig</code> type. | | String |
| <code>camel.component.ahc-ws.enabled</code> | Enable ahc-ws component | true | Boolean |
| <code>camel.component.ahc-ws.header-filter-strategy</code> | To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type. | | String |
| <code>camel.component.ahc-ws.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.ahc-ws.ssl-context-parameters</code> | Reference to a <code>org.apache.camel.util.jsse.SSLContextParameters</code> in the Registry. Note that configuring this option will override any SSL/TLS configuration options provided through the <code>clientConfig</code> option at the endpoint or component level. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type. | | String |
| <code>camel.component.ahc-ws.use-global-ssl-context-parameters</code> | Enable usage of global SSL context parameters. | false | Boolean |

4.4. WRITING AND READING DATA OVER WEBSOCKET

An ahc-ws endpoint can either write data to the socket or read from the socket, depending on whether the endpoint is configured as the producer or the consumer, respectively.

4.5. CONFIGURING URI TO WRITE OR READ DATA

In the route below, Camel will write to the specified websocket connection.

```
from("direct:start")
    .to("ahc-ws://targethost");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ahc-ws://targethost"/>
  </route>
</camelContext>
```

In the route below, Camel will read from the specified websocket connection.

```
from("ahc-ws://targethost")
    .to("direct:next");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="ahc-ws://targethost"/>
    <to uri="direct:next"/>
  </route>
</camelContext>
```

CHAPTER 5. AMQP COMPONENT

Available as of Camel version 1.2

The **amqp:** component supports the [AMQP 1.0 protocol](#) using the JMS Client API of the [Qpid](#) project. In case you want to use AMQP 0.9 (in particular RabbitMQ) you might also be interested in the [Camel RabbitMQ](#) component. Please keep in mind that prior to the Camel 2.17.0 AMQP component supported AMQP 0.9 and above, however since Camel 2.17.0 it supports only AMQP 1.0.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-amqp</artifactId>
  <version>${camel.version}</version> <!-- use the same version as your Camel core version -->
</dependency>
```

5.1. URI FORMAT

```
amqp:[queue:|topic:]destinationName[?options]
```

5.2. AMQP OPTIONS

You can specify all of the various configuration options of the [JMS](#) component after the destination name.

The AMQP component supports 81 options which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | To use a shared JMS configuration | | JmsConfiguration |
| acceptMessagesWhile Stopping (consumer) | Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option. | false | boolean |

| Name | Description | Default | Type |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------|
| allowReplyManagerQuickStop (consumer) | Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration#isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag. | false | boolean |
| acknowledgmentMode (consumer) | The JMS acknowledgement mode defined as an Integer. Allows you to set vendor-specific extensions to the acknowledgment mode. For the regular modes, it is preferable to use the acknowledgmentModeName instead. | | int |
| eagerLoadingOfProperties (consumer) | Enables eager loading of JMS properties as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties | false | boolean |
| acknowledgmentModeName (consumer) | The JMS acknowledgement name, which is one of: SESSION_TRANSACTED, CLIENT_ACKNOWLEDGE, AUTO_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE | AUTO_ACKNOWLEDGE | String |
| autoStartup (consumer) | Specifies whether the consumer container should auto-startup. | true | boolean |
| cacheLevel (consumer) | Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details. | | int |
| cacheLevelName (consumer) | Sets the cache level by name for the underlying JMS resources. Possible values are: CACHE_AUTO, CACHE_CONNECTION, CACHE_CONSUMER, CACHE_NONE, and CACHE_SESSION. The default setting is CACHE_AUTO. See the Spring documentation and Transactions Cache Levels for more information. | CACHE_AUTO | String |

| Name | Description | Default | Type |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| replyToCacheLevelName (producer) | Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: <code>CACHE_CONSUMER</code> for exclusive or shared w/ <code>replyToSelectorName</code> . And <code>CACHE_SESSION</code> for shared without <code>replyToSelectorName</code> . Some JMS brokers such as IBM WebSphere may require to set the <code>replyToCacheLevelName=CACHE_NONE</code> to work. Note: If using temporary queues then <code>CACHE_NONE</code> is not allowed, and you must use a higher value such as <code>CACHE_CONSUMER</code> or <code>CACHE_SESSION</code> . | | String |
| clientId (common) | Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead. | | String |
| concurrentConsumers (consumer) | Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener. | 1 | int |
| replyToConcurrentConsumers (producer) | Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. | 1 | int |
| connectionFactory (common) | The connection factory to be use. A connection factory must be configured either on the component or endpoint. | | ConnectionFactory |
| username (security) | Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory. | | String |
| password (security) | Password to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory. | | String |

| Name | Description | Default | Type |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| deliveryPersistent (producer) | Specifies whether persistent delivery is used by default. | true | boolean |
| deliveryMode (producer) | Specifies the delivery mode to be used. Possible values are those defined by <code>javax.jms.DeliveryMode</code> . <code>NON_PERSISTENT = 1</code> and <code>PERSISTENT = 2</code> . | | Integer |
| durableSubscriptionName (common) | The durable subscriber name for specifying durable topic subscriptions. The <code>clientId</code> option must be configured as well. | | String |
| exceptionListener (advanced) | Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions. | | ExceptionListener |
| errorHandler (advanced) | Specifies a <code>org.springframework.util.ErrorHandler</code> to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using <code>errorHandlerLoggingLevel</code> and <code>errorHandlerLogStackTrace</code> options. This makes it much easier to configure, than having to code a custom errorHandler. | | ErrorHandler |
| errorHandlerLoggingLevel (logging) | Allows to configure the default errorHandler logging level for logging uncaught exceptions. | WARN | LoggingLevel |
| errorHandlerLogStackTrace (logging) | Allows to control whether stacktraces should be logged or not, by the default errorHandler. | true | boolean |
| explicitQoSEnabled (producer) | Set if the deliveryMode, priority or timeToLive qualities of service should be used when sending messages. This option is based on Spring's <code>JmsTemplate</code> . The deliveryMode, priority and timeToLive options are applied to the current endpoint. This contrasts with the <code>preserveMessageQoS</code> option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers. | false | boolean |
| exposeListenerSession (consumer) | Specifies whether the listener session should be exposed when consuming messages. | false | boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| idleTaskExecutionLimit (advanced) | Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the <code>maxConcurrentConsumers</code> setting). There is additional doc available from Spring. | 1 | int |
| idleConsumerLimit (advanced) | Specify the limit for the number of consumers that are allowed to be idle at any given time. | 1 | int |
| maxConcurrentConsumers (consumer) | Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToMaxConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener. | | int |
| replyToMaxConcurrentConsumers (producer) | Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. | | int |
| replyOnTimeoutToMaxConcurrentConsumers (producer) | Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS. | 1 | int |
| maxMessagesPerTask (advanced) | The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required. | -1 | int |
| messageConverter (advanced) | To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code> . | | MessageConverter |
| mapJmsMessage (advanced) | Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a String etc. | true | boolean |

| Name | Description | Default | Type |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| messageIdEnabled (advanced) | When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker.If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value | true | boolean |
| messageTimestampEnabled (advanced) | Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker.If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value | true | boolean |
| alwaysCopyMessage (producer) | If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a <code>replyToDestinationSelectorName</code> is set (incidentally, Camel will set the <code>alwaysCopyMessage</code> option to true, if a <code>replyToDestinationSelectorName</code> is set) | false | boolean |
| useMessageIDAsCorrelationID (advanced) | Specifies whether <code>JMSMessageID</code> should always be used as <code>JMSCorrelationID</code> for InOut messages. | false | boolean |
| priority (producer) | Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The <code>explicitQosEnabled</code> option must also be enabled in order for this option to have any effect. | 4 | int |
| pubSubNoLocal (advanced) | Specifies whether to inhibit the delivery of messages published by its own connection. | false | boolean |
| receiveTimeout (advanced) | The timeout for receiving messages (in milliseconds). | 1000 | long |
| recoveryInterval (advanced) | Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds. | 5000 | long |
| taskExecutor (consumer) | Allows you to specify a custom task executor for consuming messages. | | TaskExecutor |
| deliveryDelay (producer) | Sets delivery delay to use for send calls for JMS. This option requires JMS 2.0 compliant broker. | -1 | long |

| Name | Description | Default | Type |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|
| timeToLive (producer) | When sending messages, specifies the time-to-live of the message (in milliseconds). | -1 | long |
| transacted (transaction) | Specifies whether to use transacted mode | false | boolean |
| lazyCreateTransactionManager (transaction) | If true, Camel will create a <code>JmsTransactionManager</code> , if there is no <code>transactionManager</code> injected when option <code>transacted=true</code> . | true | boolean |
| transactionManager (transaction) | The Spring transaction manager to use. | | PlatformTransactionManager |
| transactionName (transaction) | The name of the transaction to use. | | String |
| transactionTimeout (transaction) | The timeout value of the transaction (in seconds), if using transacted mode. | -1 | int |
| testConnectionOnStartup (common) | Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well. | false | boolean |
| asyncStartListener (advanced) | Whether to startup the <code>JmsConsumer</code> message listener asynchronously, when starting a route. For example if a <code>JmsConsumer</code> cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the <code>JmsConsumer</code> connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry. | false | boolean |
| asyncStopListener (advanced) | Whether to stop the <code>JmsConsumer</code> message listener asynchronously, when stopping a route. | false | boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| forceSendOriginal Message (producer) | When using <code>mapJmsMessage=false</code> Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received. | false | boolean |
| requestTimeout (producer) | The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header <code>CamelJmsRequestTimeout</code> to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the <code>requestTimeoutCheckerInterval</code> option. | 20000 | long |
| requestTimeoutChecker Interval (advanced) | Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option <code>requestTimeout</code> . | 1000 | long |
| transferExchange (advanced) | You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload. | false | boolean |
| transferException (advanced) | If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a <code>javax.jms.ObjectMessage</code> . If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have <code>transferExchange</code> enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as <code>org.apache.camel.RuntimeCamelException</code> when returned to the producer. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| transferFault (advanced) | If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on <code>Message#isFault()</code> will be send back in the response as a JMS header with the key <code>org.apache.camel.component.jms.JmsConstants#JMS_TRANSFER_FAULT#JMS_TRANSFER_FAULT</code> . If the client is Camel, the returned fault flag will be set on the <code>org.apache.camel.Message#setFault(boolean)</code> . You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws. | false | boolean |
| jmsOperations (advanced) | Allows you to use your own implementation of the <code>org.springframework.jms.core.JmsOperations</code> interface. Camel uses <code>JmsTemplate</code> as default. Can be used for testing purpose, but not used much as stated in the spring API docs. | | JmsOperations |
| destinationResolver (advanced) | A pluggable <code>org.springframework.jms.support.destination.DestinationResolver</code> that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry). | | DestinationResolver |
| replyToType (producer) | Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive. | | ReplyToType |

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| preserveMessageQos (producer) | Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header. | false | boolean |
| asyncConsumer (consumer) | Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions). | false | boolean |
| allowNullBody (producer) | Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSException is thrown. | true | boolean |
| includeSentJMSMessageID (producer) | Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination. | false | boolean |
| includeAllJMSXProperties (advanced) | Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| defaultTaskExecutor Type (consumer) | Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring's SimpleAsyncTaskExecutor) or ThreadPool (uses Spring's ThreadPoolTaskExecutor with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers. | | DefaultTaskExecutor Type |
| jmsKeyFormatStrategy (advanced) | Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and -). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the org.apache.camel.component.jms.JmsKeyFormatStrategy and refer to it using the # notation. | | JmsKeyFormatStrategy |
| allowAdditionalHeaders (producer) | This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching. | | String |
| queueBrowseStrategy (advanced) | To use a custom QueueBrowseStrategy when browsing queues | | QueueBrowseStrategy |
| messageCreatedStrategy (advanced) | To use the given MessageCreatedStrategy which are invoked when Camel creates new instances of javax.jms.Message objects when Camel is sending a JMS message. | | MessageCreatedStrategy |
| waitForProvisionCorrelationToBeUpdated Counter (advanced) | Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option useMessageIDAsCorrelationID is enabled. | 50 | int |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| waitForProvisionCorrelationToBeUpdatedThreadSleepingTime (advanced) | Interval in millis to sleep each time while waiting for provisional correlation id to be updated. | 100 | long |
| correlationProperty (producer) | Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of JMSCorrelationID property. This allows you to exchange messages with systems that do not correlate messages using JMSCorrelationID JMS property. If used JMSCorrelationID will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name. | | String |
| subscriptionDurable (consumer) | Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. | false | boolean |
| subscriptionShared (consumer) | Set whether to make the subscription shared. The shared subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a shared subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with subscriptionDurable as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. Requires a JMS 2.0 compatible message broker. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| subscriptionName (consumer) | Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client's JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0). | | String |
| streamMessageType Enabled (producer) | Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data. | false | boolean |
| formatDateHeadersTo Iso8601 (producer) | Sets whether date headers should be formatted according to the ISO 8601 standard. | false | boolean |
| headerFilterStrategy (filter) | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AMQP endpoint is configured using URI syntax:

```
amqp:destinationType:destinationName
```

with the following path and query parameters:

5.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------------|--------------------------------|---------|--------|
| destinationType | The kind of destination to use | queue | String |

| Name | Description | Default | Type |
|------------------------|------------------------------------------------------------------|---------|--------|
| destinationName | Required Name of the queue or topic to use as destination | | String |

5.2.2. Query Parameters (92 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| clientId (common) | Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead. | | String |
| connectionFactory (common) | The connection factory to be use. A connection factory must be configured either on the component or endpoint. | | ConnectionFactory |
| disableReplyTo (common) | Specifies whether Camel ignores the JMSReplyTo header in messages. If true, Camel does not send a reply back to the destination specified in the JMSReplyTo header. You can use this option if you want Camel to consume from a route and you do not want Camel to automatically send back a reply message because another component in your code handles the reply message. You can also use this option if you want to use Camel as a proxy between different message brokers and you want to route message from one system to another. | false | boolean |
| durableSubscriptionName (common) | The durable subscriber name for specifying durable topic subscriptions. The clientId option must be configured as well. | | String |
| jmsMessageType (common) | Allows you to force the use of a specific javax.jms.Message implementation for sending JMS messages. Possible values are: Bytes, Map, Object, Stream, Text. By default, Camel would determine which JMS message type to use from the In body type. This option allows you to specify it. | | JmsMessageType |

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------|
| testConnectionOnStartup (common) | Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well. | false | boolean |
| acknowledgmentModeName (consumer) | The JMS acknowledgement name, which is one of: SESSION_TRANSACTED, CLIENT_ACKNOWLEDGE, AUTO_ACKNOWLEDGE, DUPS_OK_ACKNOWLEDGE | AUTO_ACKNOWLEDGE | String |
| asyncConsumer (consumer) | Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions). | false | boolean |
| autoStartup (consumer) | Specifies whether the consumer container should auto-startup. | true | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| cacheLevel (consumer) | Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details. | | int |

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|---------|
| cacheLevelName (consumer) | Sets the cache level by name for the underlying JMS resources. Possible values are: <code>CACHE_AUTO</code> , <code>CACHE_CONNECTION</code> , <code>CACHE_CONSUMER</code> , <code>CACHE_NONE</code> , and <code>CACHE_SESSION</code> . The default setting is <code>CACHE_AUTO</code> . See the Spring documentation and Transactions Cache Levels for more information. | <code>CACHE_AUTO</code> | String |
| concurrentConsumers (consumer) | Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener. | 1 | int |
| maxConcurrentConsumers (consumer) | Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToMaxConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener. | | int |
| replyTo (consumer) | Provides an explicit <code>ReplyTo</code> destination, which overrides any incoming value of <code>Message.getJMSReplyTo()</code> . | | String |
| replyToDeliveryPersistent (consumer) | Specifies whether to use persistent delivery by default for replies. | true | boolean |
| selector (consumer) | Sets the JMS selector to use | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| subscriptionDurable (consumer) | Set whether to make the subscription durable. The durable subscription name to be used can be specified through the <code>subscriptionName</code> property. Default is false. Set this to true to register a durable subscription, typically in combination with a <code>subscriptionName</code> value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the <code>pubSubDomain</code> flag as well. | false | boolean |
| subscriptionName (consumer) | Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client's JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0). | | String |
| subscriptionShared (consumer) | Set whether to make the subscription shared. The shared subscription name to be used can be specified through the <code>subscriptionName</code> property. Default is false. Set this to true to register a shared subscription, typically in combination with a <code>subscriptionName</code> value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with <code>subscriptionDurable</code> as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the <code>pubSubDomain</code> flag as well. Requires a JMS 2.0 compatible message broker. | false | boolean |
| acceptMessagesWhileStopping (consumer) | Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option. | false | boolean |

| Name | Description | Default | Type |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| allowReplyManagerQuickStop (consumer) | Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration#isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag. | false | boolean |
| consumerType (consumer) | The consumer type to use, which can be one of: Simple, Default, or Custom. The consumer type determines which Spring JMS listener to use. Default will use org.springframework.jms.listener.DefaultMessageListenerContainer, Simple will use org.springframework.jms.listener.SimpleMessageListenerContainer. When Custom is specified, the MessageListenerContainerFactory defined by the messageListenerContainerFactory option will determine what org.springframework.jms.listener.AbstractMessageListenerContainer to use. | Default | ConsumerType |
| defaultTaskExecutorType (consumer) | Specifies what default TaskExecutor type to use in the DefaultMessageListenerContainer, for both consumer endpoints and the ReplyTo consumer of producer endpoints. Possible values: SimpleAsync (uses Spring's SimpleAsyncTaskExecutor) or ThreadPool (uses Spring's ThreadPoolTaskExecutor with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and SimpleAsync for reply consumers. The use of ThreadPool is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers. | | DefaultTaskExecutorType |
| eagerLoadingOfProperties (consumer) | Enables eager loading of JMS properties and payload as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties | false | boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| exposeListenerSession (consumer) | Specifies whether the listener session should be exposed when consuming messages. | false | boolean |
| replyToSameDestination Allowed (consumer) | Whether a JMS consumer is allowed to send a reply message to the same destination that the consumer is using to consume from. This prevents an endless loop by consuming and sending back the same message to itself. | false | boolean |
| taskExecutor (consumer) | Allows you to specify a custom task executor for consuming messages. | | TaskExecutor |
| deliveryDelay (producer) | Sets delivery delay to use for send calls for JMS. This option requires JMS 2.0 compliant broker. | -1 | long |
| deliveryMode (producer) | Specifies the delivery mode to be used. Possible values are those defined by <code>javax.jms.DeliveryMode</code> . <code>NON_PERSISTENT</code> = 1 and <code>PERSISTENT</code> = 2. | | Integer |
| deliveryPersistent (producer) | Specifies whether persistent delivery is used by default. | true | boolean |
| explicitQoSEnabled (producer) | Set if the <code>deliveryMode</code> , <code>priority</code> or <code>timeToLive</code> qualities of service should be used when sending messages. This option is based on Spring's <code>JmsTemplate</code> . The <code>deliveryMode</code> , <code>priority</code> and <code>timeToLive</code> options are applied to the current endpoint. This contrasts with the <code>preserveMessageQoS</code> option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers. | false | Boolean |
| formatDateHeadersToIso8601 (producer) | Sets whether JMS date properties should be formatted according to the ISO 8601 standard. | false | boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| preserveMessageQos (producer) | Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The explicitQosEnabled option, by contrast, will only use options set on the endpoint, and not values from the message header. | false | boolean |
| priority (producer) | Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The explicitQosEnabled option must also be enabled in order for this option to have any effect. | 4 | int |
| replyToConcurrentConsumers (producer) | Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads. | 1 | int |
| replyToMaxConcurrentConsumers (producer) | Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the maxMessagesPerTask option to control dynamic scaling up/down of threads. | | int |
| replyToOnTimeoutMaxConcurrentConsumers (producer) | Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS. | 1 | int |
| replyToOverride (producer) | Provides an explicit ReplyTo destination in the JMS message, which overrides the setting of replyTo. It is useful if you want to forward the message to a remote Queue and receive the reply message from the ReplyTo destination. | | String |

| Name | Description | Default | Type |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|
| replyToType (producer) | Allows for explicitly specifying which kind of strategy to use for replyTo queues when doing request/reply over JMS. Possible values are: Temporary, Shared, or Exclusive. By default Camel will use temporary queues. However if replyTo has been configured, then Shared is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that Shared reply queues has lower performance than its alternatives Temporary and Exclusive. | | ReplyToType |
| requestTimeout (producer) | The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header CamelJmsRequestTimeout to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the requestTimeoutCheckerInterval option. | 20000 | long |
| timeToLive (producer) | When sending messages, specifies the time-to-live of the message (in milliseconds). | -1 | long |
| allowAdditionalHeaders (producer) | This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching. | | String |
| allowNullBody (producer) | Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSEException is thrown. | true | boolean |
| alwaysCopyMessage (producer) | If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set) | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| correlationProperty (producer) | When using InOut exchange pattern use this JMS property instead of JMSCorrelationID JMS property to correlate messages. If set messages will be correlated solely on the value of this property JMSCorrelationID property will be ignored and not set by Camel. | | String |
| disableTimeToLive (producer) | Use this option to force disabling time to live. For example when you do request/reply over JMS, then Camel will by default use the requestTimeout value as time to live on the message being sent. The problem is that the sender and receiver systems have to have their clocks synchronized, so they are in sync. This is not always so easy to archive. So you can use disableTimeToLive=true to not set a time to live value on the sent message. Then the message will not expire on the receiver system. See below in section About time to live for more details. | false | boolean |
| forceSendOriginalMessage (producer) | When using mapJmsMessage=false Camel will create a new JMS message to send to a new JMS destination if you touch the headers (get or set) during the route. Set this option to true to force Camel to send the original JMS message that was received. | false | boolean |
| includeSentJMSMessageID (producer) | Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination. | false | boolean |
| replyToCacheLevelName (producer) | Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: CACHE_CONSUMER for exclusive or shared w/ replyToSelectorName. And CACHE_SESSION for shared without replyToSelectorName. Some JMS brokers such as IBM WebSphere may require to set the replyToCacheLevelName=CACHE_NONE to work. Note: If using temporary queues then CACHE_NONE is not allowed, and you must use a higher value such as CACHE_CONSUMER or CACHE_SESSION. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| replyToDestinationSelectorName (producer) | Sets the JMS Selector using the fixed name to be used so you can filter out your own replies from the others when using a shared queue (that is, if you are not using a temporary reply queue). | | String |
| streamMessageTypeEnabled (producer) | Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data. | false | boolean |
| allowSerializedHeaders (advanced) | Controls whether or not to include serialized headers. Applies only when transferExchange is true. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. | false | boolean |
| asyncStartListener (advanced) | Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry. | false | boolean |
| asyncStopListener (advanced) | Whether to stop the JmsConsumer message listener asynchronously, when stopping a route. | false | boolean |
| destinationResolver (advanced) | A pluggable org.springframework.jms.support.destination.DestinationResolver that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry). | | DestinationResolver |

| Name | Description | Default | Type |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| errorHandler (advanced) | Specifies a <code>org.springframework.util.ErrorHandler</code> to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using <code>errorHandlerLoggingLevel</code> and <code>errorHandlerLogStackTrace</code> options. This makes it much easier to configure, than having to code a custom errorHandler. | | ErrorHandler |
| exceptionListener (advanced) | Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions. | | ExceptionListener |
| headerFilterStrategy (advanced) | To use a custom HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| idleConsumerLimit (advanced) | Specify the limit for the number of consumers that are allowed to be idle at any given time. | 1 | int |
| idleTaskExecutionLimit (advanced) | Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the <code>maxConcurrentConsumers</code> setting). There is additional doc available from Spring. | 1 | int |
| includeAllJMSXProperties (advanced) | Whether to include all JMSxxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as <code>JMSXAppID</code> , and <code>JMSXUserID</code> etc. Note: If you are using a custom headerFilterStrategy then this option does not apply. | false | boolean |
| jmsKeyFormatStrategy (advanced) | Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and -). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the <code>org.apache.camel.component.jms.JmsKeyFormatStrategy</code> and refer to it using the # notation. | | String |

| Name | Description | Default | Type |
|------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------|
| mapJmsMessage (advanced) | Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a <code>String</code> etc. | true | boolean |
| maxMessagesPerTask (advanced) | The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required. | -1 | int |
| messageConverter (advanced) | To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code> . | | MessageConverter |
| messageCreatedStrategy (advanced) | To use the given <code>MessageCreatedStrategy</code> which are invoked when Camel creates new instances of <code>javax.jms.Message</code> objects when Camel is sending a JMS message. | | MessageCreatedStrategy |
| messageIdEnabled (advanced) | When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value | true | boolean |
| messageListenerContainerFactory (advanced) | Registry ID of the <code>MessageListenerContainerFactory</code> used to determine what <code>org.springframework.jms.listener.AbstractMessageListenerContainer</code> to use to consume messages. Setting this will automatically set <code>consumerType</code> to <code>Custom</code> . | | MessageListenerContainerFactory |
| messageTimestampEnabled (advanced) | Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value | true | boolean |
| pubSubNoLocal (advanced) | Specifies whether to inhibit the delivery of messages published by its own connection. | false | boolean |
| receiveTimeout (advanced) | The timeout for receiving messages (in milliseconds). | 1000 | long |

| Name | Description | Default | Type |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| recoveryInterval (advanced) | Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds. | 5000 | long |
| requestTimeoutCheckerInterval (advanced) | Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout. | 1000 | long |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| transferException (advanced) | If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer. | false | boolean |
| transferExchange (advanced) | You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| transferFault (advanced) | If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on <code>Message#isFault()</code> will be send back in the response as a JMS header with the key <code>org.apache.camel.component.jms.JmsConstants#JMS_TRANSFER_FAULT#JMS_TRANSFER_FAULT</code> . If the client is Camel, the returned fault flag will be set on the <code>org.apache.camel.Message#setFault(boolean)</code> . You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws. | false | boolean |
| useMessageIDAsCorrelation ID (advanced) | Specifies whether <code>JMSMessageID</code> should always be used as <code>JMSCorrelationID</code> for InOut messages. | false | boolean |
| waitForProvisionCorrelation ToBeUpdatedCounter (advanced) | Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option <code>useMessageIDAsCorrelationID</code> is enabled. | 50 | int |
| waitForProvisionCorrelation ToBeUpdatedThreadSleeping Time (advanced) | Interval in millis to sleep each time while waiting for provisional correlation id to be updated. | 100 | long |
| errorHandlerLoggingLevel (logging) | Allows to configure the default errorHandler logging level for logging uncaught exceptions. | WARN | LogLevel |
| errorHandlerLogStackTrace (logging) | Allows to control whether stacktraces should be logged or not, by the default errorHandler. | true | boolean |
| password (security) | Password to use with the <code>ConnectionFactory</code> . You can also configure username/password directly on the <code>ConnectionFactory</code> . | | String |
| username (security) | Username to use with the <code>ConnectionFactory</code> . You can also configure username/password directly on the <code>ConnectionFactory</code> . | | String |
| transacted (transaction) | Specifies whether to use transacted mode | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|
| lazyCreateTransactionManager (transaction) | If true, Camel will create a <code>JmsTransactionManager</code> , if there is no <code>transactionManager</code> injected when option <code>transacted=true</code> . | true | boolean |
| transactionManager (transaction) | The Spring transaction manager to use. | | PlatformTransactionManager |
| transactionName (transaction) | The name of the transaction to use. | | String |
| transactionTimeout (transaction) | The timeout value of the transaction (in seconds), if using <code>transacted</code> mode. | -1 | int |

5.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 81 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|---------|
| camel.component.amqp.accept-messages-while-stopping | Specifies whether the consumer accept messages while it is stopping. You may consider enabling this option, if you start and stop JMS routes at runtime, while there are still messages enqueued on the queue. If this option is false, and you stop the JMS route, then messages may be rejected, and the JMS broker would have to attempt redeliveries, which yet again may be rejected, and eventually the message may be moved at a dead letter queue on the JMS broker. To avoid this its recommended to enable this option. | false | Boolean |
| camel.component.amqp.acknowledgement-mode | The JMS acknowledgement mode defined as an Integer. Allows you to set vendor-specific extensions to the acknowledgment mode. For the regular modes, it is preferable to use the <code>acknowledgementModeName</code> instead. | | Integer |
| camel.component.amqp.acknowledgement-mode-name | The JMS acknowledgement name, which is one of: <code>SESSION_TRANSACTED</code> , <code>CLIENT_ACKNOWLEDGE</code> , <code>AUTO_ACKNOWLEDGE</code> , <code>DUPS_OK_ACKNOWLEDGE</code> | <code>AUTO_ACKNOWLEDGE</code> | String |

| Name | Description | Default | Type |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.amqp.allow-additional-headers | This option is used to allow additional headers which may have values that are invalid according to JMS specification. For example some message systems such as WMQ do this with header names using prefix JMS_IBM_MQMD_ containing values with byte array or other invalid types. You can specify multiple header names separated by comma, and use as suffix for wildcard matching. | | String |
| camel.component.amqp.allow-null-body | Whether to allow sending messages with no body. If this option is false and the message body is null, then an JMSEException is thrown. | true | Boolean |
| camel.component.amqp.allow-reply-manager-quick-stop | Whether the DefaultMessageListenerContainer used in the reply managers for request-reply messaging allow the DefaultMessageListenerContainer.runningAllowed flag to quick stop in case JmsConfiguration#isAcceptMessagesWhileStopping is enabled, and org.apache.camel.CamelContext is currently being stopped. This quick stop ability is enabled by default in the regular JMS consumers but to enable for reply managers you must enable this flag. | false | Boolean |
| camel.component.amqp.always-copy-message | If true, Camel will always make a JMS message copy of the message when it is passed to the producer for sending. Copying the message is needed in some situations, such as when a replyToDestinationSelectorName is set (incidentally, Camel will set the alwaysCopyMessage option to true, if a replyToDestinationSelectorName is set) | false | Boolean |
| camel.component.amqp.async-consumer | Whether the JmsConsumer processes the Exchange asynchronously. If enabled then the JmsConsumer may pickup the next message from the JMS queue, while the previous message is being processed asynchronously (by the Asynchronous Routing Engine). This means that messages may be processed not 100% strictly in order. If disabled (as default) then the Exchange is fully processed before the JmsConsumer will pickup the next message from the JMS queue. Note if transacted has been enabled, then asyncConsumer=true does not run asynchronously, as transaction must be executed synchronously (Camel 3.0 may support async transactions). | false | Boolean |

| Name | Description | Default | Type |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------|
| camel.component.amqp.async-start-listener | Whether to startup the JmsConsumer message listener asynchronously, when starting a route. For example if a JmsConsumer cannot get a connection to a remote JMS broker, then it may block while retrying and/or failover. This will cause Camel to block while starting routes. By setting this option to true, you will let routes startup, while the JmsConsumer connects to the JMS broker using a dedicated thread in asynchronous mode. If this option is used, then beware that if the connection could not be established, then an exception is logged at WARN level, and the consumer will not be able to receive messages; You can then restart the route to retry. | false | Boolean |
| camel.component.amqp.async-stop-listener | Whether to stop the JmsConsumer message listener asynchronously, when stopping a route. | false | Boolean |
| camel.component.amqp.auto-startup | Specifies whether the consumer container should auto-startup. | true | Boolean |
| camel.component.amqp.cache-level | Sets the cache level by ID for the underlying JMS resources. See cacheLevelName option for more details. | | Integer |
| camel.component.amqp.cache-level-name | Sets the cache level by name for the underlying JMS resources. Possible values are: CACHE_AUTO, CACHE_CONNECTION, CACHE_CONSUMER, CACHE_NONE, and CACHE_SESSION. The default setting is CACHE_AUTO. See the Spring documentation and Transactions Cache Levels for more information. | CACHE_AUTO | String |
| camel.component.amqp.client-id | Sets the JMS client ID to use. Note that this value, if specified, must be unique and can only be used by a single JMS connection instance. It is typically only required for durable topic subscriptions. If using Apache ActiveMQ you may prefer to use Virtual Topics instead. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------------|
| camel.component.amqp.concurrent-consumers | Specifies the default number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener. | 1 | Integer |
| camel.component.amqp.configuration | To use a shared JMS configuration. The option is a <code>org.apache.camel.component.jms.JmsConfiguration</code> type. | | String |
| camel.component.amqp.connection-factory | The connection factory to be use. A connection factory must be configured either on the component or endpoint. The option is a <code>javax.jms.ConnectionFactory</code> type. | | String |
| camel.component.amqp.correlation-property | Use this JMS property to correlate messages in InOut exchange pattern (request-reply) instead of <code>JMSCorrelationID</code> property. This allows you to exchange messages with systems that do not correlate messages using <code>JMSCorrelationID</code> JMS property. If used <code>JMSCorrelationID</code> will not be used or set by Camel. The value of here named property will be generated if not supplied in the header of the message under the same name. | | String |
| camel.component.amqp.default-task-executor-type | Specifies what default <code>TaskExecutor</code> type to use in the <code>DefaultMessageListenerContainer</code> , for both consumer endpoints and the <code>ReplyTo</code> consumer of producer endpoints. Possible values: <code>SimpleAsync</code> (uses Spring's <code>SimpleAsyncTaskExecutor</code>) or <code>ThreadPool</code> (uses Spring's <code>ThreadPoolTaskExecutor</code> with optimal values - cached threadpool-like). If not set, it defaults to the previous behaviour, which uses a cached thread pool for consumer endpoints and <code>SimpleAsync</code> for reply consumers. The use of <code>ThreadPool</code> is recommended to reduce thread trash in elastic configurations with dynamically increasing and decreasing concurrent consumers. | | <code>DefaultTaskExecutor</code> Type |
| camel.component.amqp.delivery-mode | Specifies the delivery mode to be used. Possibles values are those defined by <code>javax.jms.DeliveryMode</code> . <code>NON_PERSISTENT</code> = 1 and <code>PERSISTENT</code> = 2. | | Integer |

| Name | Description | Default | Type |
|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| <code>camel.component.amqp.delivery-persistent</code> | Specifies whether persistent delivery is used by default. | true | Boolean |
| <code>camel.component.amqp.destination-resolver</code> | A pluggable <code>org.springframework.jms.support.destination.DestinationResolver</code> that allows you to use your own resolver (for example, to lookup the real destination in a JNDI registry). The option is a <code>org.springframework.jms.support.destination.DestinationResolver</code> type. | | String |
| <code>camel.component.amqp.durable-subscription-name</code> | The durable subscriber name for specifying durable topic subscriptions. The <code>clientId</code> option must be configured as well. | | String |
| <code>camel.component.amqp.eager-loading-of-properties</code> | Enables eager loading of JMS properties as soon as a message is loaded which generally is inefficient as the JMS properties may not be required but sometimes can catch early any issues with the underlying JMS provider and the use of JMS properties | false | Boolean |
| <code>camel.component.amqp.enabled</code> | Enable amqp component | true | Boolean |
| <code>camel.component.amqp.error-handler</code> | Specifies a <code>org.springframework.util.ErrorHandler</code> to be invoked in case of any uncaught exceptions thrown while processing a Message. By default these exceptions will be logged at the WARN level, if no errorHandler has been configured. You can configure logging level and whether stack traces should be logged using <code>errorHandlerLoggingLevel</code> and <code>errorHandlerLogStackTrace</code> options. This makes it much easier to configure, than having to code a custom errorHandler. The option is a <code>org.springframework.util.ErrorHandler</code> type. | | String |
| <code>camel.component.amqp.error-handler-log-stack-trace</code> | Allows to control whether stacktraces should be logged or not, by the default errorHandler. | true | Boolean |
| <code>camel.component.amqp.error-handler-logging-level</code> | Allows to configure the default errorHandler logging level for logging uncaught exceptions. | | LogLevel |

| Name | Description | Default | Type |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.amqp.exception-listener | Specifies the JMS Exception Listener that is to be notified of any underlying JMS exceptions. The option is a <code>javax.jms.ExceptionListener</code> type. | | String |
| camel.component.amqp.explicit-qos-enabled | Set if the <code>deliveryMode</code> , <code>priority</code> or <code>timeToLive</code> qualities of service should be used when sending messages. This option is based on Spring's <code>JmsTemplate</code> . The <code>deliveryMode</code> , <code>priority</code> and <code>timeToLive</code> options are applied to the current endpoint. This contrasts with the <code>preserveMessageQos</code> option, which operates at message granularity, reading QoS properties exclusively from the Camel In message headers. | false | Boolean |
| camel.component.amqp.expose-listener-session | Specifies whether the listener session should be exposed when consuming messages. | false | Boolean |
| camel.component.amqp.force-send-original-message | When using <code>mapJmsMessage=false</code> Camel will create a new JMS message to send to a new JMS destination if you touch the headers (<code>get</code> or <code>set</code>) during the route. Set this option to true to force Camel to send the original JMS message that was received. | false | Boolean |
| camel.component.amqp.format-date-headers-to-iso8601 | Sets whether date headers should be formatted according to the ISO 8601 standard. | false | Boolean |
| camel.component.amqp.header-filter-strategy | To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type. | | String |
| camel.component.amqp.idle-consumer-limit | Specify the limit for the number of consumers that are allowed to be idle at any given time. | 1 | Integer |
| camel.component.amqp.idle-task-execution-limit | Specifies the limit for idle executions of a receive task, not having received any message within its execution. If this limit is reached, the task will shut down and leave receiving to other executing tasks (in the case of dynamic scheduling; see the <code>maxConcurrentConsumers</code> setting). There is additional doc available from Spring. | 1 | Integer |

| Name | Description | Default | Type |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.amqp.include-all-j-m-s-x-properties</code> | Whether to include all JMSXxxx properties when mapping from JMS to Camel Message. Setting this to true will include properties such as JMSXAppID, and JMSXUserID etc. Note: If you are using a custom headerFilterStrategy then this option does not apply. | false | Boolean |
| <code>camel.component.amqp.include-sent-j-m-s-message-i-d</code> | Only applicable when sending to JMS destination using InOnly (eg fire and forget). Enabling this option will enrich the Camel Exchange with the actual JMSMessageID that was used by the JMS client when the message was sent to the JMS destination. | false | Boolean |
| <code>camel.component.amqp.jms-key-format-strategy</code> | Pluggable strategy for encoding and decoding JMS keys so they can be compliant with the JMS specification. Camel provides two implementations out of the box: default and passthrough. The default strategy will safely marshal dots and hyphens (. and -). The passthrough strategy leaves the key as is. Can be used for JMS brokers which do not care whether JMS header keys contain illegal characters. You can provide your own implementation of the <code>org.apache.camel.component.jms.JmsKeyFormatStrategy</code> and refer to it using the # notation. The option is a <code>org.apache.camel.component.jms.JmsKeyFormatStrategy</code> type. | | String |
| <code>camel.component.amqp.jms-operations</code> | Allows you to use your own implementation of the <code>org.springframework.jms.core.JmsOperations</code> interface. Camel uses <code>JmsTemplate</code> as default. Can be used for testing purpose, but not used much as stated in the spring API docs. The option is a <code>org.springframework.jms.core.JmsOperations</code> type. | | String |
| <code>camel.component.amqp.lazy-create-transaction-manager</code> | If true, Camel will create a <code>JmsTransactionManager</code> , if there is no <code>transactionManager</code> injected when <code>option transacted=true</code> . | true | Boolean |
| <code>camel.component.amqp.map-jms-message</code> | Specifies whether Camel should auto map the received JMS message to a suited payload type, such as <code>javax.jms.TextMessage</code> to a String etc. | true | Boolean |

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.amqp.max-concurrent-consumers</code> | Specifies the maximum number of concurrent consumers when consuming from JMS (not for request/reply over JMS). See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. When doing request/reply over JMS then the option <code>replyToMaxConcurrentConsumers</code> is used to control number of concurrent consumers on the reply message listener. | | Integer |
| <code>camel.component.amqp.max-messages-per-task</code> | The number of messages per task. -1 is unlimited. If you use a range for concurrent consumers (eg min max), then this option can be used to set a value to eg 100 to control how fast the consumers will shrink when less work is required. | -1 | Integer |
| <code>camel.component.amqp.message-converter</code> | To use a custom Spring <code>org.springframework.jms.support.converter.MessageConverter</code> so you can be in control how to map to/from a <code>javax.jms.Message</code> . The option is a <code>org.springframework.jms.support.converter.MessageConverter</code> type. | | String |
| <code>camel.component.amqp.message-created-strategy</code> | To use the given <code>MessageCreatedStrategy</code> which are invoked when Camel creates new instances of <code>javax.jms.Message</code> objects when Camel is sending a JMS message. The option is a <code>org.apache.camel.component.jms.MessageCreatedStrategy</code> type. | | String |
| <code>camel.component.amqp.message-id-enabled</code> | When sending, specifies whether message IDs should be added. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value | true | Boolean |
| <code>camel.component.amqp.message-timestamp-enabled</code> | Specifies whether timestamps should be enabled by default on sending messages. This is just an hint to the JMS broker. If the JMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint the timestamp must be set to its normal value | true | Boolean |
| <code>camel.component.amqp.password</code> | Password to use with the <code>ConnectionFactory</code> . You can also configure <code>username/password</code> directly on the <code>ConnectionFactory</code> . | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.amqp.preserve-message-qos</code> | Set to true, if you want to send message using the QoS settings specified on the message, instead of the QoS settings on the JMS endpoint. The following three headers are considered JMSPriority, JMSDeliveryMode, and JMSExpiration. You can provide all or only some of them. If not provided, Camel will fall back to use the values from the endpoint instead. So, when using this option, the headers override the values from the endpoint. The <code>explicitQosEnabled</code> option, by contrast, will only use options set on the endpoint, and not values from the message header. | false | Boolean |
| <code>camel.component.amqp.priority</code> | Values greater than 1 specify the message priority when sending (where 0 is the lowest priority and 9 is the highest). The <code>explicitQosEnabled</code> option must also be enabled in order for this option to have any effect. | 4 | Integer |
| <code>camel.component.amqp.pub-sub-no-local</code> | Specifies whether to inhibit the delivery of messages published by its own connection. | false | Boolean |
| <code>camel.component.amqp.queue-browse-strategy</code> | To use a custom <code>QueueBrowseStrategy</code> when browsing queues. The option is a <code>org.apache.camel.component.jms.QueueBrowseStrategy</code> type. | | String |
| <code>camel.component.amqp.receive-timeout</code> | The timeout for receiving messages (in milliseconds). | 1000 | Long |
| <code>camel.component.amqp.recovery-interval</code> | Specifies the interval between recovery attempts, i.e. when a connection is being refreshed, in milliseconds. The default is 5000 ms, that is, 5 seconds. | 5000 | Long |
| <code>camel.component.amqp.reply-on-timeout-to-max-concurrent-consumers</code> | Specifies the maximum number of concurrent consumers for continue routing when timeout occurred when using request/reply over JMS. | 1 | Integer |

| Name | Description | Default | Type |
|---------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| <code>camel.component.amqp.reply-to-cache-level-name</code> | Sets the cache level by name for the reply consumer when doing request/reply over JMS. This option only applies when using fixed reply queues (not temporary). Camel will by default use: <code>CACHE_CONSUMER</code> for exclusive or shared w/ <code>replyToSelectorName</code> . And <code>CACHE_SESSION</code> for shared without <code>replyToSelectorName</code> . Some JMS brokers such as IBM WebSphere may require to set the <code>replyToCacheLevelName=CACHE_NONE</code> to work. Note: If using temporary queues then <code>CACHE_NONE</code> is not allowed, and you must use a higher value such as <code>CACHE_CONSUMER</code> or <code>CACHE_SESSION</code> . | | String |
| <code>camel.component.amqp.reply-to-concurrent-consumers</code> | Specifies the default number of concurrent consumers when doing request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. | 1 | Integer |
| <code>camel.component.amqp.reply-to-max-concurrent-consumers</code> | Specifies the maximum number of concurrent consumers when using request/reply over JMS. See also the <code>maxMessagesPerTask</code> option to control dynamic scaling up/down of threads. | | Integer |
| <code>camel.component.amqp.reply-to-type</code> | Allows for explicitly specifying which kind of strategy to use for <code>replyTo</code> queues when doing request/reply over JMS. Possible values are: <code>Temporary</code> , <code>Shared</code> , or <code>Exclusive</code> . By default Camel will use temporary queues. However if <code>replyTo</code> has been configured, then <code>Shared</code> is used by default. This option allows you to use exclusive queues instead of shared ones. See Camel JMS documentation for more details, and especially the notes about the implications if running in a clustered environment, and the fact that <code>Shared</code> reply queues has lower performance than its alternatives <code>Temporary</code> and <code>Exclusive</code> . | | <code>ReplyToType</code> |
| <code>camel.component.amqp.request-timeout</code> | The timeout for waiting for a reply when using the InOut Exchange Pattern (in milliseconds). The default is 20 seconds. You can include the header <code>CamelJmsRequestTimeout</code> to override this endpoint configured timeout value, and thus have per message individual timeout values. See also the <code>requestTimeoutCheckerInterval</code> option. | 20000 | Long |

| Name | Description | Default | Type |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.amqp.request-timeout-checker-interval | Configures how often Camel should check for timed out Exchanges when doing request/reply over JMS. By default Camel checks once per second. But if you must react faster when a timeout occurs, then you can lower this interval, to check more frequently. The timeout is determined by the option requestTimeout. | 1000 | Long |
| camel.component.amqp.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| camel.component.amqp.stream-message-type-enabled | Sets whether StreamMessage type is enabled or not. Message payloads of streaming kind such as files, InputStream, etc will either be sent as BytesMessage or StreamMessage. This option controls which kind will be used. By default BytesMessage is used which enforces the entire message payload to be read into memory. By enabling this option the message payload is read into memory in chunks and each chunk is then written to the StreamMessage until no more data. | false | Boolean |
| camel.component.amqp.subscription-durable | Set whether to make the subscription durable. The durable subscription name to be used can be specified through the subscriptionName property. Default is false. Set this to true to register a durable subscription, typically in combination with a subscriptionName value (unless your message listener class name is good enough as subscription name). Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the pubSubDomain flag as well. | false | Boolean |
| camel.component.amqp.subscription-name | Set the name of a subscription to create. To be applied in case of a topic (pub-sub domain) with a shared or durable subscription. The subscription name needs to be unique within this client's JMS client id. Default is the class name of the specified message listener. Note: Only 1 concurrent consumer (which is the default of this message listener container) is allowed for each subscription, except for a shared subscription (which requires JMS 2.0). | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.amqp.subscription-shared</code> | Set whether to make the subscription shared. The shared subscription name to be used can be specified through the <code>subscriptionName</code> property. Default is false. Set this to true to register a shared subscription, typically in combination with a <code>subscriptionName</code> value (unless your message listener class name is good enough as subscription name). Note that shared subscriptions may also be durable, so this flag can (and often will) be combined with <code>subscriptionDurable</code> as well. Only makes sense when listening to a topic (pub-sub domain), therefore this method switches the <code>pubSubDomain</code> flag as well. Requires a JMS 2.0 compatible message broker. | false | Boolean |
| <code>camel.component.amqp.task-executor</code> | Allows you to specify a custom task executor for consuming messages. The option is a <code>org.springframework.core.task.TaskExecutor</code> type. | | String |
| <code>camel.component.amqp.test-connection-on-startup</code> | Specifies whether to test the connection on startup. This ensures that when Camel starts that all the JMS consumers have a valid connection to the JMS broker. If a connection cannot be granted then Camel throws an exception on startup. This ensures that Camel is not started with failed connections. The JMS producers is tested as well. | false | Boolean |
| <code>camel.component.amqp.time-to-live</code> | When sending messages, specifies the time-to-live of the message (in milliseconds). | -1 | Long |
| <code>camel.component.amqp.transacted</code> | Specifies whether to use transacted mode | false | Boolean |
| <code>camel.component.amqp.transaction-manager</code> | The Spring transaction manager to use. The option is a <code>org.springframework.transaction.PlatformTransactionManager</code> type. | | String |
| <code>camel.component.amqp.transaction-name</code> | The name of the transaction to use. | | String |
| <code>camel.component.amqp.transaction-timeout</code> | The timeout value of the transaction (in seconds), if using transacted mode. | -1 | Integer |

| Name | Description | Default | Type |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.amqp.transfer-exception | If enabled and you are using Request Reply messaging (InOut) and an Exchange failed on the consumer side, then the caused Exception will be send back in response as a javax.jms.ObjectMessage. If the client is Camel, the returned Exception is rethrown. This allows you to use Camel JMS as a bridge in your routing - for example, using persistent queues to enable robust routing. Notice that if you also have transferExchange enabled, this option takes precedence. The caught exception is required to be serializable. The original Exception on the consumer side can be wrapped in an outer exception such as org.apache.camel.RuntimeCamelException when returned to the producer. | false | Boolean |
| camel.component.amqp.transfer-exchange | You can transfer the exchange over the wire instead of just the body and headers. The following fields are transferred: In body, Out body, Fault body, In headers, Out headers, Fault headers, exchange properties, exchange exception. This requires that the objects are serializable. Camel will exclude any non-serializable objects and log it at WARN level. You must enable this option on both the producer and consumer side, so Camel knows the payloads is an Exchange and not a regular payload. | false | Boolean |
| camel.component.amqp.transfer-fault | If enabled and you are using Request Reply messaging (InOut) and an Exchange failed with a SOAP fault (not exception) on the consumer side, then the fault flag on Message#isFault() will be send back in the response as a JMS header with the key org.apache.camel.component.jms.JmsConstants #JMS_TRANSFER_FAULT#JMS_TRANSFER_FAULT. If the client is Camel, the returned fault flag will be set on the org.apache.camel.Message#setFault(boolean). You may want to enable this when using Camel components that support faults such as SOAP based such as cxf or spring-ws. | false | Boolean |
| camel.component.amqp.use-message-i-d-as-correlation-i-d | Specifies whether JMSMessageID should always be used as JMSCorrelationID for InOut messages. | false | Boolean |
| camel.component.amqp.username | Username to use with the ConnectionFactory. You can also configure username/password directly on the ConnectionFactory. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.amqp.wait-for-provision-correlation-to-be-updated-counter</code> | Number of times to wait for provisional correlation id to be updated to the actual correlation id when doing request/reply over JMS and when the option <code>useMessageIDAsCorrelationID</code> is enabled. | 50 | Integer |
| <code>camel.component.amqp.wait-for-provision-correlation-to-be-updated-thread-sleeping-time</code> | Interval in millis to sleep each time while waiting for provisional correlation id to be updated. | 100 | Long |

5.4. USAGE

As AMQP component is inherited from JMS component, the usage of the former is almost identical to the latter:

Using AMQP component

```
// Consuming from AMQP queue
from("amqp:queue:incoming").
to(...);

// Sending message to the AMQP topic
from(...).
to("amqp:topic:notify");
```

5.5. CONFIGURING AMQP COMPONENT

Starting from the Camel 2.16.1 you can also use the **`AMQPComponent#amqp10Component(String connectionURI)`** factory method to return the AMQP 1.0 component with the pre-configured topic prefix:

Creating AMQP 1.0 component

```
AMQPComponent amqp =
AMQPComponent.amqp10Component("amqp://guest:guest@localhost:5672");
```

Keep in mind that starting from the Camel 2.17 the **`AMQPComponent#amqp10Component(String connectionURI)`** factory method has been deprecated on the behalf of the **`AMQPComponent#amqpComponent(String connectionURI)`**:

Creating AMQP 1.0 component

```
AMQPComponent amqp = AMQPComponent.amqpComponent("amqp://localhost:5672");
```

```
AMQPComponent authorizedAmqp = AMQPComponent.amqpComponent("amqp://localhost:5672",
"user", "password");
```

Starting from Camel 2.17, in order to automatically configure the AMQP component, you can also add an instance of **org.apache.camel.component.amqp.AMQPConnectionDetails** to the registry. For example for Spring Boot you just have to define bean:

AMQP connection details auto-configuration

```
@Bean
AMQPConnectionDetails amqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672");
}

@Bean
AMQPConnectionDetails securedAmqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672", "username", "password");
}
```

Likewise, you can also use CDI producer methods when using Camel-CDI

AMQP connection details auto-configuration for CDI

```
@Produces
AMQPConnectionDetails amqpConnection() {
    return new AMQPConnectionDetails("amqp://localhost:5672");
}
```

You can also rely on the [Camel properties](#) to read the AMQP connection details. Factory method **AMQPConnectionDetails.discoverAMQP()** attempts to read Camel properties in a Kubernetes-like convention, just as demonstrated on the snippet below:

AMQP connection details auto-configuration

```
export AMQP_SERVICE_HOST = "mybroker.com"
export AMQP_SERVICE_PORT = "6666"
export AMQP_SERVICE_USERNAME = "username"
export AMQP_SERVICE_PASSWORD = "password"

...

@Bean
AMQPConnectionDetails amqpConnection() {
    return AMQPConnectionDetails.discoverAMQP();
}
```

Enabling AMQP specific options

If you, for example, need to enable **amqp.traceFrames** you can do that by appending the option to your URI, like the following example:

```
AMQPComponent amqp = AMQPComponent.amqpComponent("amqp://localhost:5672?
amqp.traceFrames=true");
```

For reference take a look at the [QPID JMS client configuration](#)

5.6. USING TOPICS

To have using topics working with **camel-amqp** you need to configure the component to use **topic://** as topic prefix, as shown below:

```
<bean id="amqp" class="org.apache.camel.component.amqp.AmqpComponent">
  <property name="connectionFactory">
    <bean class="org.apache.qpid.jms.JmsConnectionFactory" factory-method="createFromURL">
      <property name="remoteURI" value="amqp://localhost:5672" />
      <property name="topicPrefix" value="topic://" /> <!-- only necessary when connecting to
ActiveMQ over AMQP 1.0 -->
    </bean>
  </property>
</bean>
```

Keep in mind that both **AMQPComponent#amqpComponent()** methods and **AMQPConnectionDetails** pre-configure the component with the topic prefix, so you don't have to configure it explicitly.

5.7. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 6. APNS COMPONENT

Available as of Camel version 2.8

The **apns** component is used for sending notifications to iOS devices. The apns components use [javapns](#) library.

The component supports sending notifications to Apple Push Notification Servers (APNS) and consuming feedback from the servers.

The consumer is configured with 3600 seconds for polling by default because it is a best practice to consume feedback stream from Apple Push Notification Servers only from time to time. For example: every 1 hour to avoid flooding the servers.

The feedback stream gives informations about inactive devices. You only need to get this informations every some hours if your mobile application is not a heavily used one.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-apns</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

6.1. URI FORMAT

To send notifications:

```
apns:notify[?options]
```

To consume feedback:

```
apns:consumer[?options]
```

6.2. OPTIONS

The APNS component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|
| apnsService (common) | Required The ApnsService to use. The org.apache.camel.component.apns.factory.ApnsServiceFactory can be used to build a ApnsService | | ApnsService |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The APNS endpoint is configured using URI syntax:

```
apns:name
```

with the following path and query parameters:

6.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|----------------------|---------|--------|
| name | Name of the endpoint | | String |

6.2.2. Query Parameters (20 parameters):

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| tokens (common) | Configure this property in case you want to statically declare tokens related to devices you want to notify. Tokens are separated by comma. | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |

| Name | Description | Default | Type |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

6.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.apns.apns-service | The ApnsService to use. The <code>org.apache.camel.component.apns.factory.ApnsServiceFactory</code> can be used to build a <code>ApnsService</code> . The option is a <code>com.notnoop.apns.ApnsService</code> type. | | String |
| camel.component.apns.enabled | Enable apns component | true | Boolean |
| camel.component.apns.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

You can append query options to the URI in the following format, **?option=value&option=value&...**

6.3.1. Component

The **ApnsComponent** must be configured with a **com.notnoop.apns.ApnsService**. The service can be created and configured using the **org.apache.camel.component.apns.factory.ApnsServiceFactory**. See further below for an example. And as well in the [test source code](#).

6.3.1.1. SSL Setting

In order to use secure connection, an instance of `org.apache.camel.util.jsse.SSLContextParameters` should be injected to `org.apache.camel.component.apns.factory.ApnsServiceFactory` which is used to configure the component. See the test resources for an example. [ssl example](#)

6.4. EXCHANGE DATA FORMAT

When Camel will fetch feedback data corresponding to inactive devices, it will retrieve a List of InactiveDevice objects. Each InactiveDevice object of the retrieved list will be setted as the In body, and then processed by the consumer endpoint.

6.5. MESSAGE HEADERS

Camel Apns uses these headers.

| Property | Default | Description |
|------------------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel ApnsTokens | | Empty by default. |
| Camel ApnsMessageType | STRING, PAYLOAD, APNS_NOTIFICATION | In case you choose PAYLOAD for the message type, then the message will be considered as a APNS payload and sent as is. In case you choose STRING, message will be converted as a APNS payload. From Camel 2.16 onwards APNS_NOTIFICATION is used for sending message body as <code>com.notnoop.apns.ApnsNotification</code> types. |

6.6. APNSSERVICEFACTORY BUILDER CALLBACK

`ApnsServiceFactory` comes with the empty callback method that could be used to configure (or even replace) the default `ApnsServiceBuilder` instance. The signature of the method could look as follows:

```
protected ApnsServiceBuilder configureServiceBuilder(ApnsServiceBuilder serviceBuilder);
```

And could be used like as follows:

```
ApnsServiceFactory proxiedApnsServiceFactory = new ApnsServiceFactory(){
    @Override
    protected ApnsServiceBuilder configureServiceBuilder(ApnsServiceBuilder serviceBuilder) {
        return serviceBuilder.withSocksProxy("my.proxy.com", 6666);
    }
};
```

6.7. SAMPLES

6.7.1. Camel Xml route

```

<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:camel="http://camel.apache.org/schema/spring"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans-2.5.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-
    spring.xsd">

  <!-- Replace by desired values -->
  <bean id="apnsServiceFactory"
class="org.apache.camel.component.apns.factory.ApnsServiceFactory">

    <!-- Optional configuration of feedback host and port -->
    <!-- <property name="feedbackHost" value="localhost" /> -->
    <!-- <property name="feedbackPort" value="7843" /> -->

    <!-- Optional configuration of gateway host and port -->
    <!-- <property name="gatewayHost" value="localhost" /> -->
    <!-- <property name="gatewayPort" value="7654" /> -->

    <!-- Declaration of certificate used -->
    <!-- from Camel 2.11 onwards you can use prefix: classpath:, file: to refer to load the
certificate from classpath or file. Default it classpath -->
    <property name="certificatePath" value="certificate.p12" />
    <property name="certificatePassword" value="MyCertPassword" />

    <!-- Optional connection strategy - By Default: No need to configure -->
    <!-- Possible options: NON_BLOCKING, QUEUE, POOL or Nothing -->
    <!-- <property name="connectionStrategy" value="POOL" /> -->
    <!-- Optional pool size -->
    <!-- <property name="poolSize" value="15" /> -->

    <!-- Optional connection strategy - By Default: No need to configure -->
    <!-- Possible options: EVERY_HALF_HOUR, EVERY_NOTIFICATION or Nothing (Corresponds
to NEVER javapns option) -->
    <!-- <property name="reconnectionPolicy" value="EVERY_HALF_HOUR" /> -->
  </bean>

  <bean id="apnsService" factory-bean="apnsServiceFactory" factory-method="getApnsService" />

  <!-- Replace this declaration by wanted configuration -->
  <bean id="apns" class="org.apache.camel.component.apns.ApnsComponent">
    <property name="apnsService" ref="apnsService" />
  </bean>

  <camelContext id="camel-apns-test" xmlns="http://camel.apache.org/schema/spring">
    <route id="apns-test">
      <from uri="apns:consumer?initialDelay=10&delay=3600&timeUnit=SECONDS"
/>
      <to uri="log:org.apache.camel.component.apns?showAll=true&multiline=true" />
      <to uri="mock:result" />
    </route>

```

```
</camelContext>
```

```
</beans>
```

6.7.2. Camel Java route

Create camel context and declare apns component programmatically

```
protected CamelContext createCamelContext() throws Exception {
    CamelContext camelContext = super.createCamelContext();

    ApnsServiceFactory apnsServiceFactory = new ApnsServiceFactory();
    apnsServiceFactory.setCertificatePath("classpath:/certificate.p12");
    apnsServiceFactory.setCertificatePassword("MyCertPassword");

    ApnsService apnsService = apnsServiceFactory.getApnsService(camelContext);

    ApnsComponent apnsComponent = new ApnsComponent(apnsService);
    camelContext.addComponent("apns", apnsComponent);

    return camelContext;
}
```

[[APNS-ApnsProducer-iOSTargetdeviceconfiguredviaheader:"CamelApnsTokens"]]
ApnsProducer - iOS target device dynamically configured via header: **"CamelApnsTokens"**

```
protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() throws Exception {
            from("direct:test")
                .setHeader(ApnsConstants.HEADER_TOKENS, constant(IOS_DEVICE_TOKEN))
                .to("apns:notify");
        }
    }
}
```

ApnsProducer - iOS target device statically configured via uri

```
protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() throws Exception {
            from("direct:test").
                to("apns:notify?tokens=" + IOS_DEVICE_TOKEN);
        }
    };
}
```

ApnsConsumer

```
from("apns:consumer?initialDelay=10&delay=3600&timeUnit=SECONDS")
    .to("log:com.apache.camel.component.apns?showAll=true&multiline=true")
    .to("mock:result");
```

6.8. SEE ALSO

CHAPTER 7. ASN.1 FILE DATAFORMAT

Available as of Camel version 2.20

The ASN.1 Data Format [Introduction to ASN.1](<https://www.itu.int/en/ITU-T/asn1/Pages/introduction.aspx>) is a Camel Frameworks's data format implementation based on Bouncy Castle's bcprov-jdk18on library and jASN.1's java compiler for the formal notation used for describing data transmitted by telecommunications protocols, regardless of language implementation and physical representation of these data, whatever the application, whether complex or very simple. Messages can be unmarshalled (conversion to simple Java POJO(s)) to plain Java objects. By the help of Camel's routing engine and data transformations you can then play with POJO(s) and apply customised formatting and call other Camel Component's to convert and send messages to upstream systems.

7.1. ASN.1 DATA FORMAT OPTIONS

The ASN.1 File dataformat supports 3 options, which are listed below.

| Name | Default | Java Type | Description |
|-------------------|---------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| usingIterator | false | Boolean | If the asn1 file has more then one entry, the setting this option to true, allows to work with the splitter EIP, to split the data using an iterator in a streaming mode. |
| clazzName | | String | Name of class to use when unmarshalling |
| contentTypeHeader | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. |

7.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.dataformat.asn1.clazz-name | Name of class to use when unmarshalling | | String |
| camel.dataformat.asn1.content-type-header | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. | false | Boolean |

| Name | Description | Default | Type |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.asn1.enabled</code> | Whether to enable auto configuration of the asn1 data format. This is enabled by default. | | Boolean |
| <code>camel.dataformat.asn1.using-iterator</code> | If the asn1 file has more then one entry, the setting this option to true, allows to work with the splitter EIP, to split the data using an iterator in a streaming mode. | false | Boolean |

ND

7.3. UNMARSHAL

There are 3 different ways to unmarshal ASN.1 structured messages. (Usually binary files)

In this first example we unmarshal BER file payload to OutputStream and send it to mock endpoint.

```
from("direct:unmarshal").unmarshal(asn1).to("mock:unmarshal");
```

In the second example we unmarshal BER file payload to byte array using Split EIP. The reason for applying Split EIP is that usually each BER file or (ASN.1 structured file) contains multiple records to process and Split EIP helps us to get each record in a file as byte arrays which is actually ASN1Primitive's instance (by the use of Bouncy Castle's ASN.1 support in bcprov-jdk18on library) Byte arrays then may be converted to ASN1Primitive by the help of public static method in (ASN1Primitive.fromByteArray) In such example, note that you need to set **usingIterator=true**

```
from("direct:unmarshal").unmarshal(asn1).split(body(Iterator.class)).streaming().to("mock:unmarshal");
```

In the last example we unmarshal BER file payload to plain old Java Objects using Split EIP. The reason for applying Split EIP is already mentioned in the previous example. Please note and keep in mind that reason. In such example we also need to set the fully qualified name of the class or `<YourObject>.class` reference through data format. The important thing to note here is that your object should have been generated by jasn1 compiler which is a nice tool to generate java object representations of your ASN.1 structure. For the reference usage of jasn1 compiler see [JASN.1 Project Page] (<https://www.openmuc.org/asn1/>) and please also see how the compiler is invoked with the help of maven's exec plugin. For example, in this data format's unit tests an example ASN.1 structure (TestSMSBerCdr.asn1) is added in **src/test/resources/asn1_structure**. jasn1 compiler is invoked and java object's representations are generated in **`\${basedir}/target/generated/src/test/java** The nice thing about this example, you will get POJO instance at the mock endpoint or at whatever your endpoint is.

```
from("direct:unmarshaldsl")
    .unmarshal()
    .asn1("org.apache.camel.dataformat.asn1.model.testsmsbercdr.SmsCdr")
    .split(body(Iterator.class)).streaming()
    .to("mock:unmarshaldsl");
```

7.4. DEPENDENCIES

To use ASN.1 data format in your camel routes you need to add a dependency on **camel-asn1** which implements this data format.

If you use Maven you can just add the following to your **pom.xml**, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-asn1 </artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

CHAPTER 8. AS2 COMPONENT

IMPORTANT

The **camel-as2** component for Karaf is a Technology Preview feature only. Technology Preview features are not supported with Red Hat production service level agreements (SLAs) and might not be functionally complete. Red Hat does not recommend using them in production.

These features provide early access to upcoming product features, enabling customers to test functionality and provide feedback during the development process. For more information about the support scope of Red Hat Technology Preview features, see <https://access.redhat.com/support/offerings/techpreview>.

Available as of Camel version 2.22

The AS2 component provides transport of EDI messages using the HTTP transfer protocol as specified in [RFC4130](#).

NOTE

This component is currently a work in progress. Expect URI options and path and query parameters to change in future versions of this component.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-as2</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

8.1. URI FORMAT

```
as2://apiName/methodName
```

apiName can be one of:

- client
- server

8.2. AS2 OPTIONS

The AS2 component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (common) | To use the shared configuration | | AS2Configuration |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AS2 endpoint is configured using URI syntax:

```
as2:apiName
```

with the following path and query parameters:

8.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------|---------------------------------------------------|---------|------------|
| apiName | Required What kind of operation to perform | | AS2ApiName |

8.2.2. Query Parameters (30 parameters):

| Name | Description | Default | Type |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------------|
| as2From (common) | The value of the AS2From header of AS2 message. | | String |
| as2MessageStructure (common) | The structure of AS2 Message. One of: PLAIN - No encryption, no signature, SIGNED - No encryption, signature, ENCRYPTED - Encryption, no signature, ENCRYPTED_SIGNED - Encryption, signature | | AS2MessageStructure |
| as2To (common) | The value of the AS2To header of AS2 message. | | String |
| as2Version (common) | The version of the AS2 protocol. | 1.1 | String |
| clientFqdn (common) | The Client Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint. | camel.apache.org | String |

| Name | Description | Default | Type |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|------------------------|
| dispositionNotificationTo (common) | The value of the Disposition-Notification-To header. Assigning a value to this parameter requests a message disposition notification (MDN) for the AS2 message. | | String |
| ediMessageTransferEncoding (common) | The transfer encoding of EDI message. | | String |
| ediMessageType (common) | The content type of EDI message. One of application/edifact, application/edi-x12, application/edi-consent | | ContentType |
| encryptingAlgorithm (common) | The algorithm used to encrypt EDI message. | | AS2EncryptionAlgorithm |
| encryptingCertificateChain (common) | The chain of certificates used to encrypt EDI message. | | Certificate[] |
| encryptingPrivateKey (common) | The key used to encrypt the EDI message. | | PrivateKey |
| from (common) | The value of the From header of AS2 message. | | String |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| methodName (common) | Required What sub operation to use for the selected operation | | String |
| requestUri (common) | The request URI of EDI message. | / | String |
| server (common) | The value included in the Server message header identifying the AS2 Server. | Camel AS2 Server Endpoint | String |
| serverFqdn (common) | The Server Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint. | camel.apache.org | String |

| Name | Description | Default | Type |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|-----------------------|
| serverPortNumber (common) | The port number of server. | | Integer |
| signedReceiptMIC Algorithms (common) | The list of algorithms, in order of preference, requested to generate a message integrity check (MIC) returned in message disposition notification (MDN) | | String[] |
| signingAlgorithm (common) | The algorithm used to sign EDI message. | | AS2SignatureAlgorithm |
| signingCertificateChain (common) | The chain of certificates used to sign EDI message. | | Certificate[] |
| signingPrivateKey (common) | The key used to sign the EDI message. | | PrivateKey |
| subject (common) | The value of Subject header of AS2 message. | | String |
| targetHostname (common) | The host name (IP or DNS name) of target host. | | String |
| targetPortNumber (common) | The port number of target host. -1 indicates the scheme default port. | | Integer |
| userAgent (common) | The value included in the User-Agent message header identifying the AS2 user agent. | Camel AS2 Client Endpoint | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

8.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 28 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------------|
| camel.component.as2.configuration.api-name | What kind of operation to perform | | AS2ApiName |
| camel.component.as2.configuration.as2-from | The value of the AS2From header of AS2 message. | | String |
| camel.component.as2.configuration.as2-message-structure | The structure of AS2 Message. One of: PLAIN - No encryption, no signature, SIGNED - No encryption, signature, ENCRYPTED - Encryption, no signature, ENCRYPTED_SIGNED - Encryption, signature | | AS2MessageStructure |
| camel.component.as2.configuration.as2-to | The value of the AS2To header of AS2 message. | | String |
| camel.component.as2.configuration.as2-version | The version of the AS2 protocol. | 1.1 | String |
| camel.component.as2.configuration.client-fqdn | The Client Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint. | camel.apache.org | String |
| camel.component.as2.configuration.disposition-notification-to | The value of the Disposition-Notification-To header. Assigning a value to this parameter requests a message disposition notification (MDN) for the AS2 message. | | String |

| Name | Description | Default | Type |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|---------------------------|------------------------|
| <code>camel.component.as2.configuration.edi-message-transfer-encoding</code> | The transfer encoding of EDI message. | | String |
| <code>camel.component.as2.configuration.edi-message-type</code> | The content type of EDI message. One of application/edifact, application/edi-x12, application/edi-consent | | ContentType |
| <code>camel.component.as2.configuration.encrypting-algorithm</code> | The algorithm used to encrypt EDI message. | | AS2EncryptionAlgorithm |
| <code>camel.component.as2.configuration.encrypting-certificate-chain</code> | The chain of certificates used to encrypt EDI message. | | Certificate[] |
| <code>camel.component.as2.configuration.encrypting-private-key</code> | The key used to encrypt the EDI message. | | PrivateKey |
| <code>camel.component.as2.configuration.from</code> | The value of the From header of AS2 message. | | String |
| <code>camel.component.as2.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.as2.configuration.request-uri</code> | The request URI of EDI message. | / | String |
| <code>camel.component.as2.configuration.server</code> | The value included in the Server message header identifying the AS2 Server. | Camel AS2 Server Endpoint | String |
| <code>camel.component.as2.configuration.server-fqdn</code> | The Server Fully Qualified Domain Name (FQDN). Used in message ids sent by endpoint. | camel.apache.org | String |

| Name | Description | Default | Type |
|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|-----------------------|
| <code>camel.component.as2.configuration.server-port-number</code> | The port number of server. | | Integer |
| <code>camel.component.as2.configuration.signed-receipt-mic-algorithms</code> | The list of algorithms, in order of preference, requested to generate a message integrity check (MIC) returned in message disposition notification (MDN) | | String[] |
| <code>camel.component.as2.configuration.signing-algorithm</code> | The algorithm used to sign EDI message. | | AS2SignatureAlgorithm |
| <code>camel.component.as2.configuration.signing-certificate-chain</code> | The chain of certificates used to sign EDI message. | | Certificate[] |
| <code>camel.component.as2.configuration.signing-private-key</code> | The key used to sign the EDI message. | | PrivateKey |
| <code>camel.component.as2.configuration.subject</code> | The value of Subject header of AS2 message. | | String |
| <code>camel.component.as2.configuration.target-hostname</code> | The host name (IP or DNS name) of target host. | | String |
| <code>camel.component.as2.configuration.target-port-number</code> | The port number of target host. -1 indicates the scheme default port. | | Integer |
| <code>camel.component.as2.configuration.user-agent</code> | The value included in the User-Agent message header identifying the AS2 user agent. | Camel AS2 Client Endpoint | String |
| <code>camel.component.as2.enabled</code> | Whether to enable auto configuration of the as2 component. This is enabled by default. | | Boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.as2.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

8.4. CLIENT ENDPOINTS:

Client endpoints use the endpoint prefix **client** followed by the name of a method and associated options described next. The endpoint URI MUST contain the prefix **client**.

```
as2://client/method?[options]
```

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelAS2.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelAS2.option** header.

If a value is not provided for the option **defaultRequest** either in the endpoint URI or in a message header, it will be assumed to be **null**. Note that the **null** value will only be used if other options do not satisfy matching endpoints.

In case of AS2 API errors the endpoint will throw a `RuntimeCamelException` with a `org.apache.http.HttpException` derived exception cause.

| Method | Options | Result Body Type |
|--------|---------|------------------|
|--------|---------|------------------|

| Method | Options | Result Body Type |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| send | ediMessage, requestUri, subject, from, as2From, as2To, as2MessageStructure, ediMessageContentType, ediMessageTransferEncoding, dispositionNotificationTo, signedReceiptMICAlgorithms | org.apache.http.protocol.HttpCoreContext |

URI Options for *client*

| Name | Type |
|------------|--------|
| ediMessage | String |
| requestUri | String |
| subject | String |
| from | String |
| as2From | String |
| as2To | String |

| Name | Type |
|----------------------------|--------------------------------------------------------|
| as2MessageStructure | org.apache.camel.component.as2.api.AS2MessageStructure |
| ediMessageContentType | String |
| ediMessageTransferEncoding | String |
| dispositionNotificationTo | String |
| signedReceiptMicAlgorithms | String[] |

8.5. SERVER ENDPOINTS:

Server endpoints use the endpoint prefix **server** followed by the name of a method and associated options described next. The endpoint URI MUST contain the prefix **server**.

```
as2://server/method?[options]
```

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelAS2.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelAS2.option** header.

If a value is not provided for the option **defaultRequest** either in the endpoint URI or in a message header, it will be assumed to be **null**. Note that the **null** value will only be used if other options do not satisfy matching endpoints.

In case of AS2 API errors the endpoint will throw a `RuntimeException` with a `org.apache.http.HttpException` derived exception cause.

| Method | Options | Result Body Type |
|--------|---------------------------|------------------------------------------|
| listen | request UriPatt ern | org.apache.http.protocol.HttpCoreContext |

URI Options for *server*

| Name | Type |
|---------------------------|--------|
| request UriPatt ern | String |

CHAPTER 9. ASTERISK COMPONENT

Available as of Camel version 2.18

The **asterisk:** component allows you to work easily with an Asterisk PBX Server <http://www.asterisk.org/> using [asterisk-java](#)

This component help to interface with [Asterisk Manager Interface](#)

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-asterisk</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

9.1. URI FORMAT

```
asterisk:name[?options]
```

9.2. OPTIONS

The Asterisk component has no options.

The Asterisk endpoint is configured using URI syntax:

```
asterisk:name
```

with the following path and query parameters:

9.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|-----------------------|---------|--------|
| name | Required Logical name | | String |

9.2.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|----------------------|-----------------------------------------------------|---------|--------|
| hostname (common) | Required The hostname of the asterisk server | | String |
| password (common) | Required Login password | | String |

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| username (common) | Required Login username | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| action (producer) | What action to perform such as getting queue status, sip peers or extension state. | | <code>AsteriskAction</code> |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

9.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.asterisk.enabled | Enable asterisk component | true | Boolean |
| camel.component.asterisk.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

9.4. ACTION

Supported actions are:

- `QUEUE_STATUS`, Queue Status
- `SIP_PEERS`, List SIP Peers
- `EXTENSION_STATE`, Check Extension Status

CHAPTER 10. ATMOS COMPONENT

Available as of Camel version 2.15

Camel-Atmos is an [Apache Camel](#) component that allows you to work with ViPR object data services using the [Atmos Client](#).

```
from("atmos:foo/get?remotePath=/path").to("mock:test");
```

10.1. OPTIONS

The Atmos component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| fullTokenId (security) | The token id to pass to the Atmos client | | String |
| secretKey (security) | The secret key to pass to the Atmos client | | String |
| uri (advanced) | The URI of the server for the Atmos client to connect to | | String |
| sslValidation (security) | Whether the Atmos client should perform SSL validation | false | boolean |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atmos endpoint is configured using URI syntax:

```
atmos:name/operation
```

with the following path and query parameters:

10.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------------|---------|----------------|
| name | Atmos name | | String |
| operation | Required Operation to perform | | AtmosOperation |

10.1.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| enableSslValidation (common) | Atmos SSL validation | false | boolean |
| fullTokenId (common) | Atmos client fullTokenId | | String |
| localPath (common) | Local path to put files | | String |
| newRemotePath (common) | New path on Atmos when moving files | | String |
| query (common) | Search query on Atmos | | String |
| remotePath (common) | Where to put files on Atmos | | String |
| secretKey (common) | Atmos shared secret | | String |
| uri (common) | Atmos server uri | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

10.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.atmos.enabled</code> | Enable atmos component | true | Boolean |
| <code>camel.component.atmos.full-token-id</code> | The token id to pass to the Atmos client | | String |
| <code>camel.component.atmos.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.atmos.secret-key</code> | The secret key to pass to the Atmos client | | String |
| <code>camel.component.atmos.ssl-validation</code> | Whether the Atmos client should perform SSL validation | false | Boolean |
| <code>camel.component.atmos.uri</code> | The URI of the server for the Atmos client to connect to | | String |

10.3. DEPENDENCIES

To use Atmos in your camel routes you need to add the dependency on **camel-atmos** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atmos</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

10.4. INTEGRATIONS

When you look at atmos integrations, there is one type of consumer, `GetConsumer`, which is a type of `ScheduledPollConsumer`.

- **Get**

Whereas there are 4 types of producers which are

- **Get**
- **Del**
- **Move**
- **Put**

10.5. EXAMPLES

These example are taken from tests:

```
from("atmos:foo/get?remotePath=/path").to("mock:test");
```

Here, this is a consumer example. **remotePath** represents the path from where the data will be read and passes the camel exchange to regarding producer Underneath, this component uses atmos client API for this and every other operations.

```
from("direct:start")
.to("atmos://get?remotePath=/dummy/dummy.txt")
.to("mock:result");
```

Here, this a producer sample. **remotePath** represents the path where the operations occur on ViPR object data service. In producers, operations(**Get,Del, Move,Put**) run on ViPR object data services and results are set on headers of camel exchange.

Regarding the operations, the following headers are set on camel exchange

```
DOWNLOADED_FILE, DOWNLOADED_FILES, UPLOADED_FILE, UPLOADED_FILES,
FOUND_FILES, DELETED_PATH, MOVED_PATH;
```

10.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 11. ATLASMAP COMPONENT

NOTE

Only producer is supported.

You can use the AtlasMap component to process data mapping using an [AtlasMap](#) data mapping definition. When you export the AtlasMap mapping from the AtlasMap Data Mapper UI, it is packaged as an ADM archive file.

NOTE: Although it is possible to load a mapping definition JSON file that is not packaged into an ADM archive file, some features will not work. We recommend that you always use the ADM archive file for production purposes.

To use the component with Maven, add the following dependency to your **pom.xml**:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atlasmap</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

Optionally, you can include the [Apache Daffodil](#) module DFDL module:

```
<dependency>
  <groupId>io.atlasmap</groupId>
  <artifactId>atlas-dfdl-module</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as atlasmap-core in camel-atlasmap -->
</dependency>
```

11.1. URI FORMAT

```
atlas:mappingName[?options]
```

The **mappingName** is the classpath-local URI of the AtlasMap mapping definition to process, either an ADM archive file (preferably) or a mapping definition JSON file.

11.2. CONFIGURING OPTIONS

Camel components are configured on two separate levels:

- component level
- endpoint level

11.2.1. Configuring Component Level Options

The component level is the highest configuration level. It contains general and common configurations for all endpoints.

You can configure components with the [Component DSL](#), in a configuration file (`application.properties`), or directly with Java code.

Some components only have a few options, and others may have many. A component may have security settings, credentials for authentication, URLs for network connection, and so on.

Components typically have preconfigured defaults for the most common cases, so you may not need to configure any options, or only configure a few.

11.2.2. Component Options

The AtlasMap component supports 4 options:

| Name | Description | Comment | Default | Type |
|---------------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|------------------------------------|
| lazyStartProducer (producer) | <p>Lazy start of the producer.</p> <p>The producer starts on the first message.</p> | <p>Allows CamelContext and routes to start in situations where a producer fails to start and causes the route to fail.</p> <p>When lazy start is enabled, you can handle failures during routing messages via Camel's routing error handlers.</p> <p>When the first message is processed then creating and starting the producer may prolong the total processing time.</p> | false | boolean |
| atlasContextFactory (advanced) | To use the AtlasContextFactory, otherwise a new engine is created. | | AtlasContextFactory | autowiredEnabled (advanced) |

| Name | Description | Comment | Default | Type |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|---------|----------------------------------|-----------------------------------------------------------------------------|
| Whether autowiring is enabled. This is used for automatic autowiring options (the option must be marked as autowired) by looking up in the registry to find if there is a single instance of matching type, which then gets configured on the component. This can be used for automatic configuration of JDBC data sources, JMS connection factories, AWS Clients, and so on. | true | boolean | propertiesFile (advanced) | The URI of the properties file used for AtlasContextFactory initialization. |

11.2.3. Configuring Endpoint Level Options

At the endpoint level contains configurations for the endpoints themselves.

You can configure endpoints directly in the endpoint URI as path and query parameters. You can also use the [Endpoint DSL](#) and [Data Format DSL](#) as *type safe* ways of configuring endpoints in Java.

Endpoints often have many options that configure what you need the endpoint to do.

Endpoint options are categorized by their use, either as a consumer (**from**) or producer (**to**), or both.

A good practice when configuring options is to use [Property Placeholders](#) instead of hardcoded settings for urls, port numbers, and sensitive information.

Use placeholders to externalize the configuration from your code to make it more flexible and reusable.

11.2.4. Endpoint Options

The Apache Camel Component Reference endpoint is configured using URI syntax, with path and query parameters:

```
atlas:resourceUri
```

11.2.4.1. Path Parameters (1 parameters)

| Name | Description | Default | Type |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|--------|
| <code>resourceUri</code> (producer) | <p>Required Path to the resource. You can prefix with: classpath, file, http, ref, or bean.</p> <p>The prefix classpath, file, and http loads the resource using these protocols. The ref prefix looks up the resource in the registry. The prefix bean calls a bean method to be used as the resource by name, given after the dot: bean:myBean.myMethod.</p> | classpath | String |

11.2.4.2. Query Parameters (7 parameters)

| Name | Description | Comments | Default | Type |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| allowContextMapAll (producer) | <p>Allow access to all context map details.</p> <p>By default, only access to message body and headers is allowed.</p> | When enabled, allowContextMapAll allows full access to the current Exchange and CamelContext which imposes a potential security risk as this opens access to the full power of CamelContext API. | false | boolean |
| contentCache (producer) | Use the resource content cache. | | false | boolean |
| forceReload (producer) | <p>Use force reload mode.</p> <p>This loads the ADM from a file on every Exchange.</p> | By default, the ADM file is loaded from a file only on a first Exchange, and AtlasContext will be reused until the endpoint is recreated. | false | boolean |

| | | | | |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|---------|
| <p>lazyStartProducer (producer) (advanced)</p> | <p>Lazy start of the producer.</p> <p>The producer starts on the first message.</p> | <p>Allows CamelContext and routes to start in situations where a producer fails to start and causes the route to fail.</p> <p>When lazy start is enabled, you can handle failures during routing messages via Camel's routing error handlers.</p> <p>When the first message is processed, creating and starting the producer may prolong the total processing time.</p> | false | boolean |
| <p>sourceMapName (producer)</p> | <p>The Exchange property name for a source message map which holds a java.util.Map<String, Message> where the key is AtlasMap Document ID.</p> | <p>AtlasMap consumes Message bodies as source documents, as well as message headers as source properties where the scope is equal to the Document ID.</p> | | String |

| | | | | |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------------|
| targetMapMode (producer) | TargetMapMode enum value to specify how multiple target documents are delivered if they exist. Enum values: * MAP * MESSAGE_HEAD ER * EXCHANGE_PROPERTY | MAP : Stores documents in a java.util.Map . The java.util.Map is set to an exchange property if targetMapName is specified, otherwise it is set to the message body. MESSAGE_HEADER : Stores them into message headers. EXCHANGE_PROPERTY : Stores them in exchange properties.). | MAP | TargetMapMode |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------------|

11.3. EXAMPLES

11.3.1. Producer Example

The following example shows an export of and ADM archive file from AtlasMap Data Mapper UI:

```
from("activemq:My.Queue").
to("atlas:atlasmap-mapping.adm");
```

The Apache Camel Component Reference endpoint has no path parameters.

CHAPTER 12. ATMOSPHERE WEBSOCKET COMPONENT

Available as of Camel version 2.14

The **atmosphere-websocket**: component provides Websocket based endpoints for a servlet communicating with external clients over Websocket (as a servlet accepting websocket connections from external clients).

The component uses the [SERVLET](#) component and uses the [Atmosphere](#) library to support the Websocket transport in various Servlet containers (e.g., Jetty, Tomcat, ...).

Unlike the [Websocket](#) component that starts the embedded Jetty server, this component uses the servlet provider of the container.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atmosphere-websocket</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

12.1. ATMOSPHERE-WEBSOCKET OPTIONS

The Atmosphere Websocket component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------|
| servletName (consumer) | Default name of servlet to use. The default name is CamelServlet. | CamelServlet | String |
| httpRegistry (consumer) | To use a custom org.apache.camel.component.servlet.HttpRegistry. | | HttpRegistry |
| attachmentMultipart Binding (consumer) | Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options attachmentMultipartBinding=true and disableStreamCache=false cannot work together. Remove disableStreamCache to use AttachmentMultipartBinding. This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's. | false | boolean |
| fileNameExtWhitelist (consumer) | Whitelist of accepted filename extensions for accepting uploaded files. Multiple extensions can be separated by comma, such as txt,xml. | | String |
| httpBinding (advanced) | To use a custom HttpBinding to control the mapping between Camel message and HttpClient. | | HttpBinding |

| Name | Description | Default | Type |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| httpConfiguration (advanced) | To use the shared HttpConfiguration as base configuration. | | HttpConfiguration |
| allowJavaSerialized Object (advanced) | Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | boolean |
| headerFilterStrategy (filter) | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atmosphere Websocket endpoint is configured using URI syntax:

```
atmosphere-websocket:servicePath
```

with the following path and query parameters:

12.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|--------------------------------------------|---------|--------|
| servicePath | Required Name of websocket endpoint | | String |

12.1.2. Query Parameters (38 parameters):

| Name | Description | Default | Type |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------|---------|---------|
| chunked (common) | If this option is false the Servlet will disable the HTTP streaming and set the content-length header on the response | true | boolean |

| Name | Description | Default | Type |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| disableStreamCache (common) | Determines whether or not the raw input stream from Servlet is cached or not (Camel will read the stream into a in memory/overflow to file, Stream caching) cache. By default Camel will cache the Servlet input stream to support reading it multiple times to ensure it Camel can retrieve all data from the stream. However you can set this option to true when you for example need to access the raw stream, such as streaming it directly to a file or other persistent store. DefaultHttpBinding will copy the request input stream into a stream cache and put it into message body if this option is false to support reading the stream multiple times. If you use Servlet to bridge/proxy an endpoint then consider enabling this option to improve performance, in case you do not need to read the message payload multiple times. The http/http4 producer will by default cache the response body stream. If setting this option to true, then the producers will not cache the response body stream but use the response stream as-is as the message body. | false | boolean |
| headerFilterStrategy (common) | To use a custom HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| sendToAll (common) | Whether to send to all (broadcast) or send to a single receiver. | false | boolean |
| transferException (common) | If enabled and an Exchange failed processing on the consumer side, and if the caused Exception was send back serialized in the response as a application/x-java-serialized-object content type. On the producer side the exception will be deserialized and thrown as is, instead of the HttpOperationFailedException. The caused exception is required to be serialized. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | boolean |
| useStreaming (common) | To enable streaming to send data as multiple text fragments. | false | boolean |
| httpBinding (common) | To use a custom HttpBinding to control the mapping between Camel message and HttpClient. | | HttpBinding |
| async (consumer) | Configure the consumer to work in async mode | false | boolean |

| Name | Description | Default | Type |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| httpMethodRestrict (consumer) | Used to only allow consuming if the HttpMethod matches, such as GET/POST/PUT etc. Multiple methods can be specified separated by comma. | | String |
| matchOnUriPrefix (consumer) | Whether or not the consumer should try to find a target consumer by matching the URI prefix if no exact match is found. | false | boolean |
| responseBufferSize (consumer) | To use a custom buffer size on the <code>javax.servlet.ServletResponse</code> . | | Integer |
| servletName (consumer) | Name of the servlet to use | Camel Servlet | String |
| attachmentMultipartBinding (consumer) | Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options <code>attachmentMultipartBinding=true</code> and <code>disableStreamCache=false</code> cannot work together. Remove <code>disableStreamCache</code> to use <code>AttachmentMultipartBinding</code> . This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's. | false | boolean |
| eagerCheckContentAvailable (consumer) | Whether to eager check whether the HTTP requests has content if the content-length header is 0 or not present. This can be turned on in case HTTP clients do not send streamed data. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |

| Name | Description | Default | Type |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|
| fileNameExtWhitelist (consumer) | Whitelist of accepted filename extensions for accepting uploaded files. Multiple extensions can be separated by comma, such as txt,xml. | | String |
| optionsEnabled (consumer) | Specifies whether to enable HTTP OPTIONS for this Servlet consumer. By default OPTIONS is turned off. | false | boolean |
| traceEnabled (consumer) | Specifies whether to enable HTTP TRACE for this Servlet consumer. By default TRACE is turned off. | false | boolean |
| bridgeEndpoint (producer) | If the option is true, HttpProducer will ignore the Exchange.HTTP_URI header, and use the endpoint's URI for request. You may also set the option <code>throwExceptionOnFailure</code> to be false to let the HttpProducer send all the fault response back. | false | boolean |
| connectionClose (producer) | Specifies whether a Connection Close header must be added to HTTP Request. By default <code>connectionClose</code> is false. | false | boolean |
| copyHeaders (producer) | If this option is true then IN exchange headers will be copied to OUT exchange headers according to copy strategy. Setting this to false, allows to only include the headers from the HTTP response (not propagating IN headers). | true | boolean |
| httpMethod (producer) | Configure the HTTP method to use. The <code>HttpMethod</code> header cannot override this option if set. | | HttpMethods |
| ignoreResponseBody (producer) | If this option is true, The http producer won't read response body and cache the input stream | false | boolean |
| preserveHostHeader (producer) | If the option is true, HttpProducer will set the Host header to the value contained in the current exchange Host header, useful in reverse proxy applications where you want the Host header received by the downstream server to reflect the URL called by the upstream client, this allows applications which use the Host header to generate accurate URL's for a proxied service | false | boolean |
| throwExceptionOnFailure (producer) | Option to disable throwing the <code>HttpOperationFailedException</code> in case of failed responses from the remote server. This allows you to get all responses regardless of the HTTP status code. | true | boolean |

| Name | Description | Default | Type |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| cookieHandler (producer) | Configure a cookie handler to maintain a HTTP session | | CookieHandler |
| okStatusCodeRange (producer) | The status codes which are considered a success response. The values are inclusive. Multiple ranges can be defined, separated by comma, e.g. 200-204,209,301-304. Each range must be a single number or from-to with the dash included. | 200-299 | String |
| urlRewrite (producer) | Deprecated Refers to a custom <code>org.apache.camel.component.http.UrlRewrite</code> which allows you to rewrite urls when you bridge/proxy endpoints. See more details at http://camel.apache.org/urlrewrite.html | | UrlRewrite |
| mapHttpMessageBody (advanced) | If this option is true then IN exchange Body of the exchange will be mapped to HTTP body. Setting this to false will avoid the HTTP mapping. | true | boolean |
| mapHttpMessageFormUrlEncodedBody (advanced) | If this option is true then IN exchange Form Encoded body of the exchange will be mapped to HTTP. Setting this to false will avoid the HTTP Form Encoded body mapping. | true | boolean |
| mapHttpMessageHeaders (advanced) | If this option is true then IN exchange Headers of the exchange will be mapped to HTTP headers. Setting this to false will avoid the HTTP Headers mapping. | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| proxyAuthScheme (proxy) | Proxy authentication scheme to use | | String |
| proxyHost (proxy) | Proxy hostname to use | | String |
| proxyPort (proxy) | Proxy port to use | | int |
| authHost (security) | Authentication host to use with NTLM | | String |

12.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.atmosphere-websocket.allow-java-serialized-object</code> | Whether to allow java serialization when a request uses context-type=application/x-java-serialized-object. This is by default turned off. If you enable this then be aware that Java will deserialize the incoming data from the request to Java and that can be a potential security risk. | false | Boolean |
| <code>camel.component.atmosphere-websocket.attachment-multipart-binding</code> | Whether to automatic bind multipart/form-data as attachments on the Camel Exchange. The options attachmentMultipartBinding=true and disableStreamCache=false cannot work together. Remove disableStreamCache to use AttachmentMultipartBinding. This is turn off by default as this may require servlet specific configuration to enable this when using Servlet's. | false | Boolean |
| <code>camel.component.atmosphere-websocket.enabled</code> | Enable atmosphere-websocket component | true | Boolean |
| <code>camel.component.atmosphere-websocket.file-name-ext-whitelist</code> | Whitelist of accepted filename extensions for accepting uploaded files. Multiple extensions can be separated by comma, such as txt,xml. | | String |
| <code>camel.component.atmosphere-websocket.header-filter-strategy</code> | To use a custom org.apache.camel.spi.HeaderFilterStrategy to filter header to and from Camel message. The option is a org.apache.camel.spi.HeaderFilterStrategy type. | | String |
| <code>camel.component.atmosphere-websocket.http-binding</code> | To use a custom HttpBinding to control the mapping between Camel message and HttpClient. The option is a org.apache.camel.http.common.HttpBinding type. | | String |
| <code>camel.component.atmosphere-websocket.http-configuration</code> | To use the shared HttpConfiguration as base configuration. The option is a org.apache.camel.http.common.HttpConfiguration type. | | String |
| <code>camel.component.atmosphere-websocket.http-registry</code> | To use a custom org.apache.camel.component.servlet.HttpRegistry. The option is a org.apache.camel.component.servlet.HttpRegistry type. | | String |

| Name | Description | Default | Type |
|---------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|---------|
| <code>camel.component.atmosphere-websocket.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.atmosphere-websocket.servlet-name</code> | Default name of servlet to use. The default name is CamelServlet. | CamelServlet | String |

12.3. URI FORMAT

```
atmosphere-websocket:///relative path[?options]
```

12.4. READING AND WRITING DATA OVER WEBSOCKET

An atmosphere-websocket endpoint can either write data to the socket or read from the socket, depending on whether the endpoint is configured as the producer or the consumer, respectively.

12.5. CONFIGURING URI TO READ OR WRITE DATA

In the route below, Camel will read from the specified websocket connection.

```
from("atmosphere-websocket:///servicepath")
    .to("direct:next");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="atmosphere-websocket:///servicepath"/>
    <to uri="direct:next"/>
  </route>
</camelContext>
```

In the route below, Camel will read from the specified websocket connection.

```
from("direct:next")
    .to("atmosphere-websocket:///servicepath");
```

And the equivalent Spring sample:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:next"/>
```

```
<to uri="atmosphere-websocket:///servicepath"/>
</route>
</camelContext>
```

CHAPTER 13. ATOM COMPONENT

Available as of Camel version 1.2

The `atom:` component is used for polling Atom feeds.

Camel will poll the feed every 60 seconds by default.

Note: The component currently only supports polling (consuming) feeds.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atom</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

13.1. URI FORMAT

```
atom://atomUri[?options]
```

Where `atomUri` is the URI to the Atom feed to poll.

13.2. OPTIONS

The Atom component has no options.

The Atom endpoint is configured using URI syntax:

```
atom:feedUri
```

with the following path and query parameters:

13.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------------|----------------------------------------------|---------|--------|
| <code>feedUri</code> | Required The URI to the feed to poll. | | String |

13.2.2. Query Parameters (27 parameters):

| Name | Description | Default | Type |
|------|-------------|---------|------|
|------|-------------|---------|------|

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| feedHeader (consumer) | Sets whether to add the feed object as a header | true | boolean |
| filter (consumer) | Sets whether to use filtering or not of the entries. | true | boolean |
| lastUpdate (consumer) | Sets the timestamp to be used for filtering entries from the atom feeds. This options is only in conjunction with the <code>splitEntries</code> . | | Date |
| password (consumer) | Sets the password to be used for basic authentication when polling from a HTTP feed | | String |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| sortEntries (consumer) | Sets whether to sort entries by published date. Only works when <code>splitEntries = true</code> . | false | boolean |
| splitEntries (consumer) | Sets whether or not entries should be sent individually or whether the entire feed should be sent as a single message | true | boolean |
| throttleEntries (consumer) | Sets whether all entries identified in a single feed poll should be delivered immediately. If true, only one entry is processed per <code>consumer.delay</code> . Only applicable when <code>splitEntries = true</code> . | true | boolean |
| username (consumer) | Sets the username to be used for basic authentication when polling from a HTTP feed | | String |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------------|
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumerScheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLISECONDS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

13.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.atom.enabled | Enable atom component | true | Boolean |
| camel.component.atom.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

You can append query options to the URI in the following format, **?option=value&option=value&...**

13.4. EXCHANGE DATA FORMAT

Camel will set the In body on the returned **Exchange** with the entries. Depending on the **splitEntries** flag Camel will either return one **Entry** or a **List<Entry>**.

| Option | Value | Behavior |
|---------------------|--------------|----------------------------------------------------------------------------------------------------|
| splitEntries | true | Only a single entry from the currently being processed feed is set: exchange.in.body(Entry) |
| splitEntries | false | The entire list of entries from the feed is set: exchange.in.body(List<Entry>) |

Camel can set the **Feed** object on the In header (see **feedHeader** option to disable this):

13.5. MESSAGE HEADERS

Camel atom uses these headers.

| Header | Description |
|------------------------|--------------------------------------------------------------------------------------|
| Camel Atom Feed | When consuming the org.apache.abdera.model.Feed object is set to this header. |

13.6. SAMPLES

In this sample we poll James Strachan's blog.

```
from("atom://http://macstrac.blogspot.com/feeds/posts/default").to("seda:feeds");
```

In this sample we want to filter only good blogs we like to a SEDA queue. The sample also shows how to setup Camel standalone, not running in any Container or using Spring.

CHAPTER 14. ATOMIX MAP COMPONENT

Available as of Camel version 2.20

The camel atomix-map component allows you to work with [Atomix's Distributed Map](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

14.1. URI FORMAT

```
atomix-map:mapName
```

14.2. OPTIONS

The Atomix Map component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| configuration (common) | The shared component configuration | | AtomixMapConfiguration |
| atomix (common) | The shared AtomixClient instance | | AtomixClient |
| nodes (common) | The nodes the AtomixClient should connect to | | List |
| configurationUri (common) | The path to the AtomixClient configuration | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atomix Map endpoint is configured using URI syntax:

```
atomix-map:resourceName
```

with the following path and query parameters:

14.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-----------------------------------------------|---------|--------|
| resourceName | Required The distributed resource name | | String |

14.2.2. Query Parameters (18 parameters):

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|-----------|
| atomix (common) | The Atomix instance to use | | Atomix |
| configurationUri (common) | The Atomix configuration uri. | | String |
| defaultAction (common) | The default action. | PUT | Action |
| key (common) | The key to use if none is set in the header or to listen for events for a specific key. | | Object |
| nodes (common) | The address of the nodes composing the cluster. | | String |
| resultHeader (common) | The header that wil carry the result. | | String |
| transport (common) | Sets the Atomix transport. | io.atomix.catalyst.transport.netty.NettyTransport | Transport |
| ttl (common) | The resource ttl. | | long |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| defaultResourceConfig (advanced) | The cluster wide default resource configuration. | | Properties |
| defaultResourceOptions (advanced) | The local default resource options. | | Properties |
| ephemeral (advanced) | Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored. | false | boolean |
| readConsistency (advanced) | The read consistency level. | | ReadConsistency |
| resourceConfigs (advanced) | Cluster wide resources configuration. | | Map |
| resourceOptions (advanced) | Local resources configurations | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

14.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------|--------------------------------------------------------------------------------|---------|--------|
| camel.component.atomix-map.atomix | The shared AtomixClient instance. The option is a io.atomix.AtomixClient type. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| <code>camel.component.atomix-map.configuration-uri</code> | The path to the AtomixClient configuration | | String |
| <code>camel.component.atomix-map.configuration.default-action</code> | The default action. | | AtomixMap\$Action |
| <code>camel.component.atomix-map.configuration.key</code> | The key to use if none is set in the header or to listen for events for a specific key. | | Object |
| <code>camel.component.atomix-map.configuration.result-header</code> | The header that wil carry the result. | | String |
| <code>camel.component.atomix-map.configuration.ttl</code> | The resource ttl. | | Long |
| <code>camel.component.atomix-map.enabled</code> | Whether to enable auto configuration of the atomix-map component. This is enabled by default. | | Boolean |
| <code>camel.component.atomix-map.nodes</code> | The nodes the AtomixClient should connect to | | List |
| <code>camel.component.atomix-map.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

14.4. HEADERS

| Name | Type | Values | Description |
|-------------------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| Camel Atomix ResourceAction | Atomix Map.Action | <ul style="list-style-type: none"> ● PUT ● PUT_IF_ABSENT ● GET ● CLEAR ● SIZE ● CONTAINS_KEY ● CONTAINS_VALUE ● IS_EMPTY ● ENTRY_SET ● REMOVE ● REPLACE ● VALUES | The action to perform |
| Camel Atomix ResourceKey | Object | - | The key to operate on |
| Camel Atomix ResourceValue | Object | - | The value, if missing In Body is used |
| Camel Atomix ResourceOldValue | Object | - | The old value |
| Camel Atomix ResourceTTL | String / long | - | The entry TTL |

| Name | Type | Values | Description |
|---------------------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Camel Atomix ResourceRead Consistency | ReadConsistency | <ul style="list-style-type: none"> • ATOMIC • ATOMIC_LEASE • SEQUENTIAL • LOCAL | The read consistency level |

14.5. CONFIGURING THE COMPONENT TO CONNECT TO AN ATOMIX CLUSTER

The nodes of the Atomix cluster you want to join can be set at Endpoint or component level (recommended), below some examples:

- **Endpoint:**

```
<beans xmlns="...">
  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <from uri="direct:start"/>
      <to uri="atomix-map:myMap?nodes=node-1.atomix.cluster:8700,node-2.atomix.cluster:8700"/>
    </route>
  </camelContext>
</beans>
```

- **Component:**

```
<beans xmlns="...">
  <bean id="atomix-map"
class="org.apache.camel.component.atomix.client.map.AtomixMapComponent">
    <property name="nodes" value="nodes=node-1.atomix.cluster:8700,node-2.atomix.cluster:8700"/>
  </bean>

  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <from uri="direct:start"/>
      <to uri="atomix-map:myMap"/>
    </route>
  </camelContext>
</beans>
```

14.6. USAGE EXAMPLES:

- **PUT an element with TTL of 1 second:**

```
FluentProducerTemplate.on(context)
  .withHeader(AtomixClientConstants.RESOURCE_ACTION, AtomixMap.Action.PUT)
  .withHeader(AtomixClientConstants.RESOURCE_KEY, key)
```

```
.withHeader(AtomixClientConstants.RESOURCE_TTL, "1s")  
.withBody(val)  
.to("direct:start")  
.send();
```

CHAPTER 15. ATOMIX MESSAGING COMPONENT

Available as of Camel version 2.20

The camel atomix-messaging component allows you to work with [Atomix's Group Messaging](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

15.1. URI FORMAT

```
atomix-messaging:group
```

The Atomix Messaging component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------|
| configuration (common) | The shared component configuration | | AtomixMessagingConfiguration |
| atomix (common) | The shared AtomixClient instance | | AtomixClient |
| nodes (common) | The nodes the AtomixClient should connect to | | List |
| configurationUri (common) | The path to the AtomixClient configuration | | String |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atomix Messaging endpoint is configured using URI syntax:

```
atomix-messaging:resourceName
```

with the following path and query parameters:

15.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-----------------------------------------------|---------|--------|
| resourceName | Required The distributed resource name | | String |

15.1.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|---------------|
| atomix (common) | The Atomix instance to use | | Atomix |
| broadcastType (common) | The broadcast type. | ALL | BroadcastType |
| channelName (common) | The messaging channel name | | String |
| configurationUri (common) | The Atomix configuration uri. | | String |
| defaultAction (common) | The default action. | DIRECT | Action |
| memberName (common) | The Atomix Group member name | | String |
| nodes (common) | The address of the nodes composing the cluster. | | String |
| resultHeader (common) | The header that will carry the result. | | String |
| transport (common) | Sets the Atomix transport. | io.atomix.catalyst.transport.netty.NettyTransport | Transport |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pick up incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| defaultResourceConfig (advanced) | The cluster wide default resource configuration. | | Properties |
| defaultResourceOptions (advanced) | The local default resource options. | | Properties |
| ephemeral (advanced) | Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored. | false | boolean |
| readConsistency (advanced) | The read consistency level. | | ReadConsistency |
| resourceConfigs (advanced) | Cluster wide resources configuration. | | Map |
| resourceOptions (advanced) | Local resources configurations | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

15.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------|--------------------------------------------------------------------------------|---------|--------|
| camel.component.atomix-messaging.atomix | The shared AtomixClient instance. The option is a io.atomix.AtomixClient type. | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|---------|-------------------------------------|
| <code>camel.component.atomix-messaging.configuration-uri</code> | The path to the AtomixClient configuration | | String |
| <code>camel.component.atomix-messaging.configuration.broadcast-type</code> | The broadcast type. | | AtomixMessaging \$ BroadcastType |
| <code>camel.component.atomix-messaging.configuration.channel-name</code> | The messaging channel name | | String |
| <code>camel.component.atomix-messaging.configuration.default-action</code> | The default action. | | AtomixMessaging \$ Action |
| <code>camel.component.atomix-messaging.configuration.member-name</code> | The Atomix Group member name | | String |
| <code>camel.component.atomix-messaging.configuration.result-header</code> | The header that wil carry the result. | | String |
| <code>camel.component.atomix-messaging.enabled</code> | Whether to enable auto configuration of the atomix-messaging component. This is enabled by default. | | Boolean |
| <code>camel.component.atomix-messaging.nodes</code> | The nodes the AtomixClient should connect to | | List |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.atomix-messaging.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 16. ATOMIX MULTIMAP COMPONENT

Available as of Camel version 2.20

The camel atomix-multimap component allows you to work with [Atomix's Distributed MultiMap](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

16.1. URI FORMAT

```
atomix-multimap:multiMapName
```

The Atomix MultiMap component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------|
| configuration (consumer) | The shared component configuration | | AtomixMultiMap Configuration |
| atomix (consumer) | The shared AtomixClient instance | | AtomixClient |
| nodes (consumer) | The nodes the AtomixClient should connect to | | List |
| configurationUri (consumer) | The path to the AtomixClient configuration | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atomix MultiMap endpoint is configured using URI syntax:

```
atomix-multimap:resourceName
```

with the following path and query parameters:

16.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-----------------------------------------------|---------|--------|
| resourceName | Required The distributed resource name | | String |

16.1.2. Query Parameters (18 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|-----------|
| atomix (consumer) | The Atomix instance to use | | Atomix |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| configurationUri (consumer) | The Atomix configuration uri. | | String |
| defaultAction (consumer) | The default action. | PUT | Action |
| key (consumer) | The key to use if none is set in the header or to listen for events for a specific key. | | Object |
| nodes (consumer) | The address of the nodes composing the cluster. | | String |
| resultHeader (consumer) | The header that wil carry the result. | | String |
| transport (consumer) | Sets the Atomix transport. | <code>io.atomix.catalyst.transport.netty.NettyTransport</code> | Transport |
| ttl (consumer) | The resource ttl. | | long |

| Name | Description | Default | Type |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| defaultResourceConfig (advanced) | The cluster wide default resource configuration. | | Properties |
| defaultResourceOptions (advanced) | The local default resource options. | | Properties |
| ephemeral (advanced) | Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored. | false | boolean |
| readConsistency (advanced) | The read consistency level. | | ReadConsistency |
| resourceConfigs (advanced) | Cluster wide resources configuration. | | Map |
| resourceOptions (advanced) | Local resources configurations | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

16.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------|---------|--------|
| camel.component.atomix-multimap.atomix | The shared AtomixClient instance. The option is a <code>io.atomix.AtomixClient</code> type. | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| <code>camel.component.atomix-multimap.configuration-uri</code> | The path to the AtomixClient configuration | | String |
| <code>camel.component.atomix-multimap.configuration.default-action</code> | The default action. | | AtomixMultiMap\$Action |
| <code>camel.component.atomix-multimap.configuration.key</code> | The key to use if none is set in the header or to listen for events for a specific key. | | Object |
| <code>camel.component.atomix-multimap.configuration.result-header</code> | The header that wil carry the result. | | String |
| <code>camel.component.atomix-multimap.configuration.ttl</code> | The resource ttl. | | Long |
| <code>camel.component.atomix-multimap.enabled</code> | Whether to enable auto configuration of the atomix-multimap component. This is enabled by default. | | Boolean |
| <code>camel.component.atomix-multimap.nodes</code> | The nodes the AtomixClient should connect to | | List |
| <code>camel.component.atomix-multimap.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 17. ATOMIX QUEUE COMPONENT

Available as of Camel version 2.20

The camel atomix-queue component allows you to work with [Atomix's Distributed Queue](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

17.1. URI FORMAT

```
atomix-queue:queueName
```

The Atomix Queue component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| configuration (common) | The shared component configuration | | AtomixQueue Configuration |
| atomix (common) | The shared AtomixClient instance | | AtomixClient |
| nodes (common) | The nodes the AtomixClient should connect to | | List |
| configurationUri (common) | The path to the AtomixClient configuration | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atomix Queue endpoint is configured using URI syntax:

```
atomix-queue:resourceName
```

with the following path and query parameters:

17.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-----------------------------------------------|---------|--------|
| resourceName | Required The distributed resource name | | String |

17.1.2. Query Parameters (16 parameters):

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|------------------|
| atomix (common) | The Atomix instance to use | | Atomix |
| configurationUri (common) | The Atomix configuration uri. | | String |
| defaultAction (common) | The default action. | ADD | Action |
| nodes (common) | The address of the nodes composing the cluster. | | String |
| resultHeader (common) | The header that wil carry the result. | | String |
| transport (common) | Sets the Atomix transport. | io.atomix.catalyst.transport.netty.NettyTransport | Transport |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| defaultResourceConfig (advanced) | The cluster wide default resource configuration. | | Properties |
| defaultResourceOptions (advanced) | The local default resource options. | | Properties |
| ephemeral (advanced) | Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored. | false | boolean |
| readConsistency (advanced) | The read consistency level. | | ReadConsistency |
| resourceConfigs (advanced) | Cluster wide resources configuration. | | Map |
| resourceOptions (advanced) | Local resources configurations | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

17.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 7 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------|--------------------------------------------------------------------------------|---------|---------------------|
| camel.component.atomix-queue.atomix | The shared AtomixClient instance. The option is a io.atomix.AtomixClient type. | | String |
| camel.component.atomix-queue.configuration-uri | The path to the AtomixClient configuration | | String |
| camel.component.atomix-queue.configuration.default-action | The default action. | | AtomixQueue\$Action |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.atomix-queue.configuration.result-header</code> | The header that will carry the result. | | String |
| <code>camel.component.atomix-queue.enabled</code> | Whether to enable auto configuration of the atomix-queue component. This is enabled by default. | | Boolean |
| <code>camel.component.atomix-queue.nodes</code> | The nodes the AtomixClient should connect to | | List |
| <code>camel.component.atomix-queue.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 18. ATOMIX SET COMPONENT

Available as of Camel version 2.20

The camel atomix-set component allows you to work with [Atomix's Distributed Set](#) collection.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

18.1. URI FORMAT

```
atomix-set:setName
```

The Atomix Set component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| configuration (common) | The shared component configuration | | AtomixSetConfiguration |
| atomix (common) | The shared AtomixClient instance | | AtomixClient |
| nodes (common) | The nodes the AtomixClient should connect to | | List |
| configurationUri (common) | The path to the AtomixClient configuration | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atomix Set endpoint is configured using URI syntax:

```
atomix-set:resourceName
```

with the following path and query parameters:

18.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-----------------------------------------------|---------|--------|
| resourceName | Required The distributed resource name | | String |

18.1.2. Query Parameters (17 parameters):

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|------------------|
| atomix (common) | The Atomix instance to use | | Atomix |
| configurationUri (common) | The Atomix configuration uri. | | String |
| defaultAction (common) | The default action. | ADD | Action |
| nodes (common) | The address of the nodes composing the cluster. | | String |
| resultHeader (common) | The header that wil carry the result. | | String |
| transport (common) | Sets the Atomix transport. | io.atomix.catalyst.transport.netty.NettyTransport | Transport |
| ttl (common) | The resource ttl. | | long |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| defaultResourceConfig (advanced) | The cluster wide default resource configuration. | | Properties |
| defaultResourceOptions (advanced) | The local default resource options. | | Properties |
| ephemeral (advanced) | Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored. | false | boolean |
| readConsistency (advanced) | The read consistency level. | | ReadConsistency |
| resourceConfigs (advanced) | Cluster wide resources configuration. | | Map |
| resourceOptions (advanced) | Local resources configurations | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

18.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 8 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------|--------------------------------------------------------------------------------|---------|--------|
| camel.component.atomix-set.atomix | The shared AtomixClient instance. The option is a io.atomix.AtomixClient type. | | String |
| camel.component.atomix-set.configuration-uri | The path to the AtomixClient configuration | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| <code>camel.component.atomix-set.configuration.default-action</code> | The default action. | | AtomixSet\$Action |
| <code>camel.component.atomix-set.configuration.result-header</code> | The header that wil carry the result. | | String |
| <code>camel.component.atomix-set.configuration.ttl</code> | The resource ttl. | | Long |
| <code>camel.component.atomix-set.enabled</code> | Whether to enable auto configuration of the atomix-set component. This is enabled by default. | | Boolean |
| <code>camel.component.atomix-set.nodes</code> | The nodes the AtomixClient should connect to | | List |
| <code>camel.component.atomix-set.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 19. ATOMIX VALUE COMPONENT

Available as of Camel version 2.20

The camel atomix-value component allows you to work with [Atomix's Distributed Value](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-atomix</artifactId>
  <version>${camel-version}</version>
</dependency>
```

19.1. URI FORMAT

```
atomix-value:valueName
```

The Atomix Value component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| configuration (common) | The shared component configuration | | AtomixValue Configuration |
| atomix (common) | The shared AtomixClient instance | | AtomixClient |
| nodes (common) | The nodes the AtomixClient should connect to | | List |
| configurationUri (common) | The path to the AtomixClient configuration | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Atomix Value endpoint is configured using URI syntax:

```
atomix-value:resourceName
```

with the following path and query parameters:

19.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-----------------------------------------------|---------|--------|
| resourceName | Required The distributed resource name | | String |

19.1.2. Query Parameters (17 parameters):

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|------------------|
| atomix (common) | The Atomix instance to use | | Atomix |
| configurationUri (common) | The Atomix configuration uri. | | String |
| defaultAction (common) | The default action. | SET | Action |
| nodes (common) | The address of the nodes composing the cluster. | | String |
| resultHeader (common) | The header that wil carry the result. | | String |
| transport (common) | Sets the Atomix transport. | io.atomix.catalyst.transport.netty.NettyTransport | Transport |
| ttl (common) | The resource ttl. | | long |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| defaultResourceConfig (advanced) | The cluster wide default resource configuration. | | Properties |
| defaultResourceOptions (advanced) | The local default resource options. | | Properties |
| ephemeral (advanced) | Sets if the local member should join groups as PersistentMember or not. If set to ephemeral the local member will receive an auto generated ID thus the local one is ignored. | false | boolean |
| readConsistency (advanced) | The read consistency level. | | ReadConsistency |
| resourceConfigs (advanced) | Cluster wide resources configuration. | | Map |
| resourceOptions (advanced) | Local resources configurations | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

19.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 8 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|--------------------------------------------------------------------------------|---------|--------|
| camel.component.atomix-value.atomix | The shared AtomixClient instance. The option is a io.atomix.AtomixClient type. | | String |
| camel.component.atomix-value.configuration-uri | The path to the AtomixClient configuration | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| <code>camel.component.atomix-value.configuration.default-action</code> | The default action. | | AtomixValue\$Action |
| <code>camel.component.atomix-value.configuration.result-header</code> | The header that will carry the result. | | String |
| <code>camel.component.atomix-value.configuration.ttl</code> | The resource ttl. | | Long |
| <code>camel.component.atomix-value.enabled</code> | Whether to enable auto configuration of the atomix-value component. This is enabled by default. | | Boolean |
| <code>camel.component.atomix-value.nodes</code> | The nodes the AtomixClient should connect to | | List |
| <code>camel.component.atomix-value.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 20. AVRO COMPONENT

Available as of Camel version 2.10

This component provides a dataformat for avro, which allows serialization and deserialization of messages using Apache Avro's binary dataformat. Moreover, it provides support for Apache Avro's rpc, by providing producers and consumers endpoint for using avro over netty or http.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-avro</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

20.1. APACHE AVRO OVERVIEW

Avro allows you to define message types and a protocol using a json like format and then generate java code for the specified types and messages. An example of how a schema looks like is below.

```
{"namespace": "org.apache.camel.avro.generated",
 "protocol": "KeyValueProtocol",

 "types": [
  {"name": "Key", "type": "record",
   "fields": [
    {"name": "key", "type": "string"}
   ]
 },
  {"name": "Value", "type": "record",
   "fields": [
    {"name": "value", "type": "string"}
   ]
 }
 ],

 "messages": {
  "put": {
    "request": [{"name": "key", "type": "Key"}, {"name": "value", "type": "Value"} ],
    "response": "null"
  },
  "get": {
    "request": [{"name": "key", "type": "Key"}],
    "response": "Value"
  }
 }
 }
```

You can easily generate classes from a schema, using maven, ant etc. More details can be found at the [Apache Avro documentation](#).

However, it doesn't enforce a schema first approach and you can create schema for your existing

classes. **Since 2.12** you can use existing protocol interfaces to make RCP calls. You should use interface for the protocol itself and POJO beans or primitive/String classes for parameter and result types. Here is an example of the class that corresponds to schema above:

```
package org.apache.camel.avro.reflection;

public interface KeyValueProtocol {
    void put(String key, Value value);
    Value get(String key);
}

class Value {
    private String value;
    public String getValue() { return value; }
    public void setValue(String value) { this.value = value; }
}
```

Note: Existing classes can be used only for RPC (see below), not in data format.

20.2. USING THE AVRO DATA FORMAT

Using the avro data format is as easy as specifying that the class that you want to marshal or unmarshal in your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:in"/>
    <marshal>
      <avro instanceClass="org.apache.camel.dataformat.avro.Message"/>
    </marshal>
    <to uri="log:out"/>
  </route>
</camelContext>
```

An alternative can be to specify the dataformat inside the context and reference it from your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <avro id="avro" instanceClass="org.apache.camel.dataformat.avro.Message"/>
  </dataFormats>
  <route>
    <from uri="direct:in"/>
    <marshal ref="avro"/>
    <to uri="log:out"/>
  </route>
</camelContext>
```

In the same manner you can unmarshal using the avro data format.

20.3. USING AVRO RPC IN CAMEL

As mentioned above Avro also provides RPC support over multiple transports such as http and netty. Camel provides consumers and producers for these two transports.

```
avro:[transport]:[host]:[port][?options]
```

The supported transport values are currently http or netty.

Since 2.12 you can specify message name right in the URI:

```
avro:[transport]:[host]:[port][/messageName][?options]
```

For consumers this allows you to have multiple routes attached to the same socket. Dispatching to correct route will be done by the avro component automatically. Route with no messageName specified (if any) will be used as default.

When using camel producers for avro ipc, the "in" message body needs to contain the parameters of the operation specified in the avro protocol. The response will be added in the body of the "out" message.

In a similar manner when using camel avro consumers for avro ipc, the requests parameters will be placed inside the "in" message body of the created exchange and once the exchange is processed the body of the "out" message will be send as a response.

Note: By default consumer parameters are wrapped into array. If you've got only one parameter, since 2.12 you can use **singleParameter** URI option to receive it directly in the "in" message body without array wrapping.

20.4. AVRO RPC URI OPTIONS

The Avro component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| configuration (advanced) | To use a shared AvroConfiguration to configure options once | | AvroConfiguration |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Avro endpoint is configured using URI syntax:

```
avro:transport:host:port/messageName
```

with the following path and query parameters:

20.4.1. Path Parameters (4 parameters):

| Name | Description | Default | Type |
|------------------|---------------------------------------------------------------|---------|---------------|
| transport | Required Transport to use, can be either http or netty | | AvroTransport |

| Name | Description | Default | Type |
|--------------------|------------------------------------|---------|--------|
| port | Required Port number to use | | int |
| host | Required Hostname to use | | String |
| messageName | The name of the message to send. | | String |

20.4.2. Query Parameters (10 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| protocol (common) | Avro protocol to use | | Protocol |
| protocolClassName (common) | Avro protocol to use defined by the FQN class name | | String |
| protocolLocation (common) | Avro protocol location | | String |
| reflectionProtocol (common) | If protocol object provided is reflection protocol. Should be used only with protocol parameter because for protocolClassName protocol type will be auto detected | false | boolean |
| singleParameter (common) | If true, consumer parameter won't be wrapped into array. Will fail if protocol specifies more than 1 parameter for the message | false | boolean |
| uriAuthority (common) | Authority to use (username and password) | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

20.5. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------|----------------------------------------------------|---------|----------|
| camel.component.avro.configuration.host | Hostname to use | | String |
| camel.component.avro.configuration.message-name | The name of the message to send. | | String |
| camel.component.avro.configuration.port | Port number to use | | Integer |
| camel.component.avro.configuration.protocol | Avro protocol to use | | Protocol |
| camel.component.avro.configuration.protocol-class-name | Avro protocol to use defined by the FQN class name | | String |
| camel.component.avro.configuration.protocol-location | Avro protocol location | | String |

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| <code>camel.component.avro.configuration.reflection-protocol</code> | If protocol object provided is reflection protocol. Should be used only with protocol parameter because for protocolClassName protocol type will be auto detected | false | Boolean |
| <code>camel.component.avro.configuration.single-parameter</code> | If true, consumer parameter won't be wrapped into array. Will fail if protocol specifies more than 1 parameter for the message | false | Boolean |
| <code>camel.component.avro.configuration.transport</code> | Transport to use, can be either http or netty | | AvroTransport |
| <code>camel.component.avro.configuration.uri-authority</code> | Authority to use (username and password) | | String |
| <code>camel.component.avro.enabled</code> | Enable avro component | true | Boolean |
| <code>camel.component.avro.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.dataformat.avro.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.avro.enabled</code> | Enable avro dataformat | true | Boolean |
| <code>camel.dataformat.avro.instance-class-name</code> | Class name to use for marshal and unmarshalling | | String |

20.6. AVRO RPC HEADERS

| Name | Description |
|-----------------------------|---------------------------------------------------------------------------------------|
| CamelAvroMessageName | The name of the message to send. In consumer overrides message name from URI (if any) |

20.7. EXAMPLES

An example of using camel avro producers via http:

```
<route>
  <from uri="direct:start"/>
  <to uri="avro:http:localhost:{{avroport}}?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
  <to uri="log:avro"/>
</route>
```

In the example above you need to fill **CamelAvroMessageName** header. **Since 2.12** you can use following syntax to call constant messages:

```
<route>
  <from uri="direct:start"/>
  <to uri="avro:http:localhost:{{avroport}}/put?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
  <to uri="log:avro"/>
</route>
```

An example of consuming messages using camel avro consumers via netty:

```
<route>
  <from uri="avro:netty:localhost:{{avroport}}?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol"/>
  <choice>
    <when>
      <el>${in.headers.CamelAvroMessageName == 'put'}</el>
      <process ref="putProcessor"/>
    </when>
    <when>
      <el>${in.headers.CamelAvroMessageName == 'get'}</el>
      <process ref="getProcessor"/>
    </when>
  </choice>
</route>
```

Since 2.12 you can set up two distinct routes to perform the same task:

```
<route>
  <from uri="avro:netty:localhost:{{avroport}}/put?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol">
  <process ref="putProcessor"/>
</route>
```

```
<route>
  <from uri="avro:netty:localhost:{{avroport}}/get?
protocolClassName=org.apache.camel.avro.generated.KeyValueProtocol&singleParameter=true"/>
  <process ref="getProcessor"/>
</route>
```

In the example above, `get` takes only one parameter, so **singleParameter** is used and **getProcessor** will receive `Value` class directly in body, while **putProcessor** will receive an array of size 2 with `String` key and `Value` value filled as array contents.

CHAPTER 21. AVRO DATAFORMAT

Available as of Camel version 2.14

This component provides a dataformat for avro, which allows serialization and deserialization of messages using Apache Avro's binary dataformat. Moreover, it provides support for Apache Avro's rpc, by providing producers and consumers endpoint for using avro over netty or http.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-avro</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

21.1. APACHE AVRO OVERVIEW

Avro allows you to define message types and a protocol using a json like format and then generate java code for the specified types and messages. An example of how a schema looks like is below.

```
{"namespace": "org.apache.camel.avro.generated",
 "protocol": "KeyValueProtocol",

 "types": [
  {"name": "Key", "type": "record",
   "fields": [
    {"name": "key", "type": "string"}
   ]
 },
  {"name": "Value", "type": "record",
   "fields": [
    {"name": "value", "type": "string"}
   ]
 }
 ],

 "messages": {
  "put": {
    "request": [{"name": "key", "type": "Key"}, {"name": "value", "type": "Value"} ],
    "response": "null"
  },
  "get": {
    "request": [{"name": "key", "type": "Key"}],
    "response": "Value"
  }
 }
 }
```

You can easily generate classes from a schema, using maven, ant etc. More details can be found at the [Apache Avro documentation](#).

However, it doesn't enforce a schema first approach and you can create schema for your existing

classes. **Since 2.12** you can use existing protocol interfaces to make RCP calls. You should use interface for the protocol itself and POJO beans or primitive/String classes for parameter and result types. Here is an example of the class that corresponds to schema above:

```
package org.apache.camel.avro.reflection;

public interface KeyValueProtocol {
    void put(String key, Value value);
    Value get(String key);
}

class Value {
    private String value;
    public String getValue() { return value; }
    public void setValue(String value) { this.value = value; }
}
```

Note: Existing classes can be used only for RPC (see below), not in data format.

21.2. USING THE AVRO DATA FORMAT

Using the avro data format is as easy as specifying that the class that you want to marshal or unmarshal in your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:in"/>
    <marshal>
      <avro instanceClass="org.apache.camel.dataformat.avro.Message"/>
    </marshal>
    <to uri="log:out"/>
  </route>
</camelContext>
```

An alternative can be to specify the dataformat inside the context and reference it from your route.

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <avro id="avro" instanceClass="org.apache.camel.dataformat.avro.Message"/>
  </dataFormats>
  <route>
    <from uri="direct:in"/>
    <marshal ref="avro"/>
    <to uri="log:out"/>
  </route>
</camelContext>
```

In the same manner you can umarshal using the avro data format.

21.3. AVRO DATAFORMAT OPTIONS

The Avro dataformat supports 2 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>instanceClassName</code> | | String | Class name to use for marshal and unmarshalling |
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc. |

21.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| <code>camel.component.avro.configuration.host</code> | Hostname to use | | String |
| <code>camel.component.avro.configuration.message-name</code> | The name of the message to send. | | String |
| <code>camel.component.avro.configuration.port</code> | Port number to use | | Integer |
| <code>camel.component.avro.configuration.protocol</code> | Avro protocol to use | | Protocol |
| <code>camel.component.avro.configuration.protocol-class-name</code> | Avro protocol to use defined by the FQN class name | | String |
| <code>camel.component.avro.configuration.protocol-location</code> | Avro protocol location | | String |
| <code>camel.component.avro.configuration.reflection-protocol</code> | If protocol object provided is reflection protocol. Should be used only with protocol parameter because for protocolClassName protocol type will be auto detected | false | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| <code>camel.component.avro.configuration.single-parameter</code> | If true, consumer parameter won't be wrapped into array. Will fail if protocol specifies more than 1 parameter for the message | false | Boolean |
| <code>camel.component.avro.configuration.transport</code> | Transport to use, can be either http or netty | | AvroTransport |
| <code>camel.component.avro.configuration.uri-authority</code> | Authority to use (username and password) | | String |
| <code>camel.component.avro.enabled</code> | Enable avro component | true | Boolean |
| <code>camel.component.avro.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.dataformat.avro.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.avro.enabled</code> | Enable avro dataformat | true | Boolean |
| <code>camel.dataformat.avro.instance-class-name</code> | Class name to use for marshal and unmarshalling | | String |

ND

CHAPTER 22. AWS CLOUDWATCH COMPONENT

Available as of Camel version 2.11

The CW component allows messages to be sent to an [Amazon CloudWatch](#) metrics. The implementation of the Amazon API is provided by the [AWS SDK](#).

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon CloudWatch. More information are available at [Amazon CloudWatch](#).

22.1. URI FORMAT

```
aws-cw://namespace[?options]
```

The metrics will be created if they don't already exists.

You can append query options to the URI in the following format, **?options=value&option2=value&...**

22.2. URI OPTIONS

The AWS CloudWatch component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| configuration (advanced) | The AWS CW default configuration | | CwConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which CW client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS CloudWatch endpoint is configured using URI syntax:

```
aws-cw:namespace
```

with the following path and query parameters:

22.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------------|---------|--------|
| namespace | Required The metric namespace | | String |

22.2.2. Query Parameters (11 parameters):

| Name | Description | Default | Type |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| amazonCwClient (producer) | To use the AmazonCloudWatch as the client | | AmazonCloudWatch |
| name (producer) | The metric name | | String |
| proxyHost (producer) | To define a proxy host when instantiating the CW client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the CW client | | Integer |
| region (producer) | The region in which CW client needs to work | | String |
| timestamp (producer) | The metric timestamp | | Date |
| unit (producer) | The metric unit | | String |
| value (producer) | The metric value | | Double |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

22.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------|---------------------------------------------------------|---------|------------------|
| <code>camel.component.aws-cw.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-cw.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-cw.configuration.amazon-cw-client</code> | To use the AmazonCloudWatch as the client | | AmazonCloudWatch |
| <code>camel.component.aws-cw.configuration.name</code> | The metric name | | String |
| <code>camel.component.aws-cw.configuration.namespace</code> | The metric namespace | | String |
| <code>camel.component.aws-cw.configuration.proxy-host</code> | To define a proxy host when instantiating the CW client | | String |
| <code>camel.component.aws-cw.configuration.proxy-port</code> | To define a proxy port when instantiating the CW client | | Integer |
| <code>camel.component.aws-cw.configuration.region</code> | The region in which CW client needs to work | | String |
| <code>camel.component.aws-cw.configuration.secret-key</code> | Amazon AWS Secret Key | | String |

| Name | Description | Default | Type |
|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.aws-cw.configuration.timestamp | The metric timestamp | | Date |
| camel.component.aws-cw.configuration.unit | The metric unit | | String |
| camel.component.aws-cw.configuration.value | The metric value | | Double |
| camel.component.aws-cw.enabled | Enable aws-cw component | true | Boolean |
| camel.component.aws-cw.region | The region in which CW client needs to work | | String |
| camel.component.aws-cw.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| camel.component.aws-cw.secret-key | Amazon AWS Secret Key | | String |

Required CW component options

You have to provide the `amazonCwClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's CloudWatch](#).

22.4. USAGE

22.4.1. Message headers evaluated by the CW producer

| Header | Type | Description |
|-----------------------------|---------------|----------------------------|
| CamelAwsCwMetricName | String | The Amazon CW metric name. |

| Header | Type | Description |
|---------------------------------------------------------------------|-----------------------------------------------------|------------------------------------------------------------|
| Camel AwsC wMetr icValu e | Doubl e | The Amazon CW metric value. |
| Camel AwsC wMetr icUnit | String | The Amazon CW metric unit. |
| Camel AwsC wMetr icNam espac e | String | The Amazon CW metric namespace. |
| Camel AwsC wMetr icTim estam p | Date | The Amazon CW metric timestamp. |
| Camel AwsC wMetr icDim ensio nNam e | String | Camel 2.12: The Amazon CW metric dimension name. |
| Camel AwsC wMetr icDim ensio nValu e | String | Camel 2.12: The Amazon CW metric dimension value. |
| Camel AwsC wMetr icDim ensio ns | Map< String , String > | Camel 2.12: A map of dimension names and dimension values. |

22.4.2. Advanced AmazonCloudWatch configuration

If you need more control over the **AmazonCloudWatch** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-cw://namespace?amazonCwClient=#client");
```

The **#client** refers to a **AmazonCloudWatch** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonCloudWatch client = new AmazonCloudWatchClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

22.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.10 or higher).

CHAPTER 23. AWS DYNAMODB COMPONENT

Available as of Camel version 2.10

The DynamoDB component supports storing and retrieving data from/to [Amazon's DynamoDB](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon DynamoDB. More information are available at [Amazon DynamoDB](#).

23.1. URI FORMAT

```
aws-ddb://domainName[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

23.2. URI OPTIONS

The AWS DynamoDB component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS DDB default configuration | | DdbConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which DDB client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS DynamoDB endpoint is configured using URI syntax:

```
aws-ddb:tableName
```

with the following path and query parameters:

23.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------------------------------------|---------|--------|
| tableName | Required The name of the table currently worked with. | | String |

23.2.2. Query Parameters (13 parameters):

| Name | Description | Default | Type |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|----------------|
| amazonDDBClient (producer) | To use the AmazonDynamoDB as the client | | AmazonDynamoDB |
| consistentRead (producer) | Determines whether or not strong consistency should be enforced when data is read. | false | boolean |
| keyAttributeName (producer) | Attribute name when creating table | | String |
| keyAttributeType (producer) | Attribute type when creating table | | String |
| operation (producer) | What operation to perform | PutItem | DdbOperations |
| proxyHost (producer) | To define a proxy host when instantiating the DDB client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the DDB client | | Integer |
| readCapacity (producer) | The provisioned throughput to reserve for reading resources from your table | | Long |
| region (producer) | The region in which DDB client needs to work | | String |
| writeCapacity (producer) | The provisioned throughput to reserved for writing resources to your table | | Long |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|--------------------------------------|-----------------------|---------|--------|
| <code>secretKey</code> (security) | Amazon AWS Secret Key | | String |

23.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 18 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------|---------|----------------|
| <code>camel.component.aws-ddb.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ddb.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ddb.configuration.amazon-d-d-b-client</code> | To use the AmazonDynamoDB as the client | | AmazonDynamoDB |
| <code>camel.component.aws-ddb.configuration.consistent-read</code> | Determines whether or not strong consistency should be enforced when data is read. | false | Boolean |
| <code>camel.component.aws-ddb.configuration.key-attribute-name</code> | Attribute name when creating table | | String |
| <code>camel.component.aws-ddb.configuration.key-attribute-type</code> | Attribute type when creating table | | String |
| <code>camel.component.aws-ddb.configuration.operation</code> | What operation to perform | | DdbOperations |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-ddb.configuration.proxy-host</code> | To define a proxy host when instantiating the DDB client | | String |
| <code>camel.component.aws-ddb.configuration.proxy-port</code> | To define a proxy port when instantiating the DDB client | | Integer |
| <code>camel.component.aws-ddb.configuration.read-capacity</code> | The provisioned throughput to reserve for reading resources from your table | | Long |
| <code>camel.component.aws-ddb.configuration.region</code> | The region in which DDB client needs to work | | String |
| <code>camel.component.aws-ddb.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-ddb.configuration.table-name</code> | The name of the table currently worked with. | | String |
| <code>camel.component.aws-ddb.configuration.write-capacity</code> | The provisioned throughput to reserved for writing resources to your table | | Long |
| <code>camel.component.aws-ddb.enabled</code> | Enable aws-ddb component | true | Boolean |
| <code>camel.component.aws-ddb.region</code> | The region in which DDB client needs to work | | String |
| <code>camel.component.aws-ddb.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------|-----------------------|---------|--------|
| camel.component.aws-ddb.secret-key | Amazon AWS Secret Key | | String |

Required DDB component options

You have to provide the amazonDDBClient in the Registry or your accessKey and secretKey to access the [Amazon's DynamoDB](#).

23.4. USAGE

23.4.1. Message headers evaluated by the DDB producer

| Header | Type | Description |
|----------------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CamelAwsDdbBatchItems | Map<String, KeysAndAttributes> | A map of the table name and corresponding items to get by primary key. |
| CamelAwsDdbTableName | String | Table Name for this operation. |
| CamelAwsDdbKey | Key | The primary key that uniquely identifies each item in a table. From Camel 2.16.0 the type of this header is Map<String, AttributeValue> and not Key |
| CamelAwsDdbReturnValues | String | Use this parameter if you want to get the attribute name-value pairs before or after they are modified(NONE, ALL_OLD, UPDATED_OLD, ALL_NEW, UPDATED_NEW). |
| CamelAwsDdbUpdateCondition | Map<String, ExpectedAttributeValue> | Designates an attribute for a conditional modification. |

| Header | Type | Description |
|----------------------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CamelAwsDdbAttributeNames | Collection<String> | If attribute names are not specified then all attributes will be returned. |
| CamelAwsDdbConsistentRead | Boolean | If set to true, then a consistent read is issued, otherwise eventually consistent is used. |
| CamelAwsDdbIndexName | String | If set will be used as Secondary Index for Query operation. |
| CamelAwsDdbItem | Map<String, AttributeValue> | A map of the attributes for the item, and must include the primary key values that define the item. |
| CamelAwsDdbExactCount | Boolean | If set to true, Amazon DynamoDB returns a total number of items that match the query parameters, instead of a list of the matching items and their attributes. From Camel 2.16.0 this header doesn't exist anymore. |
| CamelAwsDdbKeyConditions | Map<String, Condition> | From Camel 2.16.0. This header specify the selection criteria for the query, and merge together the two old headers CamelAwsDdbHashKeyValue and CamelAwsDdbScanRangeKeyCondition |
| CamelAwsDdbStartKey | Key | Primary key of the item from which to continue an earlier query. |
| CamelAwsDdbHashKeyValue | AttributeValue | Value of the hash component of the composite primary key. From Camel 2.16.0 this header doesn't exist anymore. |

| Header | Type | Description |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsD dbLim it | Inte ger | The maximum number of items to return. |
| Camel AwsD dbSca nRang eKeyC onditi on | Condi tion | A container for the attribute values and comparison operators to use for the query. From Camel 2.16.0 this header doesn't exist anymore. |
| Camel AwsD dbSca nInde xForw ard | Boole an | Specifies forward or backward traversal of the index. |
| Camel AwsD dbSca nFilter | Map< String , Condi tion> | Evaluates the scan results and returns only the desired values. |
| Camel AwsD dbUp dateV alues | Map< String , Attrib uteVal ueUpd ate> | Map of attribute name to the new value and action for the update. |

23.4.2. Message headers set during BatchGetItems operation

| Header | Type | Description |
|-----------------------------------------------------|------------------------------------------------------------|-----------------------------------------------------------------|
| Camel AwsD dbBat chRes ponse | Map< String ,Batch Respo nse> | Table names and the respective item attributes from the tables. |

| Header | Type | Description |
|------------------------------------------------------------|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Camel AwsD dbUn proce ssedK eys | Map< String ,Keys AndAt tribute s> | Contains a map of tables and their respective keys that were not processed with the current response. |

23.4.3. Message headers set during DeleteItem operation

| Header | Type | Description |
|---------------------------------------------|------------------------------------------------------------------|---------------------------------------------------|
| Camel AwsD dbAttr ibutes | Map< String , Attrib uteVal ue> | The list of attributes returned by the operation. |

23.4.4. Message headers set during DeleteTable operation

| Header | Type | Description |
|-----------------------------------------------------------------------|-------------|----------------------------------------------------------------|
| Camel AwsD dbPro vision edThr oughp ut | | |
| Provis ioned Throu ghput Descri ption | | The value of the ProvisionedThroughput property for this table |
| Camel AwsD dbCre ationD ate | Date | Creation DateTime of this table. |

| Header | Type | Description |
|------------------------------------------------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsD dbTab leItem Count | Long | Item count for this table. |
| Camel AwsD dbKey Sche ma | KeySc hema | The KeySchema that identifies the primary key for this table. From Camel 2.16.0 the type of this header is List<KeySchemaElement> and not KeySchema |
| Camel AwsD dbTab leNam e | String | The table name. |
| Camel AwsD dbTab leSize | Long | The table size in bytes. |
| Camel AwsD dbTab leStat us | String | The status of the table: CREATING, UPDATING, DELETING, ACTIVE |

23.4.5. Message headers set during DescribeTable operation

| Header | Type | Description |
|-----------------------------------------------------------------------|----------------------------------------------------------|----------------------------------------------------------------|
| Camel AwsD dbPro vision edThr oughp ut | {{Provi sioned Throug hputDe scriptio n}} | The value of the ProvisionedThroughput property for this table |
| Camel AwsD dbCre ationD ate | Date | Creation DateTime of this table. |

| Header | Type | Description |
|------------------------------------------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsD dbTab leItem Count | Long | Item count for this table. |
| Camel AwsD dbKey Sche ma | <code>{{KeyS chema} }</code> | The KeySchema that identifies the primary key for this table. From Camel 2.16.0 the type of this header is List<KeySchemaElement> and not KeySchema |
| Camel AwsD dbTab leNam e | String | The table name. |
| Camel AwsD dbTab leSize | Long | The table size in bytes. |
| Camel AwsD dbTab leStat us | String | The status of the table: CREATING, UPDATING, DELETING, ACTIVE |
| Camel AwsD dbRea dCapa city | Long | ReadCapacityUnits property of this table. |
| Camel AwsD dbWri teCap acity | Long | WriteCapacityUnits property of this table. |

23.4.6. Message headers set during GetItem operation

| Header | Type | Description |
|---------------------------------------------|------------------------------------------------------------------|---------------------------------------------------|
| Camel AwsD dbAttr ibutes | Map< String , Attrib uteVal ue> | The list of attributes returned by the operation. |

23.4.7. Message headers set during PutItem operation

| Header | Type | Description |
|---------------------------------------------|------------------------------------------------------------------|---------------------------------------------------|
| Camel AwsD dbAttr ibutes | Map< String , Attrib uteVal ue> | The list of attributes returned by the operation. |

23.4.8. Message headers set during Query operation

| Header | Type | Description |
|---------------------------------------------------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Camel AwsD dbItem s | List<java.util. Map <String,AttributeV alue>> | The list of attributes returned by the operation. |
| Camel AwsD dbLast EvaluatedKey | Key | Primary key of the item where the query operation stopped, inclusive of the previous result set. |
| Camel AwsD dbConsumedCapacity | Double | The number of Capacity Units of the provisioned throughput of the table consumed during the operation. |

| Header | Type | Description |
|----------------------------------------|---------------------|----------------------------------|
| Camel AwsD dbCo unt | Intege r | Number of items in the response. |

23.4.9. Message headers set during Scan operation

| Header | Type | Description |
|-------------------------------------------------------------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Camel AwsD dblte ms | List<j ava.ut il.Map <Strin g,Attri buteV alue>> | The list of attributes returned by the operation. |
| Camel AwsD dbLas tEvalu atedK ey | Key | Primary key of the item where the query operation stopped, inclusive of the previous result set. |
| Camel AwsD dbCo nsum edCap acity | Doubl e | The number of Capacity Units of the provisioned throughput of the table consumed during the operation. |
| Camel AwsD dbCo unt | Intege r | Number of items in the response. |
| Camel AwsD dbSca nnedC ount | Intege r | Number of items in the complete scan before any filters are applied. |

23.4.10. Message headers set during UpdateItem operation

| Header | Type | Description |
|------------------------------|------------------------------------------|---------------------------------------------------|
| CamelAwsddbAttributes | Map<String, AttributeValue> | The list of attributes returned by the operation. |

23.4.11. Advanced AmazonDynamoDB configuration

If you need more control over the **AmazonDynamoDB** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-ddb://domainName?amazonDDBClient=#client");
```

The **#client** refers to a **AmazonDynamoDB** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonDynamoDB client = new AmazonDynamoDBClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

23.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.10 or higher).

CHAPTER 24. AWS DYNAMODB STREAMS COMPONENT

Available as of Camel version 2.17

The DynamoDB Stream component supports receiving messages from Amazon DynamoDB Stream service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon DynamoDB Streams. More information are available at [AWS DynamoDB](#)

24.1. URI FORMAT

```
aws-ddbstream://table-name[?options]
```

The stream needs to be created prior to it being used.

You can append query options to the URI in the following format, ?options=value&option2=value&...

24.2. URI OPTIONS

The AWS DynamoDB Streams component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| configuration (advanced) | The AWS DDB stream default configuration | | DdbStreamConfiguration |
| accessKey (consumer) | Amazon AWS Access Key | | String |
| secretKey (consumer) | Amazon AWS Secret Key | | String |
| region (consumer) | Amazon AWS Region | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS DynamoDB Streams endpoint is configured using URI syntax:

```
aws-ddbstream:tableName
```

with the following path and query parameters:

24.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------------------|---------|--------|
| tableName | Required Name of the dynamodb table | | String |

24.2.2. Query Parameters (28 parameters):

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| amazonDynamoDBStreamsClient (consumer) | Amazon DynamoDB client to use for all requests for this endpoint | | AmazonDynamoDBStreams |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| iteratorType (consumer) | Defines where in the DynaboDB stream to start getting records. Note that using TRIM_HORIZON can cause a significant delay before the stream has caught up to real-time. if AT,AFTER_SEQUENCE_NUMBER are used, then a <code>sequenceNumberProvider</code> MUST be supplied. | LATEST | ShardIteratorType |
| maxResultsPerRequest (consumer) | Maximum number of records that will be fetched in each poll | | int |
| proxyHost (consumer) | To define a proxy host when instantiating the DDBStreams client | | String |
| proxyPort (consumer) | To define a proxy port when instantiating the DDBStreams client | | Integer |
| region (consumer) | The region in which DDBStreams client needs to work | | String |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| sequenceNumberProvider (consumer) | Provider for the sequence number when using one of the two <code>ShardIteratorType.AT,AFTER_SEQUENCE_NUMBER</code> iterator types. Can be a registry reference or a literal sequence number. | | SequenceNumberProvider |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at <code>WARN</code> or <code>ERROR</code> level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as <code>60s</code> (60 seconds), <code>5m30s</code> (5 minutes and 30 seconds), and <code>1h</code> (1 hour). | 500 | long |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

24.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| <code>camel.component.aws-ddbstream.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ddbstream.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ddbstream.configuration.amazon-dynamo-db-streams-client</code> | Amazon DynamoDB client to use for all requests for this endpoint | | AmazonDynamoDBStreams |
| <code>camel.component.aws-ddbstream.configuration.iterator-type</code> | Defines where in the DynaboDB stream to start getting records. Note that using TRIM_HORIZON can cause a significant delay before the stream has caught up to real-time. if AT,AFTER_SEQUENCE_NUMBER are used, then a sequenceNumberProvider MUST be supplied. | | ShardIteratorType |
| <code>camel.component.aws-ddbstream.configuration.max-results-per-request</code> | Maximum number of records that will be fetched in each poll | | Integer |
| <code>camel.component.aws-ddbstream.configuration.proxy-host</code> | To define a proxy host when instantiating the DDBStreams client | | String |
| <code>camel.component.aws-ddbstream.configuration.proxy-port</code> | To define a proxy port when instantiating the DDBStreams client | | Integer |
| <code>camel.component.aws-ddbstream.configuration.region</code> | The region in which DDBStreams client needs to work | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| <code>camel.component.aws-ddbstream.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-ddbstream.configuration.sequence-number-provider</code> | Provider for the sequence number when using one of the two <code>ShardIteratorType.AT,AFTER_SEQUENCE_NUMBER</code> iterator types. Can be a registry reference or a literal sequence number. | | SequenceNumber Provider |
| <code>camel.component.aws-ddbstream.configuration.table-name</code> | Name of the dynamodb table | | String |
| <code>camel.component.aws-ddbstream.enabled</code> | Enable aws-ddbstream component | true | Boolean |
| <code>camel.component.aws-ddbstream.region</code> | Amazon AWS Region | | String |
| <code>camel.component.aws-ddbstream.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-ddbstream.secret-key</code> | Amazon AWS Secret Key | | String |

Required DynampDBStream component options

You have to provide the `amazonDynamoDbStreamsClient` in the Registry with proxies and relevant credentials configured.

24.4. SEQUENCE NUMBERS

You can provide a literal string as the sequence number or provide a bean in the registry. An example of using the bean would be to save your current position in the change feed and restore it on Camel startup.

It is an error to provide a sequence number that is greater than the largest sequence number in the describe-streams result, as this will lead to the AWS call returning an HTTP 400.

24.5. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

24.6. USAGE

24.6.1. AmazonDynamoDBStreamsClient configuration

You will need to create an instance of AmazonDynamoDBStreamsClient and bind it to the registry

```
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonDynamoDBStreamsClient.class, null, clientConfiguration);
// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
DefaultAWSCredentialsProviderChain

registry.bind("kinesisClient", client);
```

24.6.2. Providing AWS Credentials

It is recommended that the credentials are obtained by using the [DefaultAWSCredentialsProviderChain](#) that is the default when creating a new ClientConfiguration instance, however, a different [AWSCredentialsProvider](#) can be specified when calling createClient(...).

24.7. COPING WITH DOWNTIME

24.7.1. AWS DynamoDB Streams outage of less than 24 hours

The consumer will resume from the last seen sequence number (as implemented for [CAMEL-9515](#)), so you should receive a flood of events in quick succession, as long as the outage did not also include DynamoDB itself.

24.7.2. AWS DynamoDB Streams outage of more than 24 hours

Given that AWS only retain 24 hours worth of changes, you will have missed change events no matter what mitigations are in place.

24.8. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.7 or higher).

CHAPTER 25. AWS EC2 COMPONENT

Available as of Camel version 2.16

The EC2 component supports create, run, start, stop and terminate [AWS EC2](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon EC2. More information are available at [Amazon EC2](#).

25.1. URI FORMAT

```
aws-ec2://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

25.2. URI OPTIONS

The AWS EC2 component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS EC2 default configuration | | EC2Configuration |
| region (producer) | The region in which EC2 client needs to work | | String |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS EC2 endpoint is configured using URI syntax:

```
aws-ec2:label
```

with the following path and query parameters:

25.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------|------------------------------|---------|--------|
| label | Required Logical name | | String |

25.2.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| accessKey (producer) | Amazon AWS Access Key | | String |
| amazonEc2Client (producer) | To use a existing configured AmazonEC2Client as client | | AmazonEC2Client |
| operation (producer) | Required The operation to perform. It can be createAndRunInstances, startInstances, stopInstances, terminateInstances, describeInstances, describeInstancesStatus, rebootInstances, monitorInstances, unmonitorInstances, createTags or deleteTags | | EC2Operations |
| proxyHost (producer) | To define a proxy host when instantiating the EC2 client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the EC2 client | | Integer |
| region (producer) | The region in which EC2 client needs to work | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

25.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-ec2.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| <code>camel.component.aws-ec2.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ec2.configuration.amazon-ec2-client</code> | To use a existing configured AmazonEC2Client as client | | AmazonEC2Client |
| <code>camel.component.aws-ec2.configuration.operation</code> | The operation to perform. It can be <code>createAndRunInstances</code> , <code>startInstances</code> , <code>stopInstances</code> , <code>terminateInstances</code> , <code>describeInstances</code> , <code>describeInstancesStatus</code> , <code>rebootInstances</code> , <code>monitorInstances</code> , <code>unmonitorInstances</code> , <code>createTags</code> or <code>deleteTags</code> | | EC2Operations |
| <code>camel.component.aws-ec2.configuration.proxy-host</code> | To define a proxy host when instantiating the EC2 client | | String |
| <code>camel.component.aws-ec2.configuration.proxy-port</code> | To define a proxy port when instantiating the EC2 client | | Integer |
| <code>camel.component.aws-ec2.configuration.region</code> | The region in which EC2 client needs to work | | String |
| <code>camel.component.aws-ec2.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-ec2.enabled</code> | Enable aws-ec2 component | true | Boolean |
| <code>camel.component.aws-ec2.region</code> | The region in which EC2 client needs to work | | String |
| <code>camel.component.aws-ec2.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------|-----------------------|---------|--------|
| camel.component.aws-ec2.secret-key | Amazon AWS Secret Key | | String |

Required EC2 component options

You have to provide the `amazonEc2Client` in the Registry or your `accessKey` and `secretKey` to access the [Amazon EC2](#) service.

25.4. USAGE

25.4.1. Message headers evaluated by the EC2 producer

| Header | Type | Description |
|------------------------------------|------------------------------------------------------------|-------------------------------------------------|
| CamelAwsEC2ImageId | String | An image ID of the AWS marketplace |
| CamelAwsEC2InstanceType | <code>com.amazonaws.services.ec2.model.InstanceType</code> | The instance type we want to create and run |
| CamelAwsEC2Operation | String | The operation we want to perform |
| CamelAwsEC2InstanceMinCount | Int | The minimum number of instances we want to run. |
| CamelAwsEC2InstanceMaxCount | Int | The maximum number of instances we want to run. |

| Header | Type | Description |
|------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------|
| Camel AwsE C2Inst anceM onitori ng | Boolea n | Define if we want the running instances to be monitored |
| Camel AwsE C2Inst anceE bsOpt imized | Boole an | Define if the creating instance is optimized for EBS I/O. |
| Camel AwsE C2Inst anceS ecurit yGrou ps | Collecti on | The security groups to associate to the instances |
| Camel AwsE C2Inst ancesl ds | Collec tion | A collection of instances IDS to execute start, stop, describe and terminate operations on. |
| Camel AwsE C2Inst ances Tags | Collec tion | A collection of tags to add or remove from EC2 resources |

Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.16 or higher).

CHAPTER 26. AWS IAM COMPONENT

Available as of Camel version 2.23

The KMS component supports create, run, start, stop and terminate [AWS IAM](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon IAM. More information are available at [Amazon IAM](#).

26.1. URI FORMAT

```
aws-kms://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

26.2. URI OPTIONS

The AWS IAM component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS IAM default configuration | | IAMConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which IAM client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS IAM endpoint is configured using URI syntax:

```
aws-iam:label
```

with the following path and query parameters:

26.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------|------------------------------|---------|--------|
| label | Required Logical name | | String |

26.2.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------|
| accessKey (producer) | Amazon AWS Access Key | | String |
| iamClient (producer) | To use a existing configured AWS IAM as client | | AmazonIdentityManagementClient |
| operation (producer) | Required The operation to perform | | IAMOperations |
| proxyHost (producer) | To define a proxy host when instantiating the KMS client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the KMS client | | Integer |
| region (producer) | The region in which KMS client needs to work | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

26.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-iam.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------|
| <code>camel.component.aws-iam.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-iam.configuration.iam-client</code> | To use a existing configured AWS IAM as client | | AmazonIdentityManagementClient |
| <code>camel.component.aws-iam.configuration.operation</code> | The operation to perform | | IAMOperations |
| <code>camel.component.aws-iam.configuration.proxy-host</code> | To define a proxy host when instantiating the KMS client | | String |
| <code>camel.component.aws-iam.configuration.proxy-port</code> | To define a proxy port when instantiating the KMS client | | Integer |
| <code>camel.component.aws-iam.configuration.region</code> | The region in which KMS client needs to work | | String |
| <code>camel.component.aws-iam.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-iam.enabled</code> | Whether to enable auto configuration of the aws-iam component. This is enabled by default. | | Boolean |
| <code>camel.component.aws-iam.region</code> | The region in which IAM client needs to work | | String |
| <code>camel.component.aws-iam.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------|-----------------------|---------|--------|
| camel.component.aws-iam.secret-key | Amazon AWS Secret Key | | String |

Required IAM component options

You have to provide the amazonKmsClient in the Registry or your accessKey and secretKey to access the [Amazon IAM](#) service.

26.4. USAGE

26.4.1. Message headers evaluated by the IAM producer

| Header | Type | Description |
|----------------------------|--------|-------------------------------------------------------------------------------------|
| CamelAwsIAMOperation | String | The operation we want to perform |
| CamelAwsIAMUsername | String | The username for the user you want to manage |
| CamelAwsIAMAccessKeyId | String | The accessKey you want to manage |
| CamelAwsIAMAccessKeyStatus | String | The Status of the AccessKey you want to set, possible value are active and inactive |

26.4.2. IAM Producer operations

Camel-AWS IAM component provides the following operation on the producer side:

- listAccessKeys
- createUser
- deleteUser

- `listUsers`
- `getUser`
- `createAccessKey`
- `deleteAccessKey`
- `updateAccessKey`

Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-aws</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

26.5. SEE ALSO

- [Configuring Camel](#)

- [AWS Component](#)

CHAPTER 27. AWS KINESIS COMPONENT

Available as of Camel version 2.17

The Kinesis component supports receiving messages from and sending messages to Amazon Kinesis service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Kinesis. More information are available at [AWS Kinesis](#)

27.1. URI FORMAT

```
aws-kinesis://stream-name[?options]
```

The stream needs to be created prior to it being used.

You can append query options to the URI in the following format, ?options=value&option2=value&...

27.2. URI OPTIONS

The AWS Kinesis component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| configuration (advanced) | The AWS S3 default configuration | | KinesisConfigurati on |
| accessKey (common) | Amazon AWS Access Key | | String |
| secretKey (common) | Amazon AWS Secret Key | | String |
| region (common) | Amazon AWS Region | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Kinesis endpoint is configured using URI syntax:

```
aws-kinesis:streamName
```

with the following path and query parameters:

27.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|------------------------------------|---------|--------|
| streamName | Required Name of the stream | | String |

27.2.2. Query Parameters (30 parameters):

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|-------------------|
| amazonKinesisClient (common) | Amazon Kinesis client to use for all requests for this endpoint | | AmazonKinesis |
| proxyHost (common) | To define a proxy host when instantiating the DDBStreams client | | String |
| proxyPort (common) | To define a proxy port when instantiating the DDBStreams client | | Integer |
| region (common) | The region in which Kinesis client needs to work | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| iteratorType (consumer) | Defines where in the Kinesis stream to start getting records | TRIM_HORIZON | ShardIteratorType |
| maxResultsPerRequest (consumer) | Maximum number of records that will be fetched in each poll | 1 | int |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| sequenceNumber (consumer) | The sequence number to start polling from. Required if <code>iteratorType</code> is set to <code>AFTER_SEQUENCE_NUMBER</code> or <code>AT_SEQUENCE_NUMBER</code> | | String |

| Name | Description | Default | Type |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------|
| shardClosed (consumer) | Define what will be the behavior in case of shard closed. Possible value are ignore, silent and fail. In case of ignore a message will be logged and the consumer will restart from the beginning, in case of silent there will be no logging and the consumer will start from the beginning, in case of fail a ReachedClosedStateException will be raised | ignore | KinesisShardClosedStrategyEnum |
| shardId (consumer) | Defines which shardId in the Kinesis stream to get records from | | String |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |

| Name | Description | Default | Type |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------|
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECONDS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

27.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|-----------------------------------------------------------------|---------|-------------------|
| <code>camel.component.aws-kinesis.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-kinesis.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-kinesis.configuration.amazon-kinesis-client</code> | Amazon Kinesis client to use for all requests for this endpoint | | AmazonKinesis |
| <code>camel.component.aws-kinesis.configuration.iterator-type</code> | Defines where in the Kinesis stream to start getting records | | ShardIteratorType |
| <code>camel.component.aws-kinesis.configuration.max-results-per-request</code> | Maximum number of records that will be fetched in each poll | 1 | Integer |
| <code>camel.component.aws-kinesis.configuration.proxy-host</code> | To define a proxy host when instantiating the DDBStreams client | | String |
| <code>camel.component.aws-kinesis.configuration.proxy-port</code> | To define a proxy port when instantiating the DDBStreams client | | Integer |
| <code>camel.component.aws-kinesis.configuration.region</code> | The region in which Kinesis client needs to work | | String |

| Name | Description | Default | Type |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------------------|
| <code>camel.component.aws-kinesis.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-kinesis.configuration.sequence-number</code> | The sequence number to start polling from. Required if <code>iteratorType</code> is set to <code>AFTER_SEQUENCE_NUMBER</code> or <code>AT_SEQUENCE_NUMBER</code> | | String |
| <code>camel.component.aws-kinesis.configuration.shard-closed</code> | Define what will be the behavior in case of shard closed. Possible value are ignore, silent and fail. In case of ignore a message will be logged and the consumer will restart from the beginning, in case of silent there will be no logging and the consumer will start from the beginning, in case of fail a <code>ReachedClosedStateException</code> will be raised | | <code>KinesisShardClosedStrategyEnum</code> |
| <code>camel.component.aws-kinesis.configuration.shard-id</code> | Defines which <code>shardId</code> in the Kinesis stream to get records from | | String |
| <code>camel.component.aws-kinesis.configuration.stream-name</code> | Name of the stream | | String |
| <code>camel.component.aws-kinesis.enabled</code> | Enable aws-kinesis component | true | Boolean |
| <code>camel.component.aws-kinesis.region</code> | Amazon AWS Region | | String |
| <code>camel.component.aws-kinesis.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-kinesis.secret-key</code> | Amazon AWS Secret Key | | String |

Required Kinesis component options

You have to provide the `amazonKinesisClient` in the Registry with proxies and relevant credentials configured.

27.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

27.5. USAGE

27.5.1. Message headers set by the Kinesis consumer

| Header | Type | Description |
|-------------------------------------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsKinesis SequenceNumber | String | The sequence number of the record. This is represented as a String as it size is not defined by the API. If it is to be used as a numerical type then use |
| Camel AwsKinesis ApproximateArrivalTimestamp | String | The time AWS assigned as the arrival time of the record. |
| Camel AwsKinesis PartitionKey | String | Identifies which shard in the stream the data record is assigned to. |

27.5.2. AmazonKinesis configuration

You will need to create an instance of `AmazonKinesisClient` and bind it to the registry

```
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonKinesisClient.class, null, clientConfiguration);
// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
```

```
DefaultAWSCredentialsProviderChain
```

```
registry.bind("kinesisClient", client);
```

You then have to reference the AmazonKinesisClient in the **amazonKinesisClient** URI option.

```
from("aws-kinesis://mykinesisstream?amazonKinesisClient=#kinesisClient")
    .to("log:out?showAll=true");
```

27.5.3. Providing AWS Credentials

It is recommended that the credentials are obtained by using the [DefaultAWSCredentialsProviderChain](#) that is the default when creating a new ClientConfiguration instance, however, a different [AWSCredentialsProvider](#) can be specified when calling createClient(...).

27.5.4. Message headers used by the Kinesis producer to write to Kinesis. The producer expects that the message body is a byte[].

| Header | Type | Description |
|------------------------------------------------|---------------|-------------------------------------------------------------------|
| Camel AwsKinesis PartitionKey | String | The PartitionKey to pass to Kinesis to store this record. |
| Camel AwsKinesis SequenceNumber | String | Optional paramter to indicate the sequence number of this record. |

27.5.5. Message headers set by the Kinesis producer on successful storage of a Record

| Header | Type | Description |
|------------------------------------------------|---------------|----------------------------------------------------------------------------------|
| Camel AwsKinesis SequenceNumber | String | The sequence number of the record, as defined in Response Syntax |
| Camel AwsKinesis ShardId | String | The shard ID of where the Record was stored |

27.6. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.17 or higher).

CHAPTER 28. AWS KINESIS FIREHOSE COMPONENT

Available as of Camel version 2.19

The Kinesis Firehose component supports sending messages to Amazon Kinesis Firehose service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Kinesis Firehose. More information are available at [AWS Kinesis Firehose](#)

28.1. URI FORMAT

```
aws-kinesis-firehose://delivery-stream-name[?options]
```

The stream needs to be created prior to it being used.

You can append query options to the URI in the following format, ?options=value&option2=value&...

28.2. URI OPTIONS

The AWS Kinesis Firehose component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| configuration (advanced) | The AWS Kinesis Firehose default configuration | | KinesisFirehose Configuration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | Amazon AWS Region | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Kinesis Firehose endpoint is configured using URI syntax:

```
aws-kinesis-firehose:streamName
```

with the following path and query parameters:

28.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|------------------------------------|---------|--------|
| streamName | Required Name of the stream | | String |

28.2.2. Query Parameters (7 parameters):

| Name | Description | Default | Type |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| amazonKinesisFirehoseClient (producer) | Amazon Kinesis Firehose client to use for all requests for this endpoint | | AmazonKinesisFirehose |
| proxyHost (producer) | To define a proxy host when instantiating the DDBStreams client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the DDBStreams client | | Integer |
| region (producer) | The region in which Kinesis client needs to work | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

28.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-kinesis-firehose.access-key | Amazon AWS Access Key | | String |
| camel.component.aws-kinesis-firehose.configuration.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| <code>camel.component.aws-kinesis-firehose.configuration.amazon-kinesis-firehose-client</code> | Amazon Kinesis Firehose client to use for all requests for this endpoint | | AmazonKinesisFirehose |
| <code>camel.component.aws-kinesis-firehose.configuration.proxy-host</code> | To define a proxy host when instantiating the DDBStreams client | | String |
| <code>camel.component.aws-kinesis-firehose.configuration.proxy-port</code> | To define a proxy port when instantiating the DDBStreams client | | Integer |
| <code>camel.component.aws-kinesis-firehose.configuration.region</code> | The region in which Kinesis client needs to work | | String |
| <code>camel.component.aws-kinesis-firehose.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-kinesis-firehose.configuration.stream-name</code> | Name of the stream | | String |
| <code>camel.component.aws-kinesis-firehose.enabled</code> | Enable aws-kinesis-firehose component | true | Boolean |
| <code>camel.component.aws-kinesis-firehose.region</code> | Amazon AWS Region | | String |
| <code>camel.component.aws-kinesis-firehose.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|--------------------------------------------------------------|-----------------------|---------|--------|
| <code>camel.component.aws-kinesis-firehose.secret-key</code> | Amazon AWS Secret Key | | String |

Required Kinesis Firehose component options

You have to provide the `amazonKinesisClient` in the Registry with proxies and relevant credentials configured.

28.4. USAGE

28.4.1. Amazon Kinesis Firehose configuration

You will need to create an instance of `AmazonKinesisClient` and bind it to the registry

```
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

Region region = Region.getRegion(Regions.fromName(region));
region.createClient(AmazonKinesisClient.class, null, clientConfiguration);
// the 'null' here is the AWSCredentialsProvider which defaults to an instance of
// DefaultAWSCredentialsProviderChain

registry.bind("kinesisFirehoseClient", client);
```

You then have to reference the `AmazonKinesisFirehoseClient` in the `amazonKinesisFirehoseClient` URI option.

```
from("aws-kinesis-firehose://mykinesisdeliverystream?amazonKinesisFirehoseClient=#kinesisClient")
.to("log:out?showAll=true");
```

28.4.2. Providing AWS Credentials

It is recommended that the credentials are obtained by using the `DefaultAWSCredentialsProviderChain` that is the default when creating a new `ClientConfiguration` instance, however, a different `AWSCredentialsProvider` can be specified when calling `createClient(...)`.

28.4.3. Message headers set by the Kinesis producer on successful storage of a Record

| Header | Type | Description |
|--------------------------------------------------|---------------|--------------------------------------------------------------|
| Camel AwsKinesis FirehoseRecordId | String | The record ID, as defined in Response Syntax |

28.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-aws</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.19 or higher).

CHAPTER 29. AWS KMS COMPONENT

Available as of Camel version 2.21

The KMS component supports create, run, start, stop and terminate [AWS KMS](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon KMS. More information are available at [Amazon KMS](#).

29.1. URI FORMAT

```
aws-kms://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

29.2. URI OPTIONS

The AWS KMS component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS KMS default configuration | | KMSConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which KMS client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS KMS endpoint is configured using URI syntax:

```
aws-kms:label
```

with the following path and query parameters:

29.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------|------------------------------|---------|--------|
| label | Required Logical name | | String |

29.2.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| accessKey (producer) | Amazon AWS Access Key | | String |
| kmsClient (producer) | To use a existing configured AWS KMS as client | | AWSKMS |
| operation (producer) | Required The operation to perform | | KMSOperations |
| proxyHost (producer) | To define a proxy host when instantiating the KMS client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the KMS client | | Integer |
| region (producer) | The region in which KMS client needs to work | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

29.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-kms.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| <code>camel.component.aws-kms.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-kms.configuration.kms-client</code> | To use a existing configured AWS KMS as client | | AWSKMS |
| <code>camel.component.aws-kms.configuration.operation</code> | The operation to perform | | KMSOperations |
| <code>camel.component.aws-kms.configuration.proxy-host</code> | To define a proxy host when instantiating the KMS client | | String |
| <code>camel.component.aws-kms.configuration.proxy-port</code> | To define a proxy port when instantiating the KMS client | | Integer |
| <code>camel.component.aws-kms.configuration.region</code> | The region in which KMS client needs to work | | String |
| <code>camel.component.aws-kms.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-kms.enabled</code> | Whether to enable auto configuration of the aws-kms component. This is enabled by default. | | Boolean |
| <code>camel.component.aws-kms.region</code> | The region in which KMS client needs to work | | String |
| <code>camel.component.aws-kms.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------|-----------------------|---------|--------|
| camel.component.aws-kms.secret-key | Amazon AWS Secret Key | | String |

Required KMS component options

You have to provide the `amazonKmsClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon KMS](#) service.

29.4. USAGE

29.4.1. Message headers evaluated by the MQ producer

| Header | Type | Description |
|-----------------------------------------|----------------|---------------------------------------------------------------------------------------|
| Camel AwsK MSLimit | Integer | The limit number of keys to return while performing a <code>listKeys</code> operation |
| Camel AwsK MSOperation | String | The operation we want to perform |
| Camel AwsK MSDescription | String | A key description to use while performing a <code>createKey</code> operation |
| Camel AwsK MSKeyId | String | The key Id |

29.4.2. KMS Producer operations

Camel-AWS KMS component provides the following operation on the producer side:

- `listKeys`
- `createKey`
- `disableKey`

- `scheduleKeyDeletion`
- `describeKey`
- `enableKey`

Dependencies

Maven users will need to add the following dependency to their `pom.xml`.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.16 or higher).

29.5. SEE ALSO

- [Configuring Camel](#)

- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 30. AWS LAMBDA COMPONENT

Available as of Camel version 2.20

The Lambda component supports create, get, list, delete and invoke [AWS Lambda](#) functions.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Lambda. More information are available at [Amazon Lambda](#).

When creating a Lambda function, you need to specify a IAM role which has at least the `AWSLambdaBasicExecuteRole` policy attached.

Warning

Lambda is regional service. Unlike S3 bucket, Lambda function created in a given region is not available on other regions.

30.1. URI FORMAT

```
aws-lambda://functionName[?options]
```

You can append query options to the URI in the following format, `?options=value&option2=value&...`

30.2. URI OPTIONS

The AWS Lambda component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| configuration (advanced) | The AWS Lambda default configuration | | LambdaConfigura tion |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | Amazon AWS Region | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Lambda endpoint is configured using URI syntax:

```
aws-lambda:function
```

with the following path and query parameters:

30.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------|----------------------------------------------|---------|--------|
| function | Required Name of the Lambda function. | | String |

30.2.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| operation (producer) | Required The operation to perform. It can be listFunctions, getFunction, createFunction, deleteFunction or invokeFunction | | LambdaOperations |
| region (producer) | Amazon AWS Region | | String |
| awsLambdaClient (advanced) | To use a existing configured AwsLambdaClient as client | | AWSLambda |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| proxyHost (proxy) | To define a proxy host when instantiating the Lambda client | | String |
| proxyPort (proxy) | To define a proxy port when instantiating the Lambda client | | Integer |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

30.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 13 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| <code>camel.component.aws-lambda.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-lambda.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-lambda.configuration.aws-lambda-client</code> | To use a existing configured <code>AwsLambdaClient</code> as client | | <code>AWSLambda</code> |
| <code>camel.component.aws-lambda.configuration.function</code> | Name of the Lambda function. | | String |
| <code>camel.component.aws-lambda.configuration.operation</code> | The operation to perform. It can be <code>listFunctions</code> , <code>getFunction</code> , <code>createFunction</code> , <code>deleteFunction</code> or <code>invokeFunction</code> | | <code>LambdaOperations</code> |
| <code>camel.component.aws-lambda.configuration.proxy-host</code> | To define a proxy host when instantiating the Lambda client | | String |
| <code>camel.component.aws-lambda.configuration.proxy-port</code> | To define a proxy port when instantiating the Lambda client | | Integer |
| <code>camel.component.aws-lambda.configuration.region</code> | Amazon AWS Region | | String |
| <code>camel.component.aws-lambda.configuration.secret-key</code> | Amazon AWS Secret Key | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-lambda.enabled</code> | Whether to enable auto configuration of the aws-lambda component. This is enabled by default. | | Boolean |
| <code>camel.component.aws-lambda.region</code> | Amazon AWS Region | | String |
| <code>camel.component.aws-lambda.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-lambda.secret-key</code> | Amazon AWS Secret Key | | String |

Required Lambda component options

You have to provide the `awsLambdaClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon Lambda](#) service.

30.4. USAGE

30.4.1. Message headers evaluated by the Lambda producer

| O | H | Type | Description | R |
|---|----|------|-------------|---|
| p | e | | | e |
| e | a | | | q |
| r | d | | | u |
| t | er | | | r |
| o | | | | e |
| n | | | | d |

| Operation | Header | Type | Description | Required |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| All | C a m e l A w s L a m b d a O p e r a t i o n | String | The operation we want to perform. Override operation passed as query parameter | Yes |
| createFunction | C a m e l A w s L a m b d a S 3 B u c k e t | String | Amazon S3 bucket name where the .zip file containing your deployment package is stored. This bucket must reside in the same AWS region where you are creating the Lambda function. | No |

| Operation | Header | Type | Description | Required |
|----------------|--------------------------------------|---------------|----------------------------------------------------------------------------|----------|
| createFunction | CamelAwsLambdaS3Key | String | The Amazon S3 object (the deployment package) key name you want to upload. | No |
| createFunction | CamelAwsLambdaS3ObjectVersion | String | The Amazon S3 object (the deployment package) version you want to upload. | No |

| Operation | Header | Type | Description | Required |
|----------------|------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| createFunction | CamelAWSLambdaZipFile | String | The local path of the zip file (the deployment package). Content of zip file can also be put in Message body. | No |
| createFunction | CamelAWSLambdaRole | String | The Amazon Resource Name (ARN) of the IAM role that Lambda assumes when it executes your function to access any other Amazon Web Services (AWS) resources. | Yes |

| Operation | Header | Type | Description | Required |
|-----------------|------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| create Function | CamelAWSLambdaRuntime | String | The runtime environment for the Lambda function you are uploading. (nodejs, nodejs4.3, nodejs6.10, java8, python2.7, python3.6, dotnetcore1.0, odejs4.3-edge) | Yes |
| create Function | CamelAWSLambdaHandler | String | The function within your code that Lambda calls to begin execution. For Node.js, it is the module-name.export value in your function. For Java, it can be package.class-name::handler or package.class-name. | Yes |

| Operation | Header | Type | Description | Required |
|----------------|----------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------|----------|
| createFunction | CamelAwsLambdaDescription | String | The user-provided description. | No |
| createFunction | CamelAwsLambdaTargetArn | String | The parent object that contains the target ARN (Amazon Resource Name) of an Amazon SQS queue or Amazon SNS topic. | No |

| Operation | Header | Type | Description | Required |
|-----------------|-------------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| create Function | Camel AWS Lambda Memory Size | Integer | The memory size, in MB, you configured for the function. Must be a multiple of 64 MB. | No |
| create Function | Camel AWS Lambda KMS Key Arn | String | The Amazon Resource Name (ARN) of the KMS key used to encrypt your function's environment variables. If not provided, AWS Lambda will use a default service key. | No |

| Operation | Header | Type | Description | Required |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------|----------|
| createFunction | C a m e l A w s L a m b d a P u b l i s h | Boolean | This boolean parameter can be used to request AWS Lambda to create the Lambda function and publish a version as an atomic operation. | No |
| createFunction | C a m e l A w s L a m b d a T i m e o u t | Integer | The function execution time at which Lambda should terminate the function. The default is 3 seconds. | No |

| Operation | Header | Type | Description | Required |
|----------------|--------------------------------------------------------------------------------|---------------|-----------------------------------------------------------|----------|
| createFunction | Camel Aws Lambda Tracing Config | String | Your function's tracing settings (Active or PassThrough). | No |

| Operation | Header | Type | Description | Required |
|----------------|-------------------------------------------|----------------------------------|-------------------------------------------------------------------------------|----------|
| createFunction | CamelAwsLambdaEnvironmentVariables | Map<String, String> | The key-value pairs that represent your environment's configuration settings. | No |

| Operation | Header | Type | Description | Required |
|----------------|--------------------------------------|----------------------------------|------------------------------------------------------------------|----------|
| createFunction | CamelAwsLambdaEnvironmentTags | Map<String, String> | The list of tags (key-value pairs) assigned to the new function. | No |

| Operation | Header | Type | Description | Required |
|----------------|---------------------------------------|---------------------------|-------------------------------------------------------------------------------------------------------------|----------|
| createFunction | CamelAWSLambdaSecurityGroupIds | List<String> | If your Lambda function accesses resources in a VPC, a list of one or more security groups IDs in your VPC. | No |

| Operation | Header | Type | Description | Required |
|----------------|---------------------------------------------------------------|---------------------------|----------------------------------------------------------------------------------------------------|----------|
| createFunction | Camel AWS Lambda Subnets | List<String> | If your Lambda function accesses resources in a VPC, a list of one or more subnet IDs in your VPC. | No |

30.5. LIST OF AVAILABLE OPERATIONS

- listFunctions
- getFunction,
- createFunction
- deleteFunction
- invokeFunction
- updateFunction
- createEventSourceMapping
- deleteEventSourceMapping
- listEventSourceMapping

30.6. EXAMPLE

To have a full understanding of how the component works, you may have a look at this [integration test](#)

30.7. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.16 or higher).

30.8. SEE ALSO

- [Configuring Camel](#)

- [Endpoint](#)
- [Getting Started](#)
- [AWS Component](#)

CHAPTER 31. AWS MQ COMPONENT

Available as of Camel version 2.21

The EC2 component supports create, run, start, stop and terminate [AWS MQ](#) instances.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon MQ. More information are available at [Amazon MQ](#).

31.1. URI FORMAT

```
aws-mq://label[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

31.2. URI OPTIONS

The AWS MQ component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| configuration (advanced) | The AWS MQ default configuration | | MQConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which MQ client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS MQ endpoint is configured using URI syntax:

```
aws-mq:label
```

with the following path and query parameters:

31.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------|------------------------------|---------|--------|
| label | Required Logical name | | String |

31.2.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| accessKey (producer) | Amazon AWS Access Key | | String |
| amazonMqClient (producer) | To use a existing configured AmazonMQClient as client | | AmazonMQ |
| operation (producer) | Required The operation to perform. It can be listBrokers,createBroker,deleteBroker | | MQOperations |
| proxyHost (producer) | To define a proxy host when instantiating the MQ client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the MQ client | | Integer |
| region (producer) | The region in which MQ client needs to work | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

31.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-mq.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| <code>camel.component.aws-mq.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-mq.configuration.amazon-mq-client</code> | To use a existing configured AmazonMQClient as client | | AmazonMQ |
| <code>camel.component.aws-mq.configuration.operation</code> | The operation to perform. It can be <code>listBrokers</code> , <code>createBroker</code> , <code>deleteBroker</code> | | MQOperations |
| <code>camel.component.aws-mq.configuration.proxy-host</code> | To define a proxy host when instantiating the MQ client | | String |
| <code>camel.component.aws-mq.configuration.proxy-port</code> | To define a proxy port when instantiating the MQ client | | Integer |
| <code>camel.component.aws-mq.configuration.region</code> | The region in which MQ client needs to work | | String |
| <code>camel.component.aws-mq.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-mq.enabled</code> | Whether to enable auto configuration of the <code>aws-mq</code> component. This is enabled by default. | | Boolean |
| <code>camel.component.aws-mq.region</code> | The region in which MQ client needs to work | | String |
| <code>camel.component.aws-mq.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|-----------------------------------|-----------------------|---------|--------|
| camel.component.aws-mq.secret-key | Amazon AWS Secret Key | | String |

Required EC2 component options

You have to provide the amazonEc2Client in the Registry or your accessKey and secretKey to access the [Amazon EC2](#) service.

31.4. USAGE

31.4.1. Message headers evaluated by the MQ producer

| Header | Type | Description |
|--------------------------------|--------|-------------------------------------------------------------------------|
| CamelAwsMQMaxResults | String | The number of results that must be retrieved from listBrokers operation |
| CamelAwsMQBrokerName | String | The broker name |
| CamelAwsMQOperation | String | The operation we want to perform |
| CamelAwsMQBrokerId | String | The broker id |
| CamelAwsMQBrokerDeploymentMode | String | The deployment mode for the broker in the createBroker operation |

| Header | Type | Description |
|------------------------------------------------|-------------------------|--------------------------------------------------------------------------------------------------|
| Camel AwsMQBrokerInstanceType | String | The instance type for the EC2 machine in the createBroker operation |
| Camel AwsMQBrokerEngine | String | The Broker Engine for MQ. Default is ACTIVEMQ |
| Camel AwsMQBrokerEngineVersion | String | The Broker Engine Version for MQ. Currently you can choose between 5.15.6 and 5.15.0 of ACTIVEMQ |
| Camel AwsMQBrokerUsers | List<User> | The list of users for MQ |
| Camel AwsMQBrokerPubliclyAccessible | Boolean | If the MQ instance must be publicly available or not. Default is false. |

Dependencies

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.16 or higher).

- [Getting Started](#)
- [AWS Component](#)

CHAPTER 32. AWS S3 STORAGE SERVICE COMPONENT

Available as of Camel version 2.8

The S3 component supports storing and retrieving objects from/to [Amazon's S3](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon S3. More information are available at [Amazon S3](#).

32.1. URI FORMAT

```
aws-s3://bucketNameOrArn[?options]
```

The bucket will be created if it don't already exists.

You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to read file **hello.txt** from bucket **helloBucket**, use the following snippet:

```
from("aws-s3:helloBucket?accessKey=yourAccessKey&secretKey=yourSecretKey&prefix=hello.txt")
.to("file:/var/downloaded");
```

32.2. URI OPTIONS

The AWS S3 Storage Service component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| configuration (advanced) | The AWS S3 default configuration | | S3Configuration |
| accessKey (common) | Amazon AWS Access Key | | String |
| secretKey (common) | Amazon AWS Secret Key | | String |
| region (common) | The region where the bucket is located. This option is used in the <code>com.amazonaws.services.s3.model.CreateBucketRequest</code> . | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS S3 Storage Service endpoint is configured using URI syntax:

aws-s3:bucketNameOrArn

with the following path and query parameters:

32.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------|-----------------------------|---------|--------|
| bucketNameOrArn | Required Bucket name or ARN | | String |

32.2.2. Query Parameters (50 parameters):

| Name | Description | Default | Type |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| amazonS3Client (common) | Reference to a com.amazonaws.services.sqs.AmazonS3 in the link: https://camel.apache.org/registry.htmlRegistry . | | AmazonS3 |
| pathStyleAccess (common) | Whether or not the S3 client should use path style access | false | boolean |
| policy (common) | The policy for this queue to set in the com.amazonaws.services.s3.AmazonS3#setBucketPolicy() method. | | String |
| proxyHost (common) | To define a proxy host when instantiating the SQS client | | String |
| proxyPort (common) | Specify a proxy port to be used inside the client definition. | | Integer |
| region (common) | The region in which S3 client needs to work | | String |
| useIAMCredentials (common) | Set whether the S3 client should expect to load credentials on an EC2 instance or to expect static credentials to be passed in. | false | boolean |
| encryptionMaterials (common) | The encryption materials to use in case of Symmetric/Asymmetric client usage | | EncryptionMaterials |
| useEncryption (common) | Define if encryption must be used or not | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| deleteAfterRead (consumer) | Delete objects from S3 after they have been retrieved. The delete is only performed if the Exchange is committed. If a rollback occurs, the object is not deleted. If this option is false, then the same objects will be retrieve over and over again on the polls. Therefore you need to use the Idempotent Consumer EIP in the route to filter out duplicates. You can filter using the <code>S3Constants#BUCKET_NAME</code> and <code>S3Constants#KEY</code> headers, or only the <code>S3Constants#KEY</code> header. | true | boolean |
| fileName (consumer) | To get the object from the bucket with the given file name | | String |
| includeBody (consumer) | If it is true, the exchange body will be set to a stream to the contents of the file. If false, the headers will be set with the S3 object metadata, but the body will be null. This option is strongly related to <code>autocloseBody</code> option. In case of setting <code>includeBody</code> to true and <code>autocloseBody</code> to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting <code>autocloseBody</code> to true, will close the <code>S3Object</code> stream automatically. | true | boolean |
| maxConnections (consumer) | Set the <code>maxConnections</code> parameter in the S3 client configuration | 60 | int |
| maxMessagesPerPoll (consumer) | Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited. | 10 | int |
| prefix (consumer) | The prefix which is used in the <code>com.amazonaws.services.s3.model.ListObjectsRequest</code> to only consume objects we are interested in. | | String |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |

| Name | Description | Default | Type |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------------------------------------------|
| autocloseBody (consumer) | If this option is true and includeBody is true, then the <code>S3Object.close()</code> method will be called on exchange completion. This option is strongly related to includeBody option. In case of setting includeBody to true and autocloseBody to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting autocloseBody to true, will close the <code>S3Object</code> stream automatically. | true | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at <code>WARN</code> or <code>ERROR</code> level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an <code>Exchange</code> have been created and being routed in Camel. | | <code>PollingConsumerPollStrategy</code> |
| deleteAfterWrite (producer) | Delete file object after the <code>S3</code> file has been uploaded | false | boolean |
| multiPartUpload (producer) | If it is true, camel will upload the file with multi part format, the part size is decided by the option of <code>partSize</code> | false | boolean |
| operation (producer) | The operation to do in case the user don't want to do only an upload | | <code>S3Operations</code> |
| partSize (producer) | Setup the <code>partSize</code> which is used in multi part upload, the default size is 25M. | 26214400 | long |
| serverSideEncryption (producer) | Sets the server-side encryption algorithm when encrypting the object using AWS-managed keys. For example use <code>AES256</code> . | | String |
| storageClass (producer) | The storage class to set in the <code>com.amazonaws.services.s3.model.PutObjectRequest</code> request. | | String |
| awsKMSKeyId (producer) | Define the id of KMS key to use in case KMS is enabled | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| useAwsKMS (producer) | Define if KMS must be used or not | false | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accelerateModeEnabled (advanced) | Define if Accelerate Mode enabled is true or false | false | boolean |
| chunkedEncodingDisabled (advanced) | Define if disabled Chunked Encoding is true or false | false | boolean |
| dualstackEnabled (advanced) | Define if Dualstack enabled is true or false | false | boolean |
| forceGlobalBucketAccessEnabled (advanced) | Define if Force Global Bucket Access enabled is true or false | false | boolean |
| payloadSigningEnabled (advanced) | Define if Payload Signing enabled is true or false | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------------------------|
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LogLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumerScheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

32.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 34 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-s3.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| <code>camel.component.aws-s3.configuration.accelerate-mode-enabled</code> | Define if Accelerate Mode enabled is true or false | false | Boolean |
| <code>camel.component.aws-s3.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-s3.configuration.amazon-s3-client</code> | Reference to a <code>com.amazonaws.services.sqs.AmazonS3</code> in the link: https://camel.apache.org/registry.htmlRegistry . | | AmazonS3 |
| <code>camel.component.aws-s3.configuration.autoclose-body</code> | If this option is true and <code>includeBody</code> is true, then the <code>S3Object.close()</code> method will be called on exchange completion. This option is strongly related to <code>includeBody</code> option. In case of setting <code>includeBody</code> to true and <code>autocloseBody</code> to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting <code>autocloseBody</code> to true, will close the <code>S3Object</code> stream automatically. | true | Boolean |
| <code>camel.component.aws-s3.configuration.aws-k-m-s-key-id</code> | Define the id of KMS key to use in case KMS is enabled | | String |
| <code>camel.component.aws-s3.configuration.bucket-name</code> | Name of the bucket. The bucket will be created if it doesn't already exists. | | String |
| <code>camel.component.aws-s3.configuration.chunked-encoding-disabled</code> | Define if disabled Chunked Encoding is true or false | false | Boolean |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| <code>camel.component.aws-s3.configuration.delete-after-read</code> | Delete objects from S3 after they have been retrieved. The delete is only performed if the Exchange is committed. If a rollback occurs, the object is not deleted. If this option is false, then the same objects will be retrieve over and over again on the polls. Therefore you need to use the Idempotent Consumer EIP in the route to filter out duplicates. You can filter using the <code>S3Constants#BUCKET_NAME</code> and <code>S3Constants#KEY</code> headers, or only the <code>S3Constants#KEY</code> header. | true | Boolean |
| <code>camel.component.aws-s3.configuration.delete-after-write</code> | Delete file object after the S3 file has been uploaded | false | Boolean |
| <code>camel.component.aws-s3.configuration.dualstack-enabled</code> | Define if Dualstack enabled is true or false | false | Boolean |
| <code>camel.component.aws-s3.configuration.encryption-materials</code> | The encryption materials to use in case of Symmetric/Asymmetric client usage | | EncryptionMaterials |
| <code>camel.component.aws-s3.configuration.file-name</code> | To get the object from the bucket with the given file name | | String |
| <code>camel.component.aws-s3.configuration.force-global-bucket-access-enabled</code> | Define if Force Global Bucket Access enabled is true or false | false | Boolean |
| <code>camel.component.aws-s3.configuration.include-body</code> | If it is true, the exchange body will be set to a stream to the contents of the file. If false, the headers will be set with the S3 object metadata, but the body will be null. This option is strongly related to <code>autocloseBody</code> option. In case of setting <code>includeBody</code> to true and <code>autocloseBody</code> to false, it will be up to the caller to close the <code>S3Object</code> stream. Setting <code>autocloseBody</code> to true, will close the <code>S3Object</code> stream automatically. | true | Boolean |

| Name | Description | Default | Type |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|----------|--------------|
| camel.component.aws-s3.configuration.multi-part-upload | If it is true, camel will upload the file with multi part format, the part size is decided by the option of partSize | false | Boolean |
| camel.component.aws-s3.configuration.operation | The operation to do in case the user don't want to do only an upload | | S3Operations |
| camel.component.aws-s3.configuration.part-size | Setup the partSize which is used in multi part upload, the default size is 25M. | 26214400 | Long |
| camel.component.aws-s3.configuration.path-style-access | Whether or not the S3 client should use path style access | false | Boolean |
| camel.component.aws-s3.configuration.payload-signing-enabled | Define if Payload Signing enabled is true or false | false | Boolean |
| camel.component.aws-s3.configuration.policy | The policy for this queue to set in the com.amazonaws.services.s3.AmazonS3#setBucketPolicy() method. | | String |
| camel.component.aws-s3.configuration.prefix | The prefix which is used in the com.amazonaws.services.s3.model.ListObjectsRequest to only consume objects we are interested in. | | String |
| camel.component.aws-s3.configuration.proxy-host | To define a proxy host when instantiating the SQS client | | String |
| camel.component.aws-s3.configuration.proxy-port | Specify a proxy port to be used inside the client definition. | | Integer |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-s3.configuration.region</code> | The region in which S3 client needs to work | | String |
| <code>camel.component.aws-s3.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-s3.configuration.server-side-encryption</code> | Sets the server-side encryption algorithm when encrypting the object using AWS-managed keys. For example use AES256. | | String |
| <code>camel.component.aws-s3.configuration.storage-class</code> | The storage class to set in the <code>com.amazonaws.services.s3.model.PutObjectRequest</code> request. | | String |
| <code>camel.component.aws-s3.configuration.use-aws-k-m-s</code> | Define if KMS must be used or not | false | Boolean |
| <code>camel.component.aws-s3.configuration.use-encryption</code> | Define if encryption must be used or not | false | Boolean |
| <code>camel.component.aws-s3.enabled</code> | Enable aws-s3 component | true | Boolean |
| <code>camel.component.aws-s3.region</code> | The region where the bucket is located. This option is used in the <code>com.amazonaws.services.s3.model.CreateBucketRequest</code> . | | String |
| <code>camel.component.aws-s3.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|-----------------------------------|-----------------------|---------|--------|
| camel.component.aws-s3.secret-key | Amazon AWS Secret Key | | String |

Required S3 component options

You have to provide the amazonS3Client in the Registry or your accessKey and secretKey to access the [Amazon's S3](#).

32.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

32.5. USAGE

32.5.1. Message headers evaluated by the S3 producer

| Header | Type | Description |
|---------------------------------|--------|--------------------------------------------------------------------------------------------------|
| CamelAwsS3BucketName | String | The bucket Name which this object will be stored or which will be used for the current operation |
| CamelAwsS3BucketDestinationName | String | Camel 2.18: The bucket Destination Name which will be used for the current operation |
| CamelAwsS3ContentLength | Long | The content length of this object. |
| CamelAwsS3ContentType | String | The content type of this object. |

| Header | Type | Description |
|--------------------------------------------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsS 3Cont entCo ntrol | String | Camel 2.8.2: The content control of this object. |
| Camel AwsS 3Cont entDis positi on | String | Camel 2.8.2: The content disposition of this object. |
| Camel AwsS 3Cont entEn codin g | String | Camel 2.8.2: The content encoding of this object. |
| Camel AwsS 3Cont entMD 5 | String | Camel 2.8.2: The md5 checksum of this object. |
| Camel AwsS 3Desti nation Key | String | Camel 2.18: The Destination key which will be used for the current operation |
| Camel AwsS 3Key | String | The key under which this object will be stored or which will be used for the current operation |
| Camel AwsS 3Last Modifi ed | java.u til.Dat e | Camel 2.8.2: The last modified timestamp of this object. |
| Camel AwsS 3Oper ation | String | Camel 2.18: The operation to perform. Permitted values are copyObject, deleteObject, listBuckets, deleteBucket, downloadLink, listObjects |

| Header | Type | Description |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsS 3Stora geCla ss | String | Camel 2.8.4: The storage class of this object. |
| Camel AwsS 3Cann edAcl | String | Camel 2.11.0: The canned acl that will be applied to the object. see com.amazonaws.services.s3.model.CannedAccessControlList for allowed values. |
| Camel AwsS 3Acl | com.a mazo naws. servic es.s3. model .Acce ssCon trolLis t | Camel 2.11.0: a well constructed Amazon S3 Access Control List object. see com.amazonaws.services.s3.model.AccessControlList for more details |
| Camel AwsS 3Head ers | Map< String ,Strin g> | Camel 2.15.0: support to get or set custom objectMetadata headers. |
| Camel AwsS 3Serv erSide Encry ption | String | Camel 2.16: Sets the server-side encryption algorithm when encrypting the object using AWS-managed keys. For example use AES256. |
| Camel AwsS 3Versi onId | String | The version Id of the object to be stored or returned from the current operation |

32.5.2. Message headers set by the S3 producer

| Header | Type | Description |
|---------------------------------|---------------|-----------------------------------------------|
| Camel AwsS 3ETag | String | The ETag value for the newly uploaded object. |

| Header | Type | Description |
|-----------------------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------|
| CamelAwsS3VersionId | String | The optional version ID of the newly uploaded object. |
| CamelAwsS3DownloadLinkExpiration | String | The expiration (millis) of URL download link. The link will be stored into CamelAwsS3DownloadLink response header. |

32.5.3. Message headers set by the S3 consumer

| Header | Type | Description |
|-------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CamelAwsS3Key | String | The key under which this object is stored. |
| CamelAwsS3BucketName | String | The name of the bucket in which this object is contained. |
| CamelAwsS3ETag | String | The hex encoded 128-bit MD5 digest of the associated object according to RFC 1864. This data is used as an integrity check to verify that the data received by the caller is the same data that was sent by Amazon S3. |
| CamelAwsS3LastModified | Date | The value of the Last-Modified header, indicating the date and time at which Amazon S3 last recorded a modification to the associated object. |
| CamelAwsS3VersionId | String | The version ID of the associated Amazon S3 object if available. Version IDs are only assigned to objects when an object is uploaded to an Amazon S3 bucket that has object versioning enabled. |
| CamelAwsS3ContentType | String | The Content-Type HTTP header, which indicates the type of content stored in the associated object. The value of this header is a standard MIME type. |

| Header | Type | Description |
|--------------------------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsS3ContentMD5 | String | The base64 encoded 128-bit MD5 digest of the associated object (content - not including headers) according to RFC 1864. This data is used as a message integrity check to verify that the data received by Amazon S3 is the same data that the caller sent. |
| Camel AwsS3ContentLength | Long | The Content-Length HTTP header indicating the size of the associated object in bytes. |
| Camel AwsS3ContentEncoding | String | The optional Content-Encoding HTTP header specifying what content encodings have been applied to the object and what decoding mechanisms must be applied in order to obtain the media-type referenced by the Content-Type field. |
| Camel AwsS3ContentDisposition | String | The optional Content-Disposition HTTP header, which specifies presentational information such as the recommended filename for the object to be saved as. |
| Camel AwsS3ContentControl | String | The optional Cache-Control HTTP header which allows the user to specify caching behavior along the HTTP request/reply chain. |
| Camel AwsS3ServerSideEncryption | String | Camel 2.16: The server-side encryption algorithm when encrypting the object using AWS-managed keys. |

32.5.4. S3 Producer operations

Camel-AWS s3 component provides the following operation on the producer side:

- copyObject
- deleteObject
- listBuckets
- deleteBucket

- `downloadLink`
- `listObjects`

32.5.5. Advanced AmazonS3 configuration

If your Camel Application is running behind a firewall or if you need to have more control over the **AmazonS3** instance configuration, you can create your own instance:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");

ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonS3 client = new AmazonS3Client(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

and refer to it in your Camel `aws-s3` component configuration:

```
from("aws-s3://MyBucket?amazonS3Client=#client&delay=5000&maxMessagesPerPoll=5")
.to("mock:result");
```

32.5.6. Use KMS with the S3 component

To use AWS KMS to encrypt/decrypt data by using AWS infrastructure you can use the options introduced in 2.21.x like in the following example

```
from("file:tmp/test?fileName=test.txt")
.setHeader(S3Constants.KEY, constant("testFile"))
.to("aws-s3://mybucket?amazonS3Client=#client&useAwsKMS=true&awsKMSKeyId=3f0637ad-296a-3dfe-a796-e60654fb128c");
```

In this way you'll ask to S3, to use the KMS key `3f0637ad-296a-3dfe-a796-e60654fb128c`, to encrypt the file `test.txt`. When you'll ask to download this file, the decryption will be done directly before the download.

32.5.7. Use "useIAMCredentials" with the s3 component

To use AWS IAM credentials, you must first verify that the EC2 in which you are launching the Camel application on has an IAM role associated with it containing the appropriate policies attached to run effectively. Keep in mind that this feature should only be set to "true" on remote instances. To clarify even further, you must still use static credentials locally since IAM is an AWS specific component, but AWS environments should now be easier to manage. After this is implemented and understood, you can set the query parameter "useIAMCredentials" to "true" for AWS environments! To effectively toggle this on and off based on local and remote environments, you can consider enabling this query parameter with system environment variables. For example, your code could set the "useIAMCredentials" query parameter to "true", when the system environment variable called "isRemote" is set to true (there are many other ways to do this and this should act as a simple example). Although it doesn't take away the need for static credentials completely, using IAM credentials on AWS environments takes away the need to refresh on remote environments and adds a major security boost (IAM credentials are refreshed automatically every 6 hours and update when their policies are updated). This is the AWS recommended way to manage credentials and therefore should be used as often as possible.

32.6. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.8 or higher).

CHAPTER 33. AWS SIMPLEDB COMPONENT

Available as of Camel version 2.9

The sdb component supports storing and retrieving data from/to [Amazon's SDB](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SDB. More information are available at [Amazon SDB](#).

33.1. URI FORMAT

```
aws-sdb://domainName[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

33.2. URI OPTIONS

The AWS SimpleDB component has no options.

The AWS SimpleDB endpoint is configured using URI syntax:

```
aws-sdb:domainName
```

with the following path and query parameters:

33.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|---------------------------------------------------------------|---------|--------|
| domainName | Required The name of the domain currently worked with. | | String |

33.2.2. Query Parameters (10 parameters):

| Name | Description | Default | Type |
|--------------------------------------|------------------------------------------------------------------------------------|---------|----------------|
| accessKey (producer) | Amazon AWS Access Key | | String |
| amazonSDBClient (producer) | To use the AmazonSimpleDB as the client | | AmazonSimpleDB |
| consistentRead (producer) | Determines whether or not strong consistency should be enforced when data is read. | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------------|---------------|
| maxNumberOfDomains (producer) | The maximum number of domain names you want returned. The range is 1 to 100. | | Integer |
| operation (producer) | Operation to perform | PutAttributes | SdbOperations |
| proxyHost (producer) | To define a proxy host when instantiating the SDB client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the SDB client | | Integer |
| region (producer) | The region in which SDB client needs to work | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

33.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.aws-sdb.enabled | Enable aws-sdb component | true | Boolean |
| camel.component.aws-sdb.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

Required SDB component options

You have to provide the `amazonSDBClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SDB](#).

33.4. USAGE

33.4.1. Message headers evaluated by the SDB producer

| Header | Type | Description |
|--------------------------------------------------------------------|------------------------------------------------------------|------------------------------------------------------------------------------------|
| Camel AwsS dbAttr ibutes | Collec tion< Attrib ute> | List of attributes to be acted upon. |
| Camel AwsS dbAttr ibuteN ames | Collec tion<S tring> | The names of the attributes to be retrieved. |
| Camel AwsS dbCo nsiste ntRea d | Boole an | Determines whether or not strong consistency should be enforced when data is read. |
| Camel AwsS dbDel etable Items | Collec tion< Deleta bleIte m> | A list of items on which to perform the delete operation in a batch. |
| Camel AwsS dbDo mainN ame | String | The name of the domain currently worked with. |
| Camel AwsS dbIte mNam e | String | The unique key for this item |
| Camel AwsS dbMa xNum berOf Domai ns | Intege r | The maximum number of domain names you want returned. The range is 1 * to 100. |
| Camel AwsS dbNex tToke n | String | A string specifying where to start the next list of domain/item names. |

| Header | Type | Description |
|------------------------------------------------------------------|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Camel AwsS dbOp eratio n | String | To override the operation from the URI options. |
| Camel AwsS dbRep laceab leAttri butes | Collec tion< Repla ceable Attrib ute> | List of attributes to put in an Item. |
| Camel AwsS dbRep laceab leItem s | Collec tion< Repla ceable Item> | A list of items to put in a Domain. |
| Camel AwsS dbSel ectEx pressi on | String | The expression used to query the domain. |
| Camel AwsS dbUp dateC onditi on | Updat eCondi tion | The update condition which, if specified, determines whether the specified attributes will be updated/deleted or not. |

33.4.2. Message headers set during DomainMetadata operation

| Header | Type | Description |
|-------------------------------------------------|---------------------|--------------------------------------------------------------------------|
| Camel AwsS dbTim estam p | Intege r | The data and time when metadata was calculated, in Epoch (UNIX) seconds. |

| Header | Type | Description |
|----------------------------------------------------------------|---------------------|-----------------------------------------------------------------------|
| Camel AwsS dbIte mCou nt | Intege r | The number of all items in the domain. |
| Camel AwsS dbAttr ibuteN ameC ount | Intege r | The number of unique attribute names in the domain. |
| Camel AwsS dbAttr ibuteV alueC ount | Intege r | The number of all attribute name/value pairs in the domain. |
| Camel AwsS dbAttr ibuteN ameSi ze | Long | The total size of all unique attribute names in the domain, in bytes. |
| Camel AwsS dbAttr ibuteV alueSi ze | Long | The total size of all attribute values in the domain, in bytes. |
| Camel AwsS dbIte mNam eSize | Long | The total size of all item names in the domain, in bytes. |

33.4.3. Message headers set during GetAttributes operation

| Header | Type | Description |
|---------------------------------------------|----------------------------------------|---------------------------------------------------|
| Camel AwsS dbAttr ibutes | List<A ttribut e> | The list of attributes returned by the operation. |

33.4.4. Message headers set during ListDomains operation

| Header | Type | Description |
|---------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------|
| Camel AwsS dbDo mainN ames | List<S tring> | A list of domain names that match the expression. |
| Camel AwsS dbNex tToke n | String | An opaque token indicating that there are more domains than the specified MaxNumberOfDomains still available. |

33.4.5. Message headers set during Select operation

| Header | Type | Description |
|-------------------------------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel AwsS dbIte ms | List<I tem> | A list of items that match the select expression. |
| Camel AwsS dbNex tToke n | String | An opaque token indicating that more items than MaxNumberOfItems were matched, the response size exceeded 1 megabyte, or the execution time exceeded 5 seconds. |

33.4.6. Advanced AmazonSimpleDB configuration

If you need more control over the **AmazonSimpleDB** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-sdb://domainName?amazonSDBClient=#client");
```

The **#client** refers to a **AmazonSimpleDB** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonSimpleDB client = new AmazonSimpleDBClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

33.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.8.4 or higher).

CHAPTER 34. AWS SIMPLE EMAIL SERVICE COMPONENT

Available as of Camel version 2.9

The ses component supports sending emails with [Amazon's SES](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SES. More information are available at [Amazon SES](#).

34.1. URI FORMAT

```
aws-ses://from[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

34.2. URI OPTIONS

The AWS Simple Email Service component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS SES default configuration | | SesConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which SES client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Simple Email Service endpoint is configured using URI syntax:

```
aws-ses:from
```

with the following path and query parameters:

34.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------|---------------------------------------------|---------|--------|
| from | Required The sender's email address. | | String |

34.2.2. Query Parameters (11 parameters):

| Name | Description | Default | Type |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| amazonSESClient (producer) | To use the AmazonSimpleEmailService as the client | | AmazonSimpleEmail Service |
| proxyHost (producer) | To define a proxy host when instantiating the SES client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the SES client | | Integer |
| region (producer) | The region in which SES client needs to work | | String |
| replyToAddresses (producer) | List of reply-to email address(es) for the message, override it using 'CamelAwsSesReplyToAddresses' header. | | List |
| returnPath (producer) | The email address to which bounce notifications are to be forwarded, override it using 'CamelAwsSesReturnPath' header. | | String |
| subject (producer) | The subject which is used if the message header 'CamelAwsSesSubject' is not present. | | String |
| to (producer) | List of destination email address. Can be overridden with 'CamelAwsSesTo' header. | | List |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

34.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| <code>camel.component.aws-ses.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ses.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-ses.configuration.amazon-s-e-s-client</code> | To use the AmazonSimpleEmailService as the client | | AmazonSimpleEmailService |
| <code>camel.component.aws-ses.configuration.from</code> | The sender's email address. | | String |
| <code>camel.component.aws-ses.configuration.proxy-host</code> | To define a proxy host when instantiating the SES client | | String |
| <code>camel.component.aws-ses.configuration.proxy-port</code> | To define a proxy port when instantiating the SES client | | Integer |
| <code>camel.component.aws-ses.configuration.region</code> | The region in which SES client needs to work | | String |
| <code>camel.component.aws-ses.configuration.reply-to-addresses</code> | List of reply-to email address(es) for the message, override it using 'CamelAwsSesReplyToAddresses' header. | | List |
| <code>camel.component.aws-ses.configuration.return-path</code> | The email address to which bounce notifications are to be forwarded, override it using 'CamelAwsSesReturnPath' header. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-ses.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-ses.configuration.subject</code> | The subject which is used if the message header 'CamelAwsSesSubject' is not present. | | String |
| <code>camel.component.aws-ses.configuration.to</code> | List of destination email address. Can be overridden with 'CamelAwsSesTo' header. | | List |
| <code>camel.component.aws-ses.enabled</code> | Enable aws-ses component | true | Boolean |
| <code>camel.component.aws-ses.region</code> | The region in which SES client needs to work | | String |
| <code>camel.component.aws-ses.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-ses.secret-key</code> | Amazon AWS Secret Key | | String |

Required SES component options

You have to provide the `amazonSESClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SES](#).

34.4. USAGE

34.4.1. Message headers evaluated by the SES producer

| Header | Type | Description |
|------------------------|---------------|-----------------------------|
| CamelAwsSesFrom | String | The sender's email address. |

| Header | Type | Description |
|-------------------------------------------------------------|--------------------------------|----------------------------------------------------------------------|
| Camel AwsS esTo | List<S tring> | The destination(s) for this email. |
| Camel AwsS esSub ject | String | The subject of the message. |
| Camel AwsS esRep lyToA ddres ses | List<S tring> | The reply-to email address(es) for the message. |
| Camel AwsS esRet urnPa th | String | The email address to which bounce notifications are to be forwarded. |
| Camel AwsS esHtm lEmail | Boole an | Since Camel 2.12.3 The flag to show if email content is HTML. |

34.4.2. Message headers set by the SES producer

| Header | Type | Description |
|-------------------------------------------------|---------------|----------------------------|
| Camel AwsS esMes sageI d | String | The Amazon SES message ID. |

34.4.3. Advanced AmazonSimpleEmailService configuration

If you need more control over the **AmazonSimpleEmailService** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-ses://example@example.com?amazonSESCient=#client");
```

The **#client** refers to a **AmazonSimpleEmailService** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
AmazonSimpleEmailService client = new AmazonSimpleEmailServiceClient(awsCredentials,
clientConfiguration);

registry.bind("client", client);
```

34.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.8.4 or higher).

CHAPTER 35. AWS SIMPLE NOTIFICATION SYSTEM COMPONENT

Available as of Camel version 2.8

The SNS component allows messages to be sent to an [Amazon Simple Notification Topic](#). The implementation of the Amazon API is provided by the [AWS SDK](#).

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SNS. More information are available at [Amazon SNS](#).

35.1. URI FORMAT

```
aws-sns://topicNameOrArn[?options]
```

The topic will be created if they don't already exists.

You can append query options to the URI in the following format, **?options=value&option2=value&...**

35.2. URI OPTIONS

The AWS Simple Notification System component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS SNS default configuration | | SnsConfiguration |
| accessKey (producer) | Amazon AWS Access Key | | String |
| secretKey (producer) | Amazon AWS Secret Key | | String |
| region (producer) | The region in which SNS client needs to work | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Simple Notification System endpoint is configured using URI syntax:

```
aws-sns:topicNameOrArn
```

with the following path and query parameters:

35.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------------|-----------------------------------|---------|--------|
| topicNameOrArn | Required Topic name or ARN | | String |

35.2.2. Query Parameters (11 parameters):

| Name | Description | Default | Type |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| amazonSNSClient (producer) | To use the AmazonSNS as the client | | AmazonSNS |
| headerFilterStrategy (producer) | To use a custom HeaderFilterStrategy to map headers to/from Camel. | | HeaderFilterStrategy |
| messageStructure (producer) | The message structure to use such as json | | String |
| policy (producer) | The policy for this queue | | String |
| proxyHost (producer) | To define a proxy host when instantiating the SNS client | | String |
| proxyPort (producer) | To define a proxy port when instantiating the SNS client | | Integer |
| region (producer) | The region in which SNS client needs to work | | String |
| subject (producer) | The subject which is used if the message header 'CamelAwsSnsSubject' is not present. | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

35.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------|----------------------------------------------------------|---------|-----------|
| <code>camel.component.aws-sns.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-sns.configuration.access-key</code> | Amazon AWS Access Key | | String |
| <code>camel.component.aws-sns.configuration.amazon-s-n-s-client</code> | To use the AmazonSNS as the client | | AmazonSNS |
| <code>camel.component.aws-sns.configuration.message-structure</code> | The message structure to use such as json | | String |
| <code>camel.component.aws-sns.configuration.policy</code> | The policy for this queue | | String |
| <code>camel.component.aws-sns.configuration.proxy-host</code> | To define a proxy host when instantiating the SNS client | | String |
| <code>camel.component.aws-sns.configuration.proxy-port</code> | To define a proxy port when instantiating the SNS client | | Integer |
| <code>camel.component.aws-sns.configuration.region</code> | The region in which SNS client needs to work | | String |
| <code>camel.component.aws-sns.configuration.secret-key</code> | Amazon AWS Secret Key | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-sns.configuration.subject</code> | The subject which is used if the message header 'CamelAwsSnsSubject' is not present. | | String |
| <code>camel.component.aws-sns.configuration.topic-arn</code> | The Amazon Resource Name (ARN) assigned to the created topic. | | String |
| <code>camel.component.aws-sns.configuration.topic-name</code> | The name of the topic | | String |
| <code>camel.component.aws-sns.enabled</code> | Enable aws-sns component | true | Boolean |
| <code>camel.component.aws-sns.region</code> | The region in which SNS client needs to work | | String |
| <code>camel.component.aws-sns.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-sns.secret-key</code> | Amazon AWS Secret Key | | String |

Required SNS component options

You have to provide the `amazonSNSClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SNS](#).

35.4. USAGE

35.4.1. Message headers evaluated by the SNS producer

| Header | Type | Description |
|---------------------------|---------------|---------------------------------------------------------------------------------------------------|
| CamelAwsSnsSubject | String | The Amazon SNS message subject. If not set, the subject from the SnsConfiguration is used. |

35.4.2. Message headers set by the SNS producer

| Header | Type | Description |
|-------------------------------------------------|---------------|----------------------------|
| Camel AwsS nsMes sageI d | String | The Amazon SNS message ID. |

35.4.3. Advanced AmazonSNS configuration

If you need more control over the **AmazonSNS** instance configuration you can create your own instance and refer to it from the URI:

```
from("direct:start")
.to("aws-sns://MyTopic?amazonSNSClient=#client");
```

The **#client** refers to a **AmazonSNS** in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
AmazonSNS client = new AmazonSNSClient(awsCredentials, clientConfiguration);

registry.bind("client", client);
```

35.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.8 or higher).

CHAPTER 36. AWS SIMPLE QUEUE SERVICE COMPONENT

Available as of Camel version 2.6

The sqs component supports sending and receiving messages to [Amazon's SQS](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon SQS. More information are available at [Amazon SQS](#).

36.1. URI FORMAT

```
aws-sqs://queueNameOrArn[?options]
```

The queue will be created if they don't already exists.

You can append query options to the URI in the following format, ?options=value&option2=value&...

36.2. URI OPTIONS

The AWS Simple Queue Service component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS SQS default configuration | | SqsConfiguration |
| accessKey (common) | Amazon AWS Access Key | | String |
| secretKey (common) | Amazon AWS Secret Key | | String |
| region (common) | Specify the queue region which could be used with queueOwnerAWSAccountId to build the service URL. | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Simple Queue Service endpoint is configured using URI syntax:

```
aws-sqs:queueNameOrArn
```

with the following path and query parameters:

36.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------------|-----------------------------------|---------|--------|
| queueNameOrArn | Required Queue name or ARN | | String |

36.2.2. Query Parameters (49 parameters):

| Name | Description | Default | Type |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|----------------------|
| amazonAWSHost (common) | The hostname of the Amazon AWS cloud. | amazonaws.com | String |
| amazonSQSClient (common) | To use the AmazonSQS as client | | AmazonSQS |
| headerFilterStrategy (common) | To use a custom HeaderFilterStrategy to map headers to/from Camel. | | HeaderFilterStrategy |
| queueOwnerAWSAccountid (common) | Specify the queue owner aws account id when you need to connect the queue with different account owner. | | String |
| region (common) | Specify the queue region which could be used with queueOwnerAWSAccountid to build the service URL. | | String |
| useIAMCredentials (common) | Set whether the SQS client should expect to load credentials on an EC2 instance or to expect static credentials to be passed in. | false | boolean |
| attributeNames (consumer) | A list of attribute names to receive when consuming. Multiple names can be separated by comma. | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| concurrentConsumers (consumer) | Allows you to use multiple threads to poll the sqs queue to increase throughput | 1 | int |
| defaultVisibilityTimeout (consumer) | The default visibility timeout (in seconds) | | Integer |

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| deleteAfterRead (consumer) | Delete message from SQS after it has been read | true | boolean |
| deleteIfFiltered (consumer) | Whether or not to send the DeleteMessage to the SQS queue if an exchange fails to get through a filter. If 'false' and exchange does not make it through a Camel filter upstream in the route, then don't send DeleteMessage. | true | boolean |
| extendMessageVisibility (consumer) | If enabled then a scheduled background task will keep extending the message visibility on SQS. This is needed if it takes a long time to process the message. If set to true defaultVisibilityTimeout must be set. See details at Amazon docs. | false | boolean |
| maxMessagesPerPoll (consumer) | Gets the maximum number of messages as a limit to poll at each polling. Is default unlimited, but use 0 or negative number to disable it as unlimited. | | int |
| messageAttributeNames (consumer) | A list of message attribute names to receive when consuming. Multiple names can be separated by comma. | | String |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| visibilityTimeout (consumer) | The duration (in seconds) that the received messages are hidden from subsequent retrieve requests after being retrieved by a ReceiveMessage request to set in the <code>com.amazonaws.services.sqs.model.SetQueueAttributesRequest</code> . This only make sense if its different from defaultVisibilityTimeout. It changes the queue visibility timeout attribute permanently. | | Integer |
| waitTimeSeconds (consumer) | Duration in seconds (0 to 20) that the ReceiveMessage action call will wait until a message is in the queue to include in the response. | | Integer |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|---------------------------------|
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| delaySeconds (producer) | Delay sending messages for a number of seconds. | | Integer |
| messageDeduplicationId Strategy (producer) | Only for FIFO queues. Strategy for setting the <code>messageDeduplicationId</code> on the message. Can be one of the following options: <code>useExchangeId</code> , <code>useContentBasedDeduplication</code> . For the <code>useContentBasedDeduplication</code> option, no <code>messageDeduplicationId</code> will be set on the message. | <code>useExchangeId</code> | MessageDeduplicationId Strategy |
| messageGroupId Strategy (producer) | Only for FIFO queues. Strategy for setting the <code>messageGroupId</code> on the message. Can be one of the following options: <code>useConstant</code> , <code>useExchangeId</code> , <code>usePropertyValue</code> . For the <code>usePropertyValue</code> option, the value of property <code>CamelAwsMessageGroupId</code> will be used. | | MessageGroupIdStrategy |
| delayQueue (advanced) | Define if you want to apply <code>delaySeconds</code> option to the queue or on single messages | <code>false</code> | boolean |
| queueUrl (advanced) | To define the <code>queueUrl</code> explicitly. All other parameters, which would influence the <code>queueUrl</code> , are ignored. This parameter is intended to be used, to connect to a mock implementation of SQS, for testing purposes. | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | <code>false</code> | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------|
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for <code>initialDelay</code> and <code>delay</code> options. | MILLIS ECONDS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details. | true | boolean |

| Name | Description | Default | Type |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| proxyHost (proxy) | To define a proxy host when instantiating the SQS client | | String |
| proxyPort (proxy) | To define a proxy port when instantiating the SQS client | | Integer |
| maximumMessageSize (queue) | The maximumMessageSize (in bytes) an SQS message can contain for this queue. | | Integer |
| messageRetentionPeriod (queue) | The messageRetentionPeriod (in seconds) a message will be retained by SQS for this queue. | | Integer |
| policy (queue) | The policy for this queue | | String |
| receiveMessageWaitTimeSeconds (queue) | If you do not specify WaitTimeSeconds in the request, the queue attribute ReceiveMessageWaitTimeSeconds is used to determine how long to wait. | | Integer |
| redrivePolicy (queue) | Specify the policy that send message to DeadLetter queue. See detail at Amazon docs. | | String |
| accessKey (security) | Amazon AWS Access Key | | String |
| secretKey (security) | Amazon AWS Secret Key | | String |

36.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 31 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------|-----------------------|---------|--------|
| camel.component.aws-sqs.access-key | Amazon AWS Access Key | | String |
| camel.component.aws-sqs.configuration.access-key | Amazon AWS Access Key | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------|
| camel.component. .aws- sqs.configuration. amazon-a-w-s- host | The hostname of the Amazon AWS cloud. | amazonaws.com | String |
| camel.component. .aws- sqs.configuration. amazon-s-q-s- client | To use the AmazonSQS as client | | AmazonSQS |
| camel.component. .aws- sqs.configuration. attribute-names | A list of attribute names to receive when consuming. Multiple names can be separated by comma. | | String |
| camel.component. .aws- sqs.configuration. concurrent- consumers | Allows you to use multiple threads to poll the sqs queue to increase throughput | 1 | Integer |
| camel.component. .aws- sqs.configuration. default-visibility- timeout | The default visibility timeout (in seconds) | | Integer |
| camel.component. .aws- sqs.configuration. delay-queue | Define if you want to apply delaySeconds option to the queue or on single messages | false | Boolean |
| camel.component. .aws- sqs.configuration. delay-seconds | Delay sending messages for a number of seconds. | | Integer |
| camel.component. .aws- sqs.configuration. delete-after-read | Delete message from SQS after it has been read | true | Boolean |
| camel.component. .aws- sqs.configuration. delete-if-filtered | Whether or not to send the DeleteMessage to the SQS queue if an exchange fails to get through a filter. If 'false' and exchange does not make it through a Camel filter upstream in the route, then don't send DeleteMessage. | true | Boolean |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-sqs.configuration.extend-message-visibility</code> | If enabled then a scheduled background task will keep extending the message visibility on SQS. This is needed if it takes a long time to process the message. If set to true <code>defaultVisibilityTimeout</code> must be set. See details at Amazon docs. | false | Boolean |
| <code>camel.component.aws-sqs.configuration.maximum-message-size</code> | The <code>maximumMessageSize</code> (in bytes) an SQS message can contain for this queue. | | Integer |
| <code>camel.component.aws-sqs.configuration.message-attribute-names</code> | A list of message attribute names to receive when consuming. Multiple names can be separated by comma. | | String |
| <code>camel.component.aws-sqs.configuration.message-retention-period</code> | The <code>messageRetentionPeriod</code> (in seconds) a message will be retained by SQS for this queue. | | Integer |
| <code>camel.component.aws-sqs.configuration.policy</code> | The policy for this queue | | String |
| <code>camel.component.aws-sqs.configuration.proxy-host</code> | To define a proxy host when instantiating the SQS client | | String |
| <code>camel.component.aws-sqs.configuration.proxy-port</code> | To define a proxy port when instantiating the SQS client | | Integer |
| <code>camel.component.aws-sqs.configuration.queue-name</code> | Name of queue. The queue will be created if they don't already exists. | | String |
| <code>camel.component.aws-sqs.configuration.queue-owner-aws-account-id</code> | Specify the queue owner aws account id when you need to connect the queue with different account owner. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-sqs.configuration.queue-url</code> | To define the <code>queueUrl</code> explicitly. All other parameters, which would influence the <code>queueUrl</code> , are ignored. This parameter is intended to be used, to connect to a mock implementation of SQS, for testing purposes. | | String |
| <code>camel.component.aws-sqs.configuration.receive-message-wait-time-seconds</code> | If you do not specify <code>WaitTimeSeconds</code> in the request, the queue attribute <code>ReceiveMessageWaitTimeSeconds</code> is used to determine how long to wait. | | Integer |
| <code>camel.component.aws-sqs.configuration.redrive-policy</code> | Specify the policy that send message to DeadLetter queue. See detail at Amazon docs. | | String |
| <code>camel.component.aws-sqs.configuration.region</code> | Specify the queue region which could be used with <code>queueOwnerAWSAccountId</code> to build the service URL. | | String |
| <code>camel.component.aws-sqs.configuration.secret-key</code> | Amazon AWS Secret Key | | String |
| <code>camel.component.aws-sqs.configuration.visibility-timeout</code> | The duration (in seconds) that the received messages are hidden from subsequent retrieve requests after being retrieved by a <code>ReceiveMessage</code> request to set in the <code>com.amazonaws.services.sqs.model.SetQueueAttributesRequest</code> . This only make sense if its different from <code>defaultVisibilityTimeout</code> . It changes the queue visibility timeout attribute permanently. | | Integer |
| <code>camel.component.aws-sqs.configuration.wait-time-seconds</code> | Duration in seconds (0 to 20) that the <code>ReceiveMessage</code> action call will wait until a message is in the queue to include in the response. | | Integer |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.aws-sqs.enabled</code> | Enable aws-sqs component | true | Boolean |
| <code>camel.component.aws-sqs.region</code> | Specify the queue region which could be used with <code>queueOwnerAWSAccountId</code> to build the service URL. | | String |
| <code>camel.component.aws-sqs.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-sqs.secret-key</code> | Amazon AWS Secret Key | | String |

Required SQS component options

You have to provide the `amazonSQSClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's SQS](#).

36.4. BATCH CONSUMER

This component implements the Batch Consumer.

This allows you for instance to know how many messages exists in this batch and for instance let the Aggregator aggregate this number of messages.

36.5. USAGE

36.5.1. Message headers set by the SQS producer

| Header | Type | Description |
|-----------------------------------|--------|---------------------------------------------|
| <code>CamelAwsSqsMD5OfBody</code> | String | The MD5 checksum of the Amazon SQS message. |
| <code>CamelAwsSqsMessageId</code> | String | The Amazon SQS message ID. |

| Header | Type | Description |
|----------------------------------------------------|---------------------|-----------------------------------------------------------------------------------------------|
| Camel AwsS qsDel aySec onds | Intege r | Since Camel 2.11 , the delay seconds that the Amazon SQS message can be see by others. |

36.5.2. Message headers set by the SQS consumer

| Header | Type | Description |
|--------------------------------------------------------------|-----------------------------------------------------|---------------------------------------------|
| Camel AwsS qsMD 5OfBo dy | String | The MD5 checksum of the Amazon SQS message. |
| Camel AwsS qsMes sageI d | String | The Amazon SQS message ID. |
| Camel AwsS qsRec eiptHa ndle | String | The Amazon SQS message receipt handle. |
| Camel AwsS qsMes sageA ttribut es | Map< String , String > | The Amazon SQS message attributes. |

36.5.3. Advanced AmazonSQS configuration

If your Camel Application is running behind a firewall or if you need to have more control over the AmazonSQS instance configuration, you can create your own instance:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");

ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);
```

```
AmazonSQS client = new AmazonSQSClient(awsCredentials, clientConfiguration);
registry.bind("client", client);
```

and refer to it in your Camel aws-sqs component configuration:

```
from("aws-sqs://MyQueue?amazonSQSClient=#client&delay=5000&maxMessagesPerPoll=5")
.to("mock:result");
```

36.5.4. Creating or updating an SQS Queue

In the SQS Component, when an endpoint is started, a check is executed to obtain information about the existence of the queue or not. You're able to customize the creation through the QueueAttributeName mapping with the SQSConfiguration option.

```
from("aws-sqs://MyQueue?amazonSQSClient=#client&delay=5000&maxMessagesPerPoll=5")
.to("mock:result");
```

In this example if the MyQueue queue is not already created on AWS, it will be created with default parameters from the SQS configuration. If it's already up on AWS, the SQS configuration options will be used to override the existent AWS configuration.

36.5.5. DelayQueue VS Delay for Single message

From 2.23.0 the component has a new option: delayQueue. When the option is set to true, the SQS Queue will be a DelayQueue with the DelaySeconds option as delay. For more information about DelayQueue you can read the [AWS SQS documentation](#). One important information to take into account is the following:

- For standard queues, the per-queue delay setting is not retroactive—changing the setting doesn't affect the delay of messages already in the queue.
- For FIFO queues, the per-queue delay setting is retroactive—changing the setting affects the delay of messages already in the queue.

as stated in the official documentation. If you want to specify a delay on single messages, you can ignore the delayQueue option, while you can set this option to true, if you need to add a fixed delay to all messages enqueued.

36.5.6. Using AWS IAM credentials with the SQS component

To use AWS IAM credentials, you must first confirm that the EC2 instance on which you are launching the Camel application has an IAM role associated with it and that the appropriate policies are attached.

This feature should only be set to **true** on remote instances. Additionally, you must also use static credentials locally as IAM is an AWS specific component.

To implement this feature set **useIAMCredentials** to **true**.

NOTE

To toggle this feature on and off based on local and remote environments, you could consider enabling this query parameter with system environment variables. For example, your code could set the **useIAMCredentials** query parameter to **true** if a system environment variable named **isRemote** is set to **true**.

Although this feature does not eliminate the need for static credentials completely, using IAM credentials on AWS environments does remove the need to refresh on remote environments and is more secure as IAM credentials are refreshed automatically every six hours and are also updated when EC2 security policies are updated.

This is the AWS recommended way to manage credentials and therefore should be used as often as possible.

36.6. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.6 or higher).

36.7. JMS-STYLE SELECTORS

SQS does not allow selectors, but you can effectively achieve this by using the Camel Filter EIP and setting an appropriate **visibilityTimeout**. When SQS dispatches a message, it will wait up to the visibility timeout before it will try to dispatch the message to a different consumer unless a DeleteMessage is received. By default, Camel will always send the DeleteMessage at the end of the route, unless the route ended in failure. To achieve appropriate filtering and not send the DeleteMessage even on successful completion of the route, use a Filter:

```
from("aws-sqs://MyQueue?
amazonSQSClient=#client&defaultVisibilityTimeout=5000&deleteIfFiltered=false")
.filter("${header.login} == true")
.to("mock:result");
```

In the above code, if an exchange doesn't have an appropriate header, it will not make it through the filter AND also not be deleted from the SQS queue. After 5000 milliseconds, the message will become visible to other consumers.

36.8. DELETE SINGLE MESSAGE

Use deleteMessage operation to delete a single message. You'll need to set a receipt handle header for the message you want to delete.

```
from("direct:start")
```

```
.setHeader(SqsConstants.SQS_OPERATION, constant("deleteMessage"))  
.setHeader(SqsConstants.RECEIPT_HANDLE, constant("123456"))  
.to("aws-sqs://camel-1?accessKey=RAW(xxx)&secretKey=RAW(xxx)&region=EU_WEST_1");
```

As result you'll get an exchange containing a **DeleteMessageResult** instance, that you can use to check if the message was deleted or not.

CHAPTER 37. AWS SIMPLE WORKFLOW COMPONENT

Available as of Camel version 2.13

The Simple Workflow component supports managing workflows from [Amazon's Simple Workflow](#) service.

Prerequisites

You must have a valid Amazon Web Services developer account, and be signed up to use Amazon Simple Workflow. More information are available at [Amazon Simple Workflow](#).

37.1. URI FORMAT

```
aws-swf://<workflow|activity>[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

37.2. URI OPTIONS

The AWS Simple Workflow component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (advanced) | The AWS SWF default configuration | | SWFConfiguration |
| accessKey (common) | Amazon AWS Access Key. | | String |
| secretKey (common) | Amazon AWS Secret Key. | | String |
| region (common) | Amazon AWS Region. | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The AWS Simple Workflow endpoint is configured using URI syntax:

```
aws-swf:type
```

with the following path and query parameters:

37.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------|--------------------------------------|---------|--------|
| type | Required Activity or workflow | | String |

37.2.2. Query Parameters (30 parameters):

| Name | Description | Default | Type |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|
| amazonSWClient (common) | To use the given AmazonSimpleWorkflowClient as client | | AmazonSimpleWorkflowClient |
| dataConverter (common) | An instance of <code>com.amazonaws.services.simpleworkflow.flow.DataConverter</code> to use for serializing/deserializing the data. | | DataConverter |
| domainName (common) | The workflow domain to use. | | String |
| eventName (common) | The workflow or activity event name to use. | | String |
| region (common) | Amazon AWS Region. | | String |
| version (common) | The workflow or activity event version to use. | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| clientConfigurationParameters (advanced) | To configure the ClientConfiguration using the key/values from the Map. | | Map |

| Name | Description | Default | Type |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------|
| startWorkflowOptions Parameters (advanced) | To configure the StartWorkflowOptions using the key/values from the Map. | | Map |
| swClientParameters (advanced) | To configure the AmazonSimpleWorkflowClient using the key/values from the Map. | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| activityList (activity) | The list name to consume activities from. | | String |
| activitySchedulingOptions (activity) | Activity scheduling options | | ActivitySchedulingOptions |
| activityThreadPoolSize (activity) | Maximum number of threads in work pool for activity. | 100 | int |
| activityTypeExecution Options (activity) | Activity execution options | | ActivityTypeExecutionOptions |
| activityTypeRegistration Options (activity) | Activity registration options | | ActivityTypeRegistrationOptions |
| childPolicy (workflow) | The policy to use on child workflows when terminating a workflow. | | String |
| executionStartTo Close Timeout (workflow) | Set the execution start to close timeout. | 3600 | String |
| operation (workflow) | Workflow operation | START | String |
| signalName (workflow) | The name of the signal to send to the workflow. | | String |
| stateResultType (workflow) | The type of the result when a workflow state is queried. | | String |

| Name | Description | Default | Type |
|------------------------------------------------------|------------------------------------------|---------|---------------------------------|
| taskStartToCloseTimeout (workflow) | Set the task start to close timeout. | 600 | String |
| terminationDetails (workflow) | Details for terminating a workflow. | | String |
| terminationReason (workflow) | The reason for terminating a workflow. | | String |
| workflowList (workflow) | The list name to consume workflows from. | | String |
| workflowTypeRegistrationOptions (workflow) | Workflow registration options | | WorkflowTypeRegistrationOptions |
| accessKey (security) | Amazon AWS Access Key. | | String |
| secretKey (security) | Amazon AWS Secret Key. | | String |

37.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 32 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|-------------------------------------------|---------|--------|
| camel.component.aws-swf.access-key | Amazon AWS Access Key. | | String |
| camel.component.aws-swf.configuration.access-key | Amazon AWS Access Key. | | String |
| camel.component.aws-swf.configuration.activity-list | The list name to consume activities from. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------|
| camel.component. .aws- swf.configuration. activity- scheduling- options | Activity scheduling options | | ActivitySchedulingOptions |
| camel.component. .aws- swf.configuration. activity-thread- pool-size | Maximum number of threads in work pool for activity. | 100 | Integer |
| camel.component. .aws- swf.configuration. activity-type- execution- options | Activity execution options | | ActivityTypeExecutionOptions |
| camel.component. .aws- swf.configuration. activity-type- registration- options | Activity registration options | | ActivityTypeRegistrationOptions |
| camel.component. .aws- swf.configuration. amazon-s-w- client | To use the given AmazonSimpleWorkflowClient as client | | AmazonSimpleWorkflowClient |
| camel.component. .aws- swf.configuration. child-policy | The policy to use on child workflows when terminating a workflow. | | String |
| camel.component. .aws- swf.configuration. client- configuration- parameters | To configure the ClientConfiguration using the key/values from the Map. | | Map |
| camel.component. .aws- swf.configuration. data-converter | An instance of com.amazonaws.services.simpleworkflow.flow.DataConverter to use for serializing/deserializing the data. | | DataConverter |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|---------|--------|
| <code>camel.component.aws-swf.configuration.domain-name</code> | The workflow domain to use. | | String |
| <code>camel.component.aws-swf.configuration.event-name</code> | The workflow or activity event name to use. | | String |
| <code>camel.component.aws-swf.configuration.execution-start-to-close-timeout</code> | Set the execution start to close timeout. | 3600 | String |
| <code>camel.component.aws-swf.configuration.operation</code> | Workflow operation | START | String |
| <code>camel.component.aws-swf.configuration.region</code> | Amazon AWS Region. | | String |
| <code>camel.component.aws-swf.configuration.s-w-client-parameters</code> | To configure the AmazonSimpleWorkflowClient using the key/values from the Map. | | Map |
| <code>camel.component.aws-swf.configuration.secret-key</code> | Amazon AWS Secret Key. | | String |
| <code>camel.component.aws-swf.configuration.signal-name</code> | The name of the signal to send to the workflow. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------|---------|--------|
| <code>camel.component.aws-swf.configuration.start-workflow-options-parameters</code> | To configure the StartWorkflowOptions using the key/values from the Map. | | Map |
| <code>camel.component.aws-swf.configuration.state-result-type</code> | The type of the result when a workflow state is queried. | | String |
| <code>camel.component.aws-swf.configuration.task-start-to-close-timeout</code> | Set the task start to close timeout. | 600 | String |
| <code>camel.component.aws-swf.configuration.termination-details</code> | Details for terminating a workflow. | | String |
| <code>camel.component.aws-swf.configuration.termination-reason</code> | The reason for terminating a workflow. | | String |
| <code>camel.component.aws-swf.configuration.type</code> | Activity or workflow | | String |
| <code>camel.component.aws-swf.configuration.version</code> | The workflow or activity event version to use. | | String |
| <code>camel.component.aws-swf.configuration.workflow-list</code> | The list name to consume workflows from. | | String |

| Name | Description | Default | Type |
|---------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------------|
| <code>camel.component.aws-swf.configuration.workflow-type-registration-options</code> | Workflow registration options | | WorkflowType RegistrationOptions |
| <code>camel.component.aws-swf.enabled</code> | Enable aws-swf component | true | Boolean |
| <code>camel.component.aws-swf.region</code> | Amazon AWS Region. | | String |
| <code>camel.component.aws-swf.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.aws-swf.secret-key</code> | Amazon AWS Secret Key. | | String |

Required SWF component options

You have to provide the `amazonSWClient` in the Registry or your `accessKey` and `secretKey` to access the [Amazon's Simple Workflow Service](#).

37.4. USAGE

37.4.1. Message headers evaluated by the SWF Workflow Producer

A workflow producer allows interacting with a workflow. It can start a new workflow execution, query its state, send signals to a running workflow, or terminate and cancel it.

| Header | Type | Description |
|----------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Camel SWFOperation | String | The operation to perform on the workflow. Supported operations are: SIGNAL, CANCEL, TERMINATE, GET_STATE, START, DESCRIBE, GET_HISTORY. |
| Camel SWFWorkflowId | String | A workflow ID to use. |

| Header | Type | Description |
|------------------------------------------------------------|---------------|-------------------------------------------------------------------|
| Camel AwsD bKey Camel SWFR unId | String | A workflow run ID to use. |
| Camel SWFS tateRe sultTy pe | String | The type of the result when a workflow state is queried. |
| Camel SWFE ventN ame | String | The workflow or activity event name to use. |
| Camel SWFV ersion | String | The workflow or activity event version to use. |
| Camel SWFR eason | String | The reason for terminating a workflow. |
| Camel SWFD etails | String | Details for terminating a workflow. |
| Camel SWFC hildPo licy | String | The policy to use on child workflows when terminating a workflow. |

37.4.2. Message headers set by the SWF Workflow Producer

| Header | Type | Description |
|------------------------------------------|---------------|------------------------------------------|
| Camel SWFW orkflo wId | String | The workflow ID used or newly generated. |

| Header | Type | Description |
|------------------------------------------------------------|---------------|----------------------------------------|
| Camel AwsD bKey Camel SWFR unId | String | The workflow run ID used or generated. |

37.4.3. Message headers set by the SWF Workflow Consumer

A workflow consumer represents the workflow logic. When it is started, it will start polling workflow decision tasks and process them. In addition to processing decision tasks, a workflow consumer route, will also receive signals (send from a workflow producer) or state queries. The primary purpose of a workflow consumer is to schedule activity tasks for execution using activity producers. Actually activity tasks can be scheduled only from a thread started by a workflow consumer.

| Header | Type | Description |
|------------------------------------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------|
| Camel SWFA ction | String | Indicates what type is the current event: CamelSWFActionExecute, CamelSWFSignalReceivedAction or CamelSWFGetStateAction. |
| Camel SWFW orkflo wRepl aying | boole an | Indicates whether the current decision task is a replay or not. |
| Camel SWFW orkflo wStart Time | long | The time of the start event for this decision task. |

37.4.4. Message headers set by the SWF Activity Producer

An activity producer allows scheduling activity tasks. An activity producer can be used only from a thread started by a workflow consumer ie, it can process synchronous exchanges started by a workflow consumer.

| Header | Type | Description |
|-----------------------------------------|---------------|--------------------------------|
| Camel SWFE ventN ame | String | The activity name to schedule. |

| Header | Type | Description |
|--------------------------|---------------|-----------------------------------|
| Camel SWFV ersion | String | The activity version to schedule. |

37.4.5. Message headers set by the SWF Activity Consumer

| Header | Type | Description |
|-----------------------------|---------------|-----------------------------------------------------------------------------------------|
| Camel SWFT askTo ken | String | The task token that is required to report task completion for manually completed tasks. |

37.4.6. Advanced amazonSWClient configuration

If you need more control over the `AmazonSimpleWorkflowClient` instance configuration you can create your own instance and refer to it from the URI:

The **#client** refers to a `AmazonSimpleWorkflowClient` in the Registry.

For example if your Camel Application is running behind a firewall:

```
AWSCredentials awsCredentials = new BasicAWSCredentials("myAccessKey", "mySecretKey");
ClientConfiguration clientConfiguration = new ClientConfiguration();
clientConfiguration.setProxyHost("http://myProxyHost");
clientConfiguration.setProxyPort(8080);

AmazonSimpleWorkflowClient client = new AmazonSimpleWorkflowClient(awsCredentials,
clientConfiguration);

registry.bind("client", client);
```

37.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-aws</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **#{camel-version}** must be replaced by the actual version of Camel (2.13 or higher).

37.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

[AWS Component](#)

CHAPTER 38. AWS XRAY COMPONENT

Available as of Camel 2.21

The camel-aws-xray component is used for tracing and timing incoming and outgoing Camel messages using [AWS XRay](#).

Events (subsegments) are captured for incoming and outgoing messages being sent to/from Camel.

38.1. DEPENDENCY

In order to include AWS XRay support into Camel, the archive containing the Camel related AWS XRay related classes need to be added to the project. In addition to that, AWS XRay libraries also need to be available.

To include both, AWS XRay and Camel, dependencies use the following Maven imports:

```
<dependencyManagement>
  <dependencies>
    <dependency>
      <groupId>com.amazonaws</groupId>
      <artifactId>aws-xray-recorder-sdk-bom</artifactId>
      <version>1.3.1</version>
      <type>pom</type>
      <scope>import</scope>
    </dependency>
  </dependencies>
</dependencyManagement>

<dependencies>
  <dependency>
    <groupId>org.apache.camel</groupId>
    <artifactId>camel-aws-xray</artifactId>
  </dependency>

  <dependency>
    <groupId>com.amazonaws</groupId>
    <artifactId>aws-xray-recorder-sdk-core</artifactId>
  </dependency>
  <dependency>
    <groupId>com.amazonaws</groupId>
    <artifactId>aws-xray-recorder-sdk-aws-sdk</artifactId>
  </dependency>
</dependencies>
```

38.2. CONFIGURATION

The configuration properties for the AWS XRay tracer are:

| Option | Default | Description |
|--------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| addExcludePatterns | | Sets exclude pattern(s) that will disable tracing for Camel messages that matches the pattern. The content is a Set<String> where the key is a pattern matching routeId's. The pattern uses the rules from Intercept. |
| setTracingStrategy | NoopTracingStrategy | Allows a custom Camel InterceptStrategy to be provided in order to track invoked processor definitions like BeanDefinition or ProcessDefinition . TraceAnnotatedTracingStrategy will track any classes invoked via .bean(...) or .process(...) that contain a @XRayTrace annotation at class level. |

There is currently only one way an AWS XRay tracer can be configured to provide distributed tracing for a Camel application:

38.2.1. Explicit

Include the **camel-aws-xray** component in your POM, along with any specific dependencies associated with the AWS XRay Tracer.

To explicitly configure AWS XRay support, instantiate the **XRayTracer** and initialize the camel context. You can optionally specify a **Tracer**, or alternatively it can be implicitly discovered using the **Registry** or **ServiceLoader**.

```
XRayTracer xrayTracer = new XRayTracer();
// By default it uses a NoopTracingStrategy, but you can override it with a specific InterceptStrategy
// implementation.
xrayTracer.setTracingStrategy(...);
// And then initialize the context
xrayTracer.init(camelContext);
```

To use XRayTracer in XML, all you need to do is to define the AWS XRay tracer bean. Camel will automatically discover and use it.

```
<bean id="tracingStrategy" class="..."/>
<bean id="aws-xray-tracer" class="org.apache.camel.component.aws.xray.XRayTracer" />
  <property name="tracer" ref="tracingStrategy"/>
</bean>
```

In case of the default **NoopTracingStrategy** only the creation and deletion of exchanges is tracked but not the invocation of certain beans or EIP patterns.

38.2.2. Tracking of comprehensive route execution

In order to track the execution of an exchange among multiple routes, on exchange creation a unique trace ID is generated and stored in the headers if no corresponding value was yet available. This trace ID is copied over to new exchanges in order to keep a consistent view of the processed exchange.

As AWS XRay traces work on a thread-local basis the current sub/segment should be copied over to the new thread and set as explained in [in the AWS XRay documentation](#) . The Camel AWS XRay component therefore provides an additional header field that the component will use in order to set the passed AWS XRay **Entity** to the new thread and thus keep the tracked data to the route rather than exposing a new segment which seems uncorrelated with any of the executed routes.

The component will use the following constants found in the headers of the exchange:

| Header | Description |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel-AWS-XRay-Trace-ID | Contains a reference to the AWS XRay TraceID object to provide a comprehensive view of the invoked routes |
| Camel-AWS-XRay-Trace-Entity | Contains a reference to the actual AWS XRay Segment or Subsegment which is copied over to the new thread. This header should be set in case a new thread is spawned and the performed tasks should be exposed as part of the executed route instead of creating a new unrelated segment. |

Note that the AWS XRay **Entity** (i.e., **Segment** and **Subsegment**) are not serializable and therefore should not get passed to other JVM processes.

38.3. EXAMPLE

You can find an example demonstrating the way to configure AWS XRay tracing within the tests accompanying this project.

CHAPTER 39. CAMEL COMPONENTS FOR WINDOWS AZURE SERVICES

The Camel Components for [Windows Azure Services](#) provide connectivity to Azure services from Camel.

| Azure Service | Camel Component | Camel Version | Component Description |
|---------------------------------------|-----------------------------|---------------|-----------------------------------------------------------|
| Storage Blob Service | Azure-Blob | 2.9.0 | Supports storing and retrieving of blobs |
| Storage Queue Service | Azure-Queue | 2.9.0 | Supports storing and retrieving of messages in the queues |

CHAPTER 40. AZURE STORAGE BLOB SERVICE COMPONENT

Available as of Camel version 2.19

The Azure Blob component supports storing and retrieving the blobs to/from [Azure Storage Blob](#) service.

Prerequisites

You must have a valid Windows Azure Storage account. More information is available at [Azure Documentation Portal](#).

40.1. URI FORMAT

```
azure-blob://accountName/containerName[/blobName][?options]
```

In most cases a blobName is required and the blob will be created if it does not already exist. You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to download a blob content from the public block blob **blockBlob** located on the **container1** in the **camelazure** storage account, use the following snippet:

```
from("azure-blob://camelazure/container1/blockBlob").
to("file://blobdirectory");
```

40.2. URI OPTIONS

The Azure Storage Blob Service component has no options.

The Azure Storage Blob Service endpoint is configured using URI syntax:

```
azure-blob:containerOrBlobUri
```

with the following path and query parameters:

40.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|----------------------------------------|---------|--------|
| containerOrBlobUri | Required Container or Blob compact Uri | | String |

40.2.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| azureBlobClient (common) | The blob service client | | CloudBlob |
| blobOffset (common) | Set the blob offset for the upload or download operations, default is 0 | 0 | Long |
| blobType (common) | Set a blob type, 'blob' is default | blob | BlobType |
| closeStreamAfterRead (common) | Close the stream after read or keep it open, default is true | true | boolean |
| credentials (common) | Set the storage credentials, required in most cases | | StorageCredentials |
| dataLength (common) | Set the data length for the download or page blob upload operations | | Long |
| fileDir (common) | Set the file directory where the downloaded blobs will be saved to | | String |
| publicForRead (common) | Storage resources can be public for reading their content, if this property is enabled then the credentials do not have to be set | false | boolean |
| streamReadSize (common) | Set the minimum read size in bytes when reading the blob content | | int |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|-----------|-----------------------|
| blobMetadata (producer) | Set the blob meta-data | | Map |
| blobPrefix (producer) | Set a prefix which can be used for listing the blobs | | String |
| closeStreamAfterWrite (producer) | Close the stream after write or keep it open, default is true | true | boolean |
| operation (producer) | Blob service operation hint to the producer | listBlobs | BlobServiceOperations |
| streamWriteSize (producer) | Set the size of the buffer for writing block and page blocks | | int |
| useFlatListing (producer) | Specify if the flat or hierarchical blob listing should be used | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

40.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.azure-blob.enabled | Enable azure-blob component | true | Boolean |
| camel.component.azure-blob.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

Required Azure Storage Blob Service component options

You have to provide the containerOrBlob name and the credentials if the private blob needs to be accessed.

40.4. USAGE

40.4.1. Message headers evaluated by the Azure Storage Blob Service producer

| Header | Type | Description |
|--------|------|-------------|
| | | |

40.4.2. Message headers set by the Azure Storage Blob Service producer

| Header | Type | Description |
|-----------------------|---------------|------------------------------------------------|
| Camel FileName | String | The file name for the downloaded blob content. |

40.4.3. Message headers set by the Azure Storage Blob Service producer consumer

| Header | Type | Description |
|-----------------------|---------------|------------------------------------------------|
| Camel FileName | String | The file name for the downloaded blob content. |

40.4.4. Azure Blob Service operations

Operations common to all block types

| Operation | Description |
|-------------------|---------------------------------------------------------------------------------------------|
| getBlob | Get the content of the blob. You can restrict the output of this operation to a blob range. |
| deleteBlob | Delete the blob. |
| listBlobs | List the blobs. |

Block blob operations

| Operation | Description |
|------------------------|------------------------------------------------------------------------------------------------------------|
| updateBlockBlob | Put block blob content that either creates a new block blob or overwrites the existing block blob content. |

| Operation | Description |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uploadBlobBlocks | Upload block blob content, by first generating a sequence of blob blocks and then committing them to a blob. If you enable the message CommitBlockListLater property, you can execute the commit later with the commitBlobBlockList operation. You can later update individual block blobs. |
| commitBlobBlockList | Commit a sequence of blob blocks to the block list that you previously uploaded to the blob service (by using the updateBlockBlob operation with the message CommitBlockListLater property enabled). |
| getBlobBlockList | Get the block blob list. |

Append blob operations

| Operation | Description |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| createAppendBlob | Create an append block. By default, if the block already exists then it is not reset. Note that you can alternately create an append blob by enabling the message AppendBlobCreated property and using the updateAppendBlob operation. |
| updateAppendBlob | Append the new content to the blob. This operation also creates the blob if it does not already exist and if you enabled a message AppendBlobCreated property. |

Page Block operations

| Operation | Description |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| createPageBlob | Create a page block. By default, if the block already exists then it is not reset. Note that you can also create a page blob (and set its contents) by enabling a message PageBlobCreated property and by using the updatePageBlob operation. |
| updatePageBlob | Create a page block (unless you enable a message PageBlobCreated property and the identically named block already exists) and set the content of this blob. |
| resizePageBlob | Resize the page blob. |
| clearPageBlob | Clear the page blob. |
| getPageBlobRanges | Get the page blob page ranges. |

40.4.5. Azure Blob Client configuration

If your Camel Application is running behind a firewall or if you need to have more control over the Azure Blob Client configuration, you can create your own instance:

```
StorageCredentials credentials = new StorageCredentialsAccountAndKey("camelazure", "thekey");  
  
CloudBlob client = new CloudBlob("camelazure", credentials);  
  
registry.bind("azureBlobClient", client);
```

and refer to it in your Camel azure-blob component configuration:

```
from("azure-blob:/camelazure/container1/blockBlob?azureBlobClient=#client")  
  .to("mock:result");
```

40.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-azure</artifactId>  
  <version>${camel-version}</version>  
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.19.0 or higher).

40.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)
- [Azure Component](#)

CHAPTER 41. AZURE STORAGE QUEUE SERVICE COMPONENT

Available as of Camel version 2.19

The Azure Queue component supports storing and retrieving the messages to/from [Azure Storage Queue](#) service.

Prerequisites

You must have a valid Microsoft Azure account. More information is available at [Azure Portal](#).

41.1. URI FORMAT

```
azure-queue://accountName/queueName[?options]
```

The queue will be created if it does not already exist.

You can append query options to the URI in the following format, ?options=value&option2=value&...

For example in order to get a message content from the queue **messageQueue** in the **camelazure** storage account and, use the following snippet:

```
from("azure-queue:/camelazure/messageQueue").
to("file://queuedirectory");
```

41.2. URI OPTIONS

The Azure Storage Queue Service component has no options.

The Azure Storage Queue Service endpoint is configured using URI syntax:

```
azure-queue:containerAndQueueUri
```

with the following path and query parameters:

41.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------------|--------------------------------------|---------|--------|
| containerAndQueueUri | Required Container Queue compact Uri | | String |

41.2.2. Query Parameters (10 parameters):

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|------------------------|
| azureQueueClient (common) | The queue service client | | CloudQueue |
| credentials (common) | Set the storage credentials, required in most cases | | StorageCredentials |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| messageTimeToLive (producer) | Message Time To Live in seconds | | int |
| messageVisibilityDelay (producer) | Message Visibility Delay in seconds | | int |
| operation (producer) | The operation to do in case the user does not want to send only a message. There are three enums options and the value can be one of the following: <code>sendBatchMessage</code> , <code>deleteMessage</code> , <code>listQueues</code> | listQueues | QueueServiceOperations |
| queuePrefix (producer) | Set a prefix which can be used for listing the queues | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

41.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.azure-queue.enabled</code> | Enable azure-queue component | true | Boolean |
| <code>camel.component.azure-queue.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

Required Azure Storage Queue Service component options

You have to provide the `containerAndQueue` URI and the credentials.

41.4. USAGE

41.4.1. Message headers evaluated by the Azure Storage Queue Service producer

| Header | Type | Description |
|--------|------|-------------|
| | | |

41.4.2. Message headers set by the Azure Storage Queue Service producer

| Header | Type | Description |
|--------|------|-------------|
| | | |

41.4.3. Message headers set by the Azure Storage Queue Service producer consumer

| Header | Type | Description |
|--------|------|-------------|
| | | |

41.4.4. Azure Queue Service operations

| Operation | Description |
|-------------------------|------------------|
| <code>listQueues</code> | List the queues. |

| Operation | Description |
|------------------------|----------------------------------------------------------------------------------------------------------------|
| createQueue | Create the queue. |
| deleteQueue | Delete the queue. |
| addMessage | Add a message to the queue. |
| retrieveMessage | Retrieve a message from the queue. |
| peekMessage | View the message inside the queue, for example, to determine whether the message arrived at the correct queue. |
| updateMessage | Update the message in the queue. |
| deleteMessage | Delete the message in the queue. |

41.4.5. Azure Queue Client configuration

If your Camel Application is running behind a firewall or if you need to have more control over the Azure Queue Client configuration, you can create your own instance:

```
StorageCredentials credentials = new StorageCredentialsAccountAndKey("camelazure", "thekey");
CloudQueue client = new CloudQueue("camelazure", credentials);
registry.bind("azureQueueClient", client);
```

and refer to it in your Camel azure-queue component configuration:

```
from("azure-queue:/camelazure/messageQueue?azureQueueClient=#client")
.to("mock:result");
```

41.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-azure</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`${camel-version}`** must be replaced by the actual version of Camel (2.19.0 or higher).

- Component
- Endpoint
- Getting Started
- Azure Component

CHAPTER 42. BARCODE DATAFORMAT

Available as of Camel version 2.14

The barcode data format is based on the [zxing library](#). The goal of this component is to create a barcode image from a String (marshal) and a String from a barcode image (unmarshal). You're free to use all features that zxing offers.

42.1. DEPENDENCIES

To use the barcode data format in your camel routes you need to add the a dependency on **camel-barcode** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-barcode</artifactId>
  <version>x.x.x</version>
</dependency>
```

42.2. BARCODE OPTIONS

The Barcode dataformat supports 5 options, which are listed below.

| Name | Default | Java Type | Description |
|-------------------|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| width | | Integer | Width of the barcode |
| height | | Integer | Height of the barcode |
| imageType | | String | Image type of the barcode such as png |
| barcodeFormat | | String | Barcode format such as QR-Code |
| contentTypeHeader | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. |

42.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.barcode.barcode-format</code> | Barcode format such as QR-Code | | String |
| <code>camel.dataformat.barcode.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.barcode.enabled</code> | Enable barcode dataformat | true | Boolean |
| <code>camel.dataformat.barcode.height</code> | Height of the barcode | | Integer |
| <code>camel.dataformat.barcode.image-type</code> | Image type of the barcode such as png | | String |
| <code>camel.dataformat.barcode.width</code> | Width of the barcode | | Integer |

ND

42.4. USING THE JAVA DSL

First you have to initialize the barcode data format class. You can use the default constructor, or one of parameterized (see JavaDoc). The default values are:

| Parameter | Default Value |
|-------------------------------|---------------|
| image type (BarcodeImageType) | PNG |
| width | 100 px |
| height | 100 px |
| encoding | UTF-8 |

| Parameter | Default Value |
|--------------------------------|---------------|
| barcode format (BarcodeFormat) | QR-Code |

```
// QR-Code default
DataFormat code = new BarcodeDataFormat();
```

If you want to use zxing hints, you can use the 'addToHintMap' method of your BarcodeDataFormat instance:

```
code.addToHintMap(DecodeHintType.TRY_HARDER, Boolean.TRUE);
```

For possible hints, please consult the zxing documentation.

42.4.1. Marshalling

```
from("direct://code")
  .marshal(code)
  .to("file://barcode_out");
```

You can call the route from a test class with:

```
template.sendBody("direct://code", "This is a testmessage!");
```

You should find inside the 'barcode_out' folder this image:

42.4.2. Unmarshalling

The unmarshaller is generic. For unmarshalling you can use any BarcodeDataFormat instance. If you've two instances, one for (generating) QR-Code and one for PDF417, it doesn't matter which one will be used.

```
from("file://barcode_in?noop=true")
  .unmarshal(code) // for unmarshalling, the instance doesn't matter
  .to("mock:out");
```

If you'll paste the QR-Code image above into the 'barcode_in' folder, you should find 'This is a testmessage!' inside the mock. You can find the barcode data format as header variable:

| Name | Type | Description |
|---------------|--------|------------------------------------------|
| BarcodeFormat | String | Value of com.google.zxing.BarcodeFormat. |

CHAPTER 43. BASE64 DATAFORMAT

Available as of Camel version 2.11

The Base64 data format is used for base64 encoding and decoding.

43.1. OPTIONS

The Base64 dataformat supports 4 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>lineLength</code> | 76 | Integer | To specific a maximum line length for the encoded data. By default 76 is used. |
| <code>lineSeparator</code> | | String | The line separators to use. Uses new line characters (CRLF) by default. |
| <code>urlSafe</code> | false | Boolean | Instead of emitting " and '/' we emit '-' and '_' respectively. urlSafe is only applied to encode operations. Decoding seamlessly handles both modes. Is by default false. |
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. |

43.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.base64.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. | false | Boolean |
| <code>camel.dataformat.base64.enabled</code> | Enable base64 dataformat | true | Boolean |
| <code>camel.dataformat.base64.line-length</code> | To specific a maximum line length for the encoded data. By default 76 is used. | 76 | Integer |

| Name | Description | Default | Type |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.base64.line-separator</code> | The line separators to use. Uses new line characters (CRLF) by default. | | String |
| <code>camel.dataformat.base64.url-safe</code> | Instead of emitting " and '/' we emit '-' and '_' respectively. urlSafe is only applied to encode operations. Decoding seamlessly handles both modes. Is by default false. | false | Boolean |

ND

In Spring DSL, you configure the data format using this tag:

```
<camelContext>
  <dataFormats>
    <!-- for a newline character (\n), use the HTML entity notation coupled with the ASCII code. -->
    <base64 lineSeparator="&#10;" id="base64withNewLine" />
    <base64 lineLength="64" id="base64withLineLength64" />
  </dataFormats>
  ...
</camelContext>
```

Then you can use it later by its reference:

```
<route>
  <from uri="direct:startEncode" />
  <marshal ref="base64withLineLength64" />
  <to uri="mock:result" />
</route>
```

Most of the time, you won't need to declare the data format if you use the default options. In that case, you can declare the data format inline as shown below.

43.3. MARSHAL

In this example we marshal the file content to base64 object.

```
from("file://data.bin")
  .marshal().base64()
  .to("jms://myqueue");
```

In Spring DSL:

```
<from uri="file://data.bin">
  <marshal>
    <base64/>
  </marshal>
  <to uri="jms://myqueue"/>
```

43.4. UNMARSHAL

In this example we unmarshal the payload from the JMS queue to a `byte[]` object, before its processed by the `newOrder` processor.

```
from("jms://queue/order")
    .unmarshal().base64()
    .process("newOrder");
```

In Spring DSL:

```
<from uri="jms://queue/order">
<unmarshal>
  <base64/>
</unmarshal>
<to uri="bean:newOrder"/>
```

43.5. DEPENDENCIES

To use Base64 in your Camel routes you need to add a dependency on **camel-base64** which implements this data format.

If you use Maven you can just add the following to your `pom.xml`:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-base64</artifactId>
  <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

CHAPTER 44. BEAN COMPONENT

Available as of Camel version 1.0

The **bean:** component binds beans to Camel message exchanges.

44.1. URI FORMAT

```
bean:beanName[?options]
```

Where **beanID** can be any string which is used to look up the bean in the Registry

44.2. OPTIONS

The Bean component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| cache (advanced) | If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope. | | Boolean |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Bean endpoint is configured using URI syntax:

```
bean:beanName
```

with the following path and query parameters:

44.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------|-----------------------------------------------------|---------|--------|
| beanName | Required Sets the name of the bean to invoke | | String |

44.2.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| method (producer) | Sets the name of the method to invoke on the bean | | String |
| cache (advanced) | If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope. | | Boolean |
| multiParameterArray (advanced) | Deprecated How to treat the parameters which are passed from the message body; if it is true, the message body should be an array of parameters. Note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use. | false | boolean |
| parameters (advanced) | Used for configuring additional properties on the bean | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

You can append query options to the URI in the following format, **?option=value&option=value&...**

44.3. USING

The object instance that is used to consume messages must be explicitly registered with the Registry. For example, if you are using Spring you must define the bean in the Spring configuration, **spring.xml**; or if you don't use Spring, by registering the bean in JNDI.

Error formatting macro: snippet: java.lang.IndexOutOfBoundsException: Index: 20, Size: 20

Once an endpoint has been registered, you can build Camel routes that use it to process exchanges.

A **bean**: endpoint cannot be defined as the input to the route; i.e. you cannot consume from it, you can only route from some inbound message Endpoint to the bean endpoint as output. So consider using a **direct**: or **queue**: endpoint as the input.

You can use the **createProxy()** methods on [ProxyHelper](#) to create a proxy that will generate BeanExchanges and send them to any endpoint:

And the same route using Spring DSL:

```
<route>
  <from uri="direct:hello">
    <to uri="bean:bye"/>
  </route>
```

44.4. BEAN AS ENDPOINT

Camel also supports invoking [Bean](#) as an Endpoint. In the route below:

What happens is that when the exchange is routed to the **myBean** Camel will use the Bean Binding to invoke the bean.

The source for the bean is just a plain POJO:

Camel will use Bean Binding to invoke the **sayHello** method, by converting the Exchange's In body to the **String** type and storing the output of the method on the Exchange Out body.

44.5. JAVA DSL BEAN SYNTAX

Java DSL comes with syntactic sugar for the [Bean](#) component. Instead of specifying the bean explicitly as the endpoint (i.e. `to("bean:beanName")`) you can use the following syntax:

```
// Send message to the bean endpoint
// and invoke method resolved using Bean Binding.
from("direct:start").beanRef("beanName");

// Send message to the bean endpoint
// and invoke given method.
from("direct:start").beanRef("beanName", "methodName");
```

Instead of passing name of the reference to the bean (so that Camel will lookup for it in the registry), you can specify the bean itself:

```
// Send message to the given bean instance.
from("direct:start").bean(new ExampleBean());

// Explicit selection of bean method to be invoked.
from("direct:start").bean(new ExampleBean(), "methodName");

// Camel will create the instance of bean and cache it for you.
from("direct:start").bean(ExampleBean.class);
```

44.6. BEAN BINDING

How bean methods to be invoked are chosen (if they are not specified explicitly through the **method** parameter) and how parameter values are constructed from the Message are all defined by the Bean Binding mechanism which is used throughout all of the various Bean Integration mechanisms in Camel.

CHAPTER 45. BEANIO DATAFORMAT

Available as of Camel version 2.10

The BeanIO Data Format uses [BeanIO](#) to handle flat payloads (such as XML, CSV, delimited, or fixed length formats).

BeanIO is configured using a [mappings XML](#) file where you define the mapping from the flat format to Objects (POJOs). This mapping file is mandatory to use.

45.1. OPTIONS

The BeanIO dataformat supports 9 options, which are listed below.

| Name | Default | Java Type | Description |
|----------------------------|--------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mapping | | String | The BeanIO mapping file. Is by default loaded from the classpath. You can prefix with file:, http:, or classpath: to denote from where to load the mapping file. |
| streamName | | String | The name of the stream to use. |
| ignoreUnidentifiedRecords | false | Boolean | Whether to ignore unidentified records. |
| ignoreUnexpectedRecords | false | Boolean | Whether to ignore unexpected records. |
| ignoreInvalidRecords | false | Boolean | Whether to ignore invalid records. |
| encoding | | String | The charset to use. Is by default the JVM platform default charset. |
| beanReaderErrorHandlerType | | String | To use a custom <code>org.apache.camel.dataformat.beanio.BeanIOErrorHandler</code> as error handler while parsing. Configure the fully qualified class name of the error handler. Notice the options <code>ignoreUnidentifiedRecords</code> , <code>ignoreUnexpectedRecords</code> , and <code>ignoreInvalidRecords</code> may not be in use when you use a custom error handler. |
| unmarshalSingleObject | false | Boolean | This options controls whether to unmarshal as a list of objects or as a single object only. The former is the default mode, and the latter is only intended in special use-cases where beanio maps the Camel message to a single POJO bean. |

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. |

45.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.beanio.bean-reader-error-handler-type</code> | To use a custom <code>org.apache.camel.dataformat.beanio.BeanIOErrorHandler</code> as error handler while parsing. Configure the fully qualified class name of the error handler. Notice the options <code>ignoreUnidentifiedRecords</code> , <code>ignoreUnexpectedRecords</code> , and <code>ignoreInvalidRecords</code> may not be in use when you use a custom error handler. | | String |
| <code>camel.dataformat.beanio.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.beanio.enabled</code> | Enable beanio dataformat | true | Boolean |
| <code>camel.dataformat.beanio.encoding</code> | The charset to use. Is by default the JVM platform default charset. | | String |
| <code>camel.dataformat.beanio.ignore-invalid-records</code> | Whether to ignore invalid records. | false | Boolean |
| <code>camel.dataformat.beanio.ignore-unexpected-records</code> | Whether to ignore unexpected records. | false | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.beanio.ignore-unidentified-records</code> | Whether to ignore unidentified records. | false | Boolean |
| <code>camel.dataformat.beanio.mapping</code> | The BeanIO mapping file. Is by default loaded from the classpath. You can prefix with <code>file;</code> , <code>http;</code> , or <code>classpath:</code> to denote from where to load the mapping file. | | String |
| <code>camel.dataformat.beanio.stream-name</code> | The name of the stream to use. | | String |
| <code>camel.dataformat.beanio.unmarshal-single-object</code> | This options controls whether to unmarshal as a list of objects or as a single object only. The former is the default mode, and the latter is only intended in special use-cases where beanio maps the Camel message to a single POJO bean. | false | Boolean |

ND

45.3. USAGE

An example of a [mapping file is here](#).

45.3.1. Using Java DSL

To use the **BeanIODataFormat** you need to configure the data format with the mapping file, as well the name of the stream.

In Java DSL this can be done as shown below. The streamName is "employeeFile".

Then we have two routes. The first route is for transforming CSV data into a `List<Employee>` Java objects. Which we then split, so the mock endpoint receives a message for each row.

The 2nd route is for the reverse operation, to transform a `List<Employee>` into a stream of CSV data.

The CSV data could for example be as below:

45.3.2. Using XML DSL

To use the BeanIO data format in XML, you need to configure it using the `<beanio>` XML tag as shown below. The routes is similar to the example above.

45.4. DEPENDENCIES

To use BeanIO in your Camel routes you need to add a dependency on **camel-beanio** which implements this data format.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-beanio</artifactId>  
  <version>2.10.0</version>  
</dependency>
```

CHAPTER 46. BEANSTALK COMPONENT

Available as of Camel version 2.15

camel-beanstalk project provides a Camel component for job retrieval and post-processing of Beanstalk jobs.

You can find the detailed explanation of Beanstalk job lifecycle at [Beanstalk protocol](#).

46.1. DEPENDENCIES

Maven users need to add the following dependency to their **pom.xml**

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-beanstalk</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **`\${camel-version}`** must be replaced by the actual version of Camel (2.15.0 or higher).

46.2. URI FORMAT

```
beanstalk://[host[:port]]/[tube][?options]
```

You may omit either **port** or both **host** and **port**: for the Beanstalk defaults to be used ("localhost" and 11300). If you omit **tube**, Beanstalk component will use the tube with name "default".

When listening, you may probably want to watch for jobs from several tubes. Just separate them with plus sign, e.g.

```
beanstalk://localhost:11300/tube1+tube2
```

Tube name will be URL decoded, so if your tube names include special characters like + or ?, you need to URL-encode them appropriately, or use the RAW syntax, see [more details here](#).

By the way, you cannot specify several tubes when you are writing jobs into Beanstalk.

46.3. BEANSTALK OPTIONS

The Beanstalk component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| connectionSettingsFactory (common) | Custom ConnectionSettingsFactory. Specify which ConnectionSettingsFactory to use to make connections to Beanstalkd. Especially useful for unit testing without beanstalkd daemon (you can mock ConnectionSettings) | | ConnectionSettingsFactory |

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Beanstalk endpoint is configured using URI syntax:

```
beanstalk:connectionSettings
```

with the following path and query parameters:

46.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------------|------------------------------------|---------|--------|
| connectionSettings | Connection settings host:port/tube | | String |

46.3.2. Query Parameters (26 parameters):

| Name | Description | Default | Type |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| command (common) | put means to put the job into Beanstalk. Job body is specified in the Camel message body. Job ID will be returned in beanstalk.jobId message header. delete, release, touch or bury expect Job ID in the message header beanstalk.jobId. Result of the operation is returned in beanstalk.result message header kick expects the number of jobs to kick in the message body and returns the number of jobs actually kicked out in the message header beanstalk.result. | | BeanstalkCommand |
| jobDelay (common) | Job delay in seconds. | 0 | int |
| jobPriority (common) | Job priority. (0 is the highest, see Beanstalk protocol) | 1000 | long |
| jobTimeToRun (common) | Job time to run in seconds. (when 0, the beanstalkd daemon raises it to 1 automatically, see Beanstalk protocol) | 60 | int |

| Name | Description | Default | Type |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| awaitJob (consumer) | Whether to wait for job to complete before ack the job from beanstalk | true | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| onFailure (consumer) | Command to use when processing failed. | | BeanstalkCommand |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| useBlockIO (consumer) | Whether to use blockIO. | true | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |

| Name | Description | Default | Type |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>useFixedDelay</code> (scheduler) | Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details. | true | boolean |

46.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.beanstalk.connection-settings-factory</code> | Custom <code>ConnectionSettingsFactory</code> . Specify which <code>ConnectionSettingsFactory</code> to use to make connections to Beanstalkd. Especially useful for unit testing without beanstalkd daemon (you can mock <code>ConnectionSettings</code>). The option is a <code>org.apache.camel.component.beanstalk.ConnectionSettingsFactory</code> type. | | String |
| <code>camel.component.beanstalk.enabled</code> | Enable beanstalk component | true | Boolean |
| <code>camel.component.beanstalk.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

Producer behavior is affected by the **command** parameter which tells what to do with the job, it can be

The consumer may delete the job immediately after reserving it or wait until Camel routes process it. While the first scenario is more like a "message queue", the second is similar to "job queue". This behavior is controlled by **consumer.awaitJob** parameter, which equals **true** by default (following Beanstalkd nature).

When synchronous, the consumer calls **delete** on successful job completion and calls **bury** on failure. You can choose which command to execute in the case of failure by specifying **consumer.onFailure** parameter in the URI. It can take values of **bury**, **delete** or **release**.

There is a boolean parameter **consumer.useBlockIO** which corresponds to the same parameter in `JavaBeanstalkClient` library. By default it is **true**.

Be careful when specifying **release**, as the failed job will immediately become available in the same tube and your consumer will try to acquire it again. You can **release** and specify `jobDelay` though.

The beanstalk consumer is a Scheduled [Polling Consumer](#) which means there is more options you can configure, such as how frequent the consumer should poll. For more details see [Polling Consumer](#).

46.5. CONSUMER HEADERS

The consumer stores a number of job headers in the Exchange message:

| Property | Type | Description |
|----------------------------------|--------|--------------------------------------------------------------------------------|
| <code>beanstalk.jobId</code> | long | Job ID |
| <code>beanstalk.tube</code> | string | the name of the tube that contains this job |
| <code>beanstalk.state</code> | string | "ready" or "delayed" or "reserved" or "buried" (must be "reserved") |
| <code>beanstalk.priority</code> | long | the priority value set |
| <code>beanstalk.age</code> | int | the time in seconds since the put command that created this job |
| <code>beanstalk.time-left</code> | int | the number of seconds left until the server puts this job into the ready queue |
| <code>beanstalk.timeouts</code> | int | the number of times this job has timed out during a reservation |
| <code>beanstalk.releases</code> | int | the number of times a client has released this job from a reservation |
| <code>beanstalk.buries</code> | int | the number of times this job has been buried |
| <code>beanstalk.kicks</code> | int | the number of times this job has been kicked |

46.6. EXAMPLES

This Camel component lets you both request the jobs for processing and supply them to Beanstalkd daemon. Our simple demo routes may look like

```
from("beanstalk:testTube").
  log("Processing job #${property.beanstalk.jobId} with body ${in.body}").
  process(new Processor() {
    @Override
    public void process(Exchange exchange) {
      // try to make integer value out of body
    }
  })
```

```
exchange.getIn().setBody( Integer.valueOf(exchange.getIn().getBody(classOf[String])) );
    }
  }).
  log("Parsed job #${property.beanstalk.jobId} to body ${in.body}");
```

```
from("timer:dig?period=30seconds").
  setBody(constant(10)).log("Kick ${in.body} buried/delayed tasks").
  to("beanstalk:testTube?command=kick");
```

In the first route we are listening for new jobs in tube “testTube”. When they are arriving, we are trying to parse integer value from the message body. If done successful, we log it and this successful exchange completion makes Camel component to *delete* this job from Beanstalk automatically. Contrary, when we cannot parse the job data, the exchange failed and the Camel component *buries* it by default, so that it can be processed later or probably we are going to inspect failed jobs manually.

So the second route periodically requests Beanstalk to *kick* 10 jobs out of buried and/or delayed state to the normal queue.

46.7. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 47. BEAN VALIDATOR COMPONENT

Available as of Camel version 2.3

The Validator component performs bean validation of the message body using the Java Bean Validation API ([JSR 303](#)). Camel uses the reference implementation, which is [Hibernate Validator](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bean-validator</artifactId>
  <version>x.y.z</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

47.1. URI FORMAT

```
bean-validator:label[?options]
```

or

```
bean-validator://label[?options]
```

Where **label** is an arbitrary text value describing the endpoint.

You can append query options to the URI in the following format, ?option=value&option=value&...

47.2. URI OPTIONS

The Bean Validator component has no options.

The Bean Validator endpoint is configured using URI syntax:

```
bean-validator:label
```

with the following path and query parameters:

47.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------|--------------------------------------------------------------------------------|---------|--------|
| label | Required Where label is an arbitrary text value describing the endpoint | t | String |

47.2.2. Query Parameters (6 parameters):

| Name | Description | Default | Type |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------|----------------------------|
| constraintValidatorFactory (producer) | To use a custom ConstraintValidatorFactory | | ConstraintValidatorFactory |
| group (producer) | To use a custom validation group | javax.validation.groups.Default | String |
| messageInterpolator (producer) | To use a custom MessageInterpolator | | MessageInterpolator |
| traversableResolver (producer) | To use a custom TraversableResolver | | TraversableResolver |
| validationProviderResolver (producer) | To use a a custom ValidationProviderResolver | | ValidationProviderResolver |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

47.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.bean-validator.enabled | Enable bean-validator component | true | Boolean |
| camel.component.bean-validator.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

47.4. OSGI DEPLOYMENT

To use Hibernate Validator in the OSGi environment use dedicated **ValidationProviderResolver** implementation, just as **org.apache.camel.component.bean.validator.HibernateValidationProviderResolver**. The snippet

below demonstrates this approach. Keep in mind that you can use **HibernateValidationProviderResolver** starting from the Camel 2.13.0.

Using HibernateValidationProviderResolver

```
from("direct:test").
  to("bean-validator://ValidationProviderResolverTest?
validationProviderResolver=#myValidationProviderResolver");

...

<bean id="myValidationProviderResolver"
class="org.apache.camel.component.bean.validator.HibernateValidationProviderResolver"/>
```

If no custom **ValidationProviderResolver** is defined and the validator component has been deployed into the OSGi environment, the **HibernateValidationProviderResolver** will be automatically used.

47.5. EXAMPLE

Assumed we have a java bean with the following annotations

Car.java

```
public class Car {

    @NotNull
    private String manufacturer;

    @NotNull
    @Size(min = 5, max = 14, groups = OptionalChecks.class)
    private String licensePlate;

    // getter and setter
}
```

and an interface definition for our custom validation group

OptionalChecks.java

```
public interface OptionalChecks {
}
```

with the following Camel route, only the **@NotNull** constraints on the attributes manufacturer and licensePlate will be validated (Camel uses the default group **javax.validation.groups.Default**).

```
from("direct:start")
.to("bean-validator://x")
.to("mock:end")
```

If you want to check the constraints from the group **OptionalChecks**, you have to define the route like this

```
from("direct:start")
.to("bean-validator://x?group=OptionalChecks")
.to("mock:end")
```

If you want to check the constraints from both groups, you have to define a new interface first

AllChecks.java

```
@GroupSequence({Default.class, OptionalChecks.class})
public interface AllChecks {
}
```

and then your route definition should look like this

```
from("direct:start")
.to("bean-validator://x?group=AllChecks")
.to("mock:end")
```

And if you have to provide your own message interpolator, traversable resolver and constraint validator factory, you have to write a route like this

```
<bean id="myMessageInterpolator" class="my.ConstraintValidatorFactory" />
<bean id="myTraversableResolver" class="my.TraversableResolver" />
<bean id="myConstraintValidatorFactory" class="my.ConstraintValidatorFactory" />

from("direct:start")
.to("bean-validator://x?group=AllChecks&messageInterpolator=#myMessageInterpolator
&traversableResolver=#myTraversableResolver&constraintValidatorFactory=#myConstraintValidatorFactory")
.to("mock:end")
```

It's also possible to describe your constraints as XML and not as Java annotations. In this case, you have to provide the file **META-INF/validation.xml** which could look like this

validation.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<validation-config
  xmlns="http://jboss.org/xml/ns/javax/validation/configuration"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://jboss.org/xml/ns/javax/validation/configuration">
  <default-provider>org.hibernate.validator.HibernateValidator</default-provider>
  <message-
interpolator>org.hibernate.validator.engine.ResourceBundleMessageInterpolator</message-
interpolator>
  <traversable-
resolver>org.hibernate.validator.engine.resolver.DefaultTraversableResolver</traversable-resolver>
  <constraint-validator-
factory>org.hibernate.validator.engine.ConstraintValidatorFactoryImpl</constraint-validator-factory>

  <constraint-mapping>/constraints-car.xml</constraint-mapping>
</validation-config>
```

and the **constraints-car.xml** file

constraints-car.xml

```

<?xml version="1.0" encoding="UTF-8"?>
<constraint-mappings xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://jboss.org/xml/ns/javax/validation/mapping validation-mapping-1.0.xsd"
  xmlns="http://jboss.org/xml/ns/javax/validation/mapping">
  <default-package>org.apache.camel.component.bean.validator</default-package>

  <bean class="CarWithoutAnnotations" ignore-annotations="true">
    <field name="manufacturer">
      <constraint annotation="javax.validation.constraints.NotNull" />
    </field>

    <field name="licensePlate">
      <constraint annotation="javax.validation.constraints.NotNull" />

      <constraint annotation="javax.validation.constraints.Size">
        <groups>
          <value>org.apache.camel.component.bean.validator.OptionalChecks</value>
        </groups>
        <element name="min">5</element>
        <element name="max">14</element>
      </constraint>
    </field>
  </bean>
</constraint-mappings>

```

Here is the XML syntax for the example route definition where **OrderedChecks** can be <https://github.com/apache/camel/blob/master/components/camel-bean-validator/src/test/java/org/apache/camel/component/bean/validator/OrderedChecks.java>

Note that the body should include an instance of a class to validate.

```

<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans.xsd
    http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-spring.xsd">

  <camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
    <route>
      <from uri="direct:start"/>
      <to uri="bean-validator://x?
group=org.apache.camel.component.bean.validator.OrderedChecks"/>
    </route>
  </camelContext>
</beans>

```

47.6. SEE ALSO

- [Configuring Camel](#)
- [Component](#)

- Endpoint
- Getting Started

CHAPTER 48. BINDING COMPONENT (DEPRECATED)

Available as of Camel version 2.11

In Camel terms a *binding* is a way of wrapping an Endpoint in a contract; such as a Data Format, a [Content Enricher](#) or validation step. Bindings are completely optional and you can choose to use them on any camel endpoint.

Bindings are inspired by the work of [SwitchYard project](#) adding service contracts to various technologies like Camel and many others. But rather than the SwitchYard approach of wrapping Camel in SCA, *Camel Bindings* provide a way of wrapping Camel endpoints with contracts inside the Camel framework itself; so you can use them easily inside any Camel route.

48.1. OPTIONS

The Binding component has no options.

The Binding endpoint is configured using URI syntax:

```
binding:bindingName:delegateUri
```

with the following path and query parameters:

48.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|--------------------|----------------------------------------------------------------------|---------|--------|
| bindingName | Required Name of the binding to lookup in the Camel registry. | | String |
| delegateUri | Required Uri of the delegate endpoint. | | String |

48.1.2. Query Parameters (4 parameters):

| Name | Description | Default | Type |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the default exchange pattern when creating an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

48.2. USING BINDINGS

A Binding is currently a bean which defines the contract (though we'll hopefully add bindings to the Camel DSL).

There are a few approaches to defining a bound endpoint (i.e. an endpoint bound with a Binding).

48.3. USING THE BINDING URI

You can prefix any endpoint URI with **binding:nameOfBinding:** where *nameOfBinding* is the name of the Binding bean in your registry.

```
from("binding:jaxb:activemq:myQueue").to("binding:jaxb:activemq:anotherQueue")
```

Here we are using the "jaxb" binding which may, for example, use the JAXB Data Format to marshal and unmarshal messages.

48.4. USING A BINDINGCOMPONENT

There is a Component called `BindingComponent` which can be configured in your Registry by dependency injection which allows the creation of endpoints which are already bound to some binding.

For example if you registered a new component called "jsonmq" in your registry using code like this

```
JacksonDataFormat format = new JacksonDataFormat(MyBean.class);
context.bind("jsonmq", new BindingComponent(new DataFormatBinding(format, "activemq:foo."));
```

Then you could use the endpoint as if it were any other endpoint.

```
from("jsonmq:myQueue").to("jsonmq:anotherQueue")
```

which would be using the queueus "foo.myQueue" and "foo.anotherQueue" and would use the given Jackson Data Format to marshal on and off the queue.

48.5. WHEN TO USE BINDINGS

If you only use an endpoint once in a single route; a binding may actually be more complex and more work than just using the 'raw' endpoint directly and using explicit marshalling and validation in the camel route as normal.

However bindings can help when you are composing many routes together; or using a single route as a 'template' that is configured input and output endpoints; bindings then provide a nice way to wrap up a contract and endpoint together.

Another good use case for bindings is when you are using many endpoints which use the same binding; rather than always having to mention a specific data format or validation rule, you can just use the `BindingComponent` to wrap the endpoints in the binding of your choice.

So bindings are a composition tool really; only use them when they make sense - the extra complexity may not be worth it unless you have lots of routes or endpoints.

CHAPTER 49. BINDY DATAFORMAT

Available as of Camel version 2.0

The goal of this component is to allow the parsing/binding of non-structured data (or to be more precise non-XML data) to/from Java Beans that have binding mappings defined with annotations. Using Bindy, you can bind data from sources such as :

- CSV records,
- Fixed-length records,
- FIX messages,
- or almost any other non-structured data

to one or many Plain Old Java Object (POJO). Bindy converts the data according to the type of the java property. POJOs can be linked together with one-to-many relationships available in some cases. Moreover, for data type like Date, Double, Float, Integer, Short, Long and BigDecimal, you can provide the pattern to apply during the formatting of the property.

For the BigDecimal numbers, you can also define the precision and the decimal or grouping separators.

| Type | Format Type | Pattern example | Link |
|----------|---------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date | DateFormat | dd-MM-yyyy | http://java.sun.com/j2se/1.5.0/docs/api/java/text/SimpleDateFormat.html |
| Decimal* | DecimalFormat | ..## | http://java.sun.com/j2se/1.5.0/docs/api/java/text/DecimalFormat.html |

Decimal* = Double, Integer, Float, Short, Long

Format supported

This first release only support comma separated values fields and key value pair fields (e.g. : FIX messages).

To work with camel-bindy, you must first define your model in a package (e.g. com.acme.model) and for each model class (e.g. Order, Client, Instrument, ...) add the required annotations (described hereafter) to the Class or field.

Multiple models

If you use multiple models, each model has to be placed in it's own package to prevent unpredictable results.

From **Camel 2.16** onwards this is no longer the case, as you can safely have multiple models in the same package, as you configure bindy using class names instead of package names now.

49.1. OPTIONS

The Bindy dataformat supports 5 options, which are listed below.

| Name | Default | Java Type | Description |
|-----------------------------------|--------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>type</code> | | Bindy Type | Whether to use csv, fixed or key value pairs mode. The default value is either Csv or KeyValue depending on chosen dataformat. |
| <code>classType</code> | | String | Name of model class to use. |
| <code>locale</code> | | String | To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default |
| <code>unwrapSingleInstance</code> | true | Boolean | When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a java.util.List. |
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. |

49.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 18 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.bindy-csv.class-type</code> | Name of model class to use. | | String |
| <code>camel.dataformat.bindy-csv.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. | false | Boolean |
| <code>camel.dataformat.bindy-csv.enabled</code> | Enable bindy-csv dataformat | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------|
| <code>camel.dataformat.bindy-csv.locale</code> | To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default | | String |
| <code>camel.dataformat.bindy-csv.type</code> | Whether to use csv, fixed or key value pairs mode. | | BindyType |
| <code>camel.dataformat.bindy-csv.unwrap-single-instance</code> | When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a <code>java.util.List</code> . | true | Boolean |
| <code>camel.dataformat.bindy-fixed.class-type</code> | Name of model class to use. | | String |
| <code>camel.dataformat.bindy-fixed.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc. | false | Boolean |
| <code>camel.dataformat.bindy-fixed.enabled</code> | Enable bindy-fixed dataformat | true | Boolean |
| <code>camel.dataformat.bindy-fixed.locale</code> | To configure a default locale to use, such as us for united states. To use the JVM platform default locale then use the name default | | String |
| <code>camel.dataformat.bindy-fixed.type</code> | Whether to use csv, fixed or key value pairs mode. | | BindyType |
| <code>camel.dataformat.bindy-fixed.unwrap-single-instance</code> | When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a <code>java.util.List</code> . | true | Boolean |
| <code>camel.dataformat.bindy-kvp.class-type</code> | Name of model class to use. | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------|
| <code>camel.dataformat.bindy-kvp.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc. | false | Boolean |
| <code>camel.dataformat.bindy-kvp.enabled</code> | Enable bindy-kvp dataformat | true | Boolean |
| <code>camel.dataformat.bindy-kvp.locale</code> | To configure a default locale to use, such as <code>us</code> for united states. To use the JVM platform default locale then use the name <code>default</code> | | String |
| <code>camel.dataformat.bindy-kvp.type</code> | Whether to use csv, fixed or key value pairs mode. | | BindyType |
| <code>camel.dataformat.bindy-kvp.unwrap-single-instance</code> | When unmarshalling should a single instance be unwrapped and returned instead of wrapped in a <code>java.util.List</code> . | true | Boolean |

ND

49.3. ANNOTATIONS

The annotations created allow to map different concept of your model to the POJO like :

- Type of record (csv, key value pair (e.g. FIX message), fixed length ...),
- Link (to link object in another object),
- DataField and their properties (int, type, ...),
- KeyValuePairField (for key = value format like we have in FIX financial messages),
- Section (to identify header, body and footer section),
- OneToMany,
- BindyConverter (since 2.18.0),
- FormatFactories (since 2.18.0)

This section will describe them :

49.4. 1. CSVRECORD

The CsvRecord annotation is used to identified the root class of the model. It represents a record = a line of a CSV file and can be linked to several children model classes.

| Annotation name | Record type | Level |
|-----------------|-------------|-------|
| CsvRecord | csv | Class |

| Parameter name | type | Info |
|-----------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| separator | string | mandatory - can be ',' or ';' or 'anything'. The only whitespace character supported is tab (\t). No other whitespace characters (spaces) are not supported. This value is interpreted as a regular expression. If you want to use a sign which has a special meaning in regular expressions, e.g. the ' ' sign, than you have to mask it, like ' ' |
| skipFirstLine | boolean | optional - default value = false - allow to skip the first line of the CSV file |
| crlf | string | optional - possible values = WINDOWS,UNIX,MAC, or custom; default value. WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s) |
| generateHeaderColumns | boolean | optional - default value = false - uses to generate the header columns of the CSV generates |
| autoSpanLine | boolean | Camel 2.13/2.12.2: optional - default value = false - if enabled then the last column is auto spanned to end of line, for example if its a comment, etc this allows the line to contain all characters, also the delimiter char. |
| isOrdered | boolean | optional - default value = false - allow to change the order of the fields when CSV is generated |
| quote | String | Camel 2.8.3/2.9: option - allow to specify a quote character of the fields when CSV is generated. This annotation is associated to the root class of the model and must be declared one time. |
| quoting | boolean | *Camel 2.11: optional - default value = false - Indicate if the values (and headers) must be quoted when marshaling when CSV is generated. |

| Parameter name | type | Info |
|------------------|---------|-----------------------------------------------------------------------------------------------------------------------|
| endWithLineBreak | boolean | Camel 2.21: optional - default value = true - Indicate if the CSV generated file should end with a line break. |

case 1 : separator = ','

The separator used to segregate the fields in the CSV record is ',' :

```
10, J, Pauline, M, XD12345678, Fortis Dynamic 15/15, 2500,
USD,08-01-2009
```

```
@CsvRecord( separator = "," )
public Class Order {
}
}
```

case 2 : separator = ';' :

Compare to the previous case, the separator here is ';' instead of ',' :

```
10; J; Pauline; M; XD12345678; Fortis Dynamic 15/15; 2500; USD; 08-01-2009
```

```
@CsvRecord( separator = ";" )
public Class Order {
}
}
```

case 3 : separator = '|'

Compare to the previous case, the separator here is '|' instead of ',' :

```
10| J| Pauline| M| XD12345678| Fortis Dynamic 15/15| 2500| USD|
08-01-2009
```

```
@CsvRecord( separator = "\\|" )
public Class Order {
}
}
```

case 4 : separator = '\\,\\'**Applies for Camel 2.8.2 or older**

When the field to be parsed of the CSV record contains ',' or ';' which is also used as separator, we would find another strategy to tell camel bindy how to handle this case. To define the field containing the data with a comma, you will

use simple or double quotes

as delimiter (e.g : '10', 'Street 10, NY', 'USA' or "10", "Street 10, NY", "USA").

Remark : In this case, the first and last character of the line which are a simple or double quotes will be removed by bindy

```
"10","J","Pauline"," M","XD12345678","Fortis Dynamic 15,15"
2500","USD","08-01-2009"
```

```
@CsvRecord( separator = "\",\"" )
public Class Order {

}
```

From **Camel 2.8.3/2.9** or **never** bindy will automatically detect if the record is enclosed with either single or double quotes and automatically remove those quotes when unmarshalling from CSV to Object. Therefore do **not** include the quotes in the separator, but simply do as below:

```
"10","J","Pauline"," M","XD12345678","Fortis Dynamic 15,15"
2500","USD","08-01-2009"
```

```
@CsvRecord( separator = "," )
public Class Order {

}
```

Notice that if you want to marshal from Object to CSV and use quotes, then you need to specify which quote character to use, using the **quote** attribute on the @CsvRecord as shown below:

```
@CsvRecord( separator = ",", quote = "\"" )
public Class Order {

}
```

case 5 : separator & skipfirstline

The feature is interesting when the client wants to have in the first line of the file, the name of the data fields :

order id, client id, first name, last name, isin code, instrument name, quantity, currency, date

To inform bindy that this first line must be skipped during the parsing process, then we use the attribute :

```
@CsvRecord(separator = ",", skipFirstLine = true)
public Class Order {

}
```

case 6 : generateHeaderColumns

To add at the first line of the CSV generated, the attribute generateHeaderColumns must be set to true in the annotation like this :

```
@CsvRecord( generateHeaderColumns = true )
public Class Order {

}
```

As a result, Bindy during the unmarshaling process will generate CSV like this :

order id, client id, first name, last name, isin code, instrument name, quantity, currency, date

```
10, J, Pauline, M, XD12345678, Fortis Dynamic 15/15, 2500, USD,08-01-2009
```

case 7 : carriage return

If the platform where camel-bindy will run is not Windows but Macintosh or Unix, than you can change the crlf property like this. Three values are available : WINDOWS, UNIX or MAC

```
@CsvRecord(separator = ",", crlf="MAC")
public Class Order {

}
```

Additionally, if for some reason you need to add a different line ending character, you can opt to specify it using the crlf parameter. In the following example, we can end the line with a comma followed by the newline character:

```
@CsvRecord(separator = ",", crlf=",\n")
public Class Order {

}
```

case 8 : isOrdered

Sometimes, the order to follow during the creation of the CSV record from the model is different from the order used during the parsing. Then, in this case, we can use the attribute `isOrdered = true` to indicate this in combination with attribute 'position' of the `DataField` annotation.

```
@CsvRecord(isOrdered = true)
public Class Order {

    @DataField(pos = 1, position = 11)
    private int orderNr;

    @DataField(pos = 2, position = 10)
    private String clientNr;

}
```

Remark : `pos` is used to parse the file, stream while `positions` is used to generate the CSV

49.5. 2. LINK

The link annotation will allow to link objects together.

| Annotation name | Record type | Level |
|-----------------|-------------|------------------|
| Link | all | Class & Property |

| Parameter name | type | Info |
|----------------|----------|---------------------------------------------------------------------------------------------|
| linkType | LinkType | optional - by default the value is LinkType.oneToOne - so you are not obliged to mention it |

Only one-to-one relation is allowed.

e.g : If the model Class Client is linked to the Order class, then use annotation Link in the Order class like this :

Property Link

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @Link
    private Client client;
}
```

AND for the class Client :

Class Link

```
@Link
public class Client {

}
```

49.6. 3. DATAFIELD

The DataField annotation defines the property of the field. Each datafield is identified by its position in the record, a type (string, int, date, ...) and optionally of a pattern

| Annotation name | Record type | Level |
|-----------------|-------------|----------|
| DataField | all | Property |

| Parameter name | type | Info |
|---------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pos | int | mandatory - The input position of the field. digit number starting from 1 to ... - See the position parameter. |
| pattern | string | optional - default value = "" - will be used to format Decimal, Date, |
| length | int | optional - represents the length of the field for fixed length format |
| precision | int | optional - represents the precision to be used when the Decimal number will be formatted/parsed |
| pattern | string | optional - default value = "" - is used by the Java formatter (SimpleDateFormat by example) to format/validate data. If using pattern, then setting locale on bindy data format is recommended. Either set to a known locale such as "us" or use "default" to use platform default locale. Notice that "default" requires Camel 2.14/2.13.3/2.12.5. |
| position | int | optional - must be used when the position of the field in the CSV generated (output message) must be different compare to input position (pos). See the pos parameter. |
| required | boolean | optional - default value = "false" |
| trim | boolean | optional - default value = "false" |
| default Value | string | Camel 2.10: optional - default value = "" - defines the field's default value when the respective CSV field is empty/not available |
| implied Decimal Separator | boolean | Camel 2.11: optional - default value = "false" - Indicates if there is a decimal point implied at a specified location |
| length Pos | int | Camel 2.11: optional - can be used to identify a data field in a fixed-length record that defines the fixed length for this field |
| align | string | optional - default value = "R" - Align the text to the right or left within a fixed-length field. Use values 'R' or 'L' |

| Parameter name | type | Info |
|----------------|--------|------------------------------------------------------------------------------------------------------------------------|
| delimiter | string | Camel 2.11: optional - can be used to demarcate the end of a variable-length field within a fixed-length record |

case 1 : pos

This parameter/attribute represents the position of the field in the csv record

Position

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @DataField(pos = 5)
    private String isinCode;

}
```

As you can see in this example the position starts at '1' but continues at '5' in the class Order. The numbers from '2' to '4' are defined in the class Client (see here after).

Position continues in another model class

```
public class Client {

    @DataField(pos = 2)
    private String clientNr;

    @DataField(pos = 3)
    private String firstName;

    @DataField(pos = 4)
    private String lastName;

}
```

case 2 : pattern

The pattern allows to enrich or validates the format of your data

Pattern

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;
```

```

@DataField(pos = 5)
private String isinCode;

@DataField(name = "Name", pos = 6)
private String instrumentName;

@DataField(pos = 7, precision = 2)
private BigDecimal amount;

@DataField(pos = 8)
private String currency;

// pattern used during parsing or when the date is created
@DataField(pos = 9, pattern = "dd-MM-yyyy")
private Date orderDate;
}

```

case 3 : precision

The precision is helpful when you want to define the decimal part of your number

Precision

```

@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @Link
    private Client client;

    @DataField(pos = 5)
    private String isinCode;

    @DataField(name = "Name", pos = 6)
    private String instrumentName;

    @DataField(pos = 7, precision = 2)
    private BigDecimal amount;

    @DataField(pos = 8)
    private String currency;

    @DataField(pos = 9, pattern = "dd-MM-yyyy")
    private Date orderDate;
}

```

case 4 : Position is different in output

The position attribute will inform bindy how to place the field in the CSV record generated. By default, the position used corresponds to the position defined with the attribute 'pos'. If the position is different (that means that we have an asymmetric process comparing marshaling from unmarshaling) than we can use 'position' to indicate this.

Here is an example

Position is different in output

```

@CsvRecord(separator = ",", isOrdered = true)
public class Order {

    // Positions of the fields start from 1 and not from 0

    @DataField(pos = 1, position = 11)
    private int orderNr;

    @DataField(pos = 2, position = 10)
    private String clientNr;

    @DataField(pos = 3, position = 9)
    private String firstName;

    @DataField(pos = 4, position = 8)
    private String lastName;

    @DataField(pos = 5, position = 7)
    private String instrumentCode;

    @DataField(pos = 6, position = 6)
    private String instrumentNumber;
}

```

This attribute of the annotation `@DataField` must be used in combination with attribute `isOrdered = true` of the annotation `@CsvRecord`

case 5 : required

If a field is mandatory, simply use the attribute 'required' setted to true

Required

```

@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @DataField(pos = 2, required = true)
    private String clientNr;

    @DataField(pos = 3, required = true)
    private String firstName;

    @DataField(pos = 4, required = true)
    private String lastName;
}

```

If this field is not present in the record, than an error will be raised by the parser with the following information :

Some fields are missing (optional or mandatory), line :

case 6 : trim

If a field has leading and/or trailing spaces which should be removed before they are processed, simply use the attribute 'trim' setted to true

Trim

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1, trim = true)
    private int orderNr;

    @DataField(pos = 2, trim = true)
    private Integer clientNr;

    @DataField(pos = 3, required = true)
    private String firstName;

    @DataField(pos = 4)
    private String lastName;
}
```

case 7 : defaultValue

If a field is not defined then uses the value indicated by the defaultValue attribute

Default value

```
@CsvRecord(separator = ",")
public class Order {

    @DataField(pos = 1)
    private int orderNr;

    @DataField(pos = 2)
    private Integer clientNr;

    @DataField(pos = 3, required = true)
    private String firstName;

    @DataField(pos = 4, defaultValue = "Barin")
    private String lastName;
}
```

This attribute is only applicable to optional fields.

49.7. 4. FIXEDLENGTHRECORD

The FixedLengthRecord annotation is used to identify the root class of the model. It represents a record which is "a line of a file/message containing data fixed length formatted" and can be linked to several child model classes. This format is particular because data of a field can be aligned to the right or to the left.

When the size of the data does not fill completely the length of the field, we can then add 'pad' characters.

| Annotation name | Record type | Level |
|-------------------|-------------|-------|
| FixedLengthRecord | fixed | Class |

| Parameter name | type | Required | Default value | Info |
|---------------------|---------|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| countGrapheme | boolean | | false | Indicates how chars are counted. |
| crlf | string | | WINDOWS | Character to be used to add a carriage return after each record (optional). Possible values: WINDOWS, UNIX, MAC, or custom. This option is used only during marshalling, whereas unmarshalling uses system default JDK provided line delimiter unless eol is customized. |
| eol | string | | | Character to be used to process considering end of line after each record while unmarshalling (optional - default = "" which help default JDK provided line delimiter to be used unless any other line delimiter provided). This option is used only during unmarshalling, where marshalling uses system default provided line delimiter as "WINDOWS" unless any other value is provided. |
| footer | Class | | void | Indicates that the record(s) of this type may be followed by a single footer record at the end of the file. |
| header | | | | Indicates that the record(s) of this type may be preceded by a single header record at the beginning of in the file. |
| ignoreMissingChars | | | | Indicates whether too short lines will be ignored |
| ignoreTrailingChars | | | | Indicates that characters beyond the last mapped field can be ignored when unmarshalling / parsing. This annotation is associated to the root class of the model and must be declared one time. |

| Parameter name | type | Required | Default value | Info |
|--------------------|---------|----------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| length | int | | 0 | The fixed length of the record (number of characters). It means that the record will always be that long padded with <code>{#paddingChar()}'s</code> by default. |
| name | String | | | Name describing the record (optional). |
| paddingChar | char | | | The char to pad with. |
| skipFooter | boolean | | false | Configures the data format to skip marshalling / unmarshalling of the footer record. Configure this parameter on the primary record (e.g., not the header or footer). |
| skipHeader | boolean | | false | Configures the data format to skip marshalling / unmarshalling of the header record. Configure this parameter on the primary record (e.g., not the header or footer). |

A record may not be both a header/footer and a primary fixed-length record.

case 1: Simple fixed length record

This simple example shows how to design the model to parse/format a fixed message.

```
10A9PaulineMISINXD12345678BUYShare2500.45USD01-08-2009
```

Fixed-simple

```
@FixedLengthRecord(length=54, paddingChar=' ')
public static class Order {

    @DataField(pos = 1, length=2)
    private int orderNr;

    @DataField(pos = 3, length=2)
    private String clientNr;

    @DataField(pos = 5, length=7)
    private String firstName;

    @DataField(pos = 12, length=1, align="L")
    private String lastName;

    @DataField(pos = 13, length=4)
    private String instrumentCode;

    @DataField(pos = 17, length=10)
    private String instrumentNumber;
```

```

@DataField(pos = 27, length=3)
private String orderType;

@DataField(pos = 30, length=5)
private String instrumentType;

@DataField(pos = 35, precision = 2, length=7)
private BigDecimal amount;

@DataField(pos = 42, length=3)
private String currency;

@DataField(pos = 45, length=10, pattern = "dd-MM-yyyy")
private Date orderDate;
}

```

case 2 : Fixed length record with alignment and padding

This more elaborated example shows how to define the alignment for a field and how to assign a padding character which, in this case, is ' ':

```
10A9 PaulineM ISINXD12345678BUYShare2500.45USD01-08-2009
```

Fixed-padding-align

```

@FixedLengthRecord(length=60, paddingChar=' ')
public static class Order {

    @DataField(pos = 1, length=2)
    private int orderNr;

    @DataField(pos = 3, length=2)
    private String clientNr;

    @DataField(pos = 5, length=9)
    private String firstName;

    @DataField(pos = 14, length=5, align="L") // align text to the LEFT zone of the block
    private String lastName;

    @DataField(pos = 19, length=4)
    private String instrumentCode;

    @DataField(pos = 23, length=10)
    private String instrumentNumber;

    @DataField(pos = 33, length=3)
    private String orderType;

    @DataField(pos = 36, length=5)
    private String instrumentType;

    @DataField(pos = 41, precision = 2, length=7)
    private BigDecimal amount;
}

```

```

@DataField(pos = 48, length=3)
private String currency;

@DataField(pos = 51, length=10, pattern = "dd-MM-yyyy")
private Date orderDate;
}

```

case 3 : Field padding

Sometimes, the default padding defined for a record cannot be applied to the field as we have a number format where we would like to pad with '0' instead of ' '. In this case, in the model, you can use the attribute **paddingChar** on **@DataField** to set this value.

```
10A9 PaulineM ISINXD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-padding-field

```

@FixedLengthRecord(length = 65, paddingChar = ' ')
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 3, length = 2)
    private String clientNr;

    @DataField(pos = 5, length = 9)
    private String firstName;

    @DataField(pos = 14, length = 5, align = "L")
    private String lastName;

    @DataField(pos = 19, length = 4)
    private String instrumentCode;

    @DataField(pos = 23, length = 10)
    private String instrumentNumber;

    @DataField(pos = 33, length = 3)
    private String orderType;

    @DataField(pos = 36, length = 5)
    private String instrumentType;

    @DataField(pos = 41, precision = 2, length = 12, paddingChar = '0')
    private BigDecimal amount;

    @DataField(pos = 53, length = 3)
    private String currency;

    @DataField(pos = 56, length = 10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}

```

case 4: Fixed length record with delimiter

Fixed-length records sometimes have delimited content within the record. In the following example, the `firstName` and `lastName` fields are delimited with the `^` character in the following example:

```
10A9Pauline^M^ISINXD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-delimited

```
@FixedLengthRecord
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 2, length = 2)
    private String clientNr;

    @DataField(pos = 3, delimiter = "^")
    private String firstName;

    @DataField(pos = 4, delimiter = "^")
    private String lastName;

    @DataField(pos = 5, length = 4)
    private String instrumentCode;

    @DataField(pos = 6, length = 10)
    private String instrumentNumber;

    @DataField(pos = 7, length = 3)
    private String orderType;

    @DataField(pos = 8, length = 5)
    private String instrumentType;

    @DataField(pos = 9, precision = 2, length = 12, paddingChar = '0')
    private BigDecimal amount;

    @DataField(pos = 10, length = 3)
    private String currency;

    @DataField(pos = 11, length = 10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}
```

The **pos** value(s) in a fixed-length record may optionally be defined using ordinal or sequential values instead of precise column numbers.

case 5 : Fixed length record with record-defined field length

Occasionally a fixed-length record may contain a field that defines the expected length of another field within the same record. In the following example the length of the **instrumentNumber** field value is defined by the value of **instrumentNumberLen** field in the record.

```
10A9Pauline^M^ISIN10XD12345678BUYShare000002500.45USD01-08-2009
```

Fixed-delimited

```
@FixedLengthRecord
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 2, length = 2)
    private String clientNr;

    @DataField(pos = 3, delimiter = "^")
    private String firstName;

    @DataField(pos = 4, delimiter = "^")
    private String lastName;

    @DataField(pos = 5, length = 4)
    private String instrumentCode;

    @DataField(pos = 6, length = 2, align = "R", paddingChar = '0')
    private int instrumentNumberLen;

    @DataField(pos = 7, lengthPos=6)
    private String instrumentNumber;

    @DataField(pos = 8, length = 3)
    private String orderType;

    @DataField(pos = 9, length = 5)
    private String instrumentType;

    @DataField(pos = 10, precision = 2, length = 12, paddingChar = '0')
    private BigDecimal amount;

    @DataField(pos = 11, length = 3)
    private String currency;

    @DataField(pos = 12, length = 10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}
```

case 6 : Fixed length record with header and footer

Bindy will discover fixed-length header and footer records that are configured as part of the model provided that the annotated classes exist either in the same package as the primary **@FixedLengthRecord** class, or within one of the configured scan packages. The following text illustrates two fixed-length records that are bracketed by a header record and footer record.

```
101-08-2009
10A9 PaulineM ISINXD12345678BUYShare000002500.45USD01-08-2009
10A9 RichN ISINXD12345678BUYShare000002700.45USD01-08-2009
9000000002
```

Fixed-header-and-footer-main-class

```

@FixedLengthRecord(header = OrderHeader.class, footer = OrderFooter.class)
public class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 2, length = 2)
    private String clientNr;

    @DataField(pos = 3, length = 9)
    private String firstName;

    @DataField(pos = 4, length = 5, align = "L")
    private String lastName;

    @DataField(pos = 5, length = 4)
    private String instrumentCode;

    @DataField(pos = 6, length = 10)
    private String instrumentNumber;

    @DataField(pos = 7, length = 3)
    private String orderType;

    @DataField(pos = 8, length = 5)
    private String instrumentType;

    @DataField(pos = 9, precision = 2, length = 12, paddingChar = '0')
    private BigDecimal amount;

    @DataField(pos = 10, length = 3)
    private String currency;

    @DataField(pos = 11, length = 10, pattern = "dd-MM-yyyy")
    private Date orderDate;
}

@FixedLengthRecord
public class OrderHeader {
    @DataField(pos = 1, length = 1)
    private int recordType = 1;

    @DataField(pos = 2, length = 10, pattern = "dd-MM-yyyy")
    private Date recordDate;
}

@FixedLengthRecord
public class OrderFooter {

    @DataField(pos = 1, length = 1)
    private int recordType = 9;
}

```

```

    @DataField(pos = 2, length = 9, align = "R", paddingChar = '0')
    private int numberOfRecordsInTheFile;
}

```

case 7 : Skipping content when parsing a fixed length record.

It is common to integrate with systems that provide fixed-length records containing more information than needed for the target use case. It is useful in this situation to skip the declaration and parsing of those fields that we do not need. To accommodate this, Bindy will skip forward to the next mapped field within a record if the **pos** value of the next declared field is beyond the cursor position of the last parsed field. Using absolute **pos** locations for the fields of interest (instead of ordinal values) causes Bindy to skip content between two fields.

Similarly, it is possible that none of the content beyond some field is of interest. In this case, you can tell Bindy to skip parsing of everything beyond the last mapped field by setting the **ignoreTrailingChars** property on the **@FixedLengthRecord** declaration.

```

@DataFieldRecord(ignoreTrailingChars = true)
public static class Order {

    @DataField(pos = 1, length = 2)
    private int orderNr;

    @DataField(pos = 3, length = 2)
    private String clientNr;

    // any characters that appear beyond the last mapped field will be ignored
}

```

49.8. 5. MESSAGE

The Message annotation is used to identify the class of your model who will contain key value pairs fields. This kind of format is used mainly in Financial Exchange Protocol Messages (FIX). Nevertheless, this annotation can be used for any other format where data are identified by keys. The key pair values are separated each other by a separator which can be a special character like a tab delimiter (unicode representation : \u0009) or a start of heading (unicode representation : \u0001)

```

**"FIX information"**

```

More information about FIX can be found on this web site : <http://www.fixprotocol.org/>. To work with FIX messages, the model must contain a Header and Trailer classes linked to the root message class which could be a Order class. This is not mandatory but will be very helpful when you will use camel-bindy in combination with camel-fix which is a Fix gateway based on quickFix project <http://www.quickfixj.org/>.

| Annotation name | Record type | Level |
|-----------------|----------------|-------|
| Message | key value pair | Class |

| Parameter name | type | Info |
|-----------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pairSeparator | string | mandatory - can be '=' or ';' or 'anything' |
| keyValuePairSeparator | string | mandatory - can be '\u0001', '\u0009', '#' or 'anything' |
| crlf | string | optional - possible values = WINDOWS,UNIX,MAC, or custom; default value = WINDOWS - allow to define the carriage return character to use. If you specify a value other than the three listed before, the value you enter (custom) will be used as the CRLF character(s) |
| type | string | optional - define the type of message (e.g. FIX, EMX, ...) |
| version | string | optional - version of the message (e.g. 4.1) |
| isOrdered | boolean | optional - default value = false - allow to change the order of the fields when FIX message is generated. This annotation is associated to the message class of the model and must be declared one time. |

case 1: separator = '\u0001'

The separator used to segregate the key value pair fields in a FIX message is the ASCII '01' character or in unicode format '\u0001'. This character must be escaped a second time to avoid a java runtime error. Here is an example :

```
8=FIX.4.1 9=20 34=1 35=0 49=INVMGR 56=BRKR 1=BE.CHM.001 11=CHM0001-01
22=4 ...
```

and how to use the annotation

FIX - message

```
@Message(keyValuePairSeparator = "=", pairSeparator = "\u0001", type="FIX", version="4.1")
public class Order {
}
}
```

Look at test cases

The ASCII character like tab, ... cannot be displayed in WIKI page. So, have a look to the test case of camel-bindy to see exactly how the FIX message looks like (src\test\data\fix\fix.txt) and the Order, Trailer, Header classes (src\test\java\org\apache\camel\dataformat\bindy\model\fix\simple\Order.java)

49.9. 6. KEYVALUEPAIRFIELD

The KeyValuePairField annotation defines the property of a key value pair field. Each KeyValuePairField is identified by a tag (= key) and its value associated, a type (string, int, date, ...), optionally a pattern and if the field is required

| Annotation name | Record type | Level |
|--------------------------|----------------------|----------|
| KeyValuePairField | Key Value Pair - FIX | Property |

| Parameter name | type | Info |
|-------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------|
| tag | int | mandatory - digit number identifying the field in the message - must be unique |
| pattern | string | optional - default value = "" - will be used to format Decimal, Date, ... |
| precision | int | optional - digit number - represents the precision to be used when the Decimal number will be formatted/parsed |
| position | int | optional - must be used when the position of the key/tag in the FIX message must be different |
| required | boolean | optional - default value = "false" |
| impliedDecimalSeparator | boolean | Camel 2.11: optional - default value = "false" - Indicates if there is a decimal point implied at a specified location |

case 1: tag

This parameter represents the key of the field in the message

FIX message - Tag

```
@Message(keyValuePairSeparator = "=", pairSeparator = "\u0001", type="FIX", version="4.1")
public class Order {

    @Link Header header;

    @Link Trailer trailer;
}
```

```

@KeyValuePairField(tag = 1) // Client reference
private String Account;

@KeyValuePairField(tag = 11) // Order reference
private String ClOrdId;

@KeyValuePairField(tag = 22) // Fund ID type (Sedol, ISIN, ...)
private String IDSource;

@KeyValuePairField(tag = 48) // Fund code
private String SecurityId;

@KeyValuePairField(tag = 54) // Movement type ( 1 = Buy, 2 = sell)
private String Side;

@KeyValuePairField(tag = 58) // Free text
private String Text;
}

```

case 2 : Different position in output

If the tags/keys that we will put in the FIX message must be sorted according to a predefined order, then use the attribute 'position' of the annotation @KeyValuePairField

FIX message - Tag - sort

```

@Message(keyValuePairSeparator = "=", pairSeparator = "\\u0001", type = "FIX", version = "4.1",
isOrdered = true)
public class Order {

    @Link Header header;

    @Link Trailer trailer;

    @KeyValuePairField(tag = 1, position = 1) // Client reference
    private String account;

    @KeyValuePairField(tag = 11, position = 3) // Order reference
    private String clOrdId;
}

```

49.10. 7. SECTION

In FIX message of fixed length records, it is common to have different sections in the representation of the information : header, body and section. The purpose of the annotation @Section is to inform bindy about which class of the model represents the header (= section 1), body (= section 2) and footer (= section 3)

Only one attribute/parameter exists for this annotation.

| Annotation name | Record type | Level |
|-----------------|-------------|-------|
| Section | FIX | Class |

| Parameter name | type | Info |
|----------------|------|-----------------------------------------------|
| number | int | digit number identifying the section position |

case 1: Section

Definition of the header section

FIX message - Section - Header

```
@Section(number = 1)
public class Header {

    @KeyValuePairField(tag = 8, position = 1) // Message Header
    private String beginString;

    @KeyValuePairField(tag = 9, position = 2) // Checksum
    private int bodyLength;
}
```

Definition of the body section

FIX message - Section - Body

```
@Section(number = 2)
@Message(keyValuePairSeparator = "=", pairSeparator = "\\u0001", type = "FIX", version = "4.1",
isOrdered = true)
public class Order {

    @Link Header header;

    @Link Trailer trailer;

    @KeyValuePairField(tag = 1, position = 1) // Client reference
    private String account;

    @KeyValuePairField(tag = 11, position = 3) // Order reference
    private String clOrdId;
}
```

Definition of the footer section

FIX message - Section - Footer

```

@Section(number = 3)
public class Trailer {

    @KeyValuePairField(tag = 10, position = 1)
    // CheckSum
    private int checkSum;

    public int getCheckSum() {
        return checkSum;
    }
}

```

49.11. 8. ONETOMANY

The purpose of the annotation `@OneToMany` is to allow to work with a **List<?>** field defined a POJO class or from a record containing repetitive groups.

Restrictions OneToMany

Be careful, the one to many of bindy does not allow to handle repetitions defined on several levels of the hierarchy

The relation `OneToMany` ONLY WORKS in the following cases :

- Reading a FIX message containing repetitive groups (= group of tags/keys)
- Generating a CSV with repetitive data

| Annotation name | Record type | Level |
|------------------|-------------|----------|
| OneToMany | all | property |

| Parameter name | type | Info |
|----------------|--------|--------------------------------------------------------------------------------------|
| mappedTo | string | optional - string - class name associated to the type of the List<Type of the Class> |

case 1: Generating CSV with repetitive data

Here is the CSV output that we want :

```

Claus,Ibsen,Camel in Action 1,2010,35
Claus,Ibsen,Camel in Action 2,2012,35
Claus,Ibsen,Camel in Action 3,2013,35
Claus,Ibsen,Camel in Action 4,2014,35

```

Remark : the repetitive data concern the title of the book and its publication date while first, last name and age are common

and the classes used to modeling this. The Author class contains a List of Book.

Generate CSV with repetitive data

```
@CsvRecord(separator=",")
public class Author {

    @DataField(pos = 1)
    private String firstName;

    @DataField(pos = 2)
    private String lastName;

    @OneToMany
    private List<Book> books;

    @DataField(pos = 5)
    private String Age;
}

public class Book {

    @DataField(pos = 3)
    private String title;

    @DataField(pos = 4)
    private String year;
}
```

Very simple isn't it !!!

case 2 : Reading FIX message containing group of tags/keys

Here is the message that we would like to process in our model :

```
8=FIX 4.19=2034=135=049=INVMGR56=BRKR
1=BE.CHM.00111=CHM0001-0158=this is a camel - bindy test
22=448=BE000124567854=1
22=548=BE000987654354=2
22=648=BE000999999954=3
10=220
```

tags 22, 48 and 54 are repeated

and the code

Reading FIX message containing group of tags/keys

```
public class Order {

    @Link Header header;
```

```

@Link Trailer trailer;

@KeyValuePairField(tag = 1) // Client reference
private String account;

@KeyValuePairField(tag = 11) // Order reference
private String clOrdId;

@KeyValuePairField(tag = 58) // Free text
private String text;

@OneToMany(mappedTo =
"org.apache.camel.dataformat.bindy.model.fix.complex.onetomany.Security")
List<Security> securities;
}

public class Security {

    @KeyValuePairField(tag = 22) // Fund ID type (Sedol, ISIN, ...)
    private String idSource;

    @KeyValuePairField(tag = 48) // Fund code
    private String securityCode;

    @KeyValuePairField(tag = 54) // Movement type ( 1 = Buy, 2 = sell)
    private String side;
}

```

49.12. 9. BINDYCONVERTER

The purpose of the annotation `@BindyConverter` is define a converter to be used on field level. The provided class must implement the `Format` interface.

```

@FixedLengthRecord(length = 10, paddingChar = ' ')
public static class DataModel {
    @DataField(pos = 1, length = 10, trim = true)
    @BindyConverter(CustomConverter.class)
    public String field1;
}

public static class CustomConverter implements Format<String> {
    @Override
    public String format(String object) throws Exception {
        return (new StringBuilder(object)).reverse().toString();
    }

    @Override
    public String parse(String string) throws Exception {
        return (new StringBuilder(string)).reverse().toString();
    }
}

```

49.13. 10. FORMATFACTORIES

The purpose of the annotation `@FormatFactories` is to define a set of converters at record-level. The provided classes must implement the `FormatFactoryInterface` interface.

```

@CsvRecord(separator = ",")
@FormatFactories({OrderNumberFormatFactory.class})
public static class Order {

    @DataField(pos = 1)
    private OrderNumber orderNr;

    @DataField(pos = 2)
    private String firstName;
}

public static class OrderNumber {
    private int orderNr;

    public static OrderNumber ofString(String orderNumber) {
        OrderNumber result = new OrderNumber();
        result.orderNr = Integer.valueOf(orderNumber);
        return result;
    }
}

public static class OrderNumberFormatFactory extends AbstractFormatFactory {

    {
        supportedClasses.add(OrderNumber.class);
    }

    @Override
    public Format<?> build(FormattingOptions formattingOptions) {
        return new Format<OrderNumber>() {
            @Override
            public String format(OrderNumber object) throws Exception {
                return String.valueOf(object.orderNr);
            }

            @Override
            public OrderNumber parse(String string) throws Exception {
                return OrderNumber.ofString(string);
            }
        };
    }
}

```

49.14. SUPPORTED DATATYPES

The `DefaultFormatFactory` makes formatting of the following datatype available by returning an instance of the interface `FormatFactoryInterface` based on the provided `FormattingOptions`:

- `BigDecimal`
- `BigInteger`

- Boolean
- Byte
- Character
- Date
- Double
- Enums
- Float
- Integer
- LocalDate (java 8, since 2.18.0)
- LocalDateTime (java 8, since 2.18.0)
- LocalTime (java 8, since 2.18.0)
- Long
- Short
- String

The `DefaultFormatFactory` can be overridden by providing an instance of `FactoryRegistry` in the registry in use (e.g. spring or JNDI).

49.15. USING THE JAVA DSL

The next step consists in instantiating the `DataFormat` *bindy* class associated with this record type and providing Java package name(s) as parameter.

For example the following uses the class **`BindyCsvDataFormat`** (who correspond to the class associated with the CSV record type) which is configured with **`com.acme.model`** package name to initialize the model objects configured in this package.

```
// Camel 2.15 or older (configure by package name)
DataFormat bindy = new BindyCsvDataFormat("com.acme.model");

// Camel 2.16 onwards (configure by class name)
DataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);
```

49.15.1. Setting locale

Bindy supports configuring the locale on the dataformat, such as

```
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");
// Camel 2.16 onwards (configure by class name)
```

```
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale("us");
```

Or to use the platform default locale then use "default" as the locale name. Notice this requires Camel 2.14/2.13.3/2.12.5.

```
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");
// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale("default");
```

for older releases you can set it using Java code as shown

```
// Camel 2.15 or older (configure by package name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat("com.acme.model");
// Camel 2.16 onwards (configure by class name)
BindyCsvDataFormat bindy = new BindyCsvDataFormat(com.acme.model.MyModel.class);

bindy.setLocale(Locale.getDefault().getISO3Country());
```

49.15.2. Unmarshaling

```
from("file://inbox")
  .unmarshal(bindy)
  .to("direct:handleOrders");
```

Alternatively, you can use a named reference to a data format which can then be defined in your Registry e.g. your Spring XML file:

```
from("file://inbox")
  .unmarshal("myBindyDataFormat")
  .to("direct:handleOrders");
```

The Camel route will pick-up files in the inbox directory, unmarshall CSV records into a collection of model objects and send the collection to the route referenced by 'handleOrders'.

The collection returned is a **List of Map** objects. Each Map within the list contains the model objects that were marshalled out of each line of the CSV. The reason behind this is that *each line can correspond to more than one object*. This can be confusing when you simply expect one object to be returned per line.

Each object can be retrieve using its class name.

```
List<Map<String, Object>> unmarshaledModels = (List<Map<String, Object>>)
exchange.getIn().getBody();

int modelCount = 0;
for (Map<String, Object> model : unmarshaledModels) {
  for (String className : model.keySet()) {
    Object obj = model.get(className);
```

```

    LOG.info("Count : " + modelCount + ", " + obj.toString());
  }
  modelCount++;
}

LOG.info("Total CSV records received by the csv bean : " + modelCount);

```

Assuming that you want to extract a single Order object from this map for processing in a route, you could use a combination of a Splitter and a Processor as per the following:

```

from("file://inbox")
  .unmarshal(bindy)
  .split(body())
  .process(new Processor() {
    public void process(Exchange exchange) throws Exception {
      Message in = exchange.getIn();
      Map<String, Object> modelMap = (Map<String, Object>) in.getBody();
      in.setBody(modelMap.get(Order.class.getCanonicalName()));
    }
  })
  .to("direct:handleSingleOrder")
  .end();

```

Take care of the fact that Bindy uses CHARSET_NAME property or the CHARSET_NAME header as define in the Exchange interface to do a charset conversion of the inputstream received for unmarshalling. In some producers (e.g. file-endpoint) you can define a charset. The charset conversion can already been done by this producer. Sometimes you need to remove this property or header from the exchange before sending it to the unmarshal. If you don't remove it the conversion might be done twice which might lead to unwanted results.

```

from("file://inbox?charset=Cp922")
  .removeProperty(Exchange.CHARSET_NAME)
  .unmarshal("myBindyDataFormat")
  .to("direct:handleOrders");

```

49.15.3. Marshaling

To generate CSV records from a collection of model objects, you create the following route :

```

from("direct:handleOrders")
  .marshal(bindy)
  .to("file://outbox")

```

49.16. USING SPRING XML

This is really easy to use Spring as your favorite DSL language to declare the routes to be used for camel-bindy. The following example shows two routes where the first will pick-up records from files, unmarshal the content and bind it to their model. The result is then send to a pojo (doing nothing special) and place them into a queue.

The second route will extract the pojoes from the queue and marshal the content to generate a file containing the csv record. The example above is for using Camel 2.16 onwards.

spring dsl

```

<?xml version="1.0" encoding="UTF-8"?>

<beans xmlns="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="
    http://www.springframework.org/schema/beans
    http://www.springframework.org/schema/beans/spring-beans.xsd
    http://camel.apache.org/schema/spring
    http://camel.apache.org/schema/spring/camel-spring.xsd">

  <!-- Queuing engine - ActiveMq - work locally in mode virtual memory -->
  <bean id="activemq" class="org.apache.activemq.camel.component.ActiveMQComponent">
    <property name="brokerURL" value="vm://localhost:61616"/>
  </bean>

  <camelContext xmlns="http://camel.apache.org/schema/spring">
    <dataFormats>
      <bindy id="bindyDataformat" type="Csv" classType="org.apache.camel.bindy.model.Order"/>
    </dataFormats>

    <route>
      <from uri="file://src/data/csv/?noop=true" />
      <unmarshal ref="bindyDataformat" />
      <to uri="bean:csv" />
      <to uri="activemq:queue:in" />
    </route>

    <route>
      <from uri="activemq:queue:in" />
      <marshal ref="bindyDataformat" />
      <to uri="file://src/data/csv/out/" />
    </route>
  </camelContext>
</beans>

```

NOTE

Please verify that your model classes implements serializable otherwise the queue manager will raise an error

49.17. DEPENDENCIES

To use Bindy in your camel routes you need to add the a dependency on **camel-bindy** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```

<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bindy</artifactId>
  <version>x.x.x</version>
</dependency>

```

CHAPTER 50. USING OSGI BLUEPRINT WITH CAMEL

A custom XML namespace for Blueprint has been created to let you leverage the nice XML dialect. Given Blueprint custom namespaces are not standardized yet, this namespace can only be used on the Apache Aries Blueprint implementation, which is the one used by Apache Karaf.

50.1. OVERVIEW

The XML schema is mostly the same as the one for Spring, so all the xml snippets throughout the documentation referring to Spring XML also apply to Blueprint routes.

Here is a very simple route definition using blueprint:

```
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0">
  <camelContext xmlns="http://camel.apache.org/schema/blueprint">
    <route>
      <from uri="timer:test" />
      <to uri="log:test" />
    </route>
  </camelContext>
</blueprint>
```

There are a few limitations at this point about the supported xml elements (compared to the Spring xml syntax):

- beanPostProcessor are specific to Spring and aren't allowed

However, using blueprint when you deploy your applications in an OSGi environment has several advantages:

- when upgrading to a new camel version, you don't have to change the namespace, as the correct version will be selected based on the camel packages that are imported by your bundle
- no startup ordering issue with respect to the custom namespaces and your bundles
- you can use Blueprint property placeholders

50.2. USING CAMEL-BLUEPRINT

To leverage camel-blueprint in OSGi, you only need the Aries Blueprint bundle and the camel-blueprint bundle, in addition to camel-core and its dependencies.

If you use Karaf, you can use the feature named camel-blueprint which will install all the required bundles.

CHAPTER 51. BONITA COMPONENT

Available as of Camel version 2.19

Used for communicating with a remote Bonita BPM process engine.

51.1. URI FORMAT

```
bonita://[operation]?[options]
```

Where **operation** is the specific action to perform on Bonita.

51.2. GENERAL OPTIONS

The Bonita component has no options.

The Bonita endpoint is configured using URI syntax:

```
bonita:operation
```

with the following path and query parameters:

51.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------|---------------------------|---------|-----------------|
| operation | Required Operation to use | | BonitaOperation |

51.2.2. Query Parameters (9 parameters):

| Name | Description | Default | Type |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|---------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| hostname (consumer) | Hostname where Bonita engine runs | localhost | String |
| port (consumer) | Port of the server hosting Bonita engine | 8080 | String |

| Name | Description | Default | Type |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| processName (consumer) | Name of the process involved in the operation | | String |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| password (security) | Password to authenticate to Bonita engine. | | String |
| username (security) | Username to authenticate to Bonita engine. | | String |

51.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.bonita.enabled | Enable bonita component | true | Boolean |
| camel.component.bonita.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

51.4. BODY CONTENT

For the startCase operation, the input variables are retrieved from the body message. This one has to contains a Map<String,Serializable>.

51.5. EXAMPLES

The following example start a new case in Bonita:

```
from("direct:start").to("bonita:startCase?
hostname=localhost&port=8080&processName=TestProcess&username=install&pa
ssword=install")
```

51.6. DEPENDENCIES

To use Bonita in your Camel routes you need to add a dependency on **camel-bonita**, which implements the component.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-bonita</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 52. BOON DATAFORMAT

Available as of Camel version 2.16

Boon is a Data Format which uses the [Boon JSON](#) marshalling library to unmarshal an JSON payload into Java objects or to marshal Java objects into an JSON payload. Boon aims to be a simple and [fast parser](#) than other common parsers currently used.

52.1. OPTIONS

The Boon dataformat supports 3 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>unmarshalTypeName</code> | | String | Class name of the java type to use when unarmshalling |
| <code>useList</code> | false | Boolean | To unarmshal to a List of Map or a List of Pojo. |
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. |

52.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.boon.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. | false | Boolean |
| <code>camel.dataformat.boon.enabled</code> | Enable boon dataformat | true | Boolean |
| <code>camel.dataformat.boon.unmarshal-type-name</code> | Class name of the java type to use when unarmshalling | | String |
| <code>camel.dataformat.boon.use-list</code> | To unarmshal to a List of Map or a List of Pojo. | false | Boolean |

ND

52.3. USING THE JAVA DSL

```
DataFormat boonDataFormat = new BoonDataFormat("com.acme.model.Person");  
  
from("activemq:My.Queue")  
  .unmarshal(boonDataFormat)  
  .to("mqseries:Another.Queue");
```

52.4. USING BLUEPRINT XML

```
<bean id="boonDataFormat" class="org.apache.camel.component.boon.BoonDataFormat">  
  <argument value="com.acme.model.Person"/>  
</bean>  
  
<camelContext id="camel" xmlns="http://camel.apache.org/schema/blueprint">  
  <route>  
    <from uri="activemq:My.Queue"/>  
    <unmarshal ref="boonDataFormat"/>  
    <to uri="mqseries:Another.Queue"/>  
  </route>  
</camelContext>
```

52.5. DEPENDENCIES

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-boon</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 53. BOX COMPONENT

Available as of Camel version 2.14

The Box component provides access to all of the Box.com APIs accessible using <https://github.com/box/box-java-sdk>. It allows producing messages to upload and download files, create, edit, and manage folders, etc. It also supports APIs that allow polling for updates to user accounts and even changes to enterprise accounts, etc.

Box.com requires the use of OAuth2.0 for all client application authentication. In order to use camel-box with your account, you'll need to create a new application within Box.com at <https://developer.box.com>. The Box application's client id and secret will allow access to Box APIs which require a current user. A user access token is generated and managed by the API for an end user.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-box</artifactId>
  <version>${camel-version}</version>
</dependency>
```

53.1. CONNECTION AUTHENTICATION TYPES

The Box component supports three different types of authenticated connections.

53.1.1. Standard Authentication

Standard Authentication uses the **OAuth 2.0 three-legged authentication process** to authenticate its connections with Box.com. This type of authentication enables Box **managed users** and **external users** to access, edit, and save their Box content through the Box component.

53.1.2. App Enterprise Authentication

App Enterprise Authentication uses the **OAuth 2.0 with JSON Web Tokens (JWT)** to authenticate its connections as a **Service Account** for a **Box Application**. This type of authentication enables a service account to access, edit, and save the Box content of its **Box Application** through the Box component.

53.1.3. App User Authentication

App User Authentication uses the **OAuth 2.0 with JSON Web Tokens (JWT)** to authenticate its connections as an **App User** for a **Box Application**. This type of authentication enables app users to access, edit, and save their Box content in its **Box Application** through the Box component.

53.2. BOX OPTIONS

The Box component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| configuration (common) | To use the shared configuration | | BoxConfiguration |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Box endpoint is configured using URI syntax:

```
box:apiName/methodName
```

with the following path and query parameters:

53.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------|----------------------------------------------------------------------|---------|------------|
| apiName | Required What kind of operation to perform | | BoxApiName |
| methodName | Required What sub operation to use for the selected operation | | String |

53.2.2. Query Parameters (20 parameters):

| Name | Description | Default | Type |
|---------------------------------|-------------------------------------------------------------------|---------|--------|
| clientId (common) | Box application client ID | | String |
| enterpriseId (common) | The enterprise ID to use for an App Enterprise. | | String |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| userId (common) | The user ID to use for an App User. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|----------------------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| httpParams (advanced) | Custom HTTP params for settings like proxy host | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| accessTokenCache (security) | Custom Access Token Cache for storing and retrieving access tokens. | | <code>IAccessTokenCache</code> |
| clientSecret (security) | Box application client secret | | String |
| encryptionAlgorithm (security) | The type of encryption algorithm for JWT. Supported Algorithms: <code>RSA_SHA_256</code> <code>RSA_SHA_384</code> <code>RSA_SHA_512</code> | <code>RSA_SHA_256</code> | <code>EncryptionAlgorithm</code> |
| maxCacheEntries (security) | The maximum number of access tokens in cache. | 100 | int |
| authenticationType (authentication) | The type of authentication for connection. Types of Authentication: <code>STANDARD_AUTHENTICATION - OAuth 2.0 (3-legged)</code> <code>SERVER_AUTHENTICATION - OAuth 2.0 with JSON Web Tokens</code> | <code>APP_USER_AUTHENTICATION</code> | String |
| privateKeyFile (security) | The private key for generating the JWT signature. | | String |

| Name | Description | Default | Type |
|----------------------------------------|----------------------------------------------------------------------------------------------------|---------|----------------------|
| privateKeyPassword (security) | The password for the private key. | | String |
| publicKeyId (security) | The ID for public key for validating the JWT signature. | | String |
| sslContextParameters (security) | To configure security using SSLContextParameters. | | SSLContextParameters |
| userName (security) | Box user name, MUST be provided | | String |
| userPassword (security) | Box user password, MUST be provided if authSecureStorage is not set, or returns null on first call | | String |

53.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|-------------------|
| camel.component.box.configuration.access-token-cache | Custom Access Token Cache for storing and retrieving access tokens. | | IAccessTokenCache |
| camel.component.box.configuration.api-name | What kind of operation to perform | | BoxApiName |
| camel.component.box.configuration.authentication-type | The type of authentication for connection. Types of Authentication: STANDARD_AUTHENTICATION - OAuth 2.0 (3-legged) SERVER_AUTHENTICATION - OAuth 2.0 with JSON Web Tokens | APP_USER_AUTHENTICATION | String |
| camel.component.box.configuration.client-id | Box application client ID | | String |
| camel.component.box.configuration.client-secret | Box application client secret | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|---------|----------------------|
| <code>camel.component.box.configuration.enterprise-id</code> | The enterprise ID to use for an App Enterprise. | | String |
| <code>camel.component.box.configuration.http-params</code> | Custom HTTP params for settings like proxy host | | Map |
| <code>camel.component.box.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.box.configuration.private-key-file</code> | The private key for generating the JWT signature. | | String |
| <code>camel.component.box.configuration.private-key-password</code> | The password for the private key. | | String |
| <code>camel.component.box.configuration.public-key-id</code> | The ID for public key for validating the JWT signature. | | String |
| <code>camel.component.box.configuration.ssl-context-parameters</code> | To configure security using SSLContextParameters. | | SSLContextParameters |
| <code>camel.component.box.configuration.user-id</code> | The user ID to use for an App User. | | String |
| <code>camel.component.box.configuration.user-name</code> | Box user name, MUST be provided | | String |
| <code>camel.component.box.configuration.user-password</code> | Box user password, MUST be provided if authSecureStorage is not set, or returns null on first call | | String |
| <code>camel.component.box.enabled</code> | Enable box component | true | Boolean |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component. .box.resolve- property- placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

53.4. URI FORMAT

`box:apiName/methodName`

apiName can be one of:

- collaborations
- comments
- event-logs
- files
- folders
- groups
- events
- search
- tasks
- users

53.5. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI **MUST** contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options **MUST** be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelBox.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelBox.option** header.

If a value is not provided for the option **defaultRequest** either in the endpoint URI or in a message header, it will be assumed to be **null**. Note that the **null** value will only be used if other options do not satisfy matching endpoints.

In case of Box API errors the endpoint will throw a `RuntimeCamelException` with a `com.box.sdk.BoxAPIException` derived exception cause.

53.5.1. Endpoint Prefix *collaborations*

For more information on Box collaborations see <https://developer.box.com/reference#collaboration-object>. The following endpoints can be invoked with the prefix **collaborations** as follows:

```
box:collaborations/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|-------------------------------|-----------------------|------------------------------|-----------------------------------|
| addFolderCollaboration | add | folderId, collaborator, role | com.box.sdk.BoxCollaboration |
| addFolderCollaborationByEmail | addByEmail | folderId, email, role | com.box.sdk.BoxCollaboration |
| deleteCollaboration | delete | collaborationId | |
| getFolderCollaborations | collaborations | folderId | java.util.Collection |
| getPendingCollaborations | pendingCollaborations | | java.util.Collection |
| getCollaborationInfo | info | collaborationId | com.box.sdk.BoxCollaboration.Info |
| updateCollaborationInfo | updateInfo | collaborationId, info | com.box.sdk.BoxCollaboration |

URI Options for *collaborations*

| Name | Type |
|-----------------|-----------------------------------|
| collaborationId | String |
| collaborator | com.box.sdk.BoxCollaborator |
| role | com.box.sdk.BoxCollaboration.Role |
| folderId | String |
| email | String |
| info | com.box.sdk.BoxCollaboration.Info |

53.5.2. Endpoint Prefix *comments*

For more information on Box comments see <https://developer.box.com/reference#comment-object>. The following endpoints can be invoked with the prefix **comments** as follows:

`box:comments/endpoint?[options]`

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|----------------------|---------------------|--------------------|-----------------------------|
| addFileComment | add | fileId, message | com.box.sdk.BoxFile |
| changeCommentMessage | updateMessage | commentId, message | com.box.sdk.BoxComment |
| deleteComment | delete | commentId | |
| getCommentInfo | info | commentId | com.box.sdk.BoxComment.Info |
| getFileComments | comments | fileId | java.util.List |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|----------------|---------------------|--------------------|------------------------|
| replyToComment | reply | commentId, message | com.box.sdk.BoxComment |

URI Options for *collaborations*

| Name | Type |
|-----------|--------|
| commentId | String |
| fileId | String |
| message | String |

53.5.3. Endpoint Prefix *events-logs*

For more information on Box event logs see <https://developer.box.com/reference#events>. The following endpoints can be invoked with the prefix **event-logs** as follows:

```
box:event-logs/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|---------------------|---------------------|----------------------------------|------------------|
| getEnterpriseEvents | events | position, after, before, [types] | java.util.List |

URI Options for *event-logs*

| Name | Type |
|----------|--------|
| position | String |
| after | Date |

| Name | Type |
|--------|------------------------------|
| before | Date |
| types | com.box.sdk.BoxEvent.Types[] |

53.5.4. Endpoint Prefix *files*

For more information on Box files see <https://developer.box.com/reference#file-object>. The following endpoints can be invoked with the prefix **files** as follows.

```
box:files/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|--------------|---------------------|------------------------------------------------------------------------------|----------------------|
| uploadFile | upload | parentFolderId, content, fileName, [created], [modified], [size], [listener] | com.box.sdk.BoxFile |
| downloadFile | download | fileId, output, [rangeStart], [rangeEnd], [listener] | java.io.OutputStream |
| copyFile | copy | fileId, destinationFolderId, [newName] | com.box.sdk.BoxFile |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|------------------------------|---------------------|---------------------------------------------------------|----------------------------|
| moveFile | move | fileId, destinationFolderId, [newName] | com.box.sdk.BoxFile |
| renameFile | rename | fileId, newFileName | com.box.sdk.BoxFile |
| createFileSharedLink | link | fileId, access, [unshareDate], [permissions] | com.box.sdk.BoxSharedLink |
| deleteFile | delete | fileId | |
| uploadNewFileVersion | uploadVersion | fileId, fileContent, [modified], [fileSize], [listener] | com.box.sdk.BoxFile |
| promoteFileVersion | promoteVersion | fileId, version | com.box.sdk.BoxFileVersion |
| getFileVersions | versions | fileId | java.util.Collection |
| downloadPreviousFileVersions | downloadVersion | fileId, version, output, [listener] | java.io.OutputStream |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|--------------------|---------------------|------------------------------|--------------------------|
| deleteFileVersion | deleteVersion | fileId, version | |
| getFileInfo | info | fileId, fields | com.box.sdk.BoxFile.Info |
| updateFileInfo | updateInfo | fileId, info | com.box.sdk.BoxFile |
| createFileMetadata | createMetadata | fileId, metadata, [typeName] | com.box.sdk.Metadata |
| getFileMetadata | metadata | fileId, [typeName] | com.box.sdk.Metadata |
| updateFileMetadata | updateMetadata | fileId, metadata | com.box.sdk.Metadata |
| deleteFileMetadata | deleteMetadata | fileId | |
| getDownloadUrl | url | fileId | java.net.URL |
| getPreviewLink | preview | fileId | java.net.URL |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|------------------|---------------------|------------------------------------------------------------|------------------|
| getFileThumbnail | thumbnail | fileId, fileType, minWidth, minHeight, maxWidth, maxHeight | byte[] |

URI Options for *files*

| Name | Type |
|----------------|------------------------------|
| parentFolderId | String |
| content | java.io.InputStream |
| fileName | String |
| created | Date |
| modified | Date |
| size | Long |
| listener | com.box.sdk.ProgressListener |
| output | java.io.OutputStream |
| rangeStart | Long |
| rangeEnd | Long |

| Name | Type |
|---------------------|---------------------------------------|
| outputStreams | java.io.OutputStream[] |
| destinationFolderId | String |
| newName | String |
| fields | String[] |
| info | com.box.sdk.BoxFile.Info |
| fileSize | Long |
| version | Integer |
| access | com.box.sdk.BoxSharedLink.Access |
| unshareDate | Date |
| permissions | com.box.sdk.BoxSharedLink.Permissions |
| fileType | com.box.sdk.BoxFile.ThumbnailFileType |
| minWidth | Integer |
| minHeight | Integer |
| maxWidth | Integer |
| maxHeight | Integer |
| metadata | com.box.sdk.Metadata |

| Name | Type |
|----------|--------|
| typeName | String |

53.5.5. Endpoint Prefix *folders*

For more information on Box folders see <https://developer.box.com/reference#folder-object>. The following endpoints can be invoked with the prefix **folders** as follows.

`box:folders/endpoint?[options]`

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|---------------|---------------------|------------------------------------------|-----------------------|
| getRootFolder | root | | com.box.sdk.BoxFolder |
| createFolder | create | parentFolderId, folderName | com.box.sdk.BoxFolder |
| createFolder | create | parentFolderId, path | com.box.sdk.BoxFolder |
| copyFolder | copy | folderId, destinationFolderId, [newName] | com.box.sdk.BoxFolder |
| moveFolder | move | folderId, destinationFolderId, newName | com.box.sdk.BoxFolder |
| renameFolder | rename | folderId, newFolderName | com.box.sdk.BoxFolder |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|------------------------|---------------------|-------------------------------------------------|----------------------------|
| createFolderSharedLink | link | folderId, access, [unsharedDate], [permissions] | java.util.List |
| deleteFolder | delete | folderId | |
| getFolder | folder | path | com.box.sdk.BoxFolder |
| getFolderInfo | info | folderId, fields | com.box.sdk.BoxFolder.Info |
| getFolderItems | items | folderId, offset, limit, fields | java.util.List |
| updateFolderInfo | updateInfo | folderId, info | com.box.sdk.BoxFolder |

URI Options for *folders*

| Name | Type |
|----------|----------|
| path | String[] |
| folderId | String |
| offset | Long |
| limit | Long |
| fields | String[] |

| Name | Type |
|---------------------|---------------------------------------|
| parentFolderId | String |
| folderName | String |
| destinationFolderId | String |
| newName | String |
| newFolderName | String |
| info | String |
| access | com.box.sdk.BoxSharedLink.Access |
| unshareDate | Date |
| permissions | com.box.sdk.BoxSharedLink.Permissions |

53.5.6. Endpoint Prefix *groups*

For more information on Box groups see <https://developer.box.com/reference#group-object>. The following endpoints can be invoked with the prefix **groups** as follows:

```
box:groups/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|----------|---------------------|---------|------------------|
|----------|---------------------|---------|------------------|

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|-----------------------|---------------------|----------------------------------------------------------------------------------------------------|--------------------------------|
| create Group | create | name, [provenance, externalSyncIdentifier, description, invitabilityLevel, memberViewabilityLevel] | com.box.sdk.BoxGroup |
| addGroupMembership | create Membership | groupId, userId, role | com.box.sdk.BoxGroupMembership |
| delete Group | delete | groupId | |
| getAllGroups | groups | | java.util.Collection |
| getGroupInfo | info | groupId | com.box.sdk.BoxGroup.Info |
| updateGroupInfo | updateInfo | groupId, groupInfo | com.box.sdk.BoxGroup |
| addGroupMembership | addMembership | groupId, userId, role | com.box.sdk.BoxGroupMembership |
| deleteGroupMembership | delete Membership | groupMembershipId | |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|---------------------------|----------------------|---------------|--------------------------------|
| getGroupMemberships | memberships | groupId | java.util.Collection |
| getGroupMembershipInfo | membershipInfo | groupId | com.box.sdk.BoxGroup.Info |
| updateGroupMembershipInfo | updateMembershipInfo | groupId, info | com.box.sdk.BoxGroupMembership |

URI Options for *groups*

| Name | Type |
|---------|-------------------------------------|
| name | String |
| groupId | String |
| userId | String |
| role | com.box.sdk.BoxGroupMembership.Role |
| groupId | String |
| info | com.box.sdk.BoxGroupMembership.Info |

53.5.7. Endpoint Prefix *search*

For more information on Box search API see <https://developer.box.com/reference#searching-for-content>. The following endpoints can be invoked with the prefix **search** as follows:

```
box:search/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|---------------|---------------------|-----------------|----------------------|
| search Folder | search | folderId, query | java.util.Collection |

URI Options for *search*

| Name | Type |
|----------|--------|
| folderId | String |
| query | String |

53.5.8. Endpoint Prefix *tasks*

For information on Box tasks see <https://developer.box.com/reference#task-object-1>. The following endpoints can be invoked with the prefix **tasks** as follows:

```
box:tasks/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|----------------|---------------------|----------------------------------|--------------------------|
| addFile Task | add | fileId, action, dueAt, [message] | com.box.sdk.BoxUser |
| delete Task | delete | taskId | |
| getFile Tasks | tasks | fileId | java.util.List |
| getTaskInfo | info | taskId | com.box.sdk.BoxTask.Info |
| updateTaskInfo | updateInfo | taskId, info | com.box.sdk.BoxTask |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|-----------------------|---------------------|------------------|------------------------------------|
| addAssignmentToTask | addAssignment | taskId, assignTo | com.box.sdk.BoxTask |
| deleteTaskAssignment | deleteAssignment | taskId | |
| getTaskAssignments | assignments | taskId | java.util.List |
| getTaskAssignmentInfo | assignmentInfo | taskId | com.box.sdk.BoxTaskAssignment.Info |

URI Options for *tasks*

| Name | Type |
|----------|----------------------------|
| fileId | String |
| action | com.box.sdk.BoxTask.Action |
| dueAt | Date |
| message | String |
| taskId | String |
| info | com.box.sdk.BoxTask.Info |
| assignTo | com.box.sdk.BoxUser |
| taskId | String |

53.5.9. Endpoint Prefix *users*

For information on Box users see <https://developer.box.com/reference#user-object>. The following endpoints can be invoked with the prefix **users** as follows:

```
box:users/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|---------------------------------|---------------------|---------------------------|--------------------------|
| getCurrentUser | currentUser | | com.box.sdk.BoxUser |
| getAllEnterpriseOrExternalUsers | users | filterTerm, [fields] | com.box.sdk.BoxUser |
| createAppUser | create | name, [params] | com.box.sdk.BoxUser |
| createEnterpriseUser | create | login, name, [params] | com.box.sdk.BoxUser |
| deleteUser | delete | userId, notifyUser, force | |
| getUserEmailAlias | emailAlias | userId | com.box.sdk.BoxUser |
| deleteUserEmailAliases | deleteEmailAliases | userId, emailAliasId | java.util.List |
| getUserInfo | info | userId | com.box.sdk.BoxUser.Info |
| updateUserInfo | updateInfo | userId, info | com.box.sdk.BoxUser |

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|------------------|---------------------|--------------------------|----------------------------|
| moveFolderToUser | - | userId, source UserId | com.box.sdk.BoxFolder.Info |

URI Options for *users*

| Name | Type |
|------------------------|------------------------------------------------------------------------------|
| defaultRequest | com.box.restclientv2.requestsbase.BoxDefaultRequestObject |
| emailAliasRequest | com.box.boxjavalibv2.requests.requestobjects.BoxEmailAliasRequestObject |
| emailId | String |
| filterTerm | String |
| folderId | String |
| simpleUserRequest | com.box.boxjavalibv2.requests.requestobjects.BoxSimpleUserRequestObject |
| userDeleteRequest | com.box.boxjavalibv2.requests.requestobjects.BoxUserDeleteRequestObject |
| userId | String |
| userRequest | com.box.boxjavalibv2.requests.requestobjects.BoxUserRequestObject |
| userUpdateLoginRequest | com.box.boxjavalibv2.requests.requestobjects.BoxUserUpdateLoginRequestObject |

53.6. CONSUMER ENDPOINTS:

For more information on Box events see <https://developer.box.com/reference#events>. Consumer endpoints can only use the endpoint prefix **events** as shown in the example next.

```
box:events/endpoint?[options]
```

| Endpoint | Shorthand and Alias | Options | Result Body Type |
|----------|---------------------|--------------------|----------------------|
| events | | [startingPosition] | com.box.sdk.BoxEvent |

URI Options for *events*

| Name | Type |
|------------------|------|
| startingPosition | Long |

53.7. MESSAGE HEADER

Any of the options can be provided in a message header for producer endpoints with **CamelBox.** prefix.

53.8. MESSAGE BODY

All result message bodies utilize objects provided by the Box Java SDK. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint parameter.

53.9. CONFIGURE THE COMPONENT AND ENABLE AUTHENTICATION

For authentication with Box, set the authentication properties on the component as demonstrated in the following example:

```
BoxConfiguration configuration = new BoxConfiguration();
configuration.setClientId("clientId");
configuration.setClientSecret("clientSecret");
configuration.setUserName("userName");
configuration.setUserPassword("userPassword");

// add BoxComponent to Camel context
BoxComponent component = new BoxComponent(context);
component.setConfiguration(configuration);
context.addComponent("box", component);
```

53.10. SAMPLES

The following route uploads new files to the user's root folder:

```
from("file:...")
  .to("box://files/upload/inBody=fileUploadRequest");
```

The following route polls user's account for updates:

```
from("box://events/listen?startingPosition=-1")
  .to("bean:blah");
```

The following route uses a producer with dynamic header options. The **fileId** property has the Box file id and the **output** property has the output stream of the file contents, so they are assigned to the **CamelBox.fileId** header and **CamelBox.output** header respectively as follows:

```
from("direct:foo")
  .setHeader("CamelBox.fileId", header("fileId"))
  .setHeader("CamelBox.output", header("output"))
  .to("box://files/download")
  .to("file://...");
```

CHAPTER 54. BRAINTREE COMPONENT

Available as of Camel version 2.17

The Braintree component provides access to [Braintree Payments](#) through their [Java SDK](#).

All client applications need API credential in order to process payments. In order to use camel-braintree with your account, you'll need to create a new [Sandbox](#) or [Production](#) account.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-braintree</artifactId>
  <version>${camel-version}</version>
</dependency>
```

54.1. BRAINTREE OPTIONS

The Braintree component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| configuration (common) | To use the shared configuration | | BraintreeConfiguration |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Braintree endpoint is configured using URI syntax:

```
braintree:apiName/methodName
```

with the following path and query parameters:

54.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------|------------------------------------------------------|---------|------------------|
| apiName | Required What kind of operation to perform | | BraintreeApiName |
| methodName | What sub operation to use for the selected operation | | String |

54.1.2. Query Parameters (14 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| environment (common) | The environment Either SANDBOX or PRODUCTION | | String |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| merchantId (common) | The merchant id provided by Braintree. | | String |
| privateKey (common) | The private key provided by Braintree. | | String |
| publicKey (common) | The public key provided by Braintree. | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| accessToken (advanced) | The access token granted by a merchant to another in order to process transactions on their behalf. Used in place of environment, merchant id, public key and private key fields. | | String |
| httpReadTimeout (advanced) | Set read timeout for http calls. | | Integer |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| httpLogLevel (logging) | Set logging level for http calls, see java.util.logging.Level | | String |

| Name | Description | Default | Type |
|--------------------------------|----------------|---------|---------|
| <code>proxyHost</code> (proxy) | The proxy host | | String |
| <code>proxyPort</code> (proxy) | The proxy port | | Integer |

54.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 14 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| <code>camel.component.braintree.configuration.access-token</code> | The access token granted by a merchant to another in order to process transactions on their behalf. Used in place of environment, merchant id, public key and private key fields. | | String |
| <code>camel.component.braintree.configuration.api-name</code> | What kind of operation to perform | | BraintreeApiName |
| <code>camel.component.braintree.configuration.environment</code> | The environment Either SANDBOX or PRODUCTION | | String |
| <code>camel.component.braintree.configuration.http-log-level</code> | Set logging level for http calls, see <code>java.util.logging.Level</code> | | Level |
| <code>camel.component.braintree.configuration.http-log-name</code> | Set log category to use to log http calls, default "Braintree" | | String |
| <code>camel.component.braintree.configuration.http-read-timeout</code> | Set read timeout for http calls. | | Integer |
| <code>camel.component.braintree.configuration.merchant-id</code> | The merchant id provided by Braintree. | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.braintree.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.braintree.configuration.private-key</code> | The private key provided by Braintree. | | String |
| <code>camel.component.braintree.configuration.proxy-host</code> | The proxy host | | String |
| <code>camel.component.braintree.configuration.proxy-port</code> | The proxy port | | Integer |
| <code>camel.component.braintree.configuration.public-key</code> | The public key provided by Braintree. | | String |
| <code>camel.component.braintree.enabled</code> | Enable braintree component | true | Boolean |
| <code>camel.component.braintree.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

54.3. URI FORMAT

```
braintree://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- addOn
- address
- clientToken
- creditCardverification
- customer
- discount

- dispute
- documentUpload
- merchantAccount
- paymentmethod
- paymentmethodNonce
- plan
- report
- settlementBatchSummary
- subscription
- transaction
- webhookNotification

54.4. BRAINTREECOMPONENT

The Braintree Component can be configured with the options below. These options can be provided using the component's bean property **configuration** of type **org.apache.camel.component.braintree.BraintreeConfiguration**.

| Option | Type | Description |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| environment | String | Value that specifies where requests should be directed – sandbox or production |
| merchantId | String | A unique identifier for your gateway account, which is different than your merchant account ID |
| publicKey | String | User-specific public identifier |
| privateKey | String | User-specific secure identifier that should not be shared – even with us! |
| accessToken | String | Token granted to a merchant using Braintree Auth allowing them to process transactions on another's behalf. Used in place of the environment, merchantId, publicKey and privateKey options. |

All the options above are provided by Braintree Payments

54.5. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI **MUST** contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options **MUST** be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelBraintree.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelBraintree.option** header.

For more information on the endpoints and options see Braintree references at <https://developers.braintreepayments.com/reference/overview>

54.5.1. Endpoint prefix *addOn*

The following endpoints can be invoked with the prefix **addOn** as follows:

```
braintree://addOn/endpoint
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|----------------------------------|
| all | | | List<com.braintreegateway.Addon> |

54.5.2. Endpoint prefix *address*

The following endpoints can be invoked with the prefix **address** as follows:

```
braintree://address/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------------------|-----------------------------------------------------------|
| create | | customerId, request | com.braintreegateway.Result<com.braintreegateway.Address> |
| delete | | customerId, id | com.braintreegateway.Result<com.braintreegateway.Address> |
| find | | customerId, id | com.braintreegateway.Address |

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|-------------------------|-----------------------------------------------------------|
| update | | customerId, id, request | com.braintreegateway.Result<com.braintreegateway.Address> |

URI Options for *address*

| Name | Type |
|------------|-------------------------------------|
| customerId | String |
| request | com.braintreegateway.AddressRequest |
| id | String |

54.5.3. Endpoint prefix *clientToken*

The following endpoints can be invoked with the prefix **clientToken** as follows:

```
braintree://clientToken/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|------------------|
| generate | | request | String |

URI Options for *clientToken*

| Name | Type |
|---------|-----------------------------------------|
| request | com.braintreegateway.ClientTokenrequest |

54.5.4. Endpoint prefix *creditCardVerification*

The following endpoints can be invoked with the prefix **creditCardverification** as follows:

```
braintree://creditCardVerification/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|---------------------------------------------|
| find | | id | com.braintreegateway.CreditCardVerification |

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|--------------------------------------------------------------------------------------|
| search | | query | com.braintreegateway.ResourceCollection<com.braintreegateway.CreditCardVerification> |

URI Options for *creditCardVerification*

| Name | Type |
|-------|----------------------------------------------------------|
| id | String |
| query | com.braintreegateway.CreditCardVerificationSearchRequest |

54.5.5. Endpoint prefix *customer*

The following endpoints can be invoked with the prefix **customer** as follows:

braintree://customer/endpoint?[options]

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|-------------|------------------------------------------------------------------------|
| all | | | |
| create | | request | com.braintreegateway.Result<com.braintreegateway.Customer> |
| delete | | id | com.braintreegateway.Result<com.braintreegateway.Customer> |
| find | | id | com.braintreegateway.Customer |
| search | | query | com.braintreegateway.ResourceCollection<com.braintreegateway.Customer> |
| update | | id, request | com.braintreegateway.Result<com.braintreegateway.Customer> |

URI Options for *customer*

| Name | Type |
|---------|--------------------------------------------|
| id | String |
| request | com.braintreegateway.CustomerRequest |
| query | com.braintreegateway.CustomerSearchRequest |

54.5.6. Endpoint prefix *discount*

The following endpoints can be invoked with the prefix **discount** as follows:

```
braintree://discount/endpoint
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|-------------------------------------|
| all | | | List<com.braintreegateway.Discount> |

```
+
```

```
+
```

54.5.7. Endpoint prefix *dispute*

The following endpoints can be invoked with the prefix **dispute** as follows:

```
braintree://dispute/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|-----------------|-----------------|--------------------------------|----------------------------------------------|
| accept | | id | com.braintreegateway.Result |
| addFileEvidence | | disputeId, documentId | com.braintreegateway.Result<DisputeEvidence> |
| addFileEvidence | | disputeId, fileEvidenceRequest | com.braintreegateway.Result<DisputeEvidence> |
| addTextEvidence | | disputeId, content | com.braintreegateway.Result<DisputeEvidence> |
| addTextEvidence | | disputeId, textEvidenceRequest | com.braintreegateway.Result<DisputeEvidence> |

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------------|-----------------|----------------------|------------------------------------------------------------------------|
| finalize | | id | com.braintreegateway.Result |
| find | | id | com.braintreegateway.Dispute |
| removeEvidence | | id | com.braintreegateway.Result |
| search | | disputeSearchRequest | com.braintreegateway.PaginatedCollection<com.braintreegateway.Dispute> |

URI Options for *dispute*

| Name | Type |
|------------------------------------------|------------------------------------------|
| id | String |
| disputeId | String |
| documentId | String |
| fileEvidenceRequest | com.braintreegateway.FileEvidenceRequest |
| content | String |
| | textEvidenceRequest |
| com.braintreegateway.TextEvidenceRequest | disputeSearchRequest |

54.5.8. Endpoint prefix *documentUpload*

The following endpoints can be invoked with the prefix **documentUpload** as follows:

```
braintree://documentUpload/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|------------------------------------------------------------------|
| create | | request | com.braintreegateway.Result<com.braintreegateway.DocumentUpload> |

URI Options for *documentUpload*

| Name | Type |
|---------|--------------------------------------------|
| request | com.braintreegateway.DocumentUploadRequest |

54.5.9. Endpoint prefix *merchantAccount*

The following endpoints can be invoked with the prefix **merchantAccount** as follows:

```
braintree://merchantAccount/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|-------------------|-----------------|-----------------|-------------------------------------------------------------------|
| create | | request | com.braintreegateway.Result<com.braintreegateway.MerchantAccount> |
| createForCurrency | | currencyRequest | com.braintreegateway.Result<com.braintreegateway.MerchantAccount> |
| find | | id | com.braintreegateway.MerchantAccount |
| update | | id, request | com.braintreegateway.Result<com.braintreegateway.MerchantAccount> |

URI Options for *merchantAccount*

| Name | Type |
|-----------------|--------------------------------------------------------------|
| id | String |
| request | com.braintreegateway.MerchantAccountRequest |
| currencyRequest | com.braintreegateway.MerchantAccountCreateForCurrencyRequest |

54.5.10. Endpoint prefix *paymentMethod*

The following endpoints can be invoked with the prefix **paymentMethod** as follows:

`braintree://paymentMethod/endpoint?[options]`

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|----------------------|-----------------------------------------------------------------|
| create | | request | com.braintreegateway.Result<com.braintreegateway.PaymentMethod> |
| delete | | token, deleteRequest | com.braintreegateway.Result<com.braintreegateway.PaymentMethod> |
| find | | token | com.braintreegateway.PaymentMethod |
| update | | token, request | com.braintreegateway.Result<com.braintreegateway.PaymentMethod> |

URI Options for *paymentMethod*

| Name | Type |
|---------------|-------------------------------------------------|
| token | String |
| request | com.braintreegateway.PaymentMethodRequest |
| deleteRequest | com.braintreegateway.PaymentMethodDeleteRequest |

54.5.11. Endpoint prefix *paymentMethodNonce*

The following endpoints can be invoked with the prefix **paymentMethodNonce** as follows:

`braintree://paymentMethodNonce/endpoint?[options]`

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|--------------------|----------------------------------------------------------------------|
| create | | paymentMethodToken | com.braintreegateway.Result<com.braintreegateway.PaymentMethodNonce> |
| find | | paymentMethodNonce | com.braintreegateway.PaymentMethodNonce |

URI Options for *paymentMethodNonce*

| Name | Type |
|--------------------|--------|
| paymentMethodToken | String |
| paymentMethodNonce | String |

54.5.12. Endpoint prefix *plan*

The following endpoints can be invoked with the prefix **plan** as follows:

```
braintree://plan/endpoint
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|---------------------------------|
| all | | | List<com.braintreegateway.Plan> |

54.5.13. Endpoint prefix *report*

The following endpoints can be invoked with the prefix **report** as follows:

```
braintree://plan/report?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------------------|-----------------|---------|-----------------------------------------------------------------------------|
| transactionLevelFees | | request | com.braintreegateway.Result<com.braintreegateway.TransactionLevelFeeReport> |

URI Options for *report*

| Name | Type |
|---------|-------------------------------------------------------|
| request | com.braintreegateway.TransactionLevelFeeReportRequest |

54.5.14. Endpoint prefix *settlementBatchSummary*

The following endpoints can be invoked with the prefix **settlementBatchSummary** as follows:

■

`braintree://settlementBatchSummary/endpoint?[options]`

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------|--------------------------------------------------------------------------|
| generate | | request | com.braintreegateway.Result<com.braintreegateway.SettlementBatchSummary> |

URI Options for *settlementBatchSummary*

| Name | Type |
|--------------------|----------|
| settlementDate | Calendar |
| groupByCustomField | String |

54.5.15. Endpoint prefix *subscription*

The following endpoints can be invoked with the prefix **subscription** as follows:

`braintree://subscription/endpoint?[options]`

| Endpoint | Shorthand Alias | Options | Result Body Type |
|-------------|-----------------|------------------------|----------------------------------------------------------------|
| cancel | | id | com.braintreegateway.Result<com.braintreegateway.Subscription> |
| create | | request | com.braintreegateway.Result<com.braintreegateway.Subscription> |
| delete | | customerId, id | com.braintreegateway.Result<com.braintreegateway.Subscription> |
| find | | id | com.braintreegateway.Subscription |
| retryCharge | | subscriptionId, amount | com.braintreegateway.Result<com.braintreegateway.Transaction> |

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|---------------|----------------------------------------------------------------------------|
| search | | searchRequest | com.braintreegateway.ResourceCollection<com.braintreegateway.Subscription> |
| update | | id, request | com.braintreegateway.Result<com.braintreegateway.Subscription> |

URI Options for *subscription*

| Name | Type |
|----------------|-------------------------------------------------|
| id | String |
| request | com.braintreegateway.SubscriptionRequest |
| customerId | String |
| subscriptionId | String |
| amount | BigDecimal |
| searchRequest | com.braintreegateway.SubscriptionSearchRequest. |

54.5.16. Endpoint prefix *transaction*

The following endpoints can be invoked with the prefix **transaction** as follows:

braintree://transaction/endpoint?[options]

| Endpoint | Shorthand Alias | Options | Result Body Type |
|------------------|-----------------|------------------|---------------------------------------------------------------|
| cancelRelease | | id | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| cloneTransaction | | id, cloneRequest | com.braintreegateway.Result<com.braintreegateway.Transaction> |

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------------------------|-----------------|---------------------------|---------------------------------------------------------------------------|
| credit | | request | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| find | | id | com.braintreegateway.Transaction |
| holdInEscrow | | id | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| releaseFromEscrow | | id | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| refund | | id, amount, refundRequest | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| sale | | request | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| search | | query | com.braintreegateway.ResourceCollection<com.braintreegateway.Transaction> |
| submitForPartialSettlement | | id, amount | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| submitForSettlement | | id, amount, request | com.braintreegateway.Result<com.braintreegateway.Transaction> |
| voidTransaction | | id | com.braintreegateway.Result<com.braintreegateway.Transaction> |

URI Options for *transaction*

| Name | Type |
|------|--------|
| id | String |

| Name | Type |
|---------------|-----------------------------------------------|
| request | com.braintreegateway.TransactionCloneRequest |
| cloneRequest | com.braintreegateway.TransactionCloneRequest |
| refundRequest | com.braintreegateway.TransactionRefundRequest |
| amount | BigDecimal |
| query | com.braintreegateway.TransactionSearchRequest |

54.5.17. Endpoint prefix *webhookNotification*

The following endpoints can be invoked with the prefix **webhookNotification** as follows:

```
braintree://webhookNotification/endpoint?[options]
```

| Endpoint | Shorthand Alias | Options | Result Body Type |
|----------|-----------------|--------------------|------------------------------------------|
| parse | | signature, payload | com.braintreegateway.WebhookNotification |
| verify | | challenge | String |

URI Options for *webhookNotification*

| Name | Type |
|-----------|--------|
| signature | String |
| payload | String |
| challenge | String |

54.6. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. By default Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange. To change this behavior use the property **consumer.splitResults=true** to return a single exchange for the entire list or array.

54.7. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelBraintree.** prefix.

54.8. MESSAGE BODY

All result message bodies utilize objects provided by the Braintree Java SDK. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint parameter.

54.9. EXAMPLES

Blueprint

```
<?xml version="1.0"?>
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xsi:schemaLocation="
    http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0
    http://aries.apache.org/schemas/blueprint-cm/blueprint-cm-1.0.0.xsd

54.10. SEE ALSO

* [Configuring Camel](#) * [Component](#) * [Endpoint](#) * [Getting Started](#)

CHAPTER 55. BROWSE COMPONENT

Available as of Camel version 1.3

The Browse component provides a simple `BrowsableEndpoint` which can be useful for testing, visualisation tools or debugging. The exchanges sent to the endpoint are all available to be browsed.

55.1. URI FORMAT

```
browse:someName[?options]
```

Where `someName` can be any string to uniquely identify the endpoint.

55.2. OPTIONS

The Browse component has no options.

The Browse endpoint is configured using URI syntax:

```
browse:name
```

with the following path and query parameters:

55.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|----------------------------------------------------------------------------------|---------|--------|
| <code>name</code> | Required A name which can be any string to uniquely identify the endpoint | | String |

55.2.2. Query Parameters (4 parameters):

| Name | Description | Default | Type |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>bridgeErrorHandler (consumer)</code> | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the default exchange pattern when creating an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

55.3. SAMPLE

In the route below, we insert a **browse:** component to be able to browse the Exchanges that are passing through:

```
from("activemq:order.in").to("browse:orderReceived").to("bean:processOrder");
```

We can now inspect the received exchanges from within the Java code:

```
private CamelContext context;

public void inspectRecievedOrders() {
    BrowseableEndpoint browse = context.getEndpoint("browse:orderReceived",
BrowseableEndpoint.class);
    List<Exchange> exchanges = browse.getExchanges();

    // then we can inspect the list of received exchanges from Java
    for (Exchange exchange : exchanges) {
        String payload = exchange.getIn().getBody();
        // do something with payload
    }
}
```

55.4. SEE ALSO

- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 56. EHCACHE COMPONENT (DEPRECATED)

Available as of Camel version 2.1

The **cache** component enables you to perform caching operations using EHCache as the Cache Implementation. The cache itself is created on demand or if a cache of that name already exists then it is simply utilized with its original settings.

This component supports producer and event based consumer endpoints.

The Cache consumer is an event based consumer and can be used to listen and respond to specific cache activities. If you need to perform selections from a pre-existing cache, use the processors defined for the cache component.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cache</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

56.1. URI FORMAT

```
cache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

56.2. OPTIONS

The EHCache component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|---------------------|
| cacheManagerFactory (advanced) | To use the given CacheManagerFactory for creating the CacheManager. By default the DefaultCacheManagerFactory is used. | | CacheManagerFactory |
| configuration (common) | Sets the Cache configuration | | CacheConfiguration |
| configurationFile (common) | Sets the location of the ehcache.xml file to load from classpath or file system. By default the file is loaded from classpath:ehcache.xml | classpath:ehcache.xml | String |

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The EHCACHE endpoint is configured using URI syntax:

```
cache:cacheName
```

with the following path and query parameters:

56.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|-----------------------------------|---------|--------|
| cacheName | Required Name of the cache | | String |

56.2.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|---------|---------|
| diskExpiryThreadIntervalSeconds (common) | The number of seconds between runs of the disk expiry thread. | | long |
| diskPersistent (common) | Whether the disk store persists between restarts of the application. | false | boolean |
| diskStorePath (common) | Deprecated This parameter is ignored. CacheManager sets it using setter injection. | | String |
| eternal (common) | Sets whether elements are eternal. If eternal, timeouts are ignored and the element never expires. | false | boolean |
| key (common) | The default key to use. If a key is provided in the message header, then the key from the header takes precedence. | | String |
| maxElementsInMemory (common) | The number of elements that may be stored in the defined cache in memory. | 1000 | int |

| Name | Description | Default | Type |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| memoryStoreEvictionPolicy (common) | Which eviction strategy to use when maximum number of elements in memory is reached. The strategy defines which elements to be removed. LRU - Lest Recently Used LFU - Lest Frequently Used FIFO - First In First Out | LFU | MemoryStoreEvictionPolicy |
| objectCache (common) | Whether to turn on allowing to store non serializable objects in the cache. If this option is enabled then overflow to disk cannot be enabled as well. | false | boolean |
| operation (common) | The default cache operation to use. If an operation in the message header, then the operation from the header takes precedence. | | String |
| overflowToDisk (common) | Specifies whether cache may overflow to disk | true | boolean |
| timeToldleSeconds (common) | The maximum amount of time between accesses before an element expires | 300 | long |
| timeToLiveSeconds (common) | The maximum time between creation time and when an element expires. Is used only if the element is not eternal | 300 | long |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| cacheLoaderRegistry (advanced) | To configure cache loader using the CacheLoaderRegistry | | CacheLoaderRegistry |

| Name | Description | Default | Type |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|
| cacheManagerFactory (advanced) | To use a custom CacheManagerFactory for creating the CacheManager to be used by this endpoint. By default the CacheManagerFactory configured on the component is used. | | CacheManagerFactory |
| eventListenerRegistry (advanced) | To configure event listeners using the CacheEventListenerRegistry | | CacheEventListenerRegistry |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

56.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|---------------------|
| camel.component.cache.cache-manager-factory | To use the given CacheManagerFactory for creating the CacheManager. By default the DefaultCacheManagerFactory is used. The option is a <code>org.apache.camel.component.cache.CacheManagerFactory</code> type. | | String |
| camel.component.cache.configuration-file | Sets the location of the ehcache.xml file to load from classpath or file system. By default the file is loaded from classpath:ehcache.xml | classpath:ehcache.xml | String |
| camel.component.cache.configuration.cache-loader-registry | To configure cache loader using the CacheLoaderRegistry | | CacheLoaderRegistry |
| camel.component.cache.configuration.cache-name | Name of the cache | | String |
| camel.component.cache.configuration.disk-expiry-thread-interval-seconds | The number of seconds between runs of the disk expiry thread. | | Long |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|
| <code>camel.component.cache.configuration.disk-persistent</code> | Whether the disk store persists between restarts of the application. | false | Boolean |
| <code>camel.component.cache.configuration.eternal</code> | Sets whether elements are eternal. If eternal, timeouts are ignored and the element never expires. | false | Boolean |
| <code>camel.component.cache.configuration.event-listener-registry</code> | To configure event listeners using the CacheEventListenerRegistry | | CacheEventListenerRegistry |
| <code>camel.component.cache.configuration.max-elements-in-memory</code> | The number of elements that may be stored in the defined cache in memory. | 1000 | Integer |
| <code>camel.component.cache.configuration.memory-store-eviction-policy</code> | Which eviction strategy to use when maximum number of elements in memory is reached. The strategy defines which elements to be removed. LRU - Lest Recently Used LFU - Lest Frequently Used FIFO - First In First Out | | MemoryStoreEvictionPolicy |
| <code>camel.component.cache.configuration.object-cache</code> | Whether to turn on allowing to store non serializable objects in the cache. If this option is enabled then overflow to disk cannot be enabled as well. | false | Boolean |
| <code>camel.component.cache.configuration.overflow-to-disk</code> | Specifies whether cache may overflow to disk | true | Boolean |
| <code>camel.component.cache.configuration.time-to-idle-seconds</code> | The maximum amount of time between accesses before an element expires | 300 | Long |
| <code>camel.component.cache.configuration.time-to-live-seconds</code> | The maximum time between creation time and when an element expires. Is used only if the element is not eternal | 300 | Long |
| <code>camel.component.cache.enabled</code> | Enable cache component | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.cache.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.cache.configuration.disk-store-path</code> | This parameter is ignored. CacheManager sets it using setter injection. | | String |

56.4. SENDING/RECEIVING MESSAGES TO/FROM THE CACHE

56.4.1. Message Headers up to Camel 2.7

| Header | Description |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CACHE_OPERATION | The operation to be performed on the cache. Valid options are * GET * CHECK * ADD * UPDATE * DELETE * DELETEALL GET and CHECK requires Camel 2.3 onwards. |
| CACHE_KEY | The cache key used to store the Message in the cache. The cache key is optional if the CACHE_OPERATION is DELETEALL |

56.4.2. Message Headers Camel 2.8+

Header changes in Camel 2.8

The header names and supported values have changed to be prefixed with 'CamelCache' and use mixed case. This makes them easier to identify and keep separate from other headers. The CacheConstants variable names remain unchanged, just their values have been changed. Also, these headers are now removed from the exchange after the cache operation is performed.

| Header | Description |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CamelCacheOperation | The operation to be performed on the cache. The valid options are * CamelCacheGet * CamelCacheCheck * CamelCacheAdd * CamelCacheUpdate * CamelCacheDelete * CamelCacheDeleteAll |
| CamelCacheKey | The cache key used to store the Message in the cache. The cache key is optional if the CamelCacheOperation is CamelCacheDeleteAll |

The **CamelCacheAdd** and **CamelCacheUpdate** operations support additional headers:

| Header | Type | Description |
|---------------------------------------|----------------|---------------------------------------------|
| Camel Cache TimeToLive | Integer | Camel 2.11: Time to live in seconds. |
| Camel Cache TimeToIdle | Integer | Camel 2.11: Time to idle in seconds. |
| Camel Cache Eternal | Boolean | Camel 2.11: Whether the content is eternal. |

56.4.3. Cache Producer

Sending data to the cache involves the ability to direct payloads in exchanges to be stored in a pre-existing or created-on-demand cache. The mechanics of doing this involve

- setting the Message Exchange Headers shown above.
- ensuring that the Message Exchange Body contains the message directed to the cache

56.4.4. Cache Consumer

Receiving data from the cache involves the ability of the CacheConsumer to listen on a pre-existing or created-on-demand Cache using an event Listener and receive automatic notifications when any cache activity take place (i.e CamelCacheGet/CamelCacheUpdate/CamelCacheDelete/CamelCacheDeleteAll). Upon such an activity taking place

- an exchange containing Message Exchange Headers and a Message Exchange Body containing the just added/updated payload is placed and sent.
- in case of a CamelCacheDeleteAll operation, the Message Exchange Header CamelCacheKey and the Message Exchange Body are not populated.

56.4.5. Cache Processors

There are a set of nice processors with the ability to perform cache lookups and selectively replace payload content at the

- body
- token
- xpath level

56.5. CACHE USAGE SAMPLES

56.5.1. Example 1: Configuring the cache

```
from("cache://MyApplicationCache" +
    "?maxElementsInMemory=1000" +
    "&memoryStoreEvictionPolicy=" +
    "MemoryStoreEvictionPolicy.LFU" +
    "&overflowToDisk=true" +
    "&eternal=true" +
    "&timeToLiveSeconds=300" +
    "&timeToIdleSeconds=true" +
    "&diskPersistent=true" +
    "&diskExpiryThreadIntervalSeconds=300")
```

56.5.2. Example 2: Adding keys to the cache

```
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_OPERATION_ADD))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

56.5.3. Example 2: Updating existing keys in a cache

```
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_OPERATION_UPDATE))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

56.5.4. Example 3: Deleting existing keys in a cache

```
RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("direct:start")
            .setHeader(CacheConstants.CACHE_OPERATION,
                constant(CacheConstants.CACHE_DELETE))
            .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
            .to("cache://TestCache1")
    }
};
```

56.5.5. Example 4: Deleting all existing keys in a cache

```
RouteBuilder builder = new RouteBuilder() {
```

```

public void configure() {
    from("direct:start")
    .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_DELETEALL))
    .to("cache://TestCache1");
}
};

```

56.5.6. Example 5: Notifying any changes registering in a Cache to Processors and other Producers

```

RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        from("cache://TestCache1")
        .process(new Processor() {
            public void process(Exchange exchange)
                throws Exception {
                String operation = (String)
exchange.getIn().getHeader(CacheConstants.CACHE_OPERATION);
                String key = (String) exchange.getIn().getHeader(CacheConstants.CACHE_KEY);
                Object body = exchange.getIn().getBody();
                // Do something
            }
        })
    }
};

```

56.5.7. Example 6: Using Processors to selectively replace payload with cache values

```

RouteBuilder builder = new RouteBuilder() {
    public void configure() {
        //Message Body Replacer
        from("cache://TestCache1")
        .filter(header(CacheConstants.CACHE_KEY).isEqualTo("greeting"))
        .process(new CacheBasedMessageBodyReplacer("cache://TestCache1","farewell"))
        .to("direct:next");

        //Message Token replacer
        from("cache://TestCache1")
        .filter(header(CacheConstants.CACHE_KEY).isEqualTo("quote"))
        .process(new CacheBasedTokenReplacer("cache://TestCache1","novel","#novel#"))
        .process(new CacheBasedTokenReplacer("cache://TestCache1","author","#author#"))
        .process(new CacheBasedTokenReplacer("cache://TestCache1","number","#number#"))
        .to("direct:next");

        //Message XPath replacer
        from("cache://TestCache1").
        .filter(header(CacheConstants.CACHE_KEY).isEqualTo("XML_FRAGMENT"))
        .process(new CacheBasedXPathReplacer("cache://TestCache1","book1","/books/book1"))
        .process (new CacheBasedXPathReplacer("cache://TestCache1","book2","/books/book2"))
        .to("direct:next");
    }
};

```

56.5.8. Example 7: Getting an entry from the Cache

```

from("direct:start")
  // Prepare headers
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_GET))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson")).
  to("cache://TestCache1").
  // Check if entry was not found
  .choice().when(header(CacheConstants.CACHE_ELEMENT_WAS_FOUND).isNull()).
  // If not found, get the payload and put it to cache
  .to("cxf:bean:someHeavyweightOperation").
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_ADD))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
  .to("cache://TestCache1")
  .end()
  .to("direct:nextPhase");

```

56.5.9. Example 8: Checking for an entry in the Cache

Note: The CHECK command tests existence of an entry in the cache but doesn't place a message in the body.

```

from("direct:start")
  // Prepare headers
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_CHECK))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson")).
  to("cache://TestCache1").
  // Check if entry was not found
  .choice().when(header(CacheConstants.CACHE_ELEMENT_WAS_FOUND).isNull()).
  // If not found, get the payload and put it to cache
  .to("cxf:bean:someHeavyweightOperation").
  .setHeader(CacheConstants.CACHE_OPERATION,
constant(CacheConstants.CACHE_OPERATION_ADD))
  .setHeader(CacheConstants.CACHE_KEY, constant("Ralph_Waldo_Emerson"))
  .to("cache://TestCache1")
  .end();

```

56.6. MANAGEMENT OF EHCACHE

[EHCache](#) has its own statistics and management from JMX.

Here's a snippet on how to expose them via JMX in a Spring application context:

```

<bean id="ehCacheManagementService" class="net.sf.ehcache.management.ManagementService"
init-method="init" lazy-init="false">
  <constructor-arg>
    <bean class="net.sf.ehcache.CacheManager" factory-method="getInstance"/>
  </constructor-arg>
  <constructor-arg>
    <bean class="org.springframework.jmx.support.JmxUtils" factory-method="locateMBeanServer"/>
  </constructor-arg>

```

```

<constructor-arg value="true"/>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
<constructor-arg value="true"/>
</bean>

```

Of course you can do the same thing in straight Java:

```

ManagementService.registerMBeans(CacheManager.getInstance(), mbeanServer, true, true, true,
true);

```

You can get cache hits, misses, in-memory hits, disk hits, size stats this way. You can also change CacheConfiguration parameters on the fly.

56.7. CACHE REPLICATION CAMEL 2.8

The Camel Cache component is able to distribute a cache across server nodes using several different replication mechanisms including: RMI, JGroups, JMS and Cache Server.

There are two different ways to make it work:

1. You can configure **ehcache.xml** manually

OR

2. You can configure these three options:

- cacheManagerFactory
- eventListenerRegistry
- cacheLoaderRegistry

Configuring Camel Cache replication using the first option is a bit of hard work as you have to configure all caches separately. So in a situation when the all names of caches are not known, using **ehcache.xml** is not a good idea.

The second option is much better when you want to use many different caches as you do not need to define options per cache. This is because replication options are set per **CacheManager** and per **CacheEndpoint**. Also it is the only way when cache names are not know at the development phase.

Note: It might be useful to read the [EHCache manual](#) to get a better understanding of the Camel Cache replication mechanism.

56.7.1. Example: JMS cache replication

JMS replication is the most powerful and secured replication method. Used together with Camel Cache replication makes it also rather simple. An example is available on [a separate page](#).

CHAPTER 57. CAFFEINE CACHE COMPONENT

Available as of Camel version 2.20

The **caffeine-cache** component enables you to perform caching operations using the simple cache from Caffeine.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-caffeine</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

57.1. URI FORMAT

```
caffeine-cache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

57.2. OPTIONS

The Caffeine Cache component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| configuration (advanced) | Sets the global component configuration | | CaffeineConfiguration |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Caffeine Cache endpoint is configured using URI syntax:

```
caffeine-cache:cacheName
```

with the following path and query parameters:

57.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------|---------|--------|
| cacheName | Required the cache name | | String |

57.2.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-------------------------------|
| createCacheIfNotExist (common) | Configure if a cache need to be created if it does exist or can't be pre-configured. | true | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| action (producer) | To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence. | | String |
| cache (producer) | To configure an already instantiated cache to be used | | Cache |
| cacheLoader (producer) | To configure a <code>CacheLoader</code> in case of a <code>LoadCache</code> use | | <code>CacheLoader</code> |
| evictionType (producer) | Set the eviction Type for this cache | SIZE_B ASED | <code>EvictionType</code> |
| expireAfterAccessTime (producer) | Set the expire After Access Time in case of time based Eviction (in seconds) | 300 | int |

| Name | Description | Default | Type |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------|
| expireAfterWriteTime (producer) | Set the expire After Access Write in case of time based Eviction (in seconds) | 300 | int |
| initialCapacity (producer) | Set the initial Capacity for the cache | 10000 | int |
| key (producer) | To configure the default action key. If a key is set in the message header, then the key from the header takes precedence. | | Object |
| maximumSize (producer) | Set the maximum size for the cache | 10000 | int |
| removalListener (producer) | Set a specific removal Listener for the cache | | RemovalListener |
| statsCounter (producer) | Set a specific Stats Counter for the cache stats | | StatsCounter |
| statsEnabled (producer) | To enable stats on the cache | false | boolean |
| keyType (advanced) | The cache key type, default java.lang.Object | java.lang.Object | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| valueType (advanced) | The cache value type, default java.lang.Object | java.lang.Object | String |

57.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| camel.component.caffeine-cache.configuration.action | To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence. | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|------------------|--------------|
| <code>camel.component.caffeine-cache.configuration.cache</code> | To configure an already instantiated cache to be used | | Cache |
| <code>camel.component.caffeine-cache.configuration.cache-loader</code> | To configure a CacheLoader in case of a LoadCache use | | CacheLoader |
| <code>camel.component.caffeine-cache.configuration.create-cache-if-not-exist</code> | Configure if a cache need to be created if it does exist or can't be pre-configured. | true | Boolean |
| <code>camel.component.caffeine-cache.configuration.eviction-type</code> | Set the eviction Type for this cache | | EvictionType |
| <code>camel.component.caffeine-cache.configuration.expire-after-access-time</code> | Set the expire After Access Time in case of time based Eviction (in seconds) | 300 | Integer |
| <code>camel.component.caffeine-cache.configuration.expire-after-write-time</code> | Set the expire After Access Write in case of time based Eviction (in seconds) | 300 | Integer |
| <code>camel.component.caffeine-cache.configuration.initial-capacity</code> | Set the initial Capacity for the cache | 10000 | Integer |
| <code>camel.component.caffeine-cache.configuration.key</code> | To configure the default action key. If a key is set in the message header, then the key from the header takes precedence. | | Object |
| <code>camel.component.caffeine-cache.configuration.key-type</code> | The cache key type, default java.lang.Object | java.lang.Object | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------|
| <code>camel.component.caffeine-cache.configuration.maximum-size</code> | Set the maximum size for the cache | 10000 | Integer |
| <code>camel.component.caffeine-cache.configuration.removal-listener</code> | Set a specific removal Listener for the cache | | RemovalListener |
| <code>camel.component.caffeine-cache.configuration.stats-counter</code> | Set a specific Stats Counter for the cache stats | | StatsCounter |
| <code>camel.component.caffeine-cache.configuration.stats-enabled</code> | To enable stats on the cache | false | Boolean |
| <code>camel.component.caffeine-cache.configuration.value-type</code> | The cache value type, default java.lang.Object | java.lang.Object | String |
| <code>camel.component.caffeine-cache.enabled</code> | Whether to enable auto configuration of the caffeine-cache component. This is enabled by default. | | Boolean |
| <code>camel.component.caffeine-cache.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

57.4. EXAMPLES

You can use your cache with the following code:

```
@Override
protected RouteBuilder createRouteBuilder() throws Exception {
    return new RouteBuilder() {
        public void configure() {
            from("direct://start")
                .toF("caffeine-cache://%s?cache=#cache&action=PUT&key=1", "test")
                .toF("caffeine-cache://%s?cache=#cache&key=1&action=GET", "test")
        }
    };
}
```

```
        .log("Test! ${body}")
        .to("mock:result");
    }
};
}
```

In this way you'll work always on the same cache in the registry.

57.5. CHECK OPERATION RESULT

Each time you'll use an operation on the cache you'll have two different headers to check for status:

```
CaffeineConstants.ACTION_HAS_RESULT
CaffeineConstants.ACTION_SUCCEEDED
```

CHAPTER 58. CAFFEINE LOADCACHE COMPONENT

Available as of Camel version 2.20

The **caffeine-loadcache** component enables you to perform caching operations using The Load cache from Caffeine.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-caffeine</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

58.1. URI FORMAT

```
caffeine-loadcache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

58.2. OPTIONS

The Caffeine LoadCache component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| configuration (advanced) | Sets the global component configuration | | CaffeineConfiguration |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Caffeine LoadCache endpoint is configured using URI syntax:

```
caffeine-loadcache:cacheName
```

with the following path and query parameters:

58.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------|---------|--------|
| cacheName | Required the cache name | | String |

58.2.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-------------------------------|
| createCacheIfNotExist (common) | Configure if a cache need to be created if it does exist or can't be pre-configured. | true | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| action (producer) | To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence. | | String |
| cache (producer) | To configure an already instantiated cache to be used | | Cache |
| cacheLoader (producer) | To configure a <code>CacheLoader</code> in case of a <code>LoadCache</code> use | | <code>CacheLoader</code> |
| evictionType (producer) | Set the eviction Type for this cache | SIZE_B ASED | <code>EvictionType</code> |
| expireAfterAccessTime (producer) | Set the expire After Access Time in case of time based Eviction (in seconds) | 300 | int |

| Name | Description | Default | Type |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------|
| expireAfterWriteTime (producer) | Set the expire After Access Write in case of time based Eviction (in seconds) | 300 | int |
| initialCapacity (producer) | Set the initial Capacity for the cache | 10000 | int |
| key (producer) | To configure the default action key. If a key is set in the message header, then the key from the header takes precedence. | | Object |
| maximumSize (producer) | Set the maximum size for the cache | 10000 | int |
| removalListener (producer) | Set a specific removal Listener for the cache | | RemovalListener |
| statsCounter (producer) | Set a specific Stats Counter for the cache stats | | StatsCounter |
| statsEnabled (producer) | To enable stats on the cache | false | boolean |
| keyType (advanced) | The cache key type, default java.lang.Object | java.lang.Object | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| valueType (advanced) | The cache value type, default java.lang.Object | java.lang.Object | String |

58.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| camel.component.caffeine-loadcache.configuration.action | To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| <code>camel.component.caffeine-loadcache.configuration.cache</code> | To configure an already instantiated cache to be used | | Cache |
| <code>camel.component.caffeine-loadcache.configuration.cache-loader</code> | To configure a CacheLoader in case of a LoadCache use | | CacheLoader |
| <code>camel.component.caffeine-loadcache.configuration.create-cache-if-not-exist</code> | Configure if a cache need to be created if it does exist or can't be pre-configured. | true | Boolean |
| <code>camel.component.caffeine-loadcache.configuration.eviction-type</code> | Set the eviction Type for this cache | | EvictionType |
| <code>camel.component.caffeine-loadcache.configuration.expire-after-access-time</code> | Set the expire After Access Time in case of time based Eviction (in seconds) | 300 | Integer |
| <code>camel.component.caffeine-loadcache.configuration.expire-after-write-time</code> | Set the expire After Access Write in case of time based Eviction (in seconds) | 300 | Integer |
| <code>camel.component.caffeine-loadcache.configuration.initial-capacity</code> | Set the initial Capacity for the cache | 10000 | Integer |
| <code>camel.component.caffeine-loadcache.configuration.key</code> | To configure the default action key. If a key is set in the message header, then the key from the header takes precedence. | | Object |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------|
| <code>camel.component.caffeine-loadcache.configuration.key-type</code> | The cache key type, default <code>java.lang.Object</code> | <code>java.lang.Object</code> | String |
| <code>camel.component.caffeine-loadcache.configuration.maximum-size</code> | Set the maximum size for the cache | 10000 | Integer |
| <code>camel.component.caffeine-loadcache.configuration.removal-listener</code> | Set a specific removal Listener for the cache | | RemovalListener |
| <code>camel.component.caffeine-loadcache.configuration.stats-counter</code> | Set a specific Stats Counter for the cache stats | | StatsCounter |
| <code>camel.component.caffeine-loadcache.configuration.stats-enabled</code> | To enable stats on the cache | false | Boolean |
| <code>camel.component.caffeine-loadcache.configuration.value-type</code> | The cache value type, default <code>java.lang.Object</code> | <code>java.lang.Object</code> | String |
| <code>camel.component.caffeine-loadcache.enabled</code> | Whether to enable auto configuration of the caffeine-loadcache component. This is enabled by default. | | Boolean |
| <code>camel.component.caffeine-loadcache.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 59. CASTOR DATAFORMAT (DEPRECATED)

Available as of Camel version 2.1

Castor is a Data Format which uses the [Castor XML library](#) to unmarshal an XML payload into Java objects or to marshal Java objects into an XML payload.

As usually you can use either Java DSL or Spring XML to work with Castor Data Format.

59.1. USING THE JAVA DSL

```
from("direct:order").
  marshal().castor().
  to("activemq:queue:order");
```

For example the following uses a named DataFormat of Castor which uses default Castor data binding features.

```
CastorDataFormat castor = new CastorDataFormat ();

from("activemq:My.Queue").
  unmarshal(castor).
  to("mqseries:Another.Queue");
```

If you prefer to use a named reference to a data format which can then be defined in your Registry such as via your Spring XML file. e.g.

```
from("activemq:My.Queue").
  unmarshal("mycastorType").
  to("mqseries:Another.Queue");
```

If you want to override default mapping schema by providing a mapping file you can set it as follows.

```
CastorDataFormat castor = new CastorDataFormat ();
castor.setMappingFile("mapping.xml");
```

Also if you want to have more control on Castor Marshaller and Unmarshaller you can access them as below.

```
castor.getMarshaller();
castor.getUnmarshaller();
```

59.2. USING SPRING XML

The following example shows how to use Castor to unmarshal using Spring configuring the castor data type

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <unmarshal>
      <castor validation="true" />
    </unmarshal>
  </route>
</camelContext>
```

```

</unmarshal>
<to uri="mock:result"/>
</route>
</camelContext>

```

This example shows how to configure the data type just once and reuse it on multiple routes. You have to set the `<castor>` element directly in `<camelContext>`.

```

<camelContext>
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
  <dataFormats>
    <castor id="myCastor"/>
  </dataFormats>

  <route>
    <from uri="direct:start"/>
    <marshal ref="myCastor"/>
    <to uri="direct:marshalled"/>
  </route>
  <route>
    <from uri="direct:marshalled"/>
    <unmarshal ref="myCastor"/>
    <to uri="mock:result"/>
  </route>

</camelContext>

```

59.3. OPTIONS

The Castor dataformat supports 9 options, which are listed below.

| Name | Default | Java Type | Description |
|-----------------------------------------|-------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>mappingFile</code> | | String | Path to a Castor mapping file to load from the classpath. |
| <code>whitelistEnabled</code> | true | Boolean | Define if Whitelist feature is enabled or not |
| <code>allowedUnmarshalledObjects</code> | | String | Define the allowed objects to be unmarshalled. You can specify the FQN class name of allowed objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by <code>link org.apache.camel.util.EndpointHelper#matchPattern(String, String)</code> . Denied objects takes precedence over allowed objects. |
| <code>deniedUnmarshalledObjects</code> | | String | Define the denied objects to be unmarshalled. You can specify the FQN class name of deined objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by <code>link org.apache.camel.util.EndpointHelper#matchPattern(String, String)</code> . Denied objects takes precedence over allowed objects. |

| Name | Default | Java Type | Description |
|-------------------|---------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| validation | true | Boolean | Whether validation is turned on or off. Is by default true. |
| encoding | UTF-8 | String | Encoding to use when marshalling an Object to XML. Is by default UTF-8 |
| packages | | String [] | Add additional packages to Castor XmlContext |
| classes | | String [] | Add additional class names to Castor XmlContext |
| contentTypeHeader | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. |

59.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| camel.dataformat.castor.allowed-unmarshall-objects | Define the allowed objects to be unmarshalled. You can specify the FQN class name of allowed objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by link org.apache.camel.util.EndpointHelper#matchPattern (String, String) . Denied objects takes precedence over allowed objects. | | String |
| camel.dataformat.castor.classes | Add additional class names to Castor XmlContext | | String[] |
| camel.dataformat.castor.content-type-header | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. | false | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| <code>camel.dataformat.castor.denied-unmarshalled-objects</code> | Define the denied objects to be unmarshalled. You can specify the FQN class name of deined objects, and you can use comma to separate multiple entries. It is also possible to use wildcards and regular expression which is based on the pattern defined by link <code>org.apache.camel.util.EndpointHelper#matchPattern</code> (String, String). Denied objects takes precedence over allowed objects. | | String |
| <code>camel.dataformat.castor.enabled</code> | Enable castor dataformat | true | Boolean |
| <code>camel.dataformat.castor.encoding</code> | Encoding to use when marshalling an Object to XML. Is by default UTF-8 | UTF-8 | String |
| <code>camel.dataformat.castor.mapping-file</code> | Path to a Castor mapping file to load from the classpath. | | String |
| <code>camel.dataformat.castor.packages</code> | Add additional packages to Castor XmlContext | | String[] |
| <code>camel.dataformat.castor.validation</code> | Whether validation is turned on or off. Is by default true. | true | Boolean |
| <code>camel.dataformat.castor.whitelist-enabled</code> | Define if Whitelist feature is enabled or not | true | Boolean |

ND

59.5. DEPENDENCIES

To use Castor in your camel routes you need to add the a dependency on **camel-castor** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-castor</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 60. CAMEL CDI

The Camel CDI component provides auto-configuration for Apache Camel using CDI as dependency injection framework based on *convention-over-configuration*. It auto-detects Camel routes available in the application and provides beans for common Camel primitives like **Endpoint**, **FluentProducerTemplate**, **ProducerTemplate** or **TypeConverter**. It implements standard Camel bean integration so that Camel annotations like **@Consume**, **@Produce** and **@PropertyInject** can be used seamlessly in CDI beans. Besides, it bridges Camel events (e.g. **RouteAddedEvent**, **CamelContextStartedEvent**, **ExchangeCompletedEvent**, ...) as CDI events and provides a CDI events endpoint that can be used to consume / produce CDI events from / to Camel routes.

While the Camel CDI component is available as of **Camel 2.10**, it's been rewritten in **Camel 2.17** to better fit into the CDI programming model. Hence some of the features like the Camel events to CDI events bridge and the CDI events endpoint only apply starting Camel 2.17.

More details on how to test Camel CDI applications are available in Camel CDI testing.

CAUTION

camel-cdi is deprecated in OSGi and not supported. Use OSGi Blueprint if using Camel with OSGi.

60.1. AUTO-CONFIGURED CAMEL CONTEXT

Camel CDI automatically deploys and configures a **CamelContext** bean. That **CamelContext** bean is automatically instantiated, configured and started (resp. stopped) when the CDI container initializes (resp. shuts down). It can be injected in the application, e.g.:

```
@Inject
CamelContext context;
```

That default **CamelContext** bean is qualified with the built-in **@Default** qualifier, is scoped **@ApplicationScoped** and is of type **DefaultCamelContext**.

Note that this bean can be customized programmatically and other Camel context beans can be deployed in the application as well.

60.2. AUTO-DETECTING CAMEL ROUTES

Camel CDI automatically collects all the **RoutesBuilder** beans in the application, instantiates and add them to the **CamelContext** bean instance when the CDI container initializes. For example, adding a Camel route is as simple as declaring a class, e.g.:

```
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("jms:invoices").to("file:/invoices");
    }
}
```

Note that you can declare as many **RoutesBuilder** beans as you want. Besides, **RouteContainer** beans are also automatically collected, instantiated and added to the **CamelContext** bean instance managed by Camel CDI when the container initializes.

Available as of Camel 2.19

In some situations, it may be necessary to disable the auto-configuration of the **RouteBuilder** and **RouteContainer** beans. That can be achieved by observing for the **CdiCamelConfiguration** event, e.g.:

```
static void configuration(@Observes CdiCamelConfiguration configuration) {
    configuration.autoConfigureRoutes(false);
}
```

Similarly, it is possible to deactivate the automatic starting of the configured **CamelContext** beans, e.g.:

```
static void configuration(@Observes CdiCamelConfiguration configuration) {
    configuration.autoStartContexts(false);
}
```

60.3. AUTO-CONFIGURED CAMEL PRIMITIVES

Camel CDI provides beans for common Camel primitives that can be injected in any CDI beans, e.g.:

```
@Inject
@Uri("direct:inbound")
ProducerTemplate producerTemplate;

@Inject
@Uri("direct:inbound")
FluentProducerTemplate fluentProducerTemplate;

@Inject
MockEndpoint outbound; // URI defaults to the member name, i.e. mock:outbound

@Inject
@Uri("direct:inbound")
Endpoint endpoint;

@Inject
TypeConverter converter;
```

60.4. CAMEL CONTEXT CONFIGURATION

If you just want to change the name of the default **CamelContext** bean, you can use the **@ContextName** qualifier provided by Camel CDI, e.g.:

```
@ContextName("camel-context")
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("jms:invoices").to("file:/invoices");
    }
}
```

Else, if more customization is needed, any **CamelContext** class can be used to declare a custom Camel context bean. Then, the **@PostConstruct** and **@PreDestroy** lifecycle callbacks can be done to do the customization, e.g.:

```
@ApplicationScoped
class CustomCamelContext extends DefaultCamelContext {

    @PostConstruct
    void customize() {
        // Set the Camel context name
        setName("custom");
        // Disable JMX
        disableJMX();
    }

    @PreDestroy
    void cleanUp() {
        // ...
    }
}
```

Producer and **disposer** methods can also be used as well to customize the Camel context bean, e.g.:

```
class CamelContextFactory {

    @Produces
    @ApplicationScoped
    CamelContext customize() {
        DefaultCamelContext context = new DefaultCamelContext();
        context.setName("custom");
        return context;
    }

    void cleanUp(@Disposes CamelContext context) {
        // ...
    }
}
```

Similarly, **producer fields** can be used, e.g.:

```
@Produces
@ApplicationScoped
CamelContext context = new CustomCamelContext();

class CustomCamelContext extends DefaultCamelContext {

    CustomCamelContext() {
        setName("custom");
    }
}
```

This pattern can be used for example to avoid having the Camel context routes started automatically when the container initializes by calling the **setAutoStartup** method, e.g.:

```
@ApplicationScoped
```

```
class ManualStartupCamelContext extends DefaultCamelContext {

    @PostConstruct
    void manual() {
        setAutoStartup(false);
    }
}
```

60.5. MULTIPLE CAMEL CONTEXTS

Any number of **CamelContext** beans can actually be declared in the application as documented above. In that case, the CDI qualifiers declared on these **CamelContext** beans are used to bind the Camel routes and other Camel primitives to the corresponding Camel contexts. For example, if the following beans get declared:

```
@ApplicationScoped
@ContextName("foo")
class FooCamelContext extends DefaultCamelContext {
}

@ApplicationScoped
@BarContextQualifier
class BarCamelContext extends DefaultCamelContext {
}

@ContextName("foo")
class RouteAddedToFooCamelContext extends RouteBuilder {

    @Override
    public void configure() {
        // ...
    }
}

@BarContextQualifier
class RouteAddedToBarCamelContext extends RouteBuilder {

    @Override
    public void configure() {
        // ...
    }
}

@ContextName("baz")
class RouteAddedToBazCamelContext extends RouteBuilder {

    @Override
    public void configure() {
        // ...
    }
}

@MyOtherQualifier
class RouteNotAddedToAnyCamelContext extends RouteBuilder {
```

```

@Override
public void configure() {
    // ...
}
}

```

The **RoutesBuilder** beans qualified with **@ContextName** are automatically added to the corresponding **CamelContext** beans by Camel CDI. If no such **CamelContext** bean exists, it gets automatically created, as for the **RouteAddedToBazCamelContext** bean. Note this only happens for the **@ContextName** qualifier provided by Camel CDI. Hence the **RouteNotAddedToAnyCamelContext** bean qualified with the user-defined **@MyOtherQualifier** qualifier does not get added to any Camel contexts. That may be useful, for example, for Camel routes that may be required to be added later during the application execution.

NOTE

Since Camel version 2.17.0, Camel CDI is capable of managing any kind of **CamelContext** beans (e.g. **DefaultCamelContext**). In previous versions, it is only capable of managing beans of type **CdiCamelContext** so it is required to extend it.

The CDI qualifiers declared on the **CamelContext** beans are also used to bind the corresponding Camel primitives, e.g.:

```

@Inject
@ContextName("foo")
@Uri("direct:inbound")
ProducerTemplate producerTemplate;

@Inject
@ContextName("foo")
@Uri("direct:inbound")
FluentProducerTemplate fluentProducerTemplate;

@Inject
@BarContextQualifier
MockEndpoint outbound; // URI defaults to the member name, i.e. mock:outbound

@Inject
@ContextName("baz")
@Uri("direct:inbound")
Endpoint endpoint;

```

60.6. CONFIGURATION PROPERTIES

To configure the sourcing of the configuration properties used by Camel to resolve properties placeholders, you can declare a **PropertiesComponent** bean qualified with **@Named("properties")**, e.g.:

```

@Produces
@ApplicationScoped
@Named("properties")
PropertiesComponent propertiesComponent() {
    Properties properties = new Properties();
    properties.put("property", "value");
}

```

```

PropertiesComponent component = new PropertiesComponent();
component.setInitialProperties(properties);
component.setLocation("classpath:placeholder.properties");
return component;
}

```

If you want to use [DeltaSpike configuration mechanism](#) you can declare the following **PropertiesComponent** bean:

```

@Produces
@ApplicationScoped
@Named("properties")
PropertiesComponent properties(PropertiesParser parser) {
    PropertiesComponent component = new PropertiesComponent();
    component.setPropertiesParser(parser);
    return component;
}

// PropertiesParser bean that uses DeltaSpike to resolve properties
static class DeltaSpikeParser extends DefaultPropertiesParser {
    @Override
    public String parseProperty(String key, String value, Properties properties) {
        return ConfigResolver.getPropertyValue(key);
    }
}

```

You can see the **camel-example-cdi-properties** example for a working example of a Camel CDI application using DeltaSpike configuration mechanism.

60.7. AUTO-CONFIGURED TYPE CONVERTERS

CDI beans annotated with the **@Converter** annotation are automatically registered into the deployed Camel contexts, e.g.:

```

@Converter
public class MyTypeConverter {

    @Converter
    public Output convert(Input input) {
        //...
    }
}

```

Note that CDI injection is supported within the type converters.

60.8. CAMEL BEAN INTEGRATION

60.8.1. Camel annotations

As part of the Camel [bean integration](#), Camel comes with a set of [annotations](#) that are seamlessly supported by Camel CDI. So you can use any of these annotations in your CDI beans, e.g.:

| | Camel annotation | CDI equivalent |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration property | <pre>@PropertyInject("key") String value;</pre> | <p>If using DeltaSpike configuration mechanism:</p> <pre>@Inject @ConfigProperty(name = "key") String value;</pre> <p>See configuration properties for more details.</p> |
| Producer template injection (default Camel context) | <pre>@Produce(uri = "mock:outbound") ProducerTemplate producer;</pre> <pre>@Produce(uri = "mock:outbound") FluentProducerTemplate producer;</pre> | <pre>@Inject @Uri("direct:outbound") ProducerTemplate producer;</pre> <pre>@Produce(uri = "direct:outbound") FluentProducerTemplate producer;</pre> |
| Endpoint injection (default Camel context) | <pre>@EndpointInject(uri = "direct:inbound") Endpoint endpoint;</pre> | <pre>@Inject @Uri("direct:inbound") Endpoint endpoint;</pre> |
| Endpoint injection (Camel context by name) | <pre>@EndpointInject(uri = "direct:inbound", context = "foo") Endpoint contextEndpoint;</pre> | <pre>@Inject @ContextName("foo") @Uri("direct:inbound") Endpoint contextEndpoint;</pre> |
| Bean injection (by type) | <pre>@BeanInject MyBean bean;</pre> | <pre>@Inject MyBean bean;</pre> |
| Bean injection (by name) | <pre>@BeanInject("foo") MyBean bean;</pre> | <pre>@Inject @Named("foo") MyBean bean;</pre> |
| POJO consuming | <pre>@Consume(uri = "seda:inbound") void consume(@Body String body) { //... }</pre> | |

60.8.2. Bean component

You can refer to CDI beans, either by type or name, From the Camel DSL, e.g. with the Java Camel DSL:

```
class MyBean {
    //...
}

from("direct:inbound").bean(MyBean.class);
```

Or to lookup a CDI bean by name from the Java DSL:

```
@Named("foo")
class MyNamedBean {
    //...
}

from("direct:inbound").bean("foo");
```

60.8.3. Referring beans from Endpoint URIs

When configuring endpoints using the URI syntax you can refer to beans in the Registry using the **#** notation. If the URI parameter value starts with a **#** sign then Camel CDI will lookup for a bean of the given type by name, e.g.:

```
from("jms:queue:{{destination}}?
transacted=true&transactionManager=#jtaTransactionManager").to("...");
```

Having the following CDI bean qualified with **@Named("jtaTransactionManager")**:

```
@Produces
@Named("jtaTransactionManager")
PlatformTransactionManager createTransactionManager(TransactionManager transactionManager,
UserTransaction userTransaction) {
    JtaTransactionManager jtaTransactionManager = new JtaTransactionManager();
    jtaTransactionManager.setUserTransaction(userTransaction);
    jtaTransactionManager.setTransactionManager(transactionManager);
    jtaTransactionManager.afterPropertiesSet();
    return jtaTransactionManager;
}
```

60.9. CAMEL EVENTS TO CDI EVENTS

Available as of Camel 2.17

Camel provides a set of [management events](#) that can be subscribed to for listening to Camel context, service, route and exchange events. Camel CDI seamlessly translates these Camel events into CDI events that can be observed using CDI [observer methods](#), e.g.:

```
void onContextStarting(@Observes CamelContextStartingEvent event) {
    // Called before the default Camel context is about to start
}
```

As of Camel 2.18, it is possible to observe events for a particular route (**RouteAddedEvent**, **RouteStartedEvent**, **RouteStoppedEvent** and **RouteRemovedEvent**) should it have an explicit defined, e.g.:

```
from("...").routeId("foo").to("...");

void onRouteStarted(@Observes @Named("foo") RouteStartedEvent event) {
    // Called after the route "foo" has started
}
```

When multiple Camel contexts exist in the CDI container, the Camel context bean qualifiers, like **@ContextName**, can be used to refine the observer method resolution to a particular Camel context as specified in [observer resolution](#), e.g.:

```
void onRouteStarted(@Observes @ContextName("foo") RouteStartedEvent event) {
    // Called after the route 'event.getRoute()' for the Camel context 'foo' has started
}

void onContextStarted(@Observes @Manual CamelContextStartedEvent event) {
    // Called after the Camel context qualified with '@Manual' has started
}
```

Similarly, the **@Default** qualifier can be used to observe Camel events for the *default* Camel context if multiples contexts exist, e.g.:

```
void onExchangeCompleted(@Observes @Default ExchangeCompletedEvent event) {
    // Called after the exchange 'event.getExchange()' processing has completed
}
```

In that example, if no qualifier is specified, the **@Any** qualifier is implicitly assumed, so that corresponding events for all the Camel contexts get received.

Note that the support for Camel events translation into CDI events is only activated if observer methods listening for Camel events are detected in the deployment, and that per Camel context.

60.10. CDI EVENTS ENDPOINT

Available as of Camel 2.17

The CDI event endpoint bridges the [CDI events](#) with the Camel routes so that CDI events can be seamlessly observed / consumed (resp. produced / fired) from Camel consumers (resp. by Camel producers).

The **CdiEventEndpoint<T>** bean provided by Camel CDI can be used to observe / consume CDI events whose *event type* is **T**, for example:

```
@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from(cdiEventEndpoint).log("CDI event received: ${body}");
```

This is equivalent to writing:

```
@Inject
```

```

@Uri("direct:event")
ProducerTemplate producer;

void observeCdiEvents(@Observes String event) {
    producer.sendBody(event);
}

from("direct:event").log("CDI event received: ${body}");

```

Conversely, the **CdiEventEndpoint<T>** bean can be used to produce / fire CDI events whose *event type* is **T**, for example:

```

@Inject
CdiEventEndpoint<String> cdiEventEndpoint;

from("direct:event").to(cdiEventEndpoint).log("CDI event sent: ${body}");

```

This is equivalent to writing:

```

@Inject
Event<String> event;

from("direct:event").process(new Processor() {
    @Override
    public void process(Exchange exchange) {
        event.fire(exchange.getBody(String.class));
    }
}).log("CDI event sent: ${body}");

```

Or using a Java 8 lambda expression:

```

@Inject
Event<String> event;

from("direct:event")
    .process(exchange -> event.fire(exchange.getIn().getBody(String.class)))
    .log("CDI event sent: ${body}");

```

The type variable **T** (resp. the qualifiers) of a particular **CdiEventEndpoint<T>** injection point are automatically translated into the parameterized *event type* (resp. into the *event qualifiers*) e.g.:

```

@Inject
@FooQualifier
CdiEventEndpoint<List<String>> cdiEventEndpoint;

from("direct:event").to(cdiEventEndpoint);

void observeCdiEvents(@Observes @FooQualifier List<String> event) {
    logger.info("CDI event: {}", event);
}

```

When multiple Camel contexts exist in the CDI container, the Camel context bean qualifiers, like **@ContextName**, can be used to qualify the **CdiEventEndpoint<T>** injection points, e.g.:

```

@Inject
@ContextName("foo")
CdiEventEndpoint<List<String>> cdiEventEndpoint;
// Only observes / consumes events having the @ContextName("foo") qualifier
from(cdiEventEndpoint).log("Camel context (foo) > CDI event received: ${body}");
// Produces / fires events with the @ContextName("foo") qualifier
from("...").to(cdiEventEndpoint);

void observeCdiEvents(@Observes @ContextName("foo") List<String> event) {
    logger.info("Camel context (foo) > CDI event: {}", event);
}

```

Note that the CDI event Camel endpoint dynamically adds an [observer method](#) for each unique combination of *event type* and *event qualifiers* and solely relies on the container typesafe [observer resolution](#), which leads to an implementation as efficient as possible.

Besides, as the impedance between the *typesafe* nature of CDI and the *dynamic* nature of the [Camel component](#) model is quite high, it is not possible to create an instance of the CDI event Camel endpoint via [URIs](#). Indeed, the URI format for the CDI event component is:

```
cdi-event://PayloadType<T1,...,Tn>[?qualifiers=QualifierType1[,...[,QualifierTypeN]...]]
```

With the authority **PayloadType** (resp. the **QualifierType**) being the URI escaped fully qualified name of the payload (resp. qualifier) raw type followed by the type parameters section delimited by angle brackets for payload parameterized type. Which leads to *unfriendly* URIs, e.g.:

```
cdi-event://org.apache.camel.cdi.example.EventPayload%3Cjava.lang.Integer%3E?
qualifiers=org.apache.camel.cdi.example.FooQualifier%2Corg.apache.camel.cdi.example.BarQualifier
```

But more fundamentally, that would prevent efficient binding between the endpoint instances and the observer methods as the CDI container doesn't have any ways of discovering the Camel context model during the deployment phase.

60.11. CAMEL XML CONFIGURATION IMPORT

Available as of Camel 2.18

While CDI favors a typesafe dependency injection mechanism, it may be useful to reuse existing Camel XML configuration files into a Camel CDI application. In other use cases, it might be handy to rely on the Camel XML DSL to configure its Camel context(s).

You can use the **@ImportResource** annotation that's provided by Camel CDI on any CDI beans and Camel CDI will automatically load the Camel XML configuration at the specified locations, e.g.:

```

@ImportResource("camel-context.xml")
class MyBean {
}

```

Camel CDI will load the resources at the specified locations from the classpath (other protocols may be added in the future).

Every **CamelContext** elements and other Camel *primitives* from the imported resources are automatically deployed as CDI beans during the container bootstrap so that they benefit from the auto-configuration provided by Camel CDI and become available for injection at runtime. If such an element

has an explicit **id** attribute set, the corresponding CDI bean is qualified with the **@Named** qualifier, e.g., given the following Camel XML configuration:

```
<camelContext id="foo">
  <endpoint id="bar" uri="seda:inbound">
    <property key="queue" value="#queue"/>
    <property key="concurrentConsumers" value="10"/>
  </endpoint>
</camelContext/>
```

The corresponding CDI beans are automatically deployed and can be injected, e.g.:

```
@Inject
@ContextName("foo")
CamelContext context;

@Inject
@Named("bar")
Endpoint endpoint;
```

Note that the **CamelContext** beans are automatically qualified with both the **@Named** and **@ContextName** qualifiers. If the imported **CamelContext** element doesn't have an **id** attribute, the corresponding bean is deployed with the built-in **@Default** qualifier.

Conversely, CDI beans deployed in the application can be referred to from the Camel XML configuration, usually using the **ref** attribute, e.g., given the following bean declared:

```
@Produces
@Named("baz")
Processor processor = exchange -> exchange.getIn().setHeader("qux", "quux");
```

A reference to that bean can be declared in the imported Camel XML configuration, e.g.:

```
<camelContext id="foo">
  <route>
    <from uri="..."/>
    <process ref="baz"/>
  </route>
</camelContext/>
```

60.12. TRANSACTION SUPPORT

Available as of Camel 2.19

Camel CDI provides support for Camel transactional client using JTA.

That support is optional hence you need to have JTA in your application classpath, e.g., by explicitly add JTA as a dependency when using Maven:

```
<dependency>
  <groupId>javax.transaction</groupId>
  <artifactId>javax.transaction-api</artifactId>
  <scope>runtime</scope>
</dependency>
```

You'll have to have your application deployed in a JTA capable container or provide a standalone JTA implementation.

CAUTION

Note that, for the time being, the transaction manager is looked up as JNDI resource with the **java:TransactionManager** key.

More flexible strategies will be added in the future to support a wider range of deployment scenarios.

60.12.1. Transaction policies

Camel CDI provides implementation for the typically supported Camel **TransactedPolicy** as CDI beans. It is possible to have these policies looked up by name using the transacted EIP, e.g.:

```
class MyRouteBean extends RouteBuilder {

    @Override
    public void configure() {
        from("activemq:queue:foo")
            .transacted("PROPAGATION_REQUIRED")
            .bean("transformer")
            .to("jpa:my.application.entity.Bar")
            .log("${body.id} inserted");
    }
}
```

This would be equivalent to:

```
class MyRouteBean extends RouteBuilder {

    @Inject
    @Named("PROPAGATION_REQUIRED")
    Policy required;

    @Override
    public void configure() {
        from("activemq:queue:foo")
            .policy(required)
            .bean("transformer")
            .to("jpa:my.application.entity.Bar")
            .log("${body.id} inserted");
    }
}
```

The list of supported transaction policy names is:

- **PROPAGATION_NEVER,**
- **PROPAGATION_NOT_SUPPORTED,**
- **PROPAGATION_SUPPORTS,**
- **PROPAGATION_REQUIRED,**

- `PROPAGATION_REQUIRES_NEW`,
- `PROPAGATION_NESTED`,
- `PROPAGATION_MANDATORY`.

60.12.2. Transactional error handler

Camel CDI provides a transactional error handler that extends the redelivery error handler, forces a rollback whenever an exception occurs and creates a new transaction for each redelivery.

Camel CDI provides the `CdiRouteBuilder` class that exposes the `transactionErrorHandler` helper method to enable quick access to the configuration, e.g.:

```
class MyRouteBean extends CdiRouteBuilder {

    @Override
    public void configure() {
        errorHandler(transactionErrorHandler()
            .setTransactionPolicy("PROPAGATION_SUPPORTS")
            .maximumRedeliveries(5)
            .maximumRedeliveryDelay(5000)
            .collisionAvoidancePercent(10)
            .backOffMultiplier(1.5));
    }
}
```

60.13. AUTO-CONFIGURED OSGI INTEGRATION

Available as of Camel 2.17

The Camel context beans are automatically adapted by Camel CDI so that they are registered as OSGi services and the various resolvers (like `ComponentResolver` and `DataFormatResolver`) integrate with the OSGi registry. That means that the Karaf Camel commands can be used to operate the Camel contexts auto-configured by Camel CDI, e.g.:

```
karaf@root(>) camel:context-list
Context      Status      Total #    Failed #    Inflight #    Uptime
-----      -
camel-cdi    Started      1          0           0 1 minute
```

See the `camel-example-cdi-osgi` example for a working example of the Camel CDI OSGi integration.

60.14. LAZY INJECTION / PROGRAMMATIC LOOKUP

While the CDI programmatic model favors a [typesafe resolution](#) mechanism that occurs at application initialization time, it is possible to perform dynamic / lazy injection later during the application execution using the [programmatic lookup](#) mechanism.

Camel CDI provides for convenience the annotation literals corresponding to the CDI qualifiers that you can use for standard injection of Camel primitives. These annotation literals can be used in conjunction with the `javax.enterprise.inject.Instance` interface which is the CDI entry point to perform lazy injection / programmatic lookup.

For example, you can use the provided annotation literal for the **@Uri** qualifier to lazily lookup for Camel primitives, e.g. for **ProducerTemplate** beans:

```
@Any
@Inject
Instance<ProducerTemplate> producers;

ProducerTemplate inbound = producers
    .select(Uri.Literal.of("direct:inbound"))
    .get();
```

Or for **Endpoint** beans, e.g.:

```
@Any
@Inject
Instance<Endpoint> endpoints;

MockEndpoint outbound = endpoints
    .select(MockEndpoint.class, Uri.Literal.of("mock:outbound"))
    .get();
```

Similarly, you can use the provided annotation literal for the **@ContextName** qualifier to lazily lookup for **CamelContext** beans, e.g.:

```
@Any
@Inject
Instance<CamelContext> contexts;

CamelContext context = contexts
    .select(ContextName.Literal.of("foo"))
    .get();
```

You can also refined the selection based on the Camel context type, e.g.:

```
@Any
@Inject
Instance<CamelContext> contexts;

// Refine the selection by type
Instance<DefaultCamelContext> context = contexts.select(DefaultCamelContext.class);

// Check if such a bean exists then retrieve a reference
if (!context.isUnsatisfied())
    context.get();
```

Or even iterate over a selection of Camel contexts, e.g.:

```
@Any
@Inject
Instance<CamelContext> contexts;

for (CamelContext context : contexts)
    context.setUseBreadcrumb(true);
```

60.15. MAVEN ARCHETYPE

Among the available [Camel Maven archetypes](#), you can use the provided **camel-archetype-cdi** to generate a Camel CDI Maven project, e.g.:

```
mvn archetype:generate -DarchetypeGroupId=org.apache.camel.archetypes -
DarchetypeArtifactId=camel-archetype-cdi
```

60.16. SUPPORTED CONTAINERS

The Camel CDI component is compatible with any CDI 1.0, CDI 1.1 and CDI 1.2 compliant runtime. It's been successfully tested against the following runtimes:

| Container | Version | Runtime |
|--------------|---------------------|---------------------|
| Weld SE | 1.1.28.Final | CDI 1.0 / Java SE 7 |
| OpenWebBeans | 1.2.7 | CDI 1.0 / Java SE 7 |
| Weld SE | 2.4.2.Final | CDI 1.2 / Java SE 7 |
| OpenWebBeans | 1.7.2 | CDI 1.2 / Java SE 7 |
| WildFly | 8.2.1.Final | CDI 1.2 / Java EE 7 |
| WildFly | 9.0.1.Final | CDI 1.2 / Java EE 7 |
| WildFly | 10.1.0.Final | CDI 1.2 / Java EE 7 |

60.17. EXAMPLES

The following examples are available in the **examples** directory of the Camel project:

| Example | Description |
|-------------------------------------|--------------------------------------------------------------------------------------------|
| camel-example-cdi | Illustrates how to work with Camel using CDI to configure components, endpoints and beans |
| camel-example-cdi-kubernetes | Illustrates the integration between Camel, CDI and Kubernetes |
| camel-example-cdi-metrics | Illustrates the integration between Camel, Dropwizard Metrics and CDI |
| camel-example-cdi-properties | Illustrates the integration between Camel, DeltaSpike and CDI for configuration properties |

| Example | Description |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------|
| camel-example-cdi-osgi | A CDI application using the SJMS component that can be executed inside an OSGi container using PAX CDI |
| camel-example-cdi-rest-servlet | Illustrates the Camel REST DSL being used in a Web application that uses CDI as dependency injection framework |
| camel-example-cdi-test | Demonstrates the testing features that are provided as part of the integration between Camel and CDI |
| camel-example-cdi-xml | Illustrates the use of Camel XML configuration files into a Camel CDI application |
| camel-example-openapi-cdi | An example using REST DSL and OpenAPI Java with CDI |
| camel-example-swagger-cdi | An example using REST DSL and Swagger Java with CDI |
| camel-example-widget-gadget-cdi | The Widget and Gadget use-case from the EIP book implemented in Java with CDI dependency Injection |

60.19. CAMEL CDI FOR EAR DEPLOYMENTS ON WILDFLY-CAMEL

Camel CDI EAR deployments on WildFly-Camel have some differences in class and resource loading behaviour, compared to standard WAR or JAR deployments.

WildFly bootstraps Weld using the EAR deployment ClassLoader. WildFly also mandates that only a single CDI extension is created and shared by all EAR sub-deployments.

This results in the 'Auto-configured' CDI Camel Context using the EAR deployment ClassLoader to dynamically load classes and resources. By default, this ClassLoader does not have access to resources within EAR sub-deployments.

For EAR deployments, it is recommended that usage of the 'Auto-configured' CDI Camel Context is

avoided and that **RouteBuilder** classes are annotated with **@ContextName**, or that a **CamelContext** is created via the **@ImportResource** annotation or through CDI producer methods and fields. This helps WildFly-Camel to determine the correct ClassLoader to use with Camel.

CHAPTER 61. CHRONICLE ENGINE COMPONENT

Available as of Camel version 2.18

The camel chronicle-engine component let you leverage the power of OpenHFT's Chronicle-Engine

61.1. URI FORMAT

```
chronicle-engine:addresses/path[?options]
```

61.2. URI OPTIONS

The Chronicle Engine component has no options.

The Chronicle Engine endpoint is configured using URI syntax:

```
chronicle-engine:addresses/path
```

with the following path and query parameters:

61.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------|---------------------------------------------------------------------------------|---------|--------|
| addresses | Required Engine addresses. Multiple addresses can be separated by comma. | | String |
| path | Required Engine path | | String |

61.2.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| action (common) | The default action to perform, valid values are: - PUBLISH - PPUBLISH_AND_INDEX - PPUT - PGET_AND_PUT - PPUT_ALL - PPUT_IF_ABSENT - PGET - PGET_AND_REMOVE - PREMOVE - PIS_EMPTY - PSIZE | | String |
| clusterName (common) | Cluster name for queue | | String |
| filteredMapEvents (common) | A comma separated list of Map event type to filter, valid values are: INSERT, UPDATE, REMOVE. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| persistent (common) | Enable/disable data persistence | true | boolean |
| subscribeMapEvents (common) | Set if consumer should subscribe to Map events, default true. | true | boolean |
| subscribeTopicEvents (common) | Set if consumer should subscribe to TopicEvents, default false. | false | boolean |
| subscribeTopologicalEvents (common) | Set if consumer should subscribe to TopologicalEvents, default false. | false | boolean |
| wireType (common) | The Wire type to use, default to binary wire. | BINARY | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

61.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.chronicle-engine.enabled</code> | Enable chronicle-engine component | true | Boolean |
| <code>camel.component.chronicle-engine.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 62. CHUNK COMPONENT

Available as of Camel version 2.15

The **chunk**: component allows for processing a message using a [Chunk](#) template. This can be ideal when using Templating to generate responses for requests.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
<groupId>org.apache.camel</groupId>
<artifactId>camel-chunk</artifactId>
<version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

62.1. URI FORMAT

```
chunk:templateName[?options]
```

Where **templateName** is the classpath-local URI of the template to invoke.

You can append query options to the URI in the following format, **?option=value&option=value&...**

62.2. OPTIONS

The Chunk component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| allowContextMapAll (producer) | Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API. | false | boolean |
| allowTemplateFromHeader (producer) | Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution. | false | boolean |

The Chunk endpoint is configured using URI syntax:

```
chunk:resourceUri
```

with the following path and query parameters:

62.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| resourceUri | Required Path to the resource. You can prefix with: classpath, file, http, ref, or bean. classpath, file and http loads the resource using these protocols (classpath is default). ref will lookup the resource in the registry. bean will call a method on a bean to be used as the resource. For bean you can specify the method name after dot, eg bean:myBean.myMethod. | | String |

62.2.2. Query Parameters (9 parameters):

| Name | Description | Default | Type |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| allowContextMapAll (producer) | Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API. | false | boolean |
| allowTemplateFromHeader (producer) | Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution. | false | boolean |
| contentCache (producer) | Sets whether to use resource content cache or not | false | boolean |
| encoding (producer) | Define the encoding of the body | | String |
| extension (producer) | Define the file extension of the template | | String |
| themeFolder (producer) | Define the themes folder to scan | | String |
| themeLayer (producer) | Define the theme layer to elaborate | | String |

| Name | Description | Default | Type |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| themeSubfolder (producer) | Define the themes subfolder to scan | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

62.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.chunk.enabled | Enable chunk component | true | Boolean |
| camel.component.chunk.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

Chunk component will look for a specific template in *themes* folder with extensions *.html* or *.xml*. If you need to specify a different folder or extensions, you will need to use the specific options listed above.

62.4. CHUNK CONTEXT

Camel will provide exchange information in the Chunk context (just a **Map**). The **Exchange** is transferred as:

| key | value |
|----------------------------|---------------------------------|
| exchange | The Exchange itself. |
| exchange.properties | The Exchange properties. |
| headers | The headers of the In message. |
| camelContext | The Camel Context. |
| request | The In message. |

| key | value |
|-----------------|------------------------------------------------------------|
| body | The In message body. |
| response | The Out message (only for InOut message exchange pattern). |

62.5. DYNAMIC TEMPLATES

Camel provides two headers by which you can define a different resource location for a template or the template content itself. If any of these headers is set then Camel uses this over the endpoint configured resource. This allows you to provide a dynamic template at runtime.

| Header | Type | Description | Support Version |
|-------------------------------------------|--------|----------------------------------------------------------------------------|-----------------|
| ChunkConstants.C HUNK_RESOURCE _URI | String | A URI for the template resource to use instead of the endpoint configured. | |
| ChunkConstants.C HUNK_TEMPLATE | String | The template to use instead of the endpoint configured. | |

62.6. SAMPLES

For example you could use something like:

```
from("activemq:My.Queue").
to("chunk:template");
```

To use a Chunk template to formulate a response for a message for InOut message exchanges (where there is a **JMSReplyTo** header).

If you want to use `InOnly` and consume the message and send it to another destination you could use:

```
from("activemq:My.Queue").
to("chunk:template").
to("activemq:Another.Queue");
```

It's possible to specify what template the component should use dynamically via a header, so for example:

```
from("direct:in").
setHeader(ChunkConstants.CHUNK_RESOURCE_URI).constant("template").
to("chunk:dummy?allowTemplateFromHeader=true");
```

WARNING

Enabling the **allowTemplateFromHeader** option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.

An example of Chunk component options use:

```
from("direct:in").
to("chunk:file_example?themeFolder=template&themeSubfolder=subfolder&extension=chunk");
```

In this example Chunk component will look for the file *file_example.chunk* in the folder *template/subfolder*.

62.7. THE EMAIL SAMPLE

In this sample we want to use Chunk templating for an order confirmation email. The email template is laid out in Chunk as:

```
Dear {$headers.lastName}, {$headers.firstName}

Thanks for the order of {$headers.item}.

Regards Camel Riders Bookstore
{$body}
```

62.8. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)

- Getting Started

CHAPTER 63. CLASS COMPONENT

Available as of Camel version 2.4

The **class**: component binds beans to Camel message exchanges. It works in the same way as the [Bean](#) component but instead of looking up beans from a Registry it creates the bean based on the class name.

63.1. URI FORMAT

```
class:className[?options]
```

Where **className** is the fully qualified class name to create and use as bean.

63.2. OPTIONS

The Class component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| cache (advanced) | If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope. | | Boolean |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Class endpoint is configured using URI syntax:

```
class:beanName
```

with the following path and query parameters:

63.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------|-----------------------------------------------------|---------|--------|
| beanName | Required Sets the name of the bean to invoke | | String |

63.2.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| method (producer) | Sets the name of the method to invoke on the bean | | String |
| cache (advanced) | If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope. | | Boolean |
| multiParameterArray (advanced) | Deprecated How to treat the parameters which are passed from the message body; if it is true, the message body should be an array of parameters. Note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use. | false | boolean |
| parameters (advanced) | Used for configuring additional properties on the bean | | Map |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

63.3. USING

You simply use the **class** component just as the [Bean](#) component but by specifying the fully qualified classname instead.

For example to use the **MyFooBean** you have to do as follows:

```
from("direct:start").to("class:org.apache.camel.component.bean.MyFooBean").to("mock:result");
```

You can also specify which method to invoke on the **MyFooBean**, for example **hello**:

```
from("direct:start").to("class:org.apache.camel.component.bean.MyFooBean?method=hello").to("mock:result");
```

63.4. SETTING PROPERTIES ON THE CREATED INSTANCE

In the endpoint uri you can specify properties to set on the created instance, for example if it has a **setPrefix** method:

```
// Camel 2.17 onwards
from("direct:start")
    .to("class:org.apache.camel.component.bean.MyPrefixBean?bean.prefix=Bye")
    .to("mock:result");

// Camel 2.16 and older
```

```
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?prefix=Bye")
  .to("mock:result");
```

And you can also use the **#** syntax to refer to properties to be looked up in the Registry.

```
// Camel 2.17 onwards
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?bean.cool=#foo")
  .to("mock:result");

// Camel 2.16 and older
from("direct:start")
  .to("class:org.apache.camel.component.bean.MyPrefixBean?cool=#foo")
  .to("mock:result");
```

Which will lookup a bean from the Registry with the id **foo** and invoke the **setCool** method on the created instance of the **MyPrefixBean** class.

TIP:See more details at the [Bean](#) component as the **class** component works in much the same way.

63.5. SEE ALSO

- [Bean Integration](#)

CHAPTER 64. CMIS COMPONENT

Available as of Camel version 2.11

The cmis component uses the [Apache Chemistry](#) client API and allows you to add/read nodes to/from a CMIS compliant content repositories.

64.1. URI FORMAT

```
cmis://cmisServerUrl[?options]
```

You can append query options to the URI in the following format, ?options=value&option2=value&...

64.2. CMIS OPTIONS

The CMIS component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| sessionFacadeFactory (common) | To use a custom CMISSessionFacadeFactory to create the CMISSessionFacade instances | | CMISSessionFacade Factory |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The CMIS endpoint is configured using URI syntax:

```
cmis:cmsUrl
```

with the following path and query parameters:

64.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------|-------------------------------------|---------|--------|
| cmsUrl | Required URL to the cmis repository | | String |

64.2.2. Query Parameters (13 parameters):

| Name | Description | Default | Type |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------------|
| pageSize (common) | Number of nodes to retrieve per page | 100 | int |
| readContent (common) | If set to true, the content of document node will be retrieved in addition to the properties | false | boolean |
| readCount (common) | Max number of nodes to read | | int |
| repositoryId (common) | The Id of the repository to use. If not specified the first available repository is used | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| query (consumer) | The cmis query to execute against the repository. If not specified, the consumer will retrieve every node from the content repository by iterating the content tree recursively | | String |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| queryMode (producer) | If true, will execute the cmis query from the message body and return result, otherwise will create a node in the cmis repository | false | boolean |
| sessionFacadeFactory (advanced) | To use a custom <code>CMISessionFacadeFactory</code> to create the <code>CMISessionFacade</code> instances | | <code>CMISessionFacadeFactory</code> |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

| Name | Description | Default | Type |
|-------------------------------|----------------------------------|---------|--------|
| password (security) | Password for the cmis repository | | String |
| username (security) | Username for the cmis repository | | String |

64.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.cmis.enabled | Enable cmis component | true | Boolean |
| camel.component.cmis.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| camel.component.cmis.session-facade-factory | To use a custom CMISSessionFacadeFactory to create the CMISSessionFacade instances. The option is a <code>org.apache.camel.component.cmis.CMISSessionFacadeFactory</code> type. | | String |

64.4. USAGE

64.4.1. Message headers evaluated by the producer

| Header | Default Value | Description |
|-----------------------------------|---------------|----------------------------------------------------------------------------------------------------|
| Camel CMIS FolderPath | / | The current folder to use during the execution. If not specified will use the root folder |
| Camel CMIS RetrieveContent | false | In queryMode this header will force the producer to retrieve the content of document nodes. |

| Header | Default Value | Description |
|----------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------|
| Camel CMIS ReadSize | 0 | Max number of nodes to read. |
| cmis:path | null | If CamelCMISFolderPath is not set, will try to find out the path of the node from this cmis property and it is name |
| cmis:name | null | If CamelCMISFolderPath is not set, will try to find out the path of the node from this cmis property and it is path |
| cmis:objectTypeId | null | The type of the node |
| cmis:contentType | null | The mimetype to set for a document |

64.4.2. Message headers set during querying Producer operation

| Header | Type | Description |
|--------------------------------|----------------|------------------------------------------|
| Camel CMIS Result Count | Integer | Number of nodes returned from the query. |

The message body will contain a list of maps, where each entry in the map is cmis property and its value. If **CamelCMISRetrieveContent** header is set to true, one additional entry in the map with key **CamelCMISContent** will contain **InputStream** of the document type of nodes.

64.5. DEPENDENCIES

Maven users will need to add the following dependency to their pom.xml.

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cmis</artifactId>
```

```
<version>${camel-version}</version>  
</dependency>
```

where `${camel-version}` must be replaced by the actual version of Camel (2.11 or higher).

64.6. SEE ALSO

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 65. CM SMS GATEWAY COMPONENT

Available as of Camel version 2.18

Camel-Cm-Sms is an [Apache Camel](#) component for the [CM SMS Gateway] (<https://www.cmtelecom.com>).

It allows to integrate [CM SMS API](#) in an application as a camel component.

You must have a valid account. More information are available at [CM Telecom](#).

```
cm-sms://sgw01.cm.nl/gateway.ashx?
defaultFrom=DefaultSender&defaultMaxNumberOfParts=8&productToken=xxxxx
```

Maven users will need to add the following dependency to their pom.xml for this component:

```
---
<dependency>
<groupId>org.apache.camel</groupId>
<artifactId>camel-cm-sms</artifactId>
<version>x.x.x</version>
<!-- use the same version as your Camel core version -->
</dependency>
---
```

65.1. OPTIONS

The CM SMS Gateway component has no options.

The CM SMS Gateway endpoint is configured using URI syntax:

```
cm-sms:host
```

with the following path and query parameters:

65.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|----------------------------------------|---------|--------|
| host | Required SMS Provider HOST with scheme | | String |

65.1.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|---------------------------|---------------------------------------------------------------|---------|---------|
| defaultFrom (producer) | This is the sender name. The maximum length is 11 characters. | | String) |

| Name | Description | Default | Type |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| defaultMaxNumberOfParts (producer) | If it is a multipart message forces the max number. Message can be truncated. Technically the gateway will first check if a message is larger than 160 characters, if so, the message will be cut into multiple 153 characters parts limited by these parameters. | 8 | Max(8L)::Int) |
| productToken (producer) | Required The unique token to use | | String) |
| testConnectionOnStartup (producer) | Whether to test the connection to the SMS Gateway on startup | false | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

65.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.cm-sms.enabled | Enable cm-sms component | true | Boolean |
| camel.component.cm-sms.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

65.3. SAMPLE

You can try [this project](#) to see how camel-cm-sms can be integrated in a camel route.

CHAPTER 66. COAP COMPONENT

Available as of Camel version 2.16

Camel-CoAP is an [Apache Camel](#) component that allows you to work with CoAP, a lightweight REST-type protocol for machine-to-machine operation. [CoAP](#), Constrained Application Protocol is a specialized web transfer protocol for use with constrained nodes and constrained networks and it is based on RFC 7252.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-coap</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

66.1. OPTIONS

The CoAP component has no options.

The CoAP endpoint is configured using URI syntax:

```
coap:uri
```

with the following path and query parameters:

66.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|-------------------------------|---------|------|
| uri | The URI for the CoAP endpoint | | URI |

66.1.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| coapMethodRestrict (consumer) | Comma separated list of methods that the CoAP consumer will bind to. The default is to bind to all methods (DELETE, GET, POST, PUT). | | String |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

66.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.coap.enabled | Enable coap component | true | Boolean |
| camel.component.coap.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

66.3. MESSAGE HEADERS

| Name | Type | Description |
|--------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel Coap Method | String | The request method that the CoAP producer should use when calling the target CoAP server URI. Valid options are DELETE, GET, PING, POST & PUT. |

| Name | Type | Description |
|------------------------------|---------------|-------------------------------------------------------------------------------------------------------|
| CamelCoapResponseCode | String | The CoAP response code sent by the external server. See RFC 7252 for details of what each code means. |
| CamelCoapUri | String | The URI of a CoAP server to call. Will override any existing URI configured directly on the endpoint. |

66.3.1. Configuring the CoAP producer request method

The following rules determine which request method the CoAP producer will use to invoke the target URI:

1. The value of the **CamelCoapMethod** header
2. **GET** if a query string is provided on the target CoAP server URI.
3. **POST** if the message exchange body is not null.
4. **GET** otherwise.

CHAPTER 67. CONSTANT LANGUAGE

Available as of Camel version 1.5

The Constant Expression Language is really just a way to specify constant strings as a type of expression.

NOTE

This is a fixed constant value that is only set once during starting up the route, do not use this if you want dynamic values during routing.

67.1. CONSTANT OPTIONS

The Constant language supports 1 options, which are listed below.

| Name | Default | Java Type | Description |
|------|---------|-----------|--------------------------------------------------------------------------------------|
| trim | true | Boolean | Whether to trim the value to remove leading and trailing whitespaces and line breaks |

67.2. EXAMPLE USAGE

The `setHeader` element of the Spring DSL can utilize a constant expression like:

```
<route>
  <from uri="seda:a"/>
  <setHeader headerName="theHeader">
    <constant>the value</constant>
  </setHeader>
  <to uri="mock:b"/>
</route>
```

in this case, the Message coming from the `seda:a` Endpoint will have 'theHeader' header set to the constant value 'the value'.

And the same example using Java DSL:

```
from("seda:a")
  .setHeader("theHeader", constant("the value"))
  .to("mock:b");
```

67.3. DEPENDENCIES

The Constant language is part of `camel-core`.

CHAPTER 68. COMETD COMPONENT

Available as of Camel version 2.0

The **cometd**: component is a transport for working with the [jetty](#) implementation of the [cometd/bayeux protocol](#).

Using this component in combination with the dojo toolkit library it's possible to push Camel messages directly into the browser using an AJAX based mechanism.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cometd</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

68.1. URI FORMAT

```
cometd://host:port/channelName[?options]
```

The **channelName** represents a topic that can be subscribed to by the Camel endpoints.

68.2. EXAMPLES

```
cometd://localhost:8080/service/mychannel
cometds://localhost:8443/service/mychannel
```

where **cometds**: represents an SSL configured endpoint.

68.3. OPTIONS

The CometD component supports 8 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------|--------------------------------------------------------------------|---------|----------------|
| sslKeyPassword (security) | The password for the keystore when using SSL. | | String |
| sslPassword (security) | The password when using SSL. | | String |
| sslKeystore (security) | The path to the keystore. | | String |
| securityPolicy (security) | To use a custom configured SecurityPolicy to control authorization | | SecurityPolicy |

| Name | Description | Default | Type |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| extensions (common) | To use a list of custom BayeuxServer.Extension that allows modifying incoming and outgoing requests. | | List |
| sslContextParameters (security) | To configure security using SSLContextParameters | | SSLContextParameters |
| useGlobalSslContextParameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The CometD endpoint is configured using URI syntax:

```
cometd:host:port/channelName
```

with the following path and query parameters:

68.3.1. Path Parameters (3 parameters):

| Name | Description | Default | Type |
|--------------------|------------------------------------------------------------------------------------------------------|---------|--------|
| host | Required Hostname | | String |
| port | Required Host port number | | int |
| channelName | Required The channelName represents a topic that can be subscribed to by the Camel endpoints. | | String |

68.3.2. Query Parameters (16 parameters):

| Name | Description | Default | Type |
|-----------------------------------|------------------------------------------------------------------------------|---------|--------|
| allowedOrigins (common) | The origins domain that support to cross, if the crossOriginFilterOn is true | * | String |

| Name | Description | Default | Type |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------|
| baseResource (common) | The root directory for the web resources or classpath. Use the protocol file: or classpath: depending if you want that the component loads the resource from file system or classpath. Classpath is required for OSGI deployment where the resources are packaged in the jar | | String |
| crossOriginFilterOn (common) | If true, the server will support for cross-domain filtering | false | boolean |
| filterPath (common) | The filterPath will be used by the CrossOriginFilter, if the crossOriginFilterOn is true | | String |
| interval (common) | The client side poll timeout in milliseconds. How long a client will wait between reconnects | | int |
| jsonCommented (common) | If true, the server will accept JSON wrapped in a comment and will generate JSON wrapped in a comment. This is a defence against Ajax Hijacking. | true | boolean |
| logLevel (common) | Logging level. 0=none, 1=info, 2=debug. | 1 | int |
| maxInterval (common) | The max client side poll timeout in milliseconds. A client will be removed if a connection is not received in this time. | 30000 | int |
| multiFrameInterval (common) | The client side poll timeout, if multiple connections are detected from the same browser. | 1500 | int |
| timeout (common) | The server side poll timeout in milliseconds. This is how long the server will hold a reconnect request before responding. | 24000 0 | int |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| sessionHeadersEnabled (consumer) | Whether to include the server session headers in the Camel message when creating a Camel Message for incoming requests. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| disconnectLocalSession (producer) | Whether to disconnect local sessions after publishing a message to its channel. Disconnecting local session is needed as they are not swept by default by CometD, and therefore you can run out of memory. | false | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

68.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.cometd.enabled | Enable cometd component | true | Boolean |
| camel.component.cometd.extensions | To use a list of custom <code>BayeuxServer.Extension</code> that allows modifying incoming and outgoing requests. | | List |
| camel.component.cometd.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| camel.component.cometd.security-policy | To use a custom configured <code>SecurityPolicy</code> to control authorization. The option is a <code>org.cometd.bayeux.server.SecurityPolicy</code> type. | | String |
| camel.component.cometd.ssl-context-parameters | To configure security using <code>SSLContextParameters</code> . The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|------------------------------------------------|---------|---------|
| <code>camel.component.cometd.ssl-key-password</code> | The password for the keystore when using SSL. | | String |
| <code>camel.component.cometd.ssl-keystore</code> | The path to the keystore. | | String |
| <code>camel.component.cometd.ssl-password</code> | The password when using SSL. | | String |
| <code>camel.component.cometd.use-global-ssl-context-parameters</code> | Enable usage of global SSL context parameters. | false | Boolean |

You can append query options to the URI in the following format, **?option=value&option=value&...**

Here is some examples on How to pass the parameters

For file (for webapp resources located in the Web Application directory --> `cometd://localhost:8080?resourceBase=file./webapp`)

For classpath (when by example the web resources are packaged inside the webapp folder --> `cometd://localhost:8080?resourceBase=classpath:webapp`)

68.5. AUTHENTICATION

Available as of Camel 2.8

You can configure custom **SecurityPolicy** and **Extension's to the `CometdComponent`** which allows you to use authentication as [documented here](#)

68.6. SETTING UP SSL FOR COMETD COMPONENT

68.6.1. Using the JSSE Configuration Utility

As of Camel 2.9, the Cometd component supports SSL/TLS configuration through the [Camel JSSE Configuration Utility](#). This utility greatly decreases the amount of component specific code you need to write and is configurable at the endpoint and component levels. The following examples demonstrate how to use the utility with the Cometd component. You need to configure SSL on the CometdComponent.

Programmatic configuration of the component

```
KeyStoreParameters ksp = new KeyStoreParameters();
```

```

ksp.setResource("/users/home/server/keystore.jks");
ksp.setPassword("keystorePassword");

KeyManagersParameters kmp = new KeyManagersParameters();
kmp.setKeyStore(ksp);
kmp.setKeyPassword("keyPassword");

TrustManagersParameters tmp = new TrustManagersParameters();
tmp.setKeyStore(ksp);

SSLContextParameters scp = new SSLContextParameters();
scp.setKeyManagers(kmp);
scp.setTrustManagers(tmp);

CometdComponent commetdComponent = getContext().getComponent("cometds",
CometdComponent.class);
commetdComponent.setSslContextParameters(scp);

```

Spring DSL based configuration of endpoint

```

...
<camel:sslContextParameters
  id="sslContextParameters">
  <camel:keyManagers
    keyPassword="keyPassword">
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  <camel:trustManagers>
    <camel:keyStore
      resource="/users/home/server/keystore.jks"
      password="keystorePassword"/>
    </camel:keyManagers>
  </camel:sslContextParameters>...

<bean id="cometd" class="org.apache.camel.component.cometd.CometdComponent">
  <property name="sslContextParameters" ref="sslContextParameters"/>
</bean>

...
<to uri="cometds://127.0.0.1:443/service/test?baseResource=file:./target/test-
classes/webapp&timeout=240000&interval=0&maxInterval=30000&multiFrameInterval=1500&jsonCom
mented=true&logLevel=2"/>...

```

68.7. SEE ALSO

- [Configuring Camel](#)
- [Component](#)
- [Endpoint](#)
- [Getting Started](#)

CHAPTER 69. CONSUL COMPONENT

Available as of Camel version 2.18

The **Consul** component is a component for integrating your application with Consul.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-consul</artifactId>
  <version>${camel-version}</version>
</dependency>
```

69.1. URI FORMAT

```
consul://domain?[options]
```

You can append query options to the URI in the following format:

```
?option=value&option=value&...
```

69.2. OPTIONS

The Consul component supports 9 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------|--------------------------------------------------------------------------------------|---------|----------------------|
| url (common) | The Consul agent URL | | String |
| datacenter (common) | The data center | | String |
| sslContextParameters (common) | SSL configuration using an org.apache.camel.util.jsse.SSLContextParameters instance. | | SSLContextParameters |
| useGlobalSslContextParameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| aclToken (common) | Sets the ACL token to be used with Consul | | String |
| userName (common) | Sets the username to be used for basic authentication | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| password (common) | Sets the password to be used for basic authentication | | String |
| configuration (advanced) | Sets the common configuration shared among endpoints | | ConsulConfigurati on |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Consul endpoint is configured using URI syntax:

```
consul:apiEndpoint
```

with the following path and query parameters:

69.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|----------------------------------|---------|--------|
| apiEndpoint | Required The API endpoint | | String |

69.2.2. Query Parameters (4 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

69.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 90 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------------|-------------------------------------------|---------|-----------------|
| camel.component.consul.acl-token | Sets the ACL token to be used with Consul | | String |
| camel.component.consul.cluster.service.acl-token | | | String |
| camel.component.consul.cluster.service.attributes | Custom service attributes. | | Map |
| camel.component.consul.cluster.service.block-seconds | | | Integer |
| camel.component.consul.cluster.service.connect-timeout-millis | | | Long |
| camel.component.consul.cluster.service.consistency-mode | | | ConsistencyMode |
| camel.component.consul.cluster.service.datacenter | | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------|---------|------------|
| <code>camel.component.consul.cluster.service.enabled</code> | Sets if the consul cluster service should be enabled or not, default is false. | false | Boolean |
| <code>camel.component.consul.cluster.service.first-index</code> | | | BigInteger |
| <code>camel.component.consul.cluster.service.id</code> | Cluster Service ID | | String |
| <code>camel.component.consul.cluster.service.near-node</code> | | | String |
| <code>camel.component.consul.cluster.service.node-meta</code> | | | List |
| <code>camel.component.consul.cluster.service.order</code> | Service lookup order/priority. | | Integer |
| <code>camel.component.consul.cluster.service.password</code> | | | String |
| <code>camel.component.consul.cluster.service.ping-instance</code> | | | Boolean |
| <code>camel.component.consul.cluster.service.read-timeout-millis</code> | | | Long |
| <code>camel.component.consul.cluster.service.recursive</code> | | | Boolean |
| <code>camel.component.consul.cluster.service.root-path</code> | | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------|------------------------------------------------------------|---------|----------------------|
| camel.component.consul.cluster.service.session-lock-delay | | | Integer |
| camel.component.consul.cluster.service.session-refresh-interval | | | Integer |
| camel.component.consul.cluster.service.session-ttl | | | Integer |
| camel.component.consul.cluster.service.ssl-context-parameters | | | SSLContextParameters |
| camel.component.consul.cluster.service.tags | | | Set |
| camel.component.consul.cluster.service.url | | | String |
| camel.component.consul.cluster.service.user-name | | | String |
| camel.component.consul.cluster.service.write-timeout-millis | | | Long |
| camel.component.consul.configuration.acl-token | Sets the ACL token to be used with Consul | | String |
| camel.component.consul.configuration.action | The default action. Can be overridden by CamelConsulAction | | String |
| camel.component.consul.configuration.block-seconds | The second to wait for a watch event, default 10 seconds | | Integer |

| Name | Description | Default | Type |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------|---------|-----------------|
| camel.component.consul.configuration.connect-timeout-millis | Connect timeout for OkHttpClient | | Long |
| camel.component.consul.configuration.consistency-mode | The consistencyMode used for queries, default ConsistencyMode.DEFAULT | | ConsistencyMode |
| camel.component.consul.configuration.consul-client | Reference to a com.orbitz.consul.Consul in the registry. | | Consul |
| camel.component.consul.configuration.datacenter | The data center | | String |
| camel.component.consul.configuration.first-index | The first index for watch for, default 0 | | BigInteger |
| camel.component.consul.configuration.key | The default key. Can be overridden by CamelConsulKey | | String |
| camel.component.consul.configuration.near-node | The near node to use for queries. | | String |
| camel.component.consul.configuration.node-meta | The note meta-data to use for queries. | | List |
| camel.component.consul.configuration.password | Sets the password to be used for basic authentication | | String |
| camel.component.consul.configuration.ping-instance | Configure if the AgentClient should attempt a ping before returning the Consul instance | | Boolean |
| camel.component.consul.configuration.read-timeout-millis | Read timeout for OkHttpClient | | Long |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|---------|----------------------|
| <code>camel.component.consul.configuration.recursive</code> | Recursively watch, default false | | Boolean |
| <code>camel.component.consul.configuration.ssl-context-parameters</code> | SSL configuration using an <code>org.apache.camel.util.jsse.SSLContextParameters</code> instance. | | SSLContextParameters |
| <code>camel.component.consul.configuration.tags</code> | Set tags. You can separate multiple tags by comma. | | Set |
| <code>camel.component.consul.configuration.url</code> | The Consul agent URL | | String |
| <code>camel.component.consul.configuration.user-name</code> | Sets the username to be used for basic authentication | | String |
| <code>camel.component.consul.configuration.value-as-string</code> | Default to transform values retrieved from Consul i.e. on KV endpoint to string. | | Boolean |
| <code>camel.component.consul.configuration.write-timeout-millis</code> | Write timeout for OkHttpClient | | Long |
| <code>camel.component.consul.datacenter</code> | The data center | | String |
| <code>camel.component.consul.enabled</code> | Enable consul component | true | Boolean |
| <code>camel.component.consul.health.check.repository.checks</code> | Define the checks to include. | | List |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.consul.health.check.repository.configurations</code> | Health check configurations. | | Map |
| <code>camel.component.consul.health.check.repository.enabled</code> | | | Boolean |
| <code>camel.component.consul.health.check.repository.failure-threshold</code> | | | Integer |
| <code>camel.component.consul.health.check.repository.interval</code> | | | String |
| <code>camel.component.consul.password</code> | Sets the password to be used for basic authentication | | String |
| <code>camel.component.consul.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.consul.service-registry.acl-token</code> | | | String |
| <code>camel.component.consul.service-registry.attributes</code> | Custom service attributes. | | Map |
| <code>camel.component.consul.service-registry.block-seconds</code> | | | Integer |
| <code>camel.component.consul.service-registry.check-interval</code> | | | Integer |

| Name | Description | Default | Type |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------|---------|-----------------|
| camel.component.consul.service-registry.check-ttl | | | Integer |
| camel.component.consul.service-registry.connect-timeout-millis | | | Long |
| camel.component.consul.service-registry.consistency-mode | | | ConsistencyMode |
| camel.component.consul.service-registry.datacenter | | | String |
| camel.component.consul.service-registry.deregister-after | | | Integer |
| camel.component.consul.service-registry.deregister-services-on-stop | | | Boolean |
| camel.component.consul.service-registry.enabled | Sets if the consul service registry should be enabled or not, default is false. | false | Boolean |
| camel.component.consul.service-registry.first-index | | | BigInteger |
| camel.component.consul.service-registry.id | Service Registry ID | | String |
| camel.component.consul.service-registry.near-node | | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------|--------------------------------|---------|----------------------|
| camel.component.consul.service-registry.node-meta | | | List |
| camel.component.consul.service-registry.order | Service lookup order/priority. | | Integer |
| camel.component.consul.service-registry.override-service-host | | | Boolean |
| camel.component.consul.service-registry.password | | | String |
| camel.component.consul.service-registry.ping-instance | | | Boolean |
| camel.component.consul.service-registry.read-timeout-millis | | | Long |
| camel.component.consul.service-registry.recursive | | | Boolean |
| camel.component.consul.service-registry.service-host | | | String |
| camel.component.consul.service-registry.ssl-context-parameters | | | SSLContextParameters |
| camel.component.consul.service-registry.tags | | | Set |

| Name | Description | Default | Type |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.consul.service-registry.url | | | String |
| camel.component.consul.service-registry.user-name | | | String |
| camel.component.consul.service-registry.write-timeout-millis | | | Long |
| camel.component.consul.ssl-context-parameters | SSL configuration using an <code>org.apache.camel.util.jsse.SSLContextParameters</code> instance. The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type. | | String |
| camel.component.consul.url | The Consul agent URL | | String |
| camel.component.consul.use-global-ssl-context-parameters | Enable usage of global SSL context parameters. | false | Boolean |
| camel.component.consul.user-name | Sets the username to be used for basic authentication | | String |
| camel.component.consul.cluster.service.dc | | | String |
| camel.component.consul.configuration.dc | The data center @deprecated replaced by <code>{@link #setDatacenter(String)}()</code> | | String |
| camel.component.consul.service-registry.dc | | | String |

69.4. HEADERS

| Name | Type | Description |
|----------------------------|--------|---------------------------------------------------------------------|
| Camel Consul Action | String | The Producer action |
| Camel Consul Key | String | The Key on which the action should applied |
| Camel Consul EventId | String | The event id (consumer only) |
| Camel Consul EventName | String | The event name (consumer only) |
| Camel Consul EventLTime | Long | The event LTime |
| Camel Consul NodeFilter | String | The Node filter |
| Camel Consul TagFilter | String | The tag filter |
| Camel Consul SessionFilter | String | The session filter |
| Camel Consul Version | int | The data version |
| Camel Consul Flags | Long | Flags associated with a value |
| Camel Consul CreateIndex | Long | The internal index value that represents when the entry was created |

| Name | Type | Description |
|----------------------------|---------|--------------------------------------------------------------------------|
| Camel Consul LockIndex | Long | The number of times this key has successfully been acquired in a lock |
| Camel Consul ModifyIndex | Long | The last index that modified this key |
| Camel Consul Options | Object | Options associated to the request |
| Camel Consul Result | boolean | true if the response has a result |
| Camel Consul Session | String | The session id |
| Camel Consul ValueAsString | boolean | To transform values retrieved from Consul i.e. on KV endpoint to string. |

CHAPTER 70. CONTROL BUS COMPONENT

Available as of Camel version 2.11

The [Control Bus](#) from the EIP patterns allows for the integration system to be monitored and managed from within the framework.

Use a Control Bus to manage an enterprise integration system. The Control Bus uses the same messaging mechanism used by the application data, but uses separate channels to transmit data that is relevant to the management of components involved in the message flow.

In Camel you can manage and monitor using JMX, or by using a Java API from the **CamelContext**, or from the **org.apache.camel.api.management** package, or use the event notifier which has an example here.

From Camel 2.11 onwards we have introduced a new [ControlBus Component](#) that allows you to send messages to a control bus Endpoint that reacts accordingly.

70.1. CONTROLBUS COMPONENT

Available as of Camel 2.11

The **controlbus:** component provides easy management of Camel applications based on the [Control Bus](#) EIP pattern. For example, by sending a message to an Endpoint you can control the lifecycle of routes, or gather performance statistics.

```
controlbus:command[?options]
```

Where **command** can be any string to identify which type of command to use.

70.2. COMMANDS

| Command | Description |
|--------------|-------------------------------------------------------------------------|
| route | To control routes using the routeld and action parameter. |

| Command | Description |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| language | Allows you to specify a Language to use for evaluating the message body. If there is any result from the evaluation, then the result is put in the message body. |

70.3. OPTIONS

The Control Bus component has no options.

The Control Bus endpoint is configured using URI syntax:

```
controlbus:command:language
```

with the following path and query parameters:

70.3.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| command | Required Command can be either route or language | | String |
| language | Allows you to specify the name of a Language to use for evaluating the message body. If there is any result from the evaluation, then the result is put in the message body. | | Language |

70.3.2. Query Parameters (6 parameters):

| Name | Description | Default | Type |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| action (producer) | To denote an action that can be either: start, stop, or status. To either start or stop a route, or to get the status of the route as output in the message body. You can use suspend and resume from Camel 2.11.1 onwards to either suspend or resume a route. And from Camel 2.11.1 onwards you can use stats to get performance statistics returned in XML format; the routeld option can be used to define which route to get the performance stats for, if routeld is not defined, then you get statistics for the entire CamelContext. The restart action will restart the route. | | String |

| Name | Description | Default | Type |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| async (producer) | Whether to execute the control bus task asynchronously. Important: If this option is enabled, then any result from the task is not set on the Exchange. This is only possible if executing tasks synchronously. | false | boolean |
| loggingLevel (producer) | Logging level used for logging when task is done, or if any exceptions occurred during processing the task. | INFO | LoggingLevel |
| restartDelay (producer) | The delay in millis to use when restarting a route. | 1000 | int |
| routeId (producer) | To specify a route by its id. The special keyword <code>current</code> indicates the current route. | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

You can append query options to the URI in the following format, **?option=value&option=value&...**

70.4. USING ROUTE COMMAND

The route command allows you to do common tasks on a given route very easily, for example to start a route, you can send an empty message to this endpoint:

```
template.sendBody("controlbus:route?routeId=foo&action=start", null);
```

To get the status of the route, you can do:

```
String status = template.requestBody("controlbus:route?routeId=foo&action=status", null, String.class);
```

70.5. GETTING PERFORMANCE STATISTICS

Available as of Camel 2.11.1

This requires JMX to be enabled (is by default) then you can get the performance statics per route, or for the CamelContext. For example to get the statics for a route named `foo`, we can do:

```
String xml = template.requestBody("controlbus:route?routeId=foo&action=stats", null, String.class);
```

The returned statics is in XML format. Its the same data you can get from JMX with the **dumpRouteStatsAsXml** operation on the **ManagedRouteMBean**.

To get statics for the entire CamelContext you just omit the `routeId` parameter as shown below:

```
String xml = template.requestBody("controlbus:route?action=stats", null, String.class);
```

70.6. USING SIMPLE LANGUAGE

You can use the [Simple](#) language with the control bus, for example to stop a specific route, you can send a message to the "**controlbus:language:simple**" endpoint containing the following message:

```
template.sendBody("controlbus:language:simple", "${camelContext.stopRoute('myRoute')}");
```

As this is a void operation, no result is returned. However, if you want the route status you can do:

```
String status = template.requestBody("controlbus:language:simple",  
    "${camelContext.getRouteStatus('myRoute')}", String.class);
```

It's easier to use the **route** command to control lifecycle of routes. The **language** command allows you to execute a language script that has stronger powers such as [Groovy](#) or to some extend the [Simple](#) language.

For example to shutdown Camel itself you can do:

```
template.sendBody("controlbus:language:simple?async=true", "${camelContext.stop()}");
```

We use **async=true** to stop Camel asynchronously as otherwise we would be trying to stop Camel while it was in-flight processing the message we sent to the control bus component.

TIP

You can also use other languages such as [Groovy](#), etc.

CHAPTER 71. COUCHBASE COMPONENT

Available as of Camel version 2.19

The `couchbase:` component allows you to treat [CouchBase](#) instances as a producer or consumer of messages.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-couchbase</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

71.1. URI FORMAT

```
couchbase:url
```

71.2. OPTIONS

The Couchbase component has no options.

The Couchbase endpoint is configured using URI syntax:

```
couchbase:protocol:hostname:port
```

with the following path and query parameters:

71.2.1. Path Parameters (3 parameters):

| Name | Description | Default | Type |
|-----------------------|-------------------------------------|---------|--------|
| <code>protocol</code> | Required The protocol to use | | String |
| <code>hostname</code> | Required The hostname to use | | String |
| <code>port</code> | The port number to use | 8091 | int |

71.2.2. Query Parameters (47 parameters):

| Name | Description | Default | Type |
|------------------------------|-------------------|---------|--------|
| <code>bucket</code> (common) | The bucket to use | | String |

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------|
| key (common) | The key to use | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| consumerProcessedStrategy (consumer) | Define the consumer Processed strategy to use | none | String |
| descending (consumer) | Define if this operation is descending or not | false | boolean |
| designDocumentName (consumer) | The design document name to use | beer | String |
| limit (consumer) | The output limit to use | -1 | int |
| rangeEndKey (consumer) | Define a range for the end key | | String |
| rangeStartKey (consumer) | Define a range for the start key | | String |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| skip (consumer) | Define the skip to use | -1 | int |
| viewName (consumer) | The view name to use | brewery_beers | String |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| autoStartIdForInserts (producer) | Define if we want an autostart Id when we are doing an insert operation | false | boolean |
| operation (producer) | The operation to do | CCB_PUT | String |
| persistTo (producer) | Where to persist the data | 0 | int |
| producerRetryAttempts (producer) | Define the number of retry attempts | 2 | int |
| producerRetryPause (producer) | Define the retry pause between different attempts | 5000 | int |
| replicateTo (producer) | Where to replicate the data | 0 | int |
| startingIdForInsertsFrom (producer) | Define the starting Id where we are doing an insert operation | | long |
| additionalHosts (advanced) | The additional hosts | | String |
| maxReconnectDelay (advanced) | Define the max delay during a reconnection | 30000 | long |
| obsPollInterval (advanced) | Define the observation polling interval | 400 | long |
| obsTimeout (advanced) | Define the observation timeout | -1 | long |
| opQueueMaxBlockTime (advanced) | Define the max time an operation can be in queue blocked | 10000 | long |

| Name | Description | Default | Type |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| opTimeout (advanced) | Define the operation timeout | 2500 | long |
| readBufferSize (advanced) | Define the buffer size | 16384 | int |
| shouldOptimize (advanced) | Define if we want to use optimization or not where possible | false | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| timeoutExceptionThreshold (advanced) | Define the threshold for throwing a timeout Exception | 998 | int |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------------|
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumerScheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLISECONDS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |
| password (security) | The password to use | | String |
| username (security) | The username to use | | String |

71.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.couchbase.enabled | Enable couchbase component | true | Boolean |
| camel.component.couchbase.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 72. COUCHDB COMPONENT

Available as of Camel version 2.11

The **couchdb**: component allows you to treat [CouchDB](#) instances as a producer or consumer of messages. Using the lightweight LightCouch API, this camel component has the following features:

- As a consumer, monitors couch changesets for inserts, updates and deletes and publishes these as messages into camel routes.
- As a producer, can save, update, from Camel 2.18 delete (by using CouchDbMethod with DELETE value) documents and from Camel 2.22 get document by id (by using CouchDbMethod with GET value) into couch.
- Can support as many endpoints as required, eg for multiple databases across multiple instances.
- Ability to have events trigger for only deletes, only inserts/updates or all (default).
- Headers set for sequenceId, document revision, document id, and HTTP method type.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-couchdb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

72.1. URI FORMAT

```
couchdb:http://hostname[:port]/database?[options]
```

Where **hostname** is the hostname of the running couchdb instance. Port is optional and if not specified then defaults to 5984.

72.2. OPTIONS

The CouchDB component has no options.

The CouchDB endpoint is configured using URI syntax:

```
couchdb:protocol:hostname:port/database
```

with the following path and query parameters:

72.2.1. Path Parameters (4 parameters):

| Name | Description | Default | Type |
|------|-------------|---------|------|
| | | t | |

| Name | Description | Default | Type |
|-----------------|--------------------------------------------------------------------------|---------|--------|
| protocol | Required The protocol to use for communicating with the database. | | String |
| hostname | Required Hostname of the running couchdb instance | | String |
| port | Port number for the running couchdb instance | 5984 | int |
| database | Required Name of the database to use | | String |

72.2.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|---------|
| createDatabase (common) | Creates the database if it does not already exist | false | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| deletes (consumer) | Document deletes are published as events | true | boolean |
| heartbeat (consumer) | How often to send an empty message to keep socket alive in millis | 30000 | long |
| since (consumer) | Start tracking changes immediately after the given update sequence. The default, null, will start monitoring from the latest sequence. | | String |
| style (consumer) | Specifies how many revisions are returned in the changes array. The default, <code>main_only</code> , will only return the current winning revision; <code>all_docs</code> will return all leaf revisions (including conflicts and deleted former conflicts.) | <code>main_only</code> | String |
| updates (consumer) | Document inserts/updates are published as events | true | boolean |

| Name | Description | Default | Type |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| password (security) | Password for authenticated databases | | String |
| username (security) | Username in case of authenticated databases | | String |

72.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.couchdb.enabled | Enable couchdb component | true | Boolean |
| camel.component.couchdb.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

72.4. HEADERS

The following headers are set on exchanges during message transport.

| Property | Value |
|------------------------|----------------------------------------------------------------------|
| CouchDbDatabase | the database the message came from |
| CouchDbSeq | the couchdb changeset sequence number of the update / delete message |

| Property | Value |
|----------------------|-------------------------------|
| CouchDbId | the couchdb document id |
| CouchDbRev | the couchdb document revision |
| CouchDbMethod | the method (delete / update) |

Headers are set by the consumer once the message is received. The producer will also set the headers for downstream processors once the insert/update has taken place. Any headers set prior to the producer are ignored. That means for example, if you set CouchDbId as a header, it will not be used as the id for insertion, the id of the document will still be used.

72.5. MESSAGE BODY

The component will use the message body as the document to be inserted. If the body is an instance of String, then it will be marshalled into a GSON object before insert. This means that the string must be valid JSON or the insert / update will fail. If the body is an instance of a com.google.gson.JsonElement then it will be inserted as is. Otherwise the producer will throw an exception of unsupported body type.

72.6. SAMPLES

For example if you wish to consume all inserts, updates and deletes from a CouchDB instance running locally, on port 9999 then you could use the following:

```
from("couchdb:http://localhost:9999").process(someProcessor);
```

If you were only interested in deletes, then you could use the following

```
from("couchdb:http://localhost:9999?updates=false").process(someProcessor);
```

If you wanted to insert a message as a document, then the body of the exchange is used

```
from("someProducingEndpoint").process(someProcessor).to("couchdb:http://localhost:9999")
```

CHAPTER 73. CASSANDRA CQL COMPONENT

Available as of Camel version 2.15

[Apache Cassandra](#) is an open source NoSQL database designed to handle large amounts on commodity hardware. Like Amazon's DynamoDB, Cassandra has a peer-to-peer and master-less architecture to avoid single point of failure and garanty high availability. Like Google's BigTable, Cassandra data is structured using column families which can be accessed through the Thrift RPC API or a SQL-like API called CQL.

This component aims at integrating Cassandra 2.0+ using the CQL3 API (not the Thrift API). It's based on [Cassandra Java Driver](#) provided by DataStax.

Maven users will need to add the following dependency to their **pom.xml**:

pom.xml

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cassandraql</artifactId>
  <version>x.y.z</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

73.1. URI FORMAT

The endpoint can initiate the Cassandra connection or use an existing one.

| URI | Description |
|--------------------------------------|----------------------------------------------|
| cql:localhost/keyspace | Single host, default port, usual for testing |
| cql:host1,host2/keyspace | Multi host, default port |
| cql:host1,host2:9042/keyspace | Multi host, custom port |
| cql:host1,host2 | Default port and keyspace |
| cql:bean:sessionRef | Provided Session reference |
| cql:bean:clusterRef/keyspace | Provided Cluster reference |

To fine tune the Cassandra connection (SSL options, pooling options, load balancing policy, retry policy, reconnection policy...), create your own Cluster instance and give it to the Camel endpoint.

73.2. CASSANDRA OPTIONS

The Cassandra CQL component has no options.

The Cassandra CQL endpoint is configured using URI syntax:

■

`cql:beanRef:hosts:port/keyspace`

with the following path and query parameters:

73.2.1. Path Parameters (4 parameters):

| Name | Description | Default | Type |
|-----------------|----------------------------------------------------------------------------|---------|---------|
| beanRef | beanRef is defined using bean:id | | String |
| hosts | Hostname(s) cassandra server(s). Multiple hosts can be separated by comma. | | String |
| port | Port number of cassandra server(s) | | Integer |
| keyspace | Keyspace to use | | String |

73.2.2. Query Parameters (29 parameters):

| Name | Description | Default | Type |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| cluster (common) | To use the Cluster instance (you would normally not use this option) | | Cluster |
| clusterName (common) | Cluster name | | String |
| consistencyLevel (common) | Consistency level to use | | ConsistencyLevel |
| cql (common) | CQL query to perform. Can be overridden with the message header with key CamelCqlQuery. | | String |
| loadBalancingPolicy (common) | To use a specific LoadBalancingPolicy | | String |
| password (common) | Password for session authentication | | String |
| prepareStatements (common) | Whether to use PreparedStatements or regular Statements | true | boolean |
| resultSetConversionStrategy (common) | To use a custom class that implements logic for converting ResultSet into message body ALL, ONE, LIMIT_10, LIMIT_100... | | String |

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| session (common) | To use the Session instance (you would normally not use this option) | | Session |
| username (common) | Username for session authentication | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for <code>initialDelay</code> and <code>delay</code> options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details. | true | boolean |

73.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.cql.enabled</code> | Enable cql component | true | Boolean |
| <code>camel.component.cql.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

73.4. MESSAGES

73.4.1. Incoming Message

The Camel Cassandra endpoint expects a bunch of simple objects (**Object** or **Object[]** or **Collection<Object>**) which will be bound to the CQL statement as query parameters. If message body is null or empty, then CQL query will be executed without binding parameters.

Headers:

- **CamelCqlQuery** (optional, **String** or **RegularStatement**): CQL query either as a plain String or built using the **QueryBuilder**.

73.4.2. Outgoing Message

The Camel Cassandra endpoint produces one or many a Cassandra Row objects depending on the **resultSetConversionStrategy**:

- **List<Row>** if **resultSetConversionStrategy** is **ALL** or **LIMIT_[0-9]+**
- **Single`Row`** if **resultSetConversionStrategy** is **ONE**
- Anything else, if **resultSetConversionStrategy** is a custom implementation of the **ResultSetConversionStrategy**

73.5. REPOSITORIES

Cassandra can be used to store message keys or messages for the idempotent and aggregation EIP.

Cassandra might not be the best tool for queuing use cases yet, read [Cassandra anti-patterns queues and queue like datasets](#). It's advised to use LeveledCompaction and a small GC grace setting for these tables to allow tombstoned rows to be removed quickly.

73.6. IDEMPOTENT REPOSITORY

The **NamedCassandraIdempotentRepository** stores messages keys in a Cassandra table like this:

```
CAMEL_IDEMPOTENT.cql
```

```
CREATE TABLE CAMEL_IDEMPOTENT (
  NAME varchar, -- Repository name
  KEY varchar, -- Message key
  PRIMARY KEY (NAME, KEY)
) WITH compaction = {'class':'LeveledCompactionStrategy'}
AND gc_grace_seconds = 86400;
```

This repository implementation uses lightweight transactions (also known as Compare and Set) and requires Cassandra 2.0.7+.

Alternatively, the **CassandraIdempotentRepository** does not have a **NAME** column and can be extended to use a different data model.

| Option | Default | Description |
|------------------------------|-------------------------|--------------------------------------------------------------------------------------------|
| table | CAMEL_IDEMPOTENT | Table name |
| pkColumns | NAME, `KEY` | Primary key columns |
| name | | Repository name, value used for NAME column |
| ttl | | Key time to live |
| writeConsistencyLevel | | Consistency level used to insert/delete key: ANY, ONE, TWO, QUORUM, LOCAL_QUORUM... |
| readConsistencyLevel | | Consistency level used to read/check key: ONE, TWO, QUORUM, LOCAL_QUORUM... |

73.7. AGGREGATION REPOSITORY

The **NamedCassandraAggregationRepository** stores exchanges by correlation key in a Cassandra table like this:

CAMEL_AGGREGATION.cql

```
CREATE TABLE CAMEL_AGGREGATION (
  NAME varchar, -- Repository name
  KEY varchar, -- Correlation id
  EXCHANGE_ID varchar, -- Exchange id
  EXCHANGE blob, -- Serialized exchange
  PRIMARY KEY (NAME, KEY)
) WITH compaction = {'class':'LeveledCompactionStrategy'}
AND gc_grace_seconds = 86400;
```

Alternatively, the **CassandraAggregationRepository** does not have a **NAME** column and can be extended to use a different data model.

| Option | Default | Description |
|------------------------------|--------------------------|-------------------------------------------------------------------------------------------------|
| table | CAMEL_AGGREGATION | Table name |
| pkColumns | NAME,KEY | Primary key columns |
| exchangeIdColumn | EXCHANGE_ID | Exchange Id column |
| exchangeColumn | EXCHANGE | Exchange content column |
| name | | Repository name, value used for NAME column |
| ttl | | Exchange time to live |
| writeConsistencyLevel | | Consistency level used to insert/delete exchange: ANY, ONE, TWO, QUORUM, LOCAL_QUORUM... |
| readConsistencyLevel | | Consistency level used to read/check exchange: ONE, TWO, QUORUM, LOCAL_QUORUM... |

73.8. EXAMPLES

To insert something on a table you can use the following code:

```
String CQL = "insert into camel_user(login, first_name, last_name) values (?, ?, ?)";
from("direct:input")
    .to("cql://localhost/camel_ks?cql=" + CQL);
```

At this point you should be able to insert data by using a list as body

```
Arrays.asList("davsclaus", "Claus", "Ibsen")
```

The same approach can be used for updating or querying the table.

CHAPTER 74. CRYPTO (JCE) COMPONENT

Available as of Camel version 2.3

With Camel cryptographic endpoints and Java's Cryptographic extension it is easy to create Digital Signatures for Exchanges. Camel provides a pair of flexible endpoints which get used in concert to create a signature for an exchange in one part of the exchange's workflow and then verify the signature in a later part of the workflow.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

74.1. INTRODUCTION

Digital signatures make use of Asymmetric Cryptographic techniques to sign messages. From a (very) high level, the algorithms use pairs of complimentary keys with the special property that data encrypted with one key can only be decrypted with the other. One, the private key, is closely guarded and used to 'sign' the message while the other, public key, is shared around to anyone interested in verifying the signed messages. Messages are signed by using the private key to encrypting a digest of the message. This encrypted digest is transmitted along with the message. On the other side the verifier recalculates the message digest and uses the public key to decrypt the digest in the signature. If both digests match the verifier knows only the holder of the private key could have created the signature.

Camel uses the Signature service from the Java Cryptographic Extension to do all the heavy cryptographic lifting required to create exchange signatures. The following are some excellent resources for explaining the mechanics of Cryptography, Message digests and Digital Signatures and how to leverage them with the JCE.

- Bruce Schneier's Applied Cryptography
- Beginning Cryptography with Java by David Hook
- The ever insightful Wikipedia [Digital_signatures](#)

74.2. URI FORMAT

As mentioned Camel provides a pair of crypto endpoints to create and verify signatures

```
crypto:sign:name[?options]
crypto:verify:name[?options]
```

- **crypto:sign** creates the signature and stores it in the Header keyed by the constant **org.apache.camel.component.crypto.DigitalSignatureConstants.SIGNATURE**, i.e. "CamelDigitalSignature".
- **crypto:verify** will read in the contents of this header and do the verification calculation.

In order to correctly function, the sign and verify process needs a pair of keys to be shared, signing

requiring a **PrivateKey** and verifying a **PublicKey** (or a **Certificate** containing one). Using the JCE it is very simple to generate these key pairs but it is usually most secure to use a KeyStore to house and share your keys. The DSL is very flexible about how keys are supplied and provides a number of mechanisms.

Note a **crypto:sign** endpoint is typically defined in one route and the complimentary **crypto:verify** in another, though for simplicity in the examples they appear one after the other. It goes without saying that both signing and verifying should be configured identically.

74.3. OPTIONS

The Crypto (JCE) component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------|
| configuration (advanced) | To use the shared DigitalSignatureConfiguration as configuration | | DigitalSignature Configuration |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Crypto (JCE) endpoint is configured using URI syntax:

```
crypto:cryptoOperation:name
```

with the following path and query parameters:

74.3.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| cryptoOperation | Required Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. crypto:sign sets sign as the operation. | | CryptoOperation |
| name | Required The logical name of this operation. | | String |

74.3.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|--------------------------------|------------------------------------------------------------------------|-------------|--------|
| algorithm (producer) | Sets the JCE name of the Algorithm that should be used for the signer. | SHA1WithDSA | String |

| Name | Description | Default | Type |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|
| alias (producer) | Sets the alias used to query the KeyStore for keys and link java.security.cert.Certificate Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header org.apache.camel.component.crypto.DigitalSignature Constants#KEYSTORE_ALIAS | | String |
| certificateName (producer) | Sets the reference name for a PrivateKey that can be found in the registry. | | String |
| keystore (producer) | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | | KeyStore |
| keystoreName (producer) | Sets the reference name for a Keystore that can be found in the registry. | | String |
| privateKey (producer) | Set the PrivateKey that should be used to sign the exchange | | PrivateKey |
| privateKeyName (producer) | Sets the reference name for a PrivateKey that can be found in the registry. | | String |
| provider (producer) | Set the id of the security provider that provides the configured Signature algorithm. | | String |
| publicKeyName (producer) | references that should be resolved when the context changes | | String |
| secureRandomName (producer) | Sets the reference name for a SecureRandom that can be found in the registry. | | String |
| signatureHeader Name (producer) | Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature' | | String |
| bufferSize (advanced) | Set the size of the buffer used to read in the Exchange payload data. | 2048 | Integer |
| certificate (advanced) | Set the Certificate that should be used to verify the signature in the exchange based on its payload. | | Certificate |

| Name | Description | Default | Type |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| clearHeaders (advanced) | Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset. | true | boolean |
| keyStoreParameters (advanced) | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | | KeyStoreParameters |
| publicKey (advanced) | Set the PublicKey that should be used to verify the signature in the exchange. | | PublicKey |
| secureRandom (advanced) | Set the SecureRandom used to initialize the Signature service | | SecureRandom |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| password (security) | Sets the password used to access an aliased PrivateKey in the KeyStore. | | String |

74.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 33 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|--------|
| camel.component.crypto.configuration.algorithm | Sets the JCE name of the Algorithm that should be used for the signer. | SHA1WithDSA | String |
| camel.component.crypto.configuration.alias | Sets the alias used to query the KeyStore for keys and link java.security.cert.Certificate Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header org.apache.camel.component.crypto.DigitalSignature Constants #KEYSTORE_ALIAS | | String |

| Name | Description | Default | Type |
|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| <code>camel.component.crypto.configuration.buffer-size</code> | Set the size of the buffer used to read in the Exchange payload data. | 2048 | Integer |
| <code>camel.component.crypto.configuration.certificate</code> | Set the Certificate that should be used to verify the signature in the exchange based on its payload. | | Certificate |
| <code>camel.component.crypto.configuration.certificate-name</code> | Sets the reference name for a PrivateKey that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.clear-headers</code> | Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset. | true | Boolean |
| <code>camel.component.crypto.configuration.crypto-operation</code> | Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. crypto:sign sets sign as the operation. | | CryptoOperation |
| <code>camel.component.crypto.configuration.key-store-parameters</code> | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | | KeyStoreParameters |
| <code>camel.component.crypto.configuration.keystore</code> | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header CamelSignatureKeyStoreAlias. If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | | KeyStore |
| <code>camel.component.crypto.configuration.keystore-name</code> | Sets the reference name for a Keystore that can be found in the registry. | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| <code>camel.component.crypto.configuration.name</code> | The logical name of this operation. | | String |
| <code>camel.component.crypto.configuration.password</code> | Sets the password used to access an aliased PrivateKey in the KeyStore. | | Character[] |
| <code>camel.component.crypto.configuration.private-key</code> | Set the PrivateKey that should be used to sign the exchange | | PrivateKey |
| <code>camel.component.crypto.configuration.private-key-name</code> | Sets the reference name for a PrivateKey that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.provider</code> | Set the id of the security provider that provides the configured Signature algorithm. | | String |
| <code>camel.component.crypto.configuration.public-key</code> | Set the PublicKey that should be used to verify the signature in the exchange. | | PublicKey |
| <code>camel.component.crypto.configuration.public-key-name</code> | references that should be resolved when the context changes | | String |
| <code>camel.component.crypto.configuration.secure-random</code> | Set the SecureRandom used to initialize the Signature service | | SecureRandom |
| <code>camel.component.crypto.configuration.secure-random-name</code> | Sets the reference name for a SecureRandom that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.signature-header-name</code> | Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature' | | String |
| <code>camel.component.crypto.enabled</code> | Enable crypto component | true | Boolean |

| Name | Description | Default | Type |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------|
| <code>camel.component.crypto.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.dataformat.crypto.algorithm</code> | The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding. | DES/CBC/PKCS5Padding | String |
| <code>camel.dataformat.crypto.algorithm-parameter-ref</code> | A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a <code>java.security.spec.AlgorithmParameterSpec</code> type. | | String |
| <code>camel.dataformat.crypto.buffer-size</code> | The size of the buffer used in the signature process. | | Integer |
| <code>camel.dataformat.crypto.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.crypto.crypto-provider</code> | The name of the JCE Security Provider that should be used. | | String |
| <code>camel.dataformat.crypto.enabled</code> | Enable crypto dataformat | true | Boolean |
| <code>camel.dataformat.crypto.init-vector-ref</code> | Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher. | | String |
| <code>camel.dataformat.crypto.inline</code> | Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false. | false | Boolean |
| <code>camel.dataformat.crypto.key-ref</code> | Refers to the secret key to lookup from the register to use. | | String |
| <code>camel.dataformat.crypto.mac-algorithm</code> | The JCE algorithm name indicating the Message Authentication algorithm. | HmacSHA1 | String |

| Name | Description | Default | Type |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.crypto.should-append-h-m-a-c</code> | Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data. | false | Boolean |

74.5. USING

74.5.1. Raw keys

The most basic way to way to sign and verify an exchange is with a KeyPair as follows.

The same can be achieved with the [Spring XML Extensions](#) using references to keys

74.5.2. KeyStores and Aliases.

The JCE provides a very versatile keystore concept for housing pairs of private keys and certificates, keeping them encrypted and password protected. They can be retrieved by applying an alias to the retrieval APIs. There are a number of ways to get keys and Certificates into a keystore, most often this is done with the external 'keytool' application. [This](#) is a good example of using keytool to create a KeyStore with a self signed Cert and Private key.

The examples use a Keystore with a key and cert aliased by 'bob'. The password for the keystore and the key is 'letmein'

The following shows how to use a Keystore via the Fluent builders, it also shows how to load and initialize the keystore.

Again in Spring a ref is used to lookup an actual keystore instance.

74.5.3. Changing JCE Provider and Algorithm

Changing the Signature algorithm or the Security provider is a simple matter of specifying their names. You will need to also use Keys that are compatible with the algorithm you choose.

or

74.5.4. Changing the Signature Message Header

It may be desirable to change the message header used to store the signature. A different header name can be specified in the route definition as follows

or

74.5.5. Changing the buffersize

In case you need to update the size of the buffer...

or

74.5.6. Supplying Keys dynamically.

When using a Recipient list or similar EIP the recipient of an exchange can vary dynamically. Using the same key across all recipients may be neither feasible nor desirable. It would be useful to be able to specify signature keys dynamically on a per-exchange basis. The exchange could then be dynamically enriched with the key of its target recipient prior to signing. To facilitate this the signature mechanisms allow for keys to be supplied dynamically via the message headers below

- **Exchange.SIGNATURE_PRIVATE_KEY, "CamelSignaturePrivateKey"**
- **Exchange.SIGNATURE_PUBLIC_KEY_OR_CERT, "CamelSignaturePublicKeyOrCert"**

or

Even better would be to dynamically supply a keystore alias. Again the alias can be supplied in a message header

- **Exchange.KEYSTORE_ALIAS, "CamelSignatureKeyStoreAlias"**

or

The header would be set as follows

```
Exchange unsigned = getMandatoryEndpoint("direct:alias-sign").createExchange();
unsigned.getIn().setBody(payload);
unsigned.getIn().setHeader(DigitalSignatureConstants.KEYSTORE_ALIAS, "bob");
unsigned.getIn().setHeader(DigitalSignatureConstants.KEYSTORE_PASSWORD,
"letmein".toCharArray());
template.send("direct:alias-sign", unsigned);
Exchange signed = getMandatoryEndpoint("direct:alias-sign").createExchange();
signed.getIn().copyFrom(unsigned.getOut());
signed.getIn().setHeader(KEYSTORE_ALIAS, "bob");
template.send("direct:alias-verify", signed);
```

CHAPTER 75. CRYPTO CMS COMPONENT

Available as of Camel version 2.20

[Cryptographic Message Syntax \(CMS\)](#) is a well established standard for signing and encrypting messages. The Apache Crypto CMS component supports the following parts of this standard: * Content Type "Enveloped Data" with Key Transport (asymmetric key), * Content Type "Signed Data". You can create CMS Enveloped Data instances, decrypt CMS Enveloped Data instances, create CMS Signed Data instances, and validate CMS Signed Data instances.

The component uses the [Bouncy Castle](#) libraries `bcprov-jdk18on` and `bcpkix-jdk18on`.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto-cms</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

We recommend to register the Bouncy Castle security provider in your application before you call an endpoint of this component:

```
Security.addProvider(new BouncyCastleProvider());
```

If the Bouncy Castle security provider is not registered then the Crypto CMS component will register the provider.

75.1. OPTIONS

The Crypto CMS component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------------------------|
| signedDataVerifier Configuration (advanced) | To configure the shared <code>SignedDataVerifierConfiguration</code> , which determines the uri parameters for the verify operation. | | <code>SignedDataVerifier Configuration</code> |
| envelopedDataDecryptor Configuration (advanced) | To configure the shared <code>EnvelopedDataDecryptorConfiguration</code> , which determines the uri parameters for the decrypt operation. | | <code>EnvelopedDataDecryptor Configuration</code> |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Crypto CMS endpoint is configured using URI syntax:

`crypto-cms:cryptoOperation:name`

with the following path and query parameters:

75.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| <code>cryptoOperation</code> | Required Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. <code>crypto-cms:sign</code> sets <code>sign</code> as the operation. Possible values: <code>sign</code> , <code>verify</code> , <code>encrypt</code> , or <code>decrypt</code> . | | CryptoOperation |
| <code>name</code> | Required The name part in the URI can be chosen by the user to distinguish between different signer/verifier/encryptor/decryptor endpoints within the camel context. | | String |

75.1.2. Query Parameters (15 parameters):

| Name | Description | Default | Type |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| <code>keyStore</code> (common) | Keystore which contains signer private keys, verifier public keys, encryptor public keys, decryptor private keys depending on the operation. Use either this parameter or the parameter <code>'keyStoreParameters'</code> . | | KeyStore |
| <code>keyStoreParameters</code> (common) | Keystore containing signer private keys, verifier public keys, encryptor public keys, decryptor private keys depending on the operation. Use either this parameter or the parameter <code>'keystore'</code> . | | KeyStoreParameters |
| <code>synchronous</code> (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| <code>password</code> (decrypt) | Sets the password of the private keys. It is assumed that all private keys in the keystore have the same password. If not set then it is assumed that the password of the private keys is given by the keystore password given in the <code>KeyStoreParameters</code> . | | Char[] |
| <code>fromBase64</code> (decrypt_verify) | If true then the CMS message is base 64 encoded and must be decoded during the processing. Default value is false. | false | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| contentEncryptionAlgorithm (encrypt) | Encryption algorithm, for example DESede/CBC/PKCS5Padding. Further possible values: DESede/CBC/PKCS5Padding, AES/CBC/PKCS5Padding, Camellia/CBC/PKCS5Padding, CAST5/CBC/PKCS5Padding. | | String |
| originatorInformationProvider (encrypt) | Provider for the originator info. See https://tools.ietf.org/html/rfc5652#section-6.1 . The default value is null. | | OriginatorInformationProvider |
| recipient (encrypt) | Recipient Info: reference to a bean which implements the interface <code>org.apache.camel.component.crypto.cms.api.TransRecipientInfo</code> | | List |
| secretKeyLength (encrypt) | Key length for the secret symmetric key used for the content encryption. Only used if the specified content-encryption algorithm allows keys of different sizes. If <code>contentEncryptionAlgorithm=AES/CBC/PKCS5Padding</code> or <code>Camellia/CBC/PKCS5Padding</code> then 128; if <code>contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding</code> then 192, 128; if strong encryption is enabled then for <code>AES/CBC/PKCS5Padding</code> and <code>Camellia/CBC/PKCS5Padding</code> also the key lengths 192 and 256 are possible. | | int |
| unprotectedAttributesGeneratorProvider (encrypt) | Provider of the generator for the unprotected attributes. The default value is null which means no unprotected attribute is added to the Enveloped Data object. See https://tools.ietf.org/html/rfc5652#section-6.1 . | | AttributesGeneratorProvider |
| toBase64 (encrypt_sign) | Indicates whether the Signed Data or Enveloped Data instance shall be base 64 encoded. Default value is false. | false | Boolean |
| includeContent (sign) | Indicates whether the signed content should be included into the Signed Data instance. If false then a detached Signed Data instance is created in the header <code>CamelCryptoCmsSignedData</code> . | true | Boolean |

| Name | Description | Default | Type |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| signer (sign) | Signer information: reference to a bean which implements <code>org.apache.camel.component.crypto.cms.api.SignerInfo</code> | | List |
| signedDataHeaderBase64 (verify) | Indicates whether the value in the header <code>CamelCryptoCmsSignedData</code> is base64 encoded. Default value is false. Only relevant for detached signatures. In the detached signature case, the header contains the Signed Data object. | false | Boolean |
| verifySignaturesOfAll Signers (verify) | If true then the signatures of all signers contained in the Signed Data object are verified. If false then only one signature whose signer info matches with one of the specified certificates is verified. Default value is true. | true | Boolean |

75.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.crypto-cms.enabled | Whether to enable auto configuration of the <code>crypto-cms</code> component. This is enabled by default. | | Boolean |
| camel.component.crypto-cms.enveloped-data-decryptor-configuration | To configure the shared <code>EnvelopedDataDecryptorConfiguration</code> , which determines the uri parameters for the decrypt operation. The option is a <code>org.apache.camel.component.crypto.cms.crypt.EnvelopedDataDecryptorConfiguration</code> type. | | String |
| camel.component.crypto-cms.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| <code>camel.component.crypto-cms.signed-data-verifier-configuration</code> | To configure the shared <code>SignedDataVerifierConfiguration</code> , which determines the uri parameters for the verify operation. The option is a <code>org.apache.camel.component.crypto.cms.sig.SignedDataVerifierConfiguration</code> type. | | String |

75.3. ENVELOPED DATA

Note, that a `crypto-cms:encrypt` endpoint is typically defined in one route and the complimentary `crypto-cms:decrypt` in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create an Enveloped Data message and how you can decrypt an Enveloped Data message.

Basic Example in Java DSL

```
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the crypto-cms:decrypt endpoint

DefaultKeyTransRecipientInfo recipient1 = new DefaultKeyTransRecipientInfo();
recipient1.setCertificateAlias("rsa"); // alias of the public key used for the encryption
recipient1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("recipient1", recipient1); // register recipient info in the registry

from("direct:start")
    .to("crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&contentEncryptionAlgorithm=DESede/CBC/PKCS5Padding&secretKeyLength=128")
    .to("crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters")
    .to("mock:result");
```

Basic Example in Spring XML

```
<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="./keystore/keystore.jceks"
    password="some_password" type="JCEKS" />
<bean id="recipient1"
    class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
```

```

    <property name="keyStoreParameters" ref="keyStoreParameters1" />
    <property name="certificateAlias" value="rsa" />
  </bean>
  ...
  <route>
    <from uri="direct:start" />
    <to uri="crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&contentEncryptionAlgorithm=DESede/CBC/PKCS5Pad
ding&secretKeyLength=128" />
    <to uri="crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters1" />
    <to uri="mock:result" />
  </route>

```

Two Recipients in Java DSL

```

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the crypto-cms:decrypt endpoint

DefaultKeyTransRecipientInfo recipient1 = new DefaultKeyTransRecipientInfo();
recipient1.setCertificateAlias("rsa"); // alias of the public key used for the encryption
recipient1.setKeyStoreParameters(keystore);

DefaultKeyTransRecipientInfo recipient2 = new DefaultKeyTransRecipientInfo();
recipient2.setCertificateAlias("dsa");
recipient2.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); // register keystore in the registry
simpleReg.put("recipient1", recipient1); // register recipient info in the registry

from("direct:start")
  .to("crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&recipient=#recipient2&contentEncryptionAlgorithm=DESede/CBC
PKCS5Padding&secretKeyLength=128")
  //the decryptor will automatically choose one of the two private keys depending which one is in the
decryptor keystore
  .to("crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters")
  .to("mock:result");

```

Two Recipients in Spring XML

```

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
  id="keyStoreParameters1" resource="/keystore/keystore.jceks"
  password="some_password" type="JCEKS" />
<bean id="recipient1"
  class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="certificateAlias" value="rsa" />

```

```

</bean>
<bean id="recipient2"
  class="org.apache.camel.component.crypto.cms.crypt.DefaultKeyTransRecipientInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="certificateAlias" value="dsa" />
</bean>
...
<route>
  <from uri="direct:start" />
  <to uri="crypto-cms:encrypt://testencrypt?
toBase64=true&recipient=#recipient1&recipient=#recipient2&contentEncryptionAlgorithm
=DESede/CBC/PKCS5Padding&secretKeyLength=128" />
  <!-- the decryptor will automatically choose one of the two private keys depending which one is in
the decryptor keystore -->
  <to uri="crypto-cms:decrypt://testdecrypt?
fromBase64=true&keyStoreParameters=#keyStoreParameters1" />
  <to uri="mock:result" />
</route>

```

75.4. SIGNED DATA

Note, that a **crypto-cms:sign** endpoint is typically defined in one route and the complimentary **crypto-cms:verify** in another, though for simplicity in the examples they appear one after the other.

The following example shows how you can create a Signed Data message and how you can validate a Signed Data message.

Basic Example in Java DSL

```

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType,
signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry

```

```

from("direct:start")
  .to("crypto-cms:sign://testsign?signer=#signer1&includeContent=true&toBase64=true")
  .to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters&fromBase64=true")
  .to("mock:result");

```

Basic Example in Spring XML

```

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
  id="keyStoreParameters1" resource="/keystore/keystore.jceks"
  password="some_password" type="JCEKS" />
<bean id="signer1"
  class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
  <property name="keyStoreParameters" ref="keyStoreParameters1" />
  <property name="privateKeyAlias" value="rsa" />
  <property name="signatureAlgorithm" value="SHA256withRSA" />
  <property name="includeCertificates" value="true" />
  <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
  be used for accessing the private key -->
  <property name="password" value="private_key_pw" />
</bean>
...
<route>
  <from uri="direct:start" />
  <to uri="crypto-cms:sign://testsign?
signer=#signer1&includeContent=true&toBase64=true" />
  <to uri="crypto-cms:verify://testverify?
keyStoreParameters=#keyStoreParameters1&fromBase64=true" />
  <to uri="mock:result" />
</route>

```

Example with two Signers in Java DSL

```

import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType,
signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

```

```
DefaultSignerInfo signerInfo2 = new DefaultSignerInfo();
signerInfo2.setIncludeCertificates(true);
signerInfo2.setSignatureAlgorithm("SHA256withDSA");
signerInfo2.setPrivateKeyAlias("dsa");
signerInfo2.setKeyStoreParameters(keystore);
```

```
simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry
simpleReg.put("signer2", signerInfo2); //register signer info in the registry
```

```
from("direct:start")
    .to("crypto-cms:sign://testsign?signer=#signer1&signer=#signer2&includeContent=true")
    .to("crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters")
    .to("mock:result");
```

Example with two Signers in Spring XML

```
<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="/keystore/keystore.jceks"
    password="some_password" type="JCEKS" />
<bean id="signer1"
    class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1" />
    <property name="privateKeyAlias" value="rsa" />
    <property name="signatureAlgorithm" value="SHA256withRSA" />
    <property name="includeCertificates" value="true" />
    <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
be used for accessing the private key -->
    <property name="password" value="private_key_pw" />
</bean>
<bean id="signer2"
    class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1" />
    <property name="privateKeyAlias" value="dsa" />
    <property name="signatureAlgorithm" value="SHA256withDSA" />
    <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
be used for accessing the private key -->
    <property name="password" value="private_key_pw2" />
</bean>
...
<route>
    <from uri="direct:start" />
    <to uri="crypto-cms:sign://testsign?
signer=#signer1&signer=#signer2&includeContent=true" />
    <to uri="crypto-cms:verify://testverify?keyStoreParameters=#keyStoreParameters1" />
    <to uri="mock:result" />
</route>
```

Detached Signature Example in Java DSL

```
import org.apache.camel.util.jsse.KeyStoreParameters;
import org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo;
...
KeyStoreParameters keystore = new KeyStoreParameters();
```

```

keystore.setType("JCEKS");
keystore.setResource("keystore/keystore.jceks");
keystore.setPassword("some_password"); // this password will also be used for accessing the private
key if not specified in the signerInfo1 bean

//Signer Information, by default the following signed attributes are included: contentType,
signingTime, messageDigest, and cmsAlgorithmProtect; by default no unsigned attribute is included.
// If you want to add your own signed attributes or unsigned attributes, see methods
DefaultSignerInfo.setSignedAttributeGenerator and DefaultSignerInfo.setUnsignedAttributeGenerator.
DefaultSignerInfo signerInfo1 = new DefaultSignerInfo();
signerInfo1.setIncludeCertificates(true); // if set to true then the certificate chain of the private key will
be added to the Signed Data object
signerInfo1.setSignatureAlgorithm("SHA256withRSA"); // signature algorithm; attention, the signature
algorithm must fit to the signer private key.
signerInfo1.setPrivateKeyAlias("rsa"); // alias of the private key used for the signing
signerInfo1.setPassword("private_key_pw".toCharArray()); // optional parameter, if not set then the
password of the KeyStoreParameters will be used for accessing the private key
signerInfo1.setKeyStoreParameters(keystore);

simpleReg.put("keyStoreParameters", keystore); //register keystore in the registry
simpleReg.put("signer1", signerInfo1); //register signer info in the registry

from("direct:start")
    //with the option includeContent=false the SignedData object without the signed text will be written
into the header "CamelCryptoCmsSignedData"
    .to("crypto-cms:sign://testsign?signer=#signer1&includeContent=false&toBase64=true")
    //the verifier reads the Signed Data object form the header CamelCryptoCmsSignedData and
assumes that the signed content is in the message body
    .to("crypto-cms:verify://testverify?
keyStoreParameters=#keyStoreParameters&signedDataHeaderBase64=true")
    .to("mock:result");

```

Detached Signature Example in Spring XML

```

<keyStoreParameters xmlns="http://camel.apache.org/schema/spring"
    id="keyStoreParameters1" resource="./keystore/keystore.jceks"
    password="some_password" type="JCEKS" />
<bean id="signer1"
    class="org.apache.camel.component.crypto.cms.sig.DefaultSignerInfo">
    <property name="keyStoreParameters" ref="keyStoreParameters1" />
    <property name="privateKeyAlias" value="rsa" />
    <property name="signatureAlgorithm" value="SHA256withRSA" />
    <property name="includeCertificates" value="true" />
    <!-- optional parameter 'password', if not set then the password of the KeyStoreParameters will
be used for accessing the private key -->
    <property name="password" value="private_key_pw" />
</bean>
...
<route>
    <from uri="direct:start" />
    <!-- with the option includeContent=false the SignedData object without the signed text will be
written into the header "CamelCryptoCmsSignedData" -->
    <to uri="crypto-cms:sign://testsign?
signer=#signer1&includeContent=false&toBase64=true" />
    <!-- the verifier reads the Signed Data object form the header CamelCryptoCmsSignedData and
assumes that the signed content is in the message body -->

```

```
<to uri="crypto-cms:verify://testverify?  
keyStoreParameters=#keyStoreParameters1&signedDataHeaderBase64=true" />  
  <to uri="mock:result" />  
</route>
```

CHAPTER 76. CRYPTO (JAVA CRYPTOGRAPHIC EXTENSION) DATAFORMAT

Available as of Camel version 2.3

The Crypto Data Format integrates the Java Cryptographic Extension into Camel, allowing simple and flexible encryption and decryption of messages using Camel's familiar marshal and unmarshal formatting mechanism. It assumes marshalling to mean encryption to cyphertext and unmarshalling to mean decryption back to the original plaintext. This data format implements only symmetric (shared-key) encryption and decryption.

76.1. CRYPTODATAFORMAT OPTIONS

The Crypto (Java Cryptographic Extension) dataformat supports 10 options, which are listed below.

| Name | Default | Java Type | Description |
|-----------------------|-----------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| algorithm | DES/CBC/PKCS5Padding | String | The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding. |
| cryptoProvider | | String | The name of the JCE Security Provider that should be used. |
| keyRef | | String | Refers to the secret key to lookup from the register to use. |
| initVectorRef | | String | Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher. |
| algorithmParameterRef | | String | A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a java.security.spec.AlgorithmParameterSpec type. |
| bufferSize | | Integer | The size of the buffer used in the signature process. |
| macAlgorithm | HmacSHA1 | String | The JCE algorithm name indicating the Message Authentication algorithm. |
| shouldAppendHMAC | false | Boolean | Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data. |
| inline | false | Boolean | Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false. |

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. |

76.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 33 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----------------|
| <code>camel.component.crypto.configuration.algorithm</code> | Sets the JCE name of the Algorithm that should be used for the signer. | SHA1WithDSA | String |
| <code>camel.component.crypto.configuration.alias</code> | Sets the alias used to query the KeyStore for keys and link <code>java.security.cert.Certificate</code> Certificates to be used in signing and verifying exchanges. This value can be provided at runtime via the message header <code>org.apache.camel.component.crypto.DigitalSignatureConstants#KEYSTORE_ALIAS</code> | | String |
| <code>camel.component.crypto.configuration.buffer-size</code> | Set the size of the buffer used to read in the Exchange payload data. | 2048 | Integer |
| <code>camel.component.crypto.configuration.certificate</code> | Set the Certificate that should be used to verify the signature in the exchange based on its payload. | | Certificate |
| <code>camel.component.crypto.configuration.certificate-name</code> | Sets the reference name for a PrivateKey that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.clear-headers</code> | Determines if the Signature specific headers be cleared after signing and verification. Defaults to true, and should only be made otherwise at your extreme peril as vital private information such as Keys and passwords may escape if unset. | true | Boolean |
| <code>camel.component.crypto.configuration.crypto-operation</code> | Set the Crypto operation from that supplied after the crypto scheme in the endpoint uri e.g. <code>crypto:sign</code> sets <code>sign</code> as the operation. | | CryptoOperation |

| Name | Description | Default | Type |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| <code>camel.component.crypto.configuration.key-store-parameters</code> | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges based on the given KeyStoreParameters. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header <code>CamelSignatureKeyStoreAlias</code> . If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | | KeyStoreParameters |
| <code>camel.component.crypto.configuration.keystore</code> | Sets the KeyStore that can contain keys and Certificates for use in signing and verifying exchanges. A KeyStore is typically used with an alias, either one supplied in the Route definition or dynamically via the message header <code>CamelSignatureKeyStoreAlias</code> . If no alias is supplied and there is only a single entry in the Keystore, then this single entry will be used. | | KeyStore |
| <code>camel.component.crypto.configuration.keystore-name</code> | Sets the reference name for a Keystore that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.name</code> | The logical name of this operation. | | String |
| <code>camel.component.crypto.configuration.password</code> | Sets the password used to access an aliased PrivateKey in the KeyStore. | | Character[] |
| <code>camel.component.crypto.configuration.private-key</code> | Set the PrivateKey that should be used to sign the exchange | | PrivateKey |
| <code>camel.component.crypto.configuration.private-key-name</code> | Sets the reference name for a PrivateKey that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.provider</code> | Set the id of the security provider that provides the configured Signature algorithm. | | String |
| <code>camel.component.crypto.configuration.public-key</code> | Set the PublicKey that should be used to verify the signature in the exchange. | | PublicKey |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------|
| <code>camel.component.crypto.configuration.public-key-name</code> | references that should be resolved when the context changes | | String |
| <code>camel.component.crypto.configuration.secure-random</code> | Set the SecureRandom used to initialize the Signature service | | SecureRandom |
| <code>camel.component.crypto.configuration.secure-random-name</code> | Sets the reference name for a SecureRandom that can be found in the registry. | | String |
| <code>camel.component.crypto.configuration.signature-header-name</code> | Set the name of the message header that should be used to store the base64 encoded signature. This defaults to 'CamelDigitalSignature' | | String |
| <code>camel.component.crypto.enabled</code> | Enable crypto component | true | Boolean |
| <code>camel.component.crypto.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.dataformat.crypto.algorithm</code> | The JCE algorithm name indicating the cryptographic algorithm that will be used. Is by default DES/CBC/PKCS5Padding. | DES/CBC/PKCS5Padding | String |
| <code>camel.dataformat.crypto.algorithm-parameter-ref</code> | A JCE AlgorithmParameterSpec used to initialize the Cipher. Will lookup the type using the given name as a java.security.spec.AlgorithmParameterSpec type. | | String |
| <code>camel.dataformat.crypto.buffer-size</code> | The size of the buffer used in the signature process. | | Integer |
| <code>camel.dataformat.crypto.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. | false | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|----------|---------|
| <code>camel.dataformat.crypto.crypto-provider</code> | The name of the JCE Security Provider that should be used. | | String |
| <code>camel.dataformat.crypto.enabled</code> | Enable crypto dataformat | true | Boolean |
| <code>camel.dataformat.crypto.init-vector-ref</code> | Refers to a byte array containing the Initialization Vector that will be used to initialize the Cipher. | | String |
| <code>camel.dataformat.crypto.inline</code> | Flag indicating that the configured IV should be inlined into the encrypted data stream. Is by default false. | false | Boolean |
| <code>camel.dataformat.crypto.key-ref</code> | Refers to the secret key to lookup from the register to use. | | String |
| <code>camel.dataformat.crypto.mac-algorithm</code> | The JCE algorithm name indicating the Message Authentication algorithm. | HmacSHA1 | String |
| <code>camel.dataformat.crypto.should-append-h-m-a-c</code> | Flag indicating that a Message Authentication Code should be calculated and appended to the encrypted data. | false | Boolean |

ND

76.3. BASIC USAGE

At its most basic all that is required to encrypt/decrypt an exchange is a shared secret key. If one or more instances of the Crypto data format are configured with this key the format can be used to encrypt the payload in one route (or part of one) and decrypted in another. For example, using the Java DSL as follows:

```

KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());

from("direct:basic-encryption")
    .marshal(cryptoFormat)
    .to("mock:encrypted")
    .unmarshal(cryptoFormat)
    .to("mock:unencrypted");

```

In Spring the dataformat is configured first and then used in routes

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">
```

```

<dataFormats>
  <crypto id="basic" algorithm="DES" keyRef="desKey" />
</dataFormats>
...
<route>
  <from uri="direct:basic-encryption" />
  <marshal ref="basic" />
  <to uri="mock:encrypted" />
  <unmarshal ref="basic" />
  <to uri="mock:unencrypted" />
</route>
</camelContext>

```

76.4. SPECIFYING THE ENCRYPTION ALGORITHM

Changing the algorithm is a matter of supplying the JCE algorithm name. If you change the algorithm you will need to use a compatible key.

```

KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
cryptoFormat.setMacAlgorithm("HmacMD5");

from("direct:hmac-algorithm")
  .marshal(cryptoFormat)
  .to("mock:encrypted")
  .unmarshal(cryptoFormat)
  .to("mock:unencrypted");

```

A list of the available algorithms in Java 7 is available via the [Java Cryptography Architecture Standard Algorithm Name Documentation](#).

76.5. SPECIFYING AN INITIALIZATION VECTOR

Some crypto algorithms, particularly block algorithms, require configuration with an initial block of data known as an Initialization Vector. In the JCE this is passed as an `AlgorithmParameterSpec` when the Cipher is initialized. To use such a vector with the `CryptoDataFormat` you can configure it with a `byte[]` containing the required data e.g.

```

KeyGenerator generator = KeyGenerator.getInstance("DES");
byte[] initializationVector = new byte[] {0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07};

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding",
generator.generateKey());
cryptoFormat.setInitializationVector(initializationVector);

from("direct:init-vector")
  .marshal(cryptoFormat)
  .to("mock:encrypted")
  .unmarshal(cryptoFormat)
  .to("mock:unencrypted");

```

or with spring, supplying a reference to a `byte[]`

```
<crypto id="initvector" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey"
initVectorRef="initializationVector" />
```

The same vector is required in both the encryption and decryption phases. As it is not necessary to keep the IV a secret, the DataFormat allows for it to be inlined into the encrypted data and subsequently read out in the decryption phase to initialize the Cipher. To inline the IV set the /oinline flag.

```
KeyGenerator generator = KeyGenerator.getInstance("DES");
byte[] initializationVector = new byte[] {0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07};
SecretKey key = generator.generateKey();

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", key);
cryptoFormat.setInitializationVector(initializationVector);
cryptoFormat.setShouldInlineInitializationVector(true);
CryptoDataFormat decryptFormat = new CryptoDataFormat("DES/CBC/PKCS5Padding", key);
decryptFormat.setShouldInlineInitializationVector(true);

from("direct:inline")
    .marshal(cryptoFormat)
    .to("mock:encrypted")
    .unmarshal(decryptFormat)
    .to("mock:unencrypted");
```

or with spring.

```
<crypto id="inline" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey"
initVectorRef="initializationVector"
inline="true" />
<crypto id="inline-decrypt" algorithm="DES/CBC/PKCS5Padding" keyRef="desKey" inline="true" />
```

For more information of the use of Initialization Vectors, consult

- http://en.wikipedia.org/wiki/Initialization_vector
- <http://www.herongyang.com/Cryptography/>
- http://en.wikipedia.org/wiki/Block_cipher_modes_of_operation

76.6. HASHED MESSAGE AUTHENTICATION CODES (HMAC)

To avoid attacks against the encrypted data while it is in transit the CryptoDataFormat can also calculate a Message Authentication Code for the encrypted exchange contents based on a configurable MAC algorithm. The calculated HMAC is appended to the stream after encryption. It is separated from the stream in the decryption phase. The MAC is recalculated and verified against the transmitted version to insure nothing was tampered with in transit. For more information on Message Authentication Codes see <http://en.wikipedia.org/wiki/HMAC>

```
KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);

from("direct:hmac")
    .marshal(cryptoFormat)
```

```
.to("mock:encrypted")
.unmarshal(cryptoFormat)
.to("mock:unencrypted");
```

or with spring.

```
<crypto id="hmac" algorithm="DES" keyRef="desKey" shouldAppendHMAC="true" />
```

By default the HMAC is calculated using the HmacSHA1 mac algorithm though this can be easily changed by supplying a different algorithm name. See here for how to check what algorithms are available through the configured security providers

```
KeyGenerator generator = KeyGenerator.getInstance("DES");

CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", generator.generateKey());
cryptoFormat.setShouldAppendHMAC(true);
cryptoFormat.setMacAlgorithm("HmacMD5");

from("direct:hmac-algorithm")
.marshall(cryptoFormat)
.to("mock:encrypted")
.unmarshal(cryptoFormat)
.to("mock:unencrypted");
```

or with spring.

```
<crypto id="hmac-algorithm" algorithm="DES" keyRef="desKey" macAlgorithm="HmacMD5"
shouldAppendHMAC="true" />
```

76.7. SUPPLYING KEYS DYNAMICALLY

When using a Recipient list or similar EIP the recipient of an exchange can vary dynamically. Using the same key across all recipients may neither be feasible or desirable. It would be useful to be able to specify keys dynamically on a per exchange basis. The exchange could then be dynamically enriched with the key of its target recipient before being processed by the data format. To facilitate this the DataFormat allow for keys to be supplied dynamically via the message headers below

- `CryptoDataFormat.KEY` "CamelCryptoKey"

```
CryptoDataFormat cryptoFormat = new CryptoDataFormat("DES", null);
/**
 * Note: the header containing the key should be cleared after
 * marshalling to stop it from leaking by accident and
 * potentially being compromised. The processor version below is
 * arguably better as the key is left in the header when you use
 * the DSL leaks the fact that camel encryption was used.
 */
from("direct:key-in-header-encrypt")
.marshall(cryptoFormat)
.removeHeader(CryptoDataFormat.KEY)
.to("mock:encrypted");

from("direct:key-in-header-decrypt").unmarshal(cryptoFormat).process(new Processor() {
    public void process(Exchange exchange) throws Exception {
```

```
exchange.getIn().getHeaders().remove(CryptoDataFormat.KEY);
exchange.getOut().copyFrom(exchange.getIn());
}
}).to("mock:unencrypted");
```

or with spring.

```
<crypto id="nokey" algorithm="DES" />
```

76.8. DEPENDENCIES

To use the `Crypto` dataformat in your camel routes you need to add the following dependency to your pom.

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-crypto</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

CHAPTER 77. CSV DATAFORMAT

Available as of Camel version 1.3

The CSV Data Format uses [Apache Commons CSV](#) to handle CSV payloads (Comma Separated Values) such as those exported/imported by Excel.

77.1. OPTIONS

The CSV dataformat supports 28 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------------|--------------|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>formatRef</code> | | String | The reference format to use, it will be updated with the other format options, the default value is <code>CSVFormat.DEFAULT</code> |
| <code>formatName</code> | | String | The name of the format to use, the default value is <code>CSVFormat.DEFAULT</code> |
| <code>commentMarkerDisabled</code> | false | Boolean | Disables the comment marker of the reference format. |
| <code>commentMarker</code> | | String | Sets the comment marker of the reference format. |
| <code>delimiter</code> | | String | Sets the delimiter to use. The default value is <code>,</code> (comma) |
| <code>escapeDisabled</code> | false | Boolean | Use for disabling using escape character |
| <code>escape</code> | | String | Sets the escape character to use |
| <code>headerDisabled</code> | false | Boolean | Use for disabling headers |
| <code>header</code> | | List | To configure the CSV headers |
| <code>allowMissingColumnNames</code> | false | Boolean | Whether to allow missing column names. |
| <code>ignoreEmptyLines</code> | false | Boolean | Whether to ignore empty lines. |
| <code>ignoreSurroundingSpaces</code> | false | Boolean | Whether to ignore surrounding spaces |
| <code>nullStringDisabled</code> | false | Boolean | Used to disable null strings |

| Name | Default | Java Type | Description |
|--------------------------------------|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>nullString</code> | | String | Sets the null string |
| <code>quoteDisabled</code> | false | Boolean | Used to disable quotes |
| <code>quote</code> | | String | Sets the quote which by default is |
| <code>recordSeparatorDisabled</code> | | String | Used for disabling record separator |
| <code>recordSeparator</code> | | String | Sets the record separator (aka new line) which by default is new line characters (CRLF) |
| <code>skipHeaderRecord</code> | false | Boolean | Whether to skip the header record in the output |
| <code>quoteMode</code> | | String | Sets the quote mode |
| <code>ignoreHeaderCase</code> | false | Boolean | Sets whether or not to ignore case when accessing header names. |
| <code>trim</code> | false | Boolean | Sets whether or not to trim leading and trailing blanks. |
| <code>trailingDelimiter</code> | false | Boolean | Sets whether or not to add a trailing delimiter. |
| <code>lazyLoad</code> | false | Boolean | Whether the unmarshalling should produce an iterator that reads the lines on the fly or if all the lines must be read at one. |
| <code>useMaps</code> | false | Boolean | Whether the unmarshalling should produce maps (HashMap) for the lines values instead of lists. It requires to have header (either defined or collected). |
| <code>useOrderedMaps</code> | false | Boolean | Whether the unmarshalling should produce ordered maps (LinkedHashMap) for the lines values instead of lists. It requires to have header (either defined or collected). |
| <code>recordConverterRef</code> | | String | Refers to a custom CsvRecordConverter to lookup from the registry to use. |
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. |

77.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 29 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.csv.allow-missing-column-names</code> | Whether to allow missing column names. | false | Boolean |
| <code>camel.dataformat.csv.comment-marker</code> | Sets the comment marker of the reference format. | | String |
| <code>camel.dataformat.csv.comment-marker-disabled</code> | Disables the comment marker of the reference format. | false | Boolean |
| <code>camel.dataformat.csv.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.csv.delimiter</code> | Sets the delimiter to use. The default value is , (comma) | | String |
| <code>camel.dataformat.csv.enabled</code> | Enable csv dataformat | true | Boolean |
| <code>camel.dataformat.csv.escape</code> | Sets the escape character to use | | String |
| <code>camel.dataformat.csv.escape-disabled</code> | Use for disabling using escape character | false | Boolean |
| <code>camel.dataformat.csv.format-name</code> | The name of the format to use, the default value is CSVFormat.DEFAULT | | String |
| <code>camel.dataformat.csv.format-ref</code> | The reference format to use, it will be updated with the other format options, the default value is CSVFormat.DEFAULT | | String |
| <code>camel.dataformat.csv.header</code> | To configure the CSV headers | | List |

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.csv.header-disabled</code> | Use for disabling headers | false | Boolean |
| <code>camel.dataformat.csv.ignore-empty-lines</code> | Whether to ignore empty lines. | false | Boolean |
| <code>camel.dataformat.csv.ignore-header-case</code> | Sets whether or not to ignore case when accessing header names. | false | Boolean |
| <code>camel.dataformat.csv.ignore-surrounding-spaces</code> | Whether to ignore surrounding spaces | false | Boolean |
| <code>camel.dataformat.csv.lazy-load</code> | Whether the unmarshalling should produce an iterator that reads the lines on the fly or if all the lines must be read at one. | false | Boolean |
| <code>camel.dataformat.csv.null-string</code> | Sets the null string | | String |
| <code>camel.dataformat.csv.null-string-disabled</code> | Used to disable null strings | false | Boolean |
| <code>camel.dataformat.csv.quote</code> | Sets the quote which by default is | | String |
| <code>camel.dataformat.csv.quote-disabled</code> | Used to disable quotes | false | Boolean |
| <code>camel.dataformat.csv.quote-mode</code> | Sets the quote mode | | String |
| <code>camel.dataformat.csv.record-converter-ref</code> | Refers to a custom <code>CsvRecordConverter</code> to lookup from the registry to use. | | String |
| <code>camel.dataformat.csv.record-separator</code> | Sets the record separator (aka new line) which by default is new line characters (CRLF) | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.csv.record-separator-disabled</code> | Used for disabling record separator | | String |
| <code>camel.dataformat.csv.skip-header-record</code> | Whether to skip the header record in the output | false | Boolean |
| <code>camel.dataformat.csv.trailing-delimiter</code> | Sets whether or not to add a trailing delimiter. | false | Boolean |
| <code>camel.dataformat.csv.trim</code> | Sets whether or not to trim leading and trailing blanks. | false | Boolean |
| <code>camel.dataformat.csv.use-maps</code> | Whether the unmarshalling should produce maps (HashMap) for the lines values instead of lists. It requires to have header (either defined or collected). | false | Boolean |
| <code>camel.dataformat.csv.use-ordered-maps</code> | Whether the unmarshalling should produce ordered maps (LinkedHashMap) for the lines values instead of lists. It requires to have header (either defined or collected). | false | Boolean |

ND

77.3. MARSHALLING A MAP TO CSV

The component allows you to marshal a Java Map (or any other message type that can be converted in a Map) into a CSV payload.

Considering the following body

```
Map<String, Object> body = new LinkedHashMap<>();
body.put("foo", "abc");
body.put("bar", 123);
```

and this Java route definition

```
from("direct:start")
  .marshal().csv()
  .to("mock:result");
```

or this XML route definition

```
<route>
  <from uri="direct:start" />
  <marshal>
    <csv />
  </marshal>
  <to uri="mock:result" />
</route>
```

then it will produce

```
abc,123
```

77.4. UNMARSHALLING A CSV MESSAGE INTO A JAVA LIST

Unmarshalling will transform a CSV message into a Java List with CSV file lines (containing another List with all the field values).

An example: we have a CSV file with names of persons, their IQ and their current activity.

```
Jack Dalton, 115, mad at Averell
Joe Dalton, 105, calming Joe
William Dalton, 105, keeping Joe from killing Averell
Averell Dalton, 80, playing with Rantanplan
Lucky Luke, 120, capturing the Daltons
```

We can now use the CSV component to unmarshal this file:

```
from("file:src/test/resources/?fileName=daltons.csv&noop=true")
  .unmarshal().csv()
  .to("mock:daltons");
```

The resulting message will contain a **List<List<String>>** like...

```
List<List<String>> data = (List<List<String>>) exchange.getIn().getBody();
for (List<String> line : data) {
  LOG.debug(String.format("%s has an IQ of %s and is currently %s", line.get(0), line.get(1),
line.get(2)));
}
```

77.5. MARSHALLING A LIST<MAP> TO CSV

Available as of Camel 2.1

If you have multiple rows of data you want to be marshalled into CSV format you can now store the message payload as a **List<Map<String, Object>>** object where the list contains a Map for each row.

77.6. FILE POLLER OF CSV, THEN UNMARSHALING

Given a bean which can handle the incoming data...

MyCsvHandler.java

```
// Some comments here
public void doHandleCsvData(List<List<String>> csvData)
{
    // do magic here
}
```

i. your route then looks as follows

```
<route>
  <!-- poll every 10 seconds -->
  <from uri="file:///some/path/to/pickup/csvfiles?delete=true&consumer.delay=10000" />
  <unmarshal><csv /></unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsvData" />
</route>
```

77.7. MARSHALING WITH A PIPE AS DELIMITER

Considering the following body

```
Map<String, Object> body = new LinkedHashMap<>();
body.put("foo", "abc");
body.put("bar", 123);
```

and this Java route definition

```
// Camel version < 2.15
CsvDataFormat oldCSV = new CsvDataFormat();
oldCSV.setDelimiter("|");
from("direct:start")
    .marshal(oldCSV)
    .to("mock:result")

// Camel version >= 2.15
from("direct:start")
    .marshal(new CsvDataFormat().setDelimiter('&#39;|&#39;))
    .to("mock:result")
```

or this XML route definition

```
<route>
  <from uri="direct:start" />
  <marshal>
    <csv delimiter="|" />
  </marshal>
  <to uri="mock:result" />
</route>
```

then it will produce

```
abc|123
```

Using `autogenColumns`, `configRef` and `strategyRef` attributes inside XML # DSL

Available as of Camel 2.9.2 / 2.10 and deleted for Camel 2.15

You can customize the CSV Data Format to make use of your own **CSVConfig** and/or **CSVStrategy**. Also note that the default value of the **autogenColumns** option is true. The following example should illustrate this customization.

```
<route>
  <from uri="direct:start" />
  <marshal>
    <!-- make use of a strategy other than the default one which is
    'org.apache.commons.csv.CSVStrategy.DEFAULT_STRATEGY' -->
    <csv autogenColumns="false" delimiter="|" configRef="csvConfig" strategyRef="excelStrategy" />
  </marshal>
  <convertBodyTo type="java.lang.String" />
  <to uri="mock:result" />
</route>

<bean id="csvConfig" class="org.apache.commons.csv.writer.CSVConfig">
  <property name="fields">
    <list>
      <bean class="org.apache.commons.csv.writer.CSVField">
        <property name="name" value="orderId" />
      </bean>
      <bean class="org.apache.commons.csv.writer.CSVField">
        <property name="name" value="amount" />
      </bean>
    </list>
  </property>
</bean>

<bean id="excelStrategy"
class="org.springframework.beans.factory.config.FieldRetrievingFactoryBean">
  <property name="staticField" value="org.apache.commons.csv.CSVStrategy.EXCEL_STRATEGY"
/>
</bean>
```

77.8. USING SKIPFIRSTLINE OPTION WHILE UNMARSHALING

Available as of Camel 2.10 and deleted for Camel 2.15

You can instruct the CSV Data Format to skip the first line which contains the CSV headers. Using the Spring/XML DSL:

```
<route>
  <from uri="direct:start" />
  <unmarshal>
    <csv skipFirstLine="true" />
  </unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsv" />
</route>
```

Or the Java DSL:

```
CsvDataFormat csv = new CsvDataFormat();
```

```

csv.setSkipFirstLine(true);

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

77.9. UNMARSHALING WITH A PIPE AS DELIMITER

Using the Spring/XML DSL:

```

<route>
  <from uri="direct:start" />
  <unmarshal>
    <csv delimiter="|" />
  </unmarshal>
  <to uri="bean:myCsvHandler?method=doHandleCsv" />
</route>

```

Or the Java DSL:

```

CsvDataFormat csv = new CsvDataFormat();
CSVStrategy strategy = CSVStrategy.DEFAULT_STRATEGY;
strategy.setDelimiter("|");
csv.setStrategy(strategy);

```

```

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

```

CsvDataFormat csv = new CsvDataFormat();
csv.setDelimiter("|");

```

```

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

```

CsvDataFormat csv = new CsvDataFormat();
CSVConfig csvConfig = new CSVConfig();
csvConfig.setDelimiter(";");
csv.setConfig(csvConfig);

```

```

from("direct:start")
  .unmarshal(csv)
  .to("bean:myCsvHandler?method=doHandleCsv");

```

Issue in CSVConfig

It looks like that

```

CSVConfig csvConfig = new CSVConfig();
csvConfig.setDelimiter(';');

```

doesn't work. You have to set the delimiter as a String!

77.10. DEPENDENCIES

To use CSV in your Camel routes you need to add a dependency on **camel-csv**, which implements this data format.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-csv</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 78. CXF

CXF COMPONENT

The **cxf**: component provides integration with [Apache CXF](#) for connecting to JAX-WS services hosted in CXF.

Maven users must add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cxf</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

NOTE

If you want to learn about CXF dependencies, see the [WHICH-JARS](#) text file.

NOTE

When using CXF in streaming modes (see `DataFormat` option), then also read about [Stream caching](#).

CAMEL ON EAP DEPLOYMENT

This component is supported by the Camel on EAP (Wildfly Camel) framework, which offers a simplified deployment model on the Red Hat JBoss Enterprise Application Platform (JBoss EAP) container.

The CXF component integrates with the JBoss EAP **webservices** subsystem that also uses Apache CXF. For more information, see [JAX-WS](#).

NOTE

At present, the Camel on EAP subsystem does **not** support CXF or Restlet consumers. However, it is possible to mimic CXF consumer behaviour, using the **CamelProxy**.

URI FORMAT

```
cxf:bean:cxfEndpoint[?options]
```

Where **cxfEndpoint** represents a bean ID that references a bean in the Spring bean registry. With this URI format, most of the endpoint details are specified in the bean definition.

```
cxf://someAddress[?options]
```

Where **someAddress** specifies the CXF endpoint's address. With this URI format, most of the endpoint details are specified using options.

For either style above, you can append options to the URI as follows:

```
cxf:bean:cxfEndpoint?wsdlURL=wsdl/hello_world.wsdl&dataFormat=PAYLOAD
```

OPTIONS

| Name | Required | Description |
|---------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| wsdlURL | No | <p>The location of the WSDL. WSDL is obtained from endpoint address by default. For example:</p> <p>file://local/wsdl/hello.wsdl or wsdl/hello.wsdl</p> |
| serviceClass | Yes | <p>The name of the SEI (Service Endpoint Interface) class. This class can have, but does not require, JSR181 annotations. Since 2.0, this option is only required by POJO mode. If the wsdlURL option is provided, serviceClass is not required for PAYLOAD and MESSAGE mode. When wsdlURL option is used without serviceClass, the serviceName and portName (endpointName for Spring configuration) options MUST be provided.</p> <p>Since 2.0, it is possible to use <code>\#</code> notation to reference a serviceClass object instance from the registry..</p> <p>Please be advised that the referenced object cannot be a Proxy (Spring AOP Proxy is OK) as it relies on <code>Object.getClass().getName()</code> method for non Spring AOP Proxy.</p> <p>Since 2.8, it is possible to omit both wsdlURL and serviceClass options for PAYLOAD and MESSAGE mode. When they are omitted, arbitrary XML elements can be put in CxfPayload's body in PAYLOAD mode to facilitate CXF Dispatch Mode.</p> <p>For example: org.apache.camel.Hello</p> |

| | | |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serviceName | Only if more than one serviceName present in WSDL | The service name this service is implementing, it maps to the wsdl:serviceName . For example: {http://org.apache.camel}ServiceName |
| endpointName | Only if more than one portName under the serviceName is present, and it is required for camel-cxf consumer since camel 2.2 | The port name this service is implementing, it maps to the wsdl:portName . For example: {http://org.apache.camel}PortName |
| dataFormat | No | Which message data format the CXF endpoint supports. Possible values are: POJO (default), PAYLOAD, MESSAGE . |
| relayHeaders | No | Defines if a CXF endpoint relays headers along the route. See the section called "Description of relayHeaders option" . Currently only available when dataFormat=POJO Default: true Example: true, false |
| wrapped | No | Which kind of operation the CXF endpoint producer invokes. Possible values are: true, false (default) . |
| wrappedStyle | No | Since 2.5.0 The WSDL style that describes how parameters are represented in the SOAP body. If the value is false , CXF chooses the document-literal unwrapped style, If the value is true , CXF chooses the document-literal wrapped style |
| setDefaultBus | No | Deprecated: Specifies whether or not to use the default CXF bus for this endpoint. Possible values are: true, false (default) . This option is deprecated. Use defaultBus from Camel 2.16 onwards. |

| | | |
|------------------------------|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| defaultBus | No | Deprecated: Specifies whether or not to use the default CXF bus for this endpoint. Possible values are: true, false (default) . This option is deprecated. Use defaultBus from Camel 2.16 onwards. |
| bus | No | Use \# notation to reference a bus object from the registry – for example, bus=\#busName . The referenced object must be an instance of org.apache.cxf.Bus . By default, uses the default bus created by CXF Bus Factory. |
| cxfBinding | No | Use \# notation to reference a CXF binding object from the registry – for example, cxfBinding=\#bindingName . The referenced object must be an instance of org.apache.camel.component.cxf.CxfBinding . |
| headerFilterStrategy | No | Use \# notation to reference a header filter strategy object from the registry – for example, headerFilterStrategy=\#strategyName . The referenced object must be an instance of org.apache.camel.spi.HeaderFilterStrategy . |
| loggingFeatureEnabled | No | New in 2.3, this option enables CXF Logging Feature which writes inbound and outbound SOAP messages to log. Possible values are: true, false (default) . |
| defaultOperationName | No | New in 2.4, this option sets the default operationName that is used by the CxfProducer that invokes the remote service. For example: defaultOperationName=greetMe |

| | | |
|----------------------------------|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| defaultOperationNamespace | No | <p>New in 2.4, this option sets the default operationNamespace that is used by the CxfProducer which invokes the remote service. For example:</p> <p>defaultOperationNamespace =http://apache.org/hello_world_soap_http</p> |
| synchronous | No | <p>New in 2.5, this option lets CXF endpoint decide to use sync or async API to do the underlying work. The default value is false, which means camel-cxf endpoint tries to use async API by default.</p> |
| publishedEndpointUrl | No | <p>New in 2.5, this option overrides the endpoint URL that appears in the published WSDL that is accessed using the service address URL plus ?wsdl. For example:</p> <p>publishedEndpointUrl=http://example.com/service</p> |
| properties.propName | No | <p>Camel 2.8: Allows you to set custom CXF properties in the endpoint URI. For example, setting properties.mtom-enabled=true to enable MTOM. To make sure that CXF does not switch the thread when starting the invocation, you can set properties.org.apache.cxf.interceptor.OneWayProcessorInterceptor.USE_ORIGINAL_THREAD=true.</p> |
| allowStreaming | No | <p>New in 2.8.2. This option controls whether the CXF component, when running in PAYLOAD mode (see below), DOM parses the incoming messages into DOM Elements or keep the payload as a javax.xml.transform.Source object that would allow streaming in some cases.</p> |

| | | |
|------------------------------|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skipFaultLogging | No | New in 2.11. This option controls whether the PhaseInterceptorChain skips logging the Fault that it catches. |
| cxfEndpointConfigurer | No | New in Camel 2.11 . This option could apply the implementation of org.apache.camel.component.cxf.CxfEndpointConfigurer which supports to configure the CXF endpoint in programmatic way. Since Camel 2.15.0 , user can configure the CXF server and client by implementing <code>configure{Server/Client}</code> method of CxfEndpointConfigurer . |
| username | No | New in Camel 2.12.3 This option is used to set the basic authentication information of username for the CXF client. |
| password | No | New in Camel 2.12.3 This option is used to set the basic authentication information of password for the CXF client. |
| continuationTimeout | No | New in Camel 2.14.0 This option is used to set the CXF continuation timeout which could be used in CxfConsumer by default when the CXF server is using Jetty or Servlet transport. (Before Camel 2.14.0 , CxfConsumer just set the continuation timeout to be 0, which means the continuation suspend operation never timeout.) Default: 30000 Example: continuation=80000 |

The **serviceName** and **portName** are [QNames](#), so if you provide them be sure to prefix them with their **{namespace}** as shown in the examples above.

THE DESCRIPTIONS OF THE DATAFORMATS

| DataFormat | Description |
|------------|-------------|
|------------|-------------|

| | |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POJO | POJOs (plain old Java objects) are the Java parameters to the method being invoked on the target server. Both Protocol and Logical JAX-WS handlers are supported. |
| PAYLOAD | PAYLOAD is the message payload (the contents of the soap:body) after message configuration in the CXF endpoint is applied. Only Protocol JAX-WS handler is supported. Logical JAX-WS handler is not supported. |
| MESSAGE | MESSAGE is the raw message that is received from the transport layer. It is not suppose to touch or change Stream, some of the CXF interceptors is removed if you are using this kind of DataFormat so you can't see any soap headers after the camel-cxf consumer and JAX-WS handler is not supported. |
| CXF_MESSAGE | New in Camel 2.8.2 , CXF_MESSAGE allows for invoking the full capabilities of CXF interceptors by converting the message from the transport layer into a raw SOAP message |

You can determine the data format mode of an exchange by retrieving the exchange property, **CamelCXFDataFormat**. The exchange key constant is defined in **org.apache.camel.component.cxf.CxfConstants.DATA_FORMAT_PROPERTY**.

CONFIGURING THE CXF ENDPOINTS WITH APACHE ARIES BLUEPRINT.

Since Camel 2.8, there is support for using Aries blueprint dependency injection for your CXF endpoints. The schema is very similar to the Spring schema, so the transition is fairly transparent.

For example:

```
<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xmlns:camel-cxf="http://camel.apache.org/schema/blueprint/cxf"
  xmlns:cxfcore="http://cxf.apache.org/blueprint/core"
  xsi:schemaLocation="http://www.osgi.org/xmlns/blueprint/v1.0.0
https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd">

  <camel-cxf:cxfEndpoint id="routerEndpoint"
    address="http://localhost:9001/router"
    serviceClass="org.apache.servicemix.examples.cxf.HelloWorld">
    <camel-cxf:properties>
      <entry key="dataFormat" value="MESSAGE"/>
    </camel-cxf:properties>
  </camel-cxf:cxfEndpoint>

  <camel-cxf:cxfEndpoint id="serviceEndpoint"
```

```

address="http://localhost:9000/SoapContext/SoapPort"
    serviceClass="org.apache.servicemix.examples.cxf.HelloWorld">
</camel-cxf:cxfEndpoint>

<camelContext xmlns="http://camel.apache.org/schema/blueprint">
  <route>
    <from uri="routerEndpoint"/>
    <to uri="log:request"/>
  </route>
</camelContext>

</blueprint>

```

Currently the endpoint element is the first supported CXF namespacehandler.

You can also use the bean references just as in spring

```

<blueprint xmlns="http://www.osgi.org/xmlns/blueprint/v1.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:cm="http://aries.apache.org/blueprint/xmlns/blueprint-cm/v1.0.0"
  xmlns:jaxws="http://cxf.apache.org/blueprint/jaxws"
  xmlns:cxf="http://cxf.apache.org/blueprint/core"
  xmlns:camel="http://camel.apache.org/schema/blueprint"
  xmlns:camelcxf="http://camel.apache.org/schema/blueprint/cxf"
  xsi:schemaLocation="
    http://www.osgi.org/xmlns/blueprint/v1.0.0
    https://www.osgi.org/xmlns/blueprint/v1.0.0/blueprint.xsd
    http://cxf.apache.org/blueprint/jaxws http://cxf.apache.org/schemas/blueprint/jaxws.xsd
    http://cxf.apache.org/blueprint/core http://cxf.apache.org/schemas/blueprint/core.xsd
  ">

  <camelcxf:cxfEndpoint id="reportIncident"
    address="/camel-example-cxf-blueprint/webservices/incident"
    wsdlURL="META-INF/wsdl/report_incident.wsdl"
    serviceClass="org.apache.camel.example.reportincident.ReportIncidentEndpoint">
  </camelcxf:cxfEndpoint>

  <bean id="reportIncidentRoutes"
class="org.apache.camel.example.reportincident.ReportIncidentRoutes" />

  <camelContext xmlns="http://camel.apache.org/schema/blueprint">
    <routeBuilder ref="reportIncidentRoutes"/>
  </camelContext>

</blueprint>

```

HOW TO ENABLE CXF'S LOGGINGOUTINTERCEPTOR IN MESSAGE MODE

CXF's **LoggingOutInterceptor** outputs outbound message that goes on the wire to logging system (**java.util.logging**). Since the **LoggingOutInterceptor** is in **PRE_STREAM** phase (but **PRE_STREAM** phase is removed in **MESSAGE** mode), you have to configure **LoggingOutInterceptor** to be run during the **WRITE** phase. The following is an example.

```

<bean id="loggingOutInterceptor" class="org.apache.cxf.interceptor.LoggingOutInterceptor">
  <!-- it really should have been user-prestream but CXF does have such phase! -->
  <constructor-arg value="target/write"/>
</bean>

<cxf:cxfEndpoint id="serviceEndpoint" address="http://localhost:9002/helloworld"
serviceClass="org.apache.camel.component.cxf.HelloService">
  <cxf:outInterceptors>
    <ref bean="loggingOutInterceptor"/>
  </cxf:outInterceptors>
  <cxf:properties>
    <entry key="dataFormat" value="MESSAGE"/>
  </cxf:properties>
</cxf:cxfEndpoint>

```

DESCRIPTION OF RELAYHEADERS OPTION

There are **in-band** and **out-of-band** on-the-wire headers from the perspective of a JAXWS WSDL-first developer.

The **in-band** headers are headers that are explicitly defined as part of the WSDL binding contract for an endpoint such as SOAP headers.

The **out-of-band** headers are headers that are serialized over the wire, but are not explicitly part of the WSDL binding contract.

Headers relaying/filtering is bi-directional.

When a route has a CXF endpoint and the developer needs to have on-the-wire headers, such as SOAP headers, be relayed along the route to be consumed say by another JAXWS endpoint, then set **relayHeaders** to **true**, which is the default value.

AVAILABLE ONLY IN POJO MODE

The **relayHeaders=true** setting expresses an intent to relay the headers. The actual decision on whether a given header is relayed is delegated to a pluggable instance that implements the **MessageHeadersRelay** interface. A concrete implementation of **MessageHeadersRelay** is consulted to decide if a header needs to be relayed or not. There is already an implementation of **SoapMessageHeadersRelay** which binds itself to well-known SOAP namespaces. Currently only out-of-band headers are filtered, and in-band headers are always relayed when **relayHeaders=true**. If there is a header on the wire, whose namespace is unknown to the runtime, then a fall back **DefaultMessageHeadersRelay** is used, which simply allows all headers to be relayed.

The **relayHeaders=false** setting asserts that all headers, in-band and out-of-band, is dropped.

You can plugin your own **MessageHeadersRelay** implementations overriding or adding additional ones to the list of relays. To override a preloaded relay instance just make sure that your **MessageHeadersRelay** implementation services the same namespaces as the one you looking to override. Also note, that the overriding relay has to service all of the namespaces as the one you looking to override, or else a runtime exception on route start up is thrown as this would introduce an ambiguity in namespaces to relay instance mappings.

```

<cxf:cxfEndpoint ...>
  <cxf:properties>

```

```

<entry key="org.apache.camel.cxf.message.headers.relays">
  <list>
    <ref bean="customHeadersRelay"/>
  </list>
</entry>
</cxf:properties>
</cxf:cxfEndpoint>
<bean id="customHeadersRelay"
class="org.apache.camel.component.cxf.soap.headers.CustomHeadersRelay"/>

```

Take a look at the tests that show how you'd be able to relay/drop headers here:

link:<https://svn.apache.org/repos/asf/camel/branches/camel-1.x/components/camel-cxf/src/test/java/org/apache/camel/component/cxf/soap/headers/CxfMessageHeadersRelayTest.java>[1.x/components/camel-cxf/src/test/java/org/apache/camel/component/cxf/soap/headers/CxfMessageHeadersRelayTest.java]

CHANGES SINCE RELEASE 2.0

- **POJO** and **PAYLOAD** modes are supported. In **POJO** mode, only out-of-band message headers are available for filtering as the in-band headers have been processed and removed from the header list by CXF. The in-band headers are incorporated into the **MessageContentList** in **POJO** mode. The **camel-cxf** component does not make any attempt to remove the in-band headers from the **MessageContentList**. If filtering of in-band headers is required, please use **PAYLOAD** mode or plug in a (pretty straightforward) CXF interceptor/JAXWS Handler to the CXF endpoint.
- The Message Header Relay mechanism has been merged into **CxfHeaderFilterStrategy**. The **relayHeaders** option, its semantics, and default value remain the same, but it is a property of **CxfHeaderFilterStrategy**. Here is an example of configuring it.

```

<bean id="dropAllMessageHeadersStrategy"
class="org.apache.camel.component.cxf.common.header.CxfHeaderFilterStrategy">

  <!-- Set relayHeaders to false to drop all SOAP headers -->
  <property name="relayHeaders" value="false"/>

</bean>

```

Then, your endpoint can reference the **CxfHeaderFilterStrategy**.

```

<route>
  <from uri="cxf:bean:routerNoRelayEndpoint?
headerFilterStrategy=#dropAllMessageHeadersStrategy"/>
  <to uri="cxf:bean:serviceNoRelayEndpoint?
headerFilterStrategy=#dropAllMessageHeadersStrategy"/>
</route>

```

- The **MessageHeadersRelay** interface has changed slightly and has been renamed to **MessageHeaderFilter**. It is a property of **CxfHeaderFilterStrategy**. Here is an example of configuring user defined Message Header Filters:

```

<bean id="customMessageFilterStrategy"
class="org.apache.camel.component.cxf.common.header.CxfHeaderFilterStrategy">

```

```

<property name="messageHeaderFilters">
  <list>
    <!-- SoapMessageHeaderFilter is the built in filter. It can be removed by omitting it. -->
  >
    <bean
class="org.apache.camel.component.cxf.common.header.SoopMessageHeaderFilter"/>

    <!-- Add custom filter here -->
    <bean class="org.apache.camel.component.cxf.soap.headers.CustomHeaderFilter"/>
  </list>
</property>
</bean>

```

- Other than **relayHeaders**, there are new properties that can be configured in **CxfHeaderFilterStrategy**.

| Name | Description | type | Required? | Default value |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------|-------------------------------|
| relayHeaders | All message headers is processed by Message Header Filters | boolean | No | true (1.6.1 behavior) |
| relayAllMessage Headers | All message headers is propagated (without processing by Message Header Filters) | boolean | No | false (1.6.1 behavior) |
| allowFilterName spaceClash | Handling of overlapping filters in activation namespace. If the value is true , last one wins. If the value is false , it throws an exception. | boolean | No | false (1.6.1 behavior) |

CONFIGURE THE CXF ENDPOINTS WITH SPRING

You can configure the CXF endpoint with the Spring configuration file shown below, and you can also embed the endpoint into the **camelContext** tags. When you are invoking the service endpoint, you can set the **operationName** and **operationNamespace** headers to explicitly state which operation you are calling.

NOTE In Camel 2.x we change to use <http://camel.apache.org/schema/cxf> as the CXF endpoint's target namespace.

```
<beans xmlns="http://www.springframework.org/schema/beans"
```

```

xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:cxf="http://camel.apache.org/schema/cxf"
xsi:schemaLocation="
  http://www.springframework.org/schema/beans
  http://www.springframework.org/schema/beans/spring-beans-2.0.xsd
  http://camel.apache.org/schema/cxf http://camel.apache.org/schema/cxf/camel-cxf.xsd
  http://camel.apache.org/schema/spring http://camel.apache.org/schema/spring/camel-spring.xsd
">
::

```

NOTE

In Apache Camel 2.x, the <http://activemq.apache.org/camel/schema/cxfEndpoint> namespace was changed to <http://camel.apache.org/schema/cxf>.

Be sure to include the JAX-WS **schemaLocation** attribute specified on the root beans element. This allows CXF to validate the file and is required. Also note the namespace declarations at the end of the `<cxf:cxfEndpoint/>` tag—these are required because the combined `{namespace}localName` syntax is presently not supported for this tag's attribute values.

The `cxf:cxfEndpoint` element supports many additional attributes:

| Name | Value |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PortName | The endpoint name this service is implementing, it maps to the <code>wsdl:port@name</code> . In the format of <code>ns:PORT_NAME</code> where <code>ns</code> is a namespace prefix valid at this scope. |
| serviceName | The service name this service is implementing, it maps to the <code>wsdl:service@name</code> . In the format of <code>ns:SERVICE_NAME</code> where <code>ns</code> is a namespace prefix valid at this scope. |
| wsdlURL | The location of the WSDL. Can be on the classpath, file system, or be hosted remotely. |
| bindingId | The bindingId for the service model to use. |
| address | The service publish address. |
| bus | The bus name that is used in the JAX-WS endpoint. |
| serviceClass | The class name of the SEI (Service Endpoint Interface) class which could have JSR181 annotation or not. |

It also supports many child elements:

| Name | Value |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cxf:inInterceptors | The incoming interceptors for this endpoint. A list of <bean> or <ref> . |
| cxf:inFaultInterceptors | The incoming fault interceptors for this endpoint. A list of <bean> or <ref> . |
| cxf:outInterceptors | The outgoing interceptors for this endpoint. A list of <bean> or <ref> . |
| cxf:outFaultInterceptors | The outgoing fault interceptors for this endpoint. A list of <bean> or <ref> . |
| cxf:properties | A properties map to supply to the JAX-WS endpoint. |
| cxf:handlers | A JAX-WS handler list which to provide to the JAX-WS endpoint. |
| cxf:dataBinding | You can specify the which DataBinding is use in the endpoint. This can be supplied using the Spring <bean class="MyDataBinding"/> syntax. |
| cxf:binding | You can specify the BindingFactory for this endpoint to use. This can be supplied using the Spring <bean class="MyBindingFactory"/> syntax. |
| cxf:features | The features that hold the interceptors for this endpoint. A list of <bean> s or <ref> s |
| cxf:schemaLocations | The schema locations for endpoint to use. A list of <schemaLocation> s |
| cxf:serviceFactory | The service factory for this endpoint to use. This can be supplied using the Spring <bean class="MyServiceFactory"/> syntax |

You can find more advanced examples which show how to provide interceptors, properties and handlers here: <http://cwiki.apache.org/CXF20DOC/jax-ws-configuration.html>

NOTE

You can use CXF:properties to set the CXF endpoint's **dataFormat** and **setDefaultBus** properties from a Spring configuration file, as follows:

```
<cxf:cxfEndpoint id="testEndpoint" address="http://localhost:9000/router"
  serviceClass="org.apache.camel.component.cxf.HelloService"
  endpointName="s:PortName"
  serviceName="s:ServiceName"
  xmlns:s="http://www.example.com/test">
  <cxf:properties>
    <entry key="dataFormat" value="MESSAGE"/>
    <entry key="setDefaultBus" value="true"/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

HOW TO MAKE THE CAMEL-CXF COMPONENT USE LOG4J INSTEAD OF JAVA.UTIL.LOGGING

CXF's default logger is **java.util.logging**. If you want to change it to **log4j**, proceed as follows. Create a file, in the classpath, named **META-INF/cxf/org.apache.cxf.logger**. This file must contain the fully-qualified name of the class, **org.apache.cxf.common.logging.Log4jLogger**, with no comments, on a single line.

HOW TO LET CAMEL-CXF RESPONSE MESSAGE WITH XML START DOCUMENT

If you are using some SOAP client such as PHP, can cause this kind of error, because CXF doesn't add the XML start document **<?xml version="1.0" encoding="utf-8"?>**.

Error:sendSms: SoapFault exception: [Client] looks like we got no XML document in [...]

To resolved this issue, you just need to tell StaxOutInterceptor to write the XML start document for you.

```
public class WriteXmlDeclarationInterceptor extends AbstractPhaseInterceptor<SoapMessage> {
  public WriteXmlDeclarationInterceptor() {
    super(Phase.PRE_STREAM);
    addBefore(StaxOutInterceptor.class.getName());
  }

  public void handleMessage(SoapMessage message) throws Fault {
    message.put("org.apache.cxf.stax.force-start-document", Boolean.TRUE);
  }
}
```

You can add a customer interceptor like this and configure it into you **camel-cxf** endpoint

```
<cxf:cxfEndpoint id="routerEndpoint"
  address="http://localhost:${CXFTestSupport.port2}/CXFGreeterRouterTest/CamelContext/RouterPort"

  serviceClass="org.apache.hello_world_soap_http.GreeterImpl"
  skipFaultLogging="true">
```

```

<cx:outInterceptors>
  <!-- This interceptor forces the CXF server send the XML start document to client -->
  <bean class="org.apache.camel.component.cxf.WriteXmlDeclarationInterceptor"/>
</cx:outInterceptors>
<cx:properties>
  <!-- Set the publishedEndpointUrl which could override the service address from generated
WSDL as you want -->
  <entry key="publishedEndpointUrl" value="http://www.simple.com/services/test" />
</cx:properties>
</cx:cxfEndpoint>

```

Or adding a message header for it like this if you are using **Camel 2.4**.

```

// set up the response context which force start document
Map<String, Object> map = new HashMap<String, Object>();
map.put("org.apache.cxf.stax.force-start-document", Boolean.TRUE);
exchange.getOut().setHeader(Client.RESPONSE_CONTEXT, map);

```

HOW TO CONSUME A MESSAGE FROM A CAMEL-CXF ENDPOINT IN POJO DATA FORMAT

The **camel-cxf** endpoint consumer **POJO** data format is based on the [cxf invoker](#), so the message header has a property with the name of **CxfConstants.OPERATION_NAME** and the message body is a list of the SEI method parameters.

```

public class PersonProcessor implements Processor {

    private static final transient Logger LOG = LoggerFactory.getLogger(PersonProcessor.class);

    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        LOG.info("processing exchange in camel");

        BindingOperationInfo boi =
        (BindingOperationInfo)exchange.getProperty(BindingOperationInfo.class.toString());
        if (boi != null) {
            LOG.info("boi.isUnwrapped" + boi.isUnwrapped());
        }
        // Get the parameters list which element is the holder.
        MessageContentsList msgList = (MessageContentsList)exchange.getIn().getBody();
        Holder<String> personId = (Holder<String>)msgList.get(0);
        Holder<String> ssn = (Holder<String>)msgList.get(1);
        Holder<String> name = (Holder<String>)msgList.get(2);

        if (personId.value == null || personId.value.length() == 0) {
            LOG.info("person id 123, so throwing exception");
            // Try to throw out the soap fault message
            org.apache.camel.wsd1_first.types.UnknownPersonFault personFault =
                new org.apache.camel.wsd1_first.types.UnknownPersonFault();
            personFault.setPersonId("");
            org.apache.camel.wsd1_first.UnknownPersonFault fault =
                new org.apache.camel.wsd1_first.UnknownPersonFault("Get the null value of person name",
                personFault);
            // Since camel has its own exception handler framework, we can't throw the exception to

```

```

trigger it
    // We just set the fault message in the exchange for camel-cxf component handling and return
    exchange.getOut().setFault(true);
    exchange.getOut().setBody(fault);
    return;
}

name.value = "Bonjour";
ssn.value = "123";
LOG.info("setting Bonjour as the response");
// Set the response message, first element is the return value of the operation,
// the others are the holders of method parameters
exchange.getOut().setBody(new Object[] {null, personId, ssn, name});
}
}

```

HOW TO PREPARE THE MESSAGE FOR THE CAMEL-CXF ENDPOINT IN POJO DATA FORMAT

The **camel-cxf** endpoint producer is based on the [cxf client API](#). First you need to specify the operation name in the message header, then add the method parameters to a list, and initialize the message with this parameter list. The response message's body is a **messageContentsList**, you can get the result from that list.

If you don't specify the operation name in the message header, **CxfProducer** tries to use the **defaultOperationName** from **CxfEndpoint**. If there is no **defaultOperationName** set on **CxfEndpoint**, it picks up the first operation name from the operation list.

If you want to get the object array from the message body, you can get the body using **message.getBody(Object[].class)**, as follows:

```

Exchange senderExchange = new DefaultExchange(context, ExchangePattern.InOut);
final List<String> params = new ArrayList<String>();
// Prepare the request message for the camel-cxf procedure
params.add(TEST_MESSAGE);
senderExchange.getIn().setBody(params);
senderExchange.getIn().setHeader(CxfConstants.OPERATION_NAME, ECHO_OPERATION);

Exchange exchange = template.send("direct:EndpointA", senderExchange);

org.apache.camel.Message out = exchange.getOut();
// The response message's body is an MessageContentsList which first element is the return value of
the operation,
// If there are some holder parameters, the holder parameter is filled in the reset of List.
// The result is extract from the MessageContentsList with the String class type
MessageContentsList result = (MessageContentsList)out.getBody();
LOG.info("Received output text: " + result.get(0));
Map<String, Object> responseContext = CastUtils.cast((Map<?, ?
>)out.getHeader(Client.RESPONSE_CONTEXT));
assertNotNull(responseContext);
assertEquals("The response context", "UTF-8",
responseContext.get(org.apache.cxf.message.Message.ENCODING));
assertEquals("Reply body on Camel is wrong", "echo " + TEST_MESSAGE, result.get(0));

```

HOW TO DEAL WITH THE MESSAGE FOR A CAMEL-CXF ENDPOINT IN PAYLOAD DATA FORMAT

In Apache Camel 2.0: `CxfMessage.getBody()` returns an `org.apache.camel.component.cxf.CxfPayload` object, which has getters for SOAP message headers and Body elements. This change enables decoupling the native CXF message from the Apache Camel message.

```
protected RouteBuilder createRouteBuilder() {
    return new RouteBuilder() {
        public void configure() {
            from(SIMPLE_ENDPOINT_URI + "&dataFormat=PAYLOAD").to("log:info").process(new
Processor() {
                @SuppressWarnings("unchecked")
                public void process(final Exchange exchange) throws Exception {
                    CxfPayload<SoapHeader> requestPayload =
exchange.getIn().getBody(CxfPayload.class);
                    List<Source> inElements = requestPayload.getBodySources();
                    List<Source> outElements = new ArrayList<Source>();
                    // You can use a customer toStringConverter to turn a CxfPayload message into String
as you want
                    String request = exchange.getIn().getBody(String.class);
                    XmlConverter converter = new XmlConverter();
                    String documentString = ECHO_RESPONSE;

                    Element in = new XmlConverter().toDOMElement(inElements.get(0));
                    // Just check the element namespace
                    if (!in.getNamespaceURI().equals(ELEMENT_NAMESPACE)) {
                        throw new IllegalArgumentException("Wrong element namespace");
                    }
                    if (in.getLocalName().equals("echoBoolean")) {
                        documentString = ECHO_BOOLEAN_RESPONSE;
                        checkRequest("ECHO_BOOLEAN_REQUEST", request);
                    } else {
                        documentString = ECHO_RESPONSE;
                        checkRequest("ECHO_REQUEST", request);
                    }
                    Document outDocument = converter.toDOMDocument(documentString);
                    outElements.add(new DOMSource(outDocument.getDocumentElement()));
                    // set the payload header with null
                    CxfPayload<SoapHeader> responsePayload = new CxfPayload<SoapHeader>(null,
outElements, null);
                    exchange.getOut().setBody(responsePayload);
                }
            });
        }
    };
}
```

HOW TO GET AND SET SOAP HEADERS IN POJO MODE

POJO means that the data format is a **list of Java objects** when the CXF endpoint produces or consumes Camel exchanges. Even though Apache Camel exposes the message body as POJOs in this mode, the CXF component still provides access to read and write SOAP headers. However, since CXF

interceptors remove in-band SOAP headers from the header list after they have been processed, only out-of-band SOAP headers are available in POJO mode.

The following example illustrates how to get/set SOAP headers. Suppose we have a route that forwards from one CXF endpoint to another. That is, SOAP Client → Apache Camel → CXF service. We can attach two processors to obtain/insert SOAP headers at (1) before request goes out to the CXF service and (2) before response comes back to the SOAP Client. Processor (1) and (2) in this example are `InsertRequestOutHeaderProcessor` and `InsertResponseOutHeaderProcessor`. Our route looks like this:

```
<route>
  <from uri="cxf:bean:routerRelayEndpointWithInsertion"/>
  <process ref="InsertRequestOutHeaderProcessor" />
  <to uri="cxf:bean:serviceRelayEndpointWithInsertion"/>
  <process ref="InsertResponseOutHeaderProcessor" />
</route>
```

In 2.x SOAP headers are propagated to and from Apache Camel Message headers. The Apache Camel message header name is `org.apache.cxf.headers.Header.list`, which is a constant defined in CXF (`org.apache.cxf.headers.Header.HEADER_LIST`). The header value is a `List<>` of CXF `SoapHeader` objects (`org.apache.cxf.binding.soap.SoapHeader`). The following snippet is the `InsertResponseOutHeaderProcessor` (that inserts a new SOAP header in the response message). The way to access SOAP headers in both `InsertResponseOutHeaderProcessor` and `InsertRequestOutHeaderProcessor` are actually the same. The only difference between the two processors is setting the direction of the inserted SOAP header.

```
public static class InsertResponseOutHeaderProcessor implements Processor {

    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        // If exchange is routed from camel-cxf endpoint, this is the header
        List<SoapHeader> soapHeaders = CastUtils.cast((List<?
>)exchange.getIn().getHeader(Header.HEADER_LIST));
        if (soapHeaders == null) {
            // we just create a new soap headers in case the header is null
            soapHeaders = new ArrayList<SoapHeader>();
        }

        // Insert a new header
        String xml = "<?xml version=\"1.0\" encoding=\"utf-8\"?><outofbandHeader "
            + "xmlns=\"http://cxf.apache.org/outofband/Header\" hdrAttribute=\"testHdrAttribute\" "
            + "xmlns:soap=\"http://schemas.xmlsoap.org/soap/envelope/\" soap:mustUnderstand=\"1\">"
            + "<name>New_testOobHeader</name><value>New_testOobHeaderValue</value>"
        </outofbandHeader>";
        SoapHeader newHeader = new SoapHeader(soapHeaders.get(0).getName(),
            DOMUtils.readXml(new StringReader(xml)).getDocumentElement());
        // make sure direction is OUT since it is a response message.
        newHeader.setDirection(Direction.DIRECTION_OUT);
        //newHeader.setMustUnderstand(false);
        soapHeaders.add(newHeader);
    }
}
```

HOW TO GET AND SET SOAP HEADERS IN PAYLOAD MODE

We have already shown how to access SOAP message (**CxfPayload** object) in **PAYLOAD** mode (see [How to deal with the message for a camel-cxf endpoint in PAYLOAD data format](#)).

Once you obtain a **CxfPayload** object, you can invoke the **CxfPayload.getHeaders()** method that returns a **List** of DOM Elements (SOAP headers).

```
from(getRouterEndpointURI()).process(new Processor() {
    @SuppressWarnings("unchecked")
    public void process(Exchange exchange) throws Exception {
        CxfPayload<SoapHeader> payload = exchange.getIn().getBody(CxfPayload.class);
        List<Source> elements = payload.getBodySources();
        assertNotNull("Elements here", elements);
        assertEquals("Get the wrong elements size", 1, elements.size());

        Element el = new XmlConverter().toDOMElement(elements.get(0));
        elements.set(0, new DOMSource(el));
        assertEquals("Get the wrong namespace URI", "http://camel.apache.org/pizza/types",
            el.getNamespaceURI());

        List<SoapHeader> headers = payload.getHeaders();
        assertNotNull("Headers here", headers);
        assertEquals("Get the wrong headers size", headers.size(), 1);
        assertEquals("Get the wrong namespace URI",
            ((Element)(headers.get(0).getObject())).getNamespaceURI(),
            "http://camel.apache.org/pizza/types");
    }
})
.to(getServiceEndpointURI());
```

Since Camel 2.16.0, you can use the same approach as described in [the section called “How to get and set SOAP headers in POJO mode”](#) to set or get the SOAP headers. You can now use the **org.apache.cxf.headers.Header.list** header to get and set a list of SOAP headers. This means that if you have a route that forwards from one Camel CXF endpoint to another (SOAP Client → Camel → CXF service), the SOAP headers sent by the SOAP client are now also forwarded to the CXF service. If you do not want the headers to be forwarded, remove them from the **org.apache.cxf.headers.Header.list** Camel header.

SOAP HEADERS ARE NOT AVAILABLE IN MESSAGE MODE

SOAP headers are not available in **MESSAGE** mode as SOAP processing is skipped.

HOW TO THROW A SOAP FAULT FROM APACHE CAMEL

If you are using a CXF endpoint to consume the SOAP request, you may need to throw the SOAP **Fault** from the camel context. Basically, you can use the **throwFault** DSL to do that; it works for **POJO**, **PAYLOAD** and **MESSAGE** data format. You can define the soap fault like this:

```
SOAP_FAULT = new SoapFault(EXCEPTION_MESSAGE, SoapFault.FAULT_CODE_CLIENT);
Element detail = SOAP_FAULT.getOrCreateDetail();
Document doc = detail.getOwnerDocument();
```

```
Text tn = doc.createTextNode(DETAIL_TEXT);
detail.appendChild(tn);
```

Then throw it as you like:

```
from(routerEndpointURI).setFaultBody(constant(SOAP_FAULT));
```

If your CXF endpoint is working in the **MESSAGE** data format, you could set the the SOAP Fault message in the message body and set the response code in the message header.

```
from(routerEndpointURI).process(new Processor() {

    public void process(Exchange exchange) throws Exception {
        Message out = exchange.getOut();
        // Set the message body with the
        out.setBody(this.getClass().getResourceAsStream("SoapFaultMessage.xml"));
        // Set the response code here
        out.setHeader(org.apache.cxf.message.Message.RESPONSE_CODE, new Integer(500));
    }

});
```

The same is true for the POJO data format. You can set the SOAP Fault on the **Out** body and also indicate it's a fault by calling **Message.setFault(true)**, as follows:

```
from("direct:start").onException(SoapFault.class).maximumRedeliveries(0).handled(true)
    .process(new Processor() {
        public void process(Exchange exchange) throws Exception {
            SoapFault fault = exchange
                .getProperty(Exchange.EXCEPTION_CAUGHT, SoapFault.class);
            exchange.getOut().setFault(true);
            exchange.getOut().setBody(fault);
        }
    })
    .end().to(serviceURI);
```

HOW TO PROPAGATE A CXF ENDPOINT'S REQUEST AND RESPONSE CONTEXT

[cxf client API](#) provides a way to invoke the operation with request and response context. If you are using a CXF endpoint producer to invoke the external Web service, you can set the request context and get the response context with the following code:

```
CxfExchange exchange = (CxfExchange)template.send(getJaxwsEndpointUri(), new
Processor() {
    public void process(final Exchange exchange) {
        final List<String> params = new ArrayList<String>();
        params.add(TEST_MESSAGE);
        // Set the request context to the inMessage
        Map<String, Object> requestContext = new HashMap<String, Object>();
        requestContext.put(BindingProvider.ENDPOINT_ADDRESS_PROPERTY,
JAXWS_SERVER_ADDRESS);
        exchange.getIn().setBody(params);
```

```

        exchange.getIn().setHeader(Client.REQUEST_CONTEXT , requestContext);
        exchange.getIn().setHeader(CxfConstants.OPERATION_NAME,
GREET_ME_OPERATION);
    }
});
org.apache.camel.Message out = exchange.getOut();
// The output is an object array, the first element of the array is the return value
Object[] output = out.getBody(Object[].class);
LOG.info("Received output text: " + output[0]);
// Get the response context form outMessage
Map<String, Object> responseContext =
CastUtils.cast((Map)out.getHeader(Client.RESPONSE_CONTEXT));
assertNotNull(responseContext);
assertEquals("Get the wrong wsdl operation name", "
{http://apache.org/hello_world_soap_http}greetMe",
responseContext.get("javax.xml.ws.wsdl.operation").toString());

```

ATTACHMENT SUPPORT

POJO Mode: Both SOAP with Attachment and MTOM are supported (see example in Payload Mode for enabling MTOM). However, SOAP with Attachment is not tested. Since attachments are marshalled and unmarshalled into POJOs, users typically do not need to deal with the attachment themselves. Attachments are propagated to Camel message's attachments since 2.1. So, it is possible to retrieve attachments by Camel Message API

```
DataHandler Message.getAttachment(String id)
```

Payload Mode: MTOM is supported since 2.1. Attachments can be retrieved by Camel Message APIs mentioned above. SOAP with Attachment is not supported as there is no SOAP processing in this mode.

To enable MTOM, set the CXF endpoint property "mtom_enabled" to **true**. (I believe you can only do it with Spring.)

```

<cxf:cxfEndpoint id="routerEndpoint"
address="http://localhost:${CXFTestSupport.port1}/CxfMtomRouterPayloadModeTest/jaxws-
mtom/hello"
    wsdlURL="mtom.wsdl"
    serviceName="ns:HelloService"
    endpointName="ns:HelloPort"
    xmlns:ns="http://apache.org/camel/cxf/mtom_feature">

<cxf:properties>
    <!-- enable mtom by setting this property to true -->
    <entry key="mtom-enabled" value="true"/>

    <!-- set the camel-cxf endpoint data format to PAYLOAD mode -->
    <entry key="dataFormat" value="PAYLOAD"/>
</cxf:properties>

```

You can produce a Camel message with attachment to send to a CXF endpoint in Payload mode.

```
Exchange exchange = context.createProducerTemplate().send("direct:testEndpoint", new
```

```

Processor() {

    public void process(Exchange exchange) throws Exception {
        exchange.setPattern(ExchangePattern.InOut);
        List<Source> elements = new ArrayList<Source>();
        elements.add(new DOMSource(DOMUtils.readXml(new
StringReader(MtomTestHelper.REQ_MESSAGE)).getDocumentElement()));
        CxfPayload<SoapHeader> body = new CxfPayload<SoapHeader>(new ArrayList<SoapHeader>
(),
        elements, null);
        exchange.getIn().setBody(body);
        exchange.getIn().addAttachment(MtomTestHelper.REQ_PHOTO_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.REQ_PHOTO_DATA,
"application/octet-stream")));

        exchange.getIn().addAttachment(MtomTestHelper.REQ_IMAGE_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.requestJpeg, "image/jpeg")));

    }

});

// process response

CxfPayload<SoapHeader> out = exchange.getOut().getBody(CxfPayload.class);
Assert.assertEquals(1, out.getBody().size());

Map<String, String> ns = new HashMap<String, String>();
ns.put("ns", MtomTestHelper.SERVICE_TYPES_NS);
ns.put("xop", MtomTestHelper.XOP_NS);

XPathUtils xu = new XPathUtils(ns);
Element oute = new XmlConverter().toDOMElement(out.getBody().get(0));
Element ele = (Element)xu.getValue("//ns:DetailResponse/ns:photo/xop:Include", oute,
        XPathConstants.NODE);
String photold = ele.getAttribute("href").substring(4); // skip "cid:"

ele = (Element)xu.getValue("//ns:DetailResponse/ns:image/xop:Include", oute,
        XPathConstants.NODE);
String imageld = ele.getAttribute("href").substring(4); // skip "cid:"

DataHandler dr = exchange.getOut().getAttachment(photold);
Assert.assertEquals("application/octet-stream", dr.getContentType());
MtomTestHelper.assertEquals(MtomTestHelper.RESP_PHOTO_DATA,
        IOUtils.readBytesFromStream(dr.getInputStream()));

dr = exchange.getOut().getAttachment(imageld);
Assert.assertEquals("image/jpeg", dr.getContentType());

BufferedImage image = ImageIO.read(dr.getInputStream());
Assert.assertEquals(560, image.getWidth());
Assert.assertEquals(300, image.getHeight());

```

You can also consume a Camel message received from a CXF endpoint in Payload mode.

```

public static class MyProcessor implements Processor {

```

```

@SuppressWarnings("unchecked")
public void process(Exchange exchange) throws Exception {
    CxfPayload<SoapHeader> in = exchange.getIn().getBody(CxfPayload.class);

    // verify request
    assertEquals(1, in.getBody().size());

    Map<String, String> ns = new HashMap<String, String>();
    ns.put("ns", MtomTestHelper.SERVICE_TYPES_NS);
    ns.put("xop", MtomTestHelper.XOP_NS);

    XPathUtils xu = new XPathUtils(ns);
    Element body = new XmlConverter().toDOMElement(in.getBody().get(0));
    Element ele = (Element)xu.getValue("//ns:Detail/ns:photo/xop:Include", body,
        XPathConstants.NODE);
    String photold = ele.getAttribute("href").substring(4); // skip "cid:"
    assertEquals(MtomTestHelper.REQ_PHOTO_CID, photold);

    ele = (Element)xu.getValue("//ns:Detail/ns:image/xop:Include", body,
        XPathConstants.NODE);
    String imageld = ele.getAttribute("href").substring(4); // skip "cid:"
    assertEquals(MtomTestHelper.REQ_IMAGE_CID, imageld);

    DataHandler dr = exchange.getIn().getAttachment(photold);
    assertEquals("application/octet-stream", dr.getContentType());
    MtomTestHelper.assertEquals(MtomTestHelper.REQ_PHOTO_DATA,
    IOUtils.readBytesFromStream(dr.getInputStream()));

    dr = exchange.getIn().getAttachment(imageld);
    assertEquals("image/jpeg", dr.getContentType());
    MtomTestHelper.assertEquals(MtomTestHelper.requestJpeg,
    IOUtils.readBytesFromStream(dr.getInputStream()));

    // create response
    List<Source> elements = new ArrayList<Source>();
    elements.add(new DOMSource(DOMUtils.readXml(new
    StringReader(MtomTestHelper.RESP_MESSAGE)).getDocumentElement()));
    CxfPayload<SoapHeader> sbody = new CxfPayload<SoapHeader>(new
    ArrayList<SoapHeader>(),
        elements, null);
    exchange.getOut().setBody(sbody);
    exchange.getOut().addAttachment(MtomTestHelper.RESP_PHOTO_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.RESP_PHOTO_DATA,
    "application/octet-stream"))));

    exchange.getOut().addAttachment(MtomTestHelper.RESP_IMAGE_CID,
        new DataHandler(new ByteArrayDataSource(MtomTestHelper.responseJpeg, "image/jpeg"))));
}
}

```

Message Mode: Attachments are not supported as it does not process the message at all.

CXF_MESSAGE Mode: MTOM is supported, and Attachments can be retrieved by Camel Message APIs mentioned above.

NOTE

When receiving a multipart (that is, MTOM) message the default **SOAPMessage** to **String** converter provides the complete multi-part payload on the body. If you require just the SOAP XML as a **String**, you can set the message body with **message.getSOAPPart()**, and Camel convert can do the rest of work for you.

HOW TO PROPAGATE STACK TRACE INFORMATION

It is possible to configure a CXF endpoint so that, when a Java exception is thrown on the server side, the stack trace for the exception is marshalled into a fault message and returned to the client. To enable this feature, set the **dataFormat** to **PAYLOAD** and set the **faultStackTraceEnabled** property to **true** in the **cxfEndpoint** element, as follows:

```
<cxf:cxfEndpoint id="router" address="http://localhost:9002/TestMessage"
  wsdlURL="ship.wsdl"
  endpointName="s:TestSoapEndpoint"
  serviceName="s:TestService"
  xmlns:s="http://test">
  <cxf:properties>
    <!-- enable sending the stack trace back to client; the default value is false-->
    <entry key="faultStackTraceEnabled" value="true" /> <entry key="dataFormat" value="PAYLOAD"
  />
  </cxf:properties>
</cxf:cxfEndpoint>
```

For security reasons, the stack trace does not include the causing exception (that is, the part of a stack trace that follows **Caused by**). If you want to include the causing exception in the stack trace, set the **exceptionMessageCauseEnabled** property to **true** in the **cxfEndpoint** element, as follows:

```
<cxf:cxfEndpoint id="router" address="http://localhost:9002/TestMessage"
  wsdlURL="ship.wsdl"
  endpointName="s:TestSoapEndpoint"
  serviceName="s:TestService"
  xmlns:s="http://test">
  <cxf:properties>
    <!-- enable to show the cause exception message and the default value is false -->
    <entry key="exceptionMessageCauseEnabled" value="true" />
    <!-- enable to send the stack trace back to client, the default value is false-->
    <entry key="faultStackTraceEnabled" value="true" />
    <entry key="dataFormat" value="PAYLOAD" />
  </cxf:properties>
</cxf:cxfEndpoint>
```

WARNING

Only enable the **exceptionMessageCauseEnabled** flag for testing and diagnostic purposes. It is normal practice for servers to conceal the original cause of an exception to make it harder for hostile users to probe the server.

STREAMING SUPPORT IN PAYLOAD MODE

In 2.8.2, the camel-cxf component now supports streaming of incoming messages when using PAYLOAD mode. Previously, the incoming messages would have been completely DOM parsed. For large messages, this is time consuming and uses a significant amount of memory. Starting in 2.8.2, the incoming messages can remain as a `javax.xml.transform.Source` while being routed and, if nothing modifies the payload, can then be directly streamed out to the target destination. For common "simple proxy" use cases (example: `from("cxf:...").to("cxf:...")`), this can provide very significant performance increases as well as significantly lowered memory requirements.

However, there are cases where streaming may not be appropriate or desired. Due to the streaming nature, invalid incoming XML may not be caught until later in the processing chain. Also, certain actions may require the message to be DOM parsed anyway (like WS-Security or message tracing and such) in which case the advantages of the streaming is limited. At this point, there are two ways to control the streaming:

- Endpoint property: you can add `allowStreaming=false` as an endpoint property to turn the streaming on/off.
- Component property: the `CxfComponent` object also has an `allowStreaming` property that can set the default for endpoints created from that component.
- Global system property: you can add a system property of **`org.apache.camel.component.cxf.streaming`** to **`false`** to turn it off. That sets the global default, but setting the endpoint property above overrides this value for that endpoint.

USING THE GENERIC CXF DISPATCH MODE

From 2.8.0, the camel-cxf component supports the generic [CXF dispatch mode](#) that can transport messages of arbitrary structures (i.e., not bound to a specific XML schema). To use this mode, you simply omit specifying the `wsdlURL` and `serviceClass` attributes of the CXF endpoint.

```
<cxf:cxfEndpoint id="testEndpoint" address="http://localhost:9000/SoapContext/SoapAnyPort">
  <cxf:properties>
    <entry key="dataFormat" value="PAYLOAD"/>
  </cxf:properties>
</cxf:cxfEndpoint>
```

It is noted that the default CXF dispatch client does not send a specific SOAPAction header. Therefore, when the target service requires a specific SOAPAction value, it is supplied in the Camel header using the key `SOAPAction` (case-insensitive).

78.1. CXF CONSUMERS ON WILDFLY

The configuration of camel-cxf consumers on WildFly is different to that of standalone Camel. Producer endpoints work as per normal.

On WildFly, camel-cxf consumers leverage the default Undertow HTTP server provided by the container. The server is defined within the undertow subsystem configuration. Here's an excerpt of the default configuration from `standalone.xml`:

```
<subsystem xmlns="urn:jboss:domain:undertow:4.0">
  <buffer-cache name="default" />
  <server name="default-server">
```

```

<http-listener name="default" socket-binding="http" redirect-socket="https" enable-http2="true" />
<https-listener name="https" socket-binding="https" security-realm="ApplicationRealm" enable-
http2="true" />
  <host name="default-host" alias="localhost">
    <location name="/" handler="welcome-content" />
    <filter-ref name="server-header" />
    <filter-ref name="x-powered-by-header" />
    <http-invoker security-realm="ApplicationRealm" />
  </host>
</server>
</subsystem>

```

In this instance, Undertow is configured to listen on interfaces / ports specified by the http and https socket-binding. By default this is port 8080 for http and 8443 for https.

For example, if you configure an endpoint consumer using different host or port combinations, a warning will appear within the server log file. For example the following host & port configurations would be ignored:

```

<cxfrsServer id="cxfrsConsumer"
  address="http://somehost:1234/path/to/resource"
  serviceClass="org.example.ServiceClass" />

```

```

<cxfcxfEndpoint id="cxfcxfConsumer"
  address="http://somehost:1234/path/to/resource"
  serviceClass="org.example.ServiceClass" />

```

```

[org.wildfly.extension.camel] (pool-2-thread-1) Ignoring configured host:
http://somehost:1234/path/to/resource

```

However, the consumer is still available on the default host & port localhost:8080 or localhost:8443.

NOTE

Applications which use camel-cxf consumers **must** be packaged as a WAR. In previous WildFly-Camel releases, other types of archive such as JAR were permitted, but this is no longer supported.

78.1.1. Configuring alternative ports

If alternative ports are to be accepted, then these must be configured via the WildFly subsystem configuration. This is explained in the server documentation:

https://access.redhat.com/documentation/en-us/red_hat_jboss_enterprise_application_platform/7.1/html/configuration_guide/configuring_the_web_ser

78.1.2. Configuring SSL

To configure SSL, refer to the WildFly SSL configuration guide:

https://access.redhat.com/documentation/en-us/red_hat_jboss_enterprise_application_platform/7.1/html-single/how_to_configure_server_security/#configure_one_way_and_two_way_ssl_tls_for_application

78.1.3. Configuring security with Elytron

WildFly-Camel supports securing camel-cxf consumer endpoints with the [Elytron](#) security framework.

78.1.3.1. Configuring a security domain

To secure a WildFly-Camel application with Elytron, an application security domain needs to be referenced within **WEB-INF/jboss-web.xml** of your WAR deployment:

```
<jboss-web>
  <security-domain>my-application-security-domain</security-domain>
</jboss-web>
```

The **<security-domain>** configuration references the name of an **<application-security-domain>** defined by the Undertow subsystem. For example, the Undertow subsystem **<application-security-domain>** is configured within the WildFly server **standalone.xml** configuration file as follows:

```
<subsystem xmlns="urn:jboss:domain:undertow:6.0">
  ...
  <application-security-domains>
    <application-security-domain name="my-application-security-domain" http-authentication-
factory="application-http-authentication"/>
  </application-security-domains>
</subsystem>
```

The **<http-authentication-factory>** **application-http-authentication** is defined within the Elytron subsystem. **application-http-authentication** is available by default in both the **standalone.xml** and **standalone-full.xml** server configuration files. For example:

```
<subsystem xmlns="urn:wildfly:elytron:1.2">
  ...
  <http>
    ...
    <http-authentication-factory name="application-http-authentication" http-server-mechanism-
factory="global" security-domain="ApplicationDomain">
      <mechanism-configuration>
        <mechanism mechanism-name="BASIC">
          <mechanism-realm realm-name="Application Realm" />
        </mechanism>
        <mechanism mechanism-name="FORM" />
      </mechanism-configuration>
    </http-authentication-factory>
    <provider-http-server-mechanism-factory name="global" />
  </http>
  ...
</subsystem>
```

The **<http-authentication-factory>** named **application-http-authentication**, holds a reference to a Elytron security domain called **ApplicationDomain**.

For more information on how to configure the Elytron subsystem, refer to the [Elytron documentation](#).

78.1.3.2. Configuring security constraints, authentication methods and security roles

Security constraints, authentication methods and security roles for camel-cxf consumer endpoints can be configured within your WAR deployment **WEB-INF/web.xml**. For example, to configure BASIC Authentication:

```
<web-app>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>secure</web-resource-name>
      <url-pattern>/webservices/*</url-pattern>
    </web-resource-collection>
    <auth-constraint>
      <role-name>my-role</role-name>
    </auth-constraint>
  </security-constraint>
  <security-role>
    <description>The role that is required to log in to /webservices/*</description>
    <role-name>my-role</role-name>
  </security-role>
  <login-config>
    <auth-method>BASIC</auth-method>
    <realm-name>my-realm</realm-name>
  </login-config>
</web-app>
```

Note that the **<url-pattern>** defined by the Servlet Specification is relative to the context path of the web application. If your application is packaged as **my-app.war**, WildFly will make it accessible under the context path **/my-app** and the **<url-pattern>** **/webservices/*** will be applied to paths relative to **/my-app**.

For example, requests against <http://my-server/my-app/webservices/my-endpoint> will match the **/webservices/*** pattern, while <http://my-server/webservices/my-endpoint> will not match.

This is important because WildFly-Camel allows the creation of camel-cxf endpoint consumers whose base path is outside of the host web application context path. For example, it is possible to create a camel-cxf consumer for <http://my-server/webservices/my-endpoint> inside **my-app.war**.

In order to define security constraints for such out-of-context endpoints, WildFly-Camel supports a custom, *non-standard* **<url-pattern>** convention where prefixing the pattern with three forward slashes **///** will be interpreted as absolute to server host name. For example, to secure <http://my-server/webservices/my-endpoint> inside **my-app.war**, you would add the following configuration to **web.xml**:

```
<web-app>
  <security-constraint>
    <web-resource-collection>
      <web-resource-name>secure</web-resource-name>
      <url-pattern>///webservices/*</url-pattern>
    </web-resource-collection>
    <auth-constraint>
      <role-name>my-role</role-name>
    </auth-constraint>
  </security-constraint>
  <security-role>
    <description>The role that is required to log in to /webservices/*</description>
    <role-name>my-role</role-name>
  </security-role>
```

```
<login-config>  
  <auth-method>BASIC</auth-method>  
  <realm-name>my-realm</realm-name>  
</login-config>  
</web-app>
```

CHAPTER 79. CXF-RS COMPONENT

Available as of Camel version 2.0

The **cxfrs**: component provides integration with [Apache CXF](#) for connecting to JAX-RS 1.1 and 2.0 services hosted in CXF.

When using CXF as a consumer, the [CXF Bean Component](#) allows you to factor out how message payloads are received from their processing as a RESTful or SOAP web service. This has the potential of using a multitude of transports to consume web services. The bean component's configuration is also simpler and provides the fastest method to implement web services using Camel and CXF.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-cxf</artifactId>
  <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

79.1. URI FORMAT

```
cxfrs://address?options
```

Where **address** represents the CXF endpoint's address

```
cxfrs:bean:rsEndpoint
```

Where **rsEndpoint** represents the spring bean's name which presents the CXFRS client or server

For either style above, you can append options to the URI as follows:

```
cxfrs:bean:cxfrsEndpoint?resourceClasses=org.apache.camel.rs.Example
```

79.2. OPTIONS

The CXF-RS component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| useGlobalSslContext Parameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| headerFilterStrategy (filter) | To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. | | HeaderFilterStrategy |

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The CXF-RS endpoint is configured using URI syntax:

```
cxfrs:beanId:address
```

with the following path and query parameters:

79.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|----------------|----------------------------------------------------------------------------|---------|--------|
| beanId | To lookup an existing configured CxfRsEndpoint. Must used bean: as prefix. | | String |
| address | The service publish address. | | String |

79.2.2. Query Parameters (30 parameters):

| Name | Description | Default | Type |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| features (common) | Set the feature list to the CxfRs endpoint. | | List |
| loggingFeatureEnabled (common) | This option enables CXF Logging Feature which writes inbound and outbound REST messages to log. | false | boolean |
| loggingSizeLimit (common) | To limit the total size of number of bytes the logger will output when logging feature has been enabled. | | int |
| modelRef (common) | This option is used to specify the model file which is useful for the resource class without annotation. When using this option, then the service class can be omitted, to emulate document-only endpoints | | String |
| providers (common) | Set custom JAX-RS provider(s) list to the CxfRs endpoint. You can specify a string with a list of providers to lookup in the registry separated by comma. | | String |

| Name | Description | Default | Type |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| resourceClasses (common) | The resource classes which you want to export as REST service. Multiple classes can be separated by comma. | | List |
| schemaLocations (common) | Sets the locations of the schema(s) which can be used to validate the incoming XML or JAXB-driven JSON. | | List |
| skipFaultLogging (common) | This option controls whether the PhaseInterceptorChain skips logging the Fault that it catches. | false | boolean |
| bindingStyle (consumer) | Sets how requests and responses will be mapped to/from Camel. Two values are possible: SimpleConsumer: This binding style processes request parameters, multipart, etc. and maps them to IN headers, IN attachments and to the message body. It aims to eliminate low-level processing of org.apache.cxf.message.MessageContentsList. It also adds more flexibility and simplicity to the response mapping. Only available for consumers. Default: The default style. For consumers this passes on a MessageContentsList to the route, requiring low-level processing in the route. This is the traditional binding style, which simply dumps the org.apache.cxf.message.MessageContentsList coming in from the CXF stack onto the IN message body. The user is then responsible for processing it according to the contract defined by the JAX-RS method signature. Custom: allows you to specify a custom binding through the binding option. | Default | BindingStyle |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which means any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| publishedEndpointUrl (consumer) | This option can override the endpointUrl that published from the WADL which can be accessed with resource address url plus _wadl | | String |

| Name | Description | Default | Type |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| serviceBeans (consumer) | The service beans which you want to export as REST service. Multiple beans can be separated by comma. | | List |
| cookieHandler (producer) | Configure a cookie handler to maintain a HTTP session | | CookieHandler |
| hostnameVerifier (producer) | The hostname verifier to be used. Use the # notation to reference a HostnameVerifier from the registry. | | HostnameVerifier |
| sslContextParameters (producer) | The Camel SSL setting reference. Use the # notation to reference the SSL Context. | | SSLContextParameters |
| throwExceptionOnFailure (producer) | This option tells the CxfRsProducer to inspect return codes and will generate an Exception if the return code is larger than 207. | true | boolean |
| httpClientAPI (producer) | If it is true, the CxfRsProducer will use the HttpClientAPI to invoke the service. If it is false, the CxfRsProducer will use the ProxyClientAPI to invoke the service | true | boolean |
| ignoreDeleteMethodMessageBody (producer) | This option is used to tell CxfRsProducer to ignore the message body of the DELETE method when using HTTP API. | false | boolean |
| maxClientCacheSize (producer) | This option allows you to configure the maximum size of the cache. The implementation caches CXF clients or ClientFactoryBean in CxfProvider and CxfRsProvider. | 10 | int |
| binding (advanced) | To use a custom CxfBinding to control the binding between Camel Message and CXF Message. | | CxfRsBinding |
| bus (advanced) | To use a custom configured CXF Bus. | | Bus |

| Name | Description | Default | Type |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| continuationTimeout (advanced) | This option is used to set the CXF continuation timeout which could be used in CxfConsumer by default when the CXF server is using Jetty or Servlet transport. | 30000 | long |
| cxfrsEndpointConfigurer (advanced) | This option could apply the implementation of org.apache.camel.component.cxf.jaxrs.CxfRsEndpointConfigurer which supports to configure the CXF endpoint in programmatic way. User can configure the CXF server and client by implementing configureServer/Client method of CxfEndpointConfigurer. | | CxfRsEndpointConfigurer |
| defaultBus (advanced) | Will set the default bus when CXF endpoint create a bus by itself | false | boolean |
| headerFilterStrategy (advanced) | To use a custom HeaderFilterStrategy to filter header to and from Camel message. | | HeaderFilterStrategy |
| performInvocation (advanced) | When the option is true, Camel will perform the invocation of the resource class instance and put the response object into the exchange for further processing. | false | boolean |
| propagateContexts (advanced) | When the option is true, JAXRS UriInfo, HttpHeaders, Request and SecurityContext contexts will be available to custom CXFRS processors as typed Camel exchange properties. These contexts can be used to analyze the current requests using JAX-RS API. | false | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

79.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------|------------------------|---------|---------|
| camel.component.cxf.rs.enabled | Enable cxfrs component | true | Boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.cxf.rs.header-filter-strategy</code> | To use a custom <code>org.apache.camel.spi.HeaderFilterStrategy</code> to filter header to and from Camel message. The option is a <code>org.apache.camel.spi.HeaderFilterStrategy</code> type. | | String |
| <code>camel.component.cxf.rs.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.cxf.rs.use-global-ssl-context-parameters</code> | Enable usage of global SSL context parameters. | false | Boolean |

You can also configure the CXF REST endpoint through the spring configuration. Since there are lots of difference between the CXF REST client and CXF REST Server, we provide different configuration for them. Please check out the [schema file](#) and [CXF JAX-RS documentation](#) for more information.

79.4. HOW TO CONFIGURE THE REST ENDPOINT IN CAMEL

In [camel-cxf schema file](#), there are two elements for the REST endpoint definition. `cxf:rsServer` for REST consumer, `cxf:rsClient` for REST producer.

You can find a Camel REST service route configuration example here.

79.5. HOW TO OVERRIDE THE CXF PRODUCER ADDRESS FROM MESSAGE HEADER

The `camel-cxf.rs` producer supports to override the services address by setting the message with the key of "CamelDestinationOverrideUrl".

```
// set up the service address from the message header to override the setting of CXF endpoint
exchange.getIn().setHeader(Exchange.DESTINATION_OVERRIDE_URL,
constant(getServiceAddress()));
```

79.6. CONSUMING A REST REQUEST - SIMPLE BINDING STYLE

Available as of Camel 2.11

The **Default** binding style is rather low-level, requiring the user to manually process the **MessageContentsList** object coming into the route. Thus, it tightly couples the route logic with the method signature and parameter indices of the JAX-RS operation. Somewhat inelegant, difficult and error-prone.

In contrast, the **SimpleConsumer** binding style performs the following mappings, in order to **make the request data more accessible** to you within the Camel Message:

- JAX-RS Parameters (`@HeaderParam`, `@QueryParam`, etc.) are injected as IN message headers. The header name matches the value of the annotation.
- The request entity (POJO or other type) becomes the IN message body. If a single entity cannot be identified in the JAX-RS method signature, it falls back to the original **MessageContentsList**.
- Binary **@Multipart** body parts become IN message attachments, supporting **DataHandler**, **InputStream**, **DataSource** and CXF's **Attachment** class.
- Non-binary **@Multipart** body parts are mapped as IN message headers. The header name matches the Body Part name.

Additionally, the following rules apply to the **Response mapping**:

- If the message body type is different to **javax.ws.rs.core.Response** (user-built response), a new **Response** is created and the message body is set as the entity (so long it's not null). The response status code is taken from the **Exchange.HTTP_RESPONSE_CODE** header, or defaults to 200 OK if not present.
- If the message body type is equal to **javax.ws.rs.core.Response**, it means that the user has built a custom response, and therefore it is respected and it becomes the final response.
- In all cases, Camel headers permitted by custom or default **HeaderFilterStrategy** are added to the HTTP response.

79.6.1. Enabling the Simple Binding Style

This binding style can be activated by setting the **bindingStyle** parameter in the consumer endpoint to value **SimpleConsumer**:

```
from("cxfrs:bean:rsServer?bindingStyle=SimpleConsumer")
.to("log:TEST?showAll=true");
```

79.6.2. Examples of request binding with different method signatures

Below is a list of method signatures along with the expected result from the Simple binding.

public Response doAction(BusinessObject request);

Request payload is placed in IN message body, replacing the original MessageContentsList.

public Response doAction(BusinessObject request, @HeaderParam("abcd") String abcd, @QueryParam("defg") String defg); Request payload placed in IN message body, replacing the original MessageContentsList. Both request params mapped as IN message headers with names abcd and defg.

public Response doAction(@HeaderParam("abcd") String abcd, @QueryParam("defg") String defg); Both request params mapped as IN message headers with names abcd and defg. The original MessageContentsList is preserved, even though it only contains the 2 parameters.

public Response doAction(@Multipart(value="body1") BusinessObject request, @Multipart(value="body2") BusinessObject request2); The first parameter is transferred as a header with name body1, and the second one is mapped as header body2. The original MessageContentsList is

preserved as the IN message body.

public Response doAction(InputStream abcd); The InputStream is unwrapped from the MessageContentsList and preserved as the IN message body.

public Response doAction(DataHandler abcd); The DataHandler is unwrapped from the MessageContentsList and preserved as the IN message body.

79.6.3. More examples of the Simple Binding Style

Given a JAX-RS resource class with this method:

```
@POST @Path("/customers/{type}")
public Response newCustomer(Customer customer, @PathParam("type") String type,
    @QueryParam("active") @DefaultValue("true") boolean active) {
    return null;
}
```

Serviced by the following route:

```
from("cxfrs:bean:rsServer?bindingStyle=SimpleConsumer")
    .recipientList(simple("direct:${header.operationName}"));

from("direct:newCustomer")
    .log("Request: type=${header.type}, active=${header.active}, customerData=${body}");
```

The following HTTP request with XML payload (given that the Customer DTO is JAXB-annotated):

```
POST /customers/gold?active=true

Payload:
<Customer>
  <fullName>Raul Kripalani</fullName>
  <country>Spain</country>
  <project>Apache Camel</project>
</Customer>
```

Will print the message:

```
Request: type=gold, active=true, customerData=<Customer.toString() representation>
```

For more examples on how to process requests and write responses can be found [here](#).

79.7. CONSUMING A REST REQUEST - DEFAULT BINDING STYLE

The [CXF JAXRS front end](#) implements the [JAX-RS \(JSR-311\) API](#), so we can export the resources classes as a REST service. And we leverage the [CXF Invoker API](#) to turn a REST request into a normal Java object method invocation. Unlike the [Camel Restlet](#) component, you don't need to specify the URI template within your endpoint, CXF takes care of the REST request URI to resource class method mapping according to the JSR-311 specification. All you need to do in Camel is delegate this method request to a right processor or endpoint.

Here is an example of a CXFRS route...

■

```

private static final String CXF_RS_ENDPOINT_URI =
    "cxfrs://http://localhost:" + CXT + "/rest?
resourceClasses=org.apache.camel.component.cxf.jaxrs.testbean.CustomerServiceResource";
private static final String CXF_RS_ENDPOINT_URI2 =
    "cxfrs://http://localhost:" + CXT + "/rest2?
resourceClasses=org.apache.camel.component.cxf.jaxrs.testbean.CustomerService";
private static final String CXF_RS_ENDPOINT_URI3 =
    "cxfrs://http://localhost:" + CXT + "/rest3?"
    +
    "resourceClasses=org.apache.camel.component.cxf.jaxrs.testbean.CustomerServiceNoAnnotations&"
    + "modelRef=classpath:/org/apache/camel/component/cxf/jaxrs/CustomerServiceModel.xml";
private static final String CXF_RS_ENDPOINT_URI4 =
    "cxfrs://http://localhost:" + CXT + "/rest4?"
    +
    "modelRef=classpath:/org/apache/camel/component/cxf/jaxrs/CustomerServiceDefaultHandlerModel.xml";
private static final String CXF_RS_ENDPOINT_URI5 =
    "cxfrs://http://localhost:" + CXT + "/rest5?"
    + "propagateContexts=true&"
    +
    "modelRef=classpath:/org/apache/camel/component/cxf/jaxrs/CustomerServiceDefaultHandlerModel.xml";
protected RouteBuilder createRouteBuilder() throws Exception {
    final Processor testProcessor = new TestProcessor();
    final Processor testProcessor2 = new TestProcessor2();
    final Processor testProcessor3 = new TestProcessor3();
    return new RouteBuilder() {
        public void configure() {
            errorHandler(new NoErrorHandlerBuilder());
            from(CXF_RS_ENDPOINT_URI).process(testProcessor);
            from(CXF_RS_ENDPOINT_URI2).process(testProcessor);
            from(CXF_RS_ENDPOINT_URI3).process(testProcessor);
            from(CXF_RS_ENDPOINT_URI4).process(testProcessor2);
            from(CXF_RS_ENDPOINT_URI5).process(testProcessor3);
        }
    };
}

```

And the corresponding resource class used to configure the endpoint...

INFO:*Note about resource classes*

By default, JAX-RS resource classes are **only*used to configure JAX-RS properties. Methods will *not** be executed during routing of messages to the endpoint. Instead, it is the responsibility of the route to do all processing.

Note that starting from Camel 2.15 it is also sufficient to provide an interface only as opposed to a no-op service implementation class for the default mode.

Starting from Camel 2.15, if a **performInvocation** option is enabled, the service implementation will be invoked first, the response will be set on the Camel exchange and the route execution will continue as usual. This can be useful for integrating the existing JAX-RS implementations into Camel routes and for post-processing JAX-RS Responses in custom processors.

```
@Path("/customerservice/")
```

```

public interface CustomerServiceResource {

    @GET
    @Path("/customers/{id}")
    Customer getCustomer(@PathParam("id") String id);

    @PUT
    @Path("/customers/")
    Response updateCustomer(Customer customer);

    @Path("/{id}")
    @PUT()
    @Consumes({ "application/xml", "text/plain",
                "application/json" })
    @Produces({ "application/xml", "text/plain",
                "application/json" })
    Object invoke(@PathParam("id") String id,
                  String payload);
}

```

79.8. HOW TO INVOKE THE REST SERVICE THROUGH CAMEL-CXFERS PRODUCER

The [CXF JAXRS front end](#) implements a [proxy-based client API](#), with this API you can invoke the remote REST service through a proxy. The **camel-cxfers** producer is based on this [proxy API](#). You just need to specify the operation name in the message header and prepare the parameter in the message body, the camel-cxfers producer will generate right REST request for you.

Here is an example:

```

Exchange exchange = template.send("direct://proxy", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.setPattern(ExchangePattern.InOut);
        Message inMessage = exchange.getIn();
        // set the operation name
        inMessage.setHeader(CxfConstants.OPERATION_NAME, "getCustomer");
        // using the proxy client API
        inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_USING_HTTP_API, Boolean.FALSE);
        // set a customer header
        inMessage.setHeader("key", "value");
        // setup the accept content type
        inMessage.setHeader(Exchange.ACCEPT_CONTENT_TYPE, "application/json");
        // set the parameters , if you just have one parameter
        // camel will put this object into an Object[] itself
        inMessage.setBody("123");
    }
});

// get the response message
Customer response = (Customer) exchange.getOut().getBody();

assertNotNull("The response should not be null ", response);
assertEquals("Get a wrong customer id ", 123, response.getId());
assertEquals("Get a wrong customer name", "John", response.getName());

```

```
assertEquals("Get a wrong response code", 200,
exchange.getOut().getHeader(Exchange.HTTP_RESPONSE_CODE));
assertEquals("Get a wrong header value", "value", exchange.getOut().getHeader("key"));
```

The [CXF JAXRS front end](#) also provides a [http centric client API](#). You can also invoke this API from **camel-cxf**s producer. You need to specify the [HTTP_PATH](#) and the [HTTP_METHOD](#) and let the producer use the http centric client API by using the URI option **httpClientAPI** or by setting the message header [CxfConstants.CAMEL_CXF_RS_USING_HTTP_API](#). You can turn the response object to the type class specified with the message header [CxfConstants.CAMEL_CXF_RS_RESPONSE_CLASS](#).

```
Exchange exchange = template.send("direct://http", new Processor() {
    public void process(Exchange exchange) throws Exception {
        exchange.setPattern(ExchangePattern.InOut)
        Message inMessage = exchange.getIn();
        // using the http central client API
        inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_USING_HTTP_API, Boolean.TRUE);
        // set the Http method
        inMessage.setHeader(Exchange.HTTP_METHOD, "GET");
        // set the relative path
        inMessage.setHeader(Exchange.HTTP_PATH, "/customerservice/customers/123");
        // Specify the response class , cxf will use InputStream as the response object type
        inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_RESPONSE_CLASS, Customer.class);
        // set a customer header
        inMessage.setHeader("key", "value");
        // since we use the Get method, so we don't need to set the message body
        inMessage.setBody(null);
    }
});
```

From Camel 2.1, we also support to specify the query parameters from cxf rs URI for the CXFRS http centric client.

```
Exchange exchange = template.send("cxf://http://localhost:9003/testQuery?
httpClientAPI=true&q1=12&q2=13"
```

To support the Dynamical routing, you can override the URI's query parameters by using the [CxfConstants.CAMEL_CXF_RS_QUERY_MAP](#) header to set the parameter map for it.

```
Map<String, String> queryMap = new LinkedHashMap<>();
queryMap.put("q1", "new");
queryMap.put("q2", "world");
inMessage.setHeader(CxfConstants.CAMEL_CXF_RS_QUERY_MAP, queryMap);
```

79.9. WHAT'S THE CAMEL TRANSPORT FOR CXF

In CXF you offer or consume a webservice by defining its address. The first part of the address specifies the protocol to use. For example address="http://localhost:9000" in an endpoint configuration means your service will be offered using the http protocol on port 9000 of localhost. When you integrate Camel Transport into CXF you get a new transport "camel". So you can specify address="camel://direct:MyEndpointName" to bind the CXF service address to a camel direct endpoint.

Technically speaking Camel transport for CXF is a component which implements the [CXF transport API](#) with the Camel core library. This allows you to easily use Camel's routing engine and integration patterns support together with your CXF services.

79.10. INTEGRATE CAMEL INTO CXF TRANSPORT LAYER

To include the Camel Transport into your CXF bus you use the CamelTransportFactory. You can do this in Java as well as in Spring.

79.10.1. Setting up the Camel Transport in Spring

You can use the following snippet in your application context if you want to configure anything special. If you only want to activate the camel transport you do not have to do anything in your application context. As soon as you include the camel-cxf-transport jar (or camel-cxf.jar if your camel version is less than 2.7.x) in your app, cxf will scan the jar and load a CamelTransportFactory for you.

```
<!-- you don't need to specify the CamelTransportFactory configuration as it is auto load by CXF bus -->
-->
<bean class="org.apache.camel.component.cxf.transport.CamelTransportFactory">
  <property name="bus" ref="cxf" />
  <property name="camelContext" ref="camelContext" />
  <!-- checkException new added in Camel 2.1 and Camel 1.6.2 -->
  <!-- If checkException is true , CamelDestination will check the outMessage's
       exception and set it into camel exchange. You can also override this value
       in CamelDestination's configuration. The default value is false.
       This option should be set true when you want to leverage the camel's error
       handler to deal with fault message -->
  <property name="checkException" value="true" />
  <property name="transportIds">
    <list>
      <value>http://cxf.apache.org/transports/camel</value>
    </list>
  </property>
</bean>
```

79.10.2. Integrating the Camel Transport in a programmatic way

Camel transport provides a setContext method that you could use to set the Camel context into the transport factory. If you want this factory take effect, you need to register the factory into the CXF bus. Here is a full example for you.

```
import org.apache.cxf.Bus;
import org.apache.cxf.BusFactory;
import org.apache.cxf.transport.ConduitInitiatorManager;
import org.apache.cxf.transport.DestinationFactoryManager;
...

BusFactory bf = BusFactory.newInstance();
Bus bus = bf.createBus();
CamelTransportFactory camelTransportFactory = new CamelTransportFactory();
// set up the CamelContext which will be use by the CamelTransportFactory
camelTransportFactory.setCamelContext(context)
// if you are using CXF higher then 2.4.x the
camelTransportFactory.setBus(bus);
```

```
// if you are lower CXF, you need to register the ConduitInitiatorManager and
// DestinationFactoryManager like below
// register the conduit initiator
ConduitInitiatorManager cim = bus.getExtension(ConduitInitiatorManager.class);
cim.registerConduitInitiator(CamelTransportFactory.TRANSPORT_ID, camelTransportFactory);
// register the destination factory
DestinationFactoryManager dfm = bus.getExtension(DestinationFactoryManager.class);
dfm.registerDestinationFactory(CamelTransportFactory.TRANSPORT_ID, camelTransportFactory);
// set or bus as the default bus for cxf
BusFactory.setDefaultBus(bus);
```

79.11. CONFIGURE THE DESTINATION AND CONDUIT WITH SPRING

79.11.1. Namespace

The elements used to configure an Camel transport endpoint are defined in the namespace <http://cxf.apache.org/transports/camel>. It is commonly referred to using the prefix **camel**. In order to use the Camel transport configuration elements, you will need to add the lines shown below to the beans element of your endpoint's configuration file. In addition, you will need to add the configuration elements' namespace to the **xsi:schemaLocation** attribute.

Adding the Configuration Namespace

```
<beans ...
  xmlns:camel="http://cxf.apache.org/transports/camel
  ...
  xsi:schemaLocation="...
    http://cxf.apache.org/transports/camel
    http://cxf.apache.org/transports/camel.xsd
  ...>
```

79.11.2. The destination element

You configure an Camel transport server endpoint using the **camel:destination** element and its children. The **camel:destination** element takes a single attribute, **name**, that specifies the WSDL port element that corresponds to the endpoint. The value for the **name** attribute takes the form `portQName` .camel-destination``. The example below shows the **camel:destination** element that would be used to add configuration for an endpoint that was specified by the WSDL fragment **<port binding="widgetSOAPBinding" name="widgetSOAPPort">** if the endpoint's target namespace was <http://widgets.widgetvendor.net>.

camel:destination Element

```
...
<camel:destination name="{http://widgets/widgetvendor.net}widgetSOAPPort.http-destination">
  <camelContext id="context" xmlns="http://activemq.apache.org/camel/schema/spring">
    <route>
      <from uri="direct:EndpointC" />
      <to uri="direct:EndpointD" />
    </route>
  </camelContext>
</camel:destination>
```

```

<!-- new added feature since Camel 2.11.x
<camel:destination name="{http://widgets/widgetvendor.net}widgetSOAPPort.camel-destination"
camelContextId="context" />
...

```

The **camel:destination** element for Spring has a number of child elements that specify configuration information. They are described below.

Element

Description

camel-spring:camelContext

You can specify the camel context in the camel destination

camel:camelContextRef

The camel context id which you want inject into the camel destination

79.11.3. The conduit element

You configure a Camel transport client using the **camel:conduit** element and its children. The **camel:conduit** element takes a single attribute, **name**, that specifies the WSDL port element that corresponds to the endpoint. The value for the **name** attribute takes the form `port QName`.camel-conduit``. For example, the code below shows the **camel:conduit** element that would be used to add configuration for an endpoint that was specified by the WSDL fragment **<port binding="widgetSOAPBinding" name="widgetSOAPPort">** if the endpoint's target namespace was <http://widgets.widgetvendor.net>.

http-conf:conduit Element

```

...
<camelContext id="conduit_context" xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="direct:EndpointA" />
    <to uri="direct:EndpointB" />
  </route>
</camelContext>

<camel:conduit name="{http://widgets/widgetvendor.net}widgetSOAPPort.camel-conduit">
  <camel:camelContextRef>conduit_context</camel:camelContextRef>
</camel:conduit>

<!-- new added feature since Camel 2.11.x
<camel:conduit name="{http://widgets/widgetvendor.net}widgetSOAPPort.camel-conduit"
camelContextId="conduit_context" />

<camel:conduit name="*.camel-conduit">
<!-- you can also using the wild card to specify the camel-conduit that you want to configure -->
...
</camel:conduit>
...

```

-

The **camel:conduit** element has a number of child elements that specify configuration information. They are described below.

Element

Description

camel-spring:camelContext

You can specify the camel context in the camel conduit

camel:camelContextRef

The camel context id which you want inject into the camel conduit

79.12. CONFIGURE THE DESTINATION AND CONDUIT WITH BLUEPRINT

From **Camel 2.11.x**, Camel Transport supports to be configured with Blueprint.

If you are using blueprint, you should use the namespace <http://xf.apache.org/transports/camel/blueprint> and import the schema like the blow.

Adding the Configuration Namespace for blueprint

```
<beans ...
  xmlns:camel="http://xf.apache.org/transports/camel/blueprint"
  ...
  xsi:schemaLocation="...
    http://xf.apache.org/transports/camel/blueprint
    http://xf.apache.org/schememas/blueprint/camel.xsd
  ...>
```

In blueprint **camel:conduit camel:destination** only has one camelContextId attribute, they doesn't support to specify the camel context in the camel destination.

```
<camel:conduit id="*.camel-conduit" camelContextId="camel1" />
<camel:destination id="*.camel-destination" camelContextId="camel1" />
```

79.13. EXAMPLE USING CAMEL AS A LOAD BALANCER FOR CXF

This example shows how to use the camel load balancing feature in CXF. You need to load the configuration file in CXF and publish the endpoints on the address "camel://direct:EndpointA" and "camel://direct:EndpointB"

79.14. COMPLETE HOWTO AND EXAMPLE FOR ATTACHING CAMEL TO CXF

[Better JMS Transport for CXF Webservice using Apache Camel](#)

CHAPTER 80. DATA FORMAT COMPONENT

Available as of Camel version 2.12

The `dataformat:` component allows to use [Data Format](#) as a Camel Component.

80.1. URI FORMAT

```
dataformat:name:(marshal|unmarshal)[?options]
```

Where **name** is the name of the Data Format. And then followed by the operation which must either be **marshal** or **unmarshal**. The options is used for configuring the [Data Format](#) in use. See the Data Format documentation for which options it support.

80.2. DATAFORMAT OPTIONS

The Data Format component has no options.

The Data Format endpoint is configured using URI syntax:

```
dataformat:name:operation
```

with the following path and query parameters:

80.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------------|--------------------------------------------------------------|---------|--------|
| <code>name</code> | Required Name of data format | | String |
| <code>operation</code> | Required Operation to use either marshal or unmarshal | | String |

80.2.2. Query Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>synchronous</code> (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

80.3. SAMPLES

For example to use the [JAXB Data Format](#) we can do as follows:

```
from("activemq:My.Queue").  
  to("dataformat:jaxb:unmarshal?contextPath=com.acme.model").  
  to("mqseries:Another.Queue");
```

And in XML DSL you do:

```
<camelContext id="camel" xmlns="http://camel.apache.org/schema/spring">  
  <route>  
    <from uri="activemq:My.Queue"/>  
    <to uri="dataformat:jaxb:unmarshal?contextPath=com.acme.model"/>  
    <to uri="mqseries:Another.Queue"/>  
  </route>  
</camelContext>
```

CHAPTER 81. DATASET COMPONENT

Available as of Camel version 1.3

Testing of distributed and asynchronous processing is notoriously difficult. The [Mock](#), [Test](#) and [DataSet](#) endpoints work great with the Camel Testing Framework to simplify your unit and integration testing using [Enterprise Integration Patterns](#) and Camel's large range of Components together with the powerful Bean Integration.

The DataSet component provides a mechanism to easily perform load & soak testing of your system. It works by allowing you to create [DataSet instances](#) both as a source of messages and as a way to assert that the data set is received.

Camel will use the [throughput logger](#) when sending dataset's.

81.1. URI FORMAT

```
dataset:name[?options]
```

Where **name** is used to find the [DataSet instance](#) in the Registry

Camel ships with a support implementation of **org.apache.camel.component.dataset.DataSet**, the **org.apache.camel.component.dataset.DataSetSupport** class, that can be used as a base for implementing your own DataSet. Camel also ships with some implementations that can be used for testing: **org.apache.camel.component.dataset.SimpleDataSet**, **org.apache.camel.component.dataset.ListDataSet** and **org.apache.camel.component.dataset.FileDataSet**, all of which extend **DataSetSupport**.

81.2. OPTIONS

The Dataset component has no options.

The Dataset endpoint is configured using URI syntax:

```
dataset:name
```

with the following path and query parameters:

81.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|----------------------------------------------------|---------|---------|
| name | Required Name of DataSet to lookup in the registry | | DataSet |

81.2.2. Query Parameters (19 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| dataSetIndex (common) | Controls the behaviour of the CamelDataSetIndex header. For Consumers: - off = the header will not be set - strict/lenient = the header will be set For Producers: - off = the header value will not be verified, and will not be set if it is not present = strict = the header value must be present and will be verified = lenient = the header value will be verified if it is present, and will be set if it is not present | lenient | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored. | false | boolean |
| initialDelay (consumer) | Time period in millis to wait before starting sending messages. | 1000 | long |
| minRate (consumer) | Wait until the DataSet contains at least this number of messages | 0 | int |
| preloadSize (consumer) | Sets how many messages should be preloaded (sent) before the route completes its initialization | 0 | long |
| produceDelay (consumer) | Allows a delay to be specified which causes a delay when a message is sent by the consumer (to simulate slow processing) | 3 | long |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the default exchange pattern when creating an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------|
| assertPeriod (producer) | Sets a grace period after which the mock endpoint will re-assert to ensure the preliminary assertion is still valid. This is used for example to assert that exactly a number of messages arrives. For example if <code>expectedMessageCount(int)</code> was set to 5, then the assertion is satisfied when 5 or more message arrives. To ensure that exactly 5 messages arrives, then you would need to wait a little period to ensure no further message arrives. This is what you can use this <code>setAssertPeriod(long)</code> method for. By default this period is disabled. | 0 | long |
| consumeDelay (producer) | Allows a delay to be specified which causes a delay when a message is consumed by the producer (to simulate slow processing) | 0 | long |
| expectedCount (producer) | Specifies the expected number of message exchanges that should be received by this endpoint. Beware: If you want to expect that 0 messages, then take extra care, as 0 matches when the tests starts, so you need to set a assert period time to let the test run for a while to make sure there are still no messages arrived; for that use <code>setAssertPeriod(long)</code> . An alternative is to use <code>NotifyBuilder</code> , and use the notifier to know when Camel is done routing some messages, before you call the <code>assertIsSatisfied()</code> method on the mocks. This allows you to not use a fixed assert period, to speedup testing times. If you want to assert that exactly n'th message arrives to this mock endpoint, then see also the <code>setAssertPeriod(long)</code> method for further details. | -1 | int |
| reportGroup (producer) | A number that is used to turn on throughput logging based on groups of the size. | | int |
| resultMinimumWaitTime (producer) | Sets the minimum expected amount of time (in millis) the <code>assertIsSatisfied()</code> will wait on a latch until it is satisfied | 0 | long |
| resultWaitTime (producer) | Sets the maximum amount of time (in millis) the <code>assertIsSatisfied()</code> will wait on a latch until it is satisfied | 0 | long |

| Name | Description | Default | Type |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| retainFirst (producer) | Specifies to only retain the first n'th number of received Exchanges. This is used when testing with big data, to reduce memory consumption by not storing copies of every Exchange this mock endpoint receives. Important: When using this limitation, then the <code>getReceivedCounter()</code> will still return the actual number of received Exchanges. For example if we have received 5000 Exchanges, and have configured to only retain the first 10 Exchanges, then the <code>getReceivedCounter()</code> will still return 5000 but there is only the first 10 Exchanges in the <code>getExchanges()</code> and <code>getReceivedExchanges()</code> methods. When using this method, then some of the other expectation methods is not supported, for example the <code>expectedBodiesReceived(Object...)</code> sets a expectation on the first number of bodies received. You can configure both <code>setRetainFirst(int)</code> and <code>setRetainLast(int)</code> methods, to limit both the first and last received. | -1 | int |
| retainLast (producer) | Specifies to only retain the last n'th number of received Exchanges. This is used when testing with big data, to reduce memory consumption by not storing copies of every Exchange this mock endpoint receives. Important: When using this limitation, then the <code>getReceivedCounter()</code> will still return the actual number of received Exchanges. For example if we have received 5000 Exchanges, and have configured to only retain the last 20 Exchanges, then the <code>getReceivedCounter()</code> will still return 5000 but there is only the last 20 Exchanges in the <code>getExchanges()</code> and <code>getReceivedExchanges()</code> methods. When using this method, then some of the other expectation methods is not supported, for example the <code>expectedBodiesReceived(Object...)</code> sets a expectation on the first number of bodies received. You can configure both <code>setRetainFirst(int)</code> and <code>setRetainLast(int)</code> methods, to limit both the first and last received. | -1 | int |
| sleepForEmptyTest (producer) | Allows a sleep to be specified to wait to check that this endpoint really is empty when <code>expectedMessageCount(int)</code> is called with zero | 0 | long |
| copyOnExchange (producer) | Sets whether to make a deep copy of the incoming Exchange when received at this mock endpoint. Is by default true. | true | boolean |

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

You can append query options to the URI in the following format, **?option=value&option=value&...**

81.3. CONFIGURING DATASET

Camel will lookup in the Registry for a bean implementing the DataSet interface. So you can register your own DataSet as:

```
<bean id="myDataSet" class="com.mycompany.MyDataSet">
  <property name="size" value="100"/>
</bean>
```

81.4. EXAMPLE

For example, to test that a set of messages are sent to a queue and then consumed from the queue without losing any messages:

```
// send the dataset to a queue
from("dataset:foo").to("activemq:SomeQueue");

// now lets test that the messages are consumed correctly
from("activemq:SomeQueue").to("dataset:foo");
```

The above would look in the Registry to find the **foo** DataSet instance which is used to create the messages.

Then you create a DataSet implementation, such as using the **SimpleDataSet** as described below, configuring things like how big the data set is and what the messages look like etc.

81.5. DATASETSUPPORT (ABSTRACT CLASS)

The DataSetSupport abstract class is a nice starting point for new DataSets, and provides some useful features to derived classes.

81.5.1. Properties on DataSetSupport

| Property | Type | Default | Description |
|-----------------------|----------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| defaultHeaders | Map<String, Object> | null | Specifies the default message body. For SimpleDataSet it is a constant payload; though if you want to create custom payloads per message, create your own derivation of DataSetSupport . |

| Property | Type | Default | Description |
|--------------------------|-----------------------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| outputTransformer | org.apache.camel.Processor | null | |
| size | long | 10 | Specifies how many messages to send/consume. |
| reportCount | long | -1 | Specifies the number of messages to be received before reporting progress. Useful for showing progress of a large load test. If < 0, then size / 5, if is 0 then size , else set to reportCount value. |

81.6. SIMPLEDATASET

The **SimpleDataSet** extends **DataSetSupport**, and adds a default body.

81.6.1. Additional Properties on SimpleDataSet

| Property | Type | Default | Description |
|--------------------|---------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| defaultBody | Object | <hello>world!</hello> | Specifies the default message body. By default, the SimpleDataSet produces the same constant payload for each exchange. If you want to customize the payload for each exchange, create a Camel Processor and configure the SimpleDataSet to use it by setting the outputTransformer property. |

81.7. LISTDATASET

Available since Camel 2.17

The **ListDataSet** extends **DataSetSupport**, and adds a list of default bodies.

81.7.1. Additional Properties on ListDataSet

| Property | Type | Default | Description |
|----------------------|---------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| defaultBodies | List<Object> | emptyLinkedList<Object> | Specifies the default message body. By default, the ListDataSet selects a constant payload from the list of defaultBodies using the CamelDataSetIndex . If you want to customize the payload, create a Camel Processor and configure the ListDataSet to use it by setting the outputTransformer property. |

| Property | Type | Default | Description |
|-------------|-------------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| size | long | the size of the default Bodies list | Specifies how many messages to send/consume. This value can be different from the size of the defaultBodies list. If the value is less than the size of the defaultBodies list, some of the list elements will not be used. If the value is greater than the size of the defaultBodies list, the payload for the exchange will be selected using the modulus of the CamelDataSetIndex and the size of the defaultBodies list (i.e. CamelDataSetIndex % defaultBodies.size()) |

81.8. FILEDATASET

Available since Camel 2.17

The **FileDataSet** extends **ListDataSet**, and adds support for loading the bodies from a file.

81.8.1. Additional Properties on FileDataSet

| Property | Type | Default | Description |
|-------------------|---------------|---------|--------------------------------------------------------------------------------------------------------------|
| sourceFile | File | null | Specifies the source file for payloads |
| delimiter | String | \z | Specifies the delimiter pattern used by a java.util.Scanner to split the file into multiple payloads. |

CHAPTER 82. DIGITALOCEAN COMPONENT

Available as of Camel version 2.19

The **DigitalOcean** component allows you to manage Droplets and resources within the DigitalOcean cloud with **Camel** by encapsulating [digitalocean-api-java] (<https://www.digitalocean.com/community/projects/api-client-in-java>). All of the functionality that you are familiar with in the DigitalOcean control panel is also available through this Camel component.

82.1. PREREQUISITES

You must have a valid DigitalOcean account and a valid OAuth token. You can generate an OAuth token by visiting the [Apps & API](<https://cloud.digitalocean.com/settings/applications>) section of the DigitalOcean control panel for your account.

82.2. URI FORMAT

The **DigitalOcean Component** uses the following URI format:

```
digitalocean://endpoint?[options]
```

where **endpoint** is a DigitalOcean resource type.

Example : to list your droplets:

```
digitalocean://droplets?operation=list&oAuthToken=XXXXXX&page=1&perPage=10
```

The DigitalOcean component only supports producer endpoints so you cannot use this component at the beginning of a route to listen to messages in a channel.

82.3. OPTIONS

The DigitalOcean component has no options.

The DigitalOcean endpoint is configured using URI syntax:

```
digitalocean:operation
```

with the following path and query parameters:

82.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------|-------------------------------------------------|---------|------------------------|
| operation | The operation to perform to the given resource. | | DigitalOceanOperations |

82.3.2. Query Parameters (10 parameters):

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| page (producer) | Use for pagination. Force the page number. | 1 | Integer |
| perPage (producer) | Use for pagination. Set the number of item per request. The maximum number of results per page is 200. | 25 | Integer |
| resource (producer) | Required The DigitalOcean resource type on which perform the operation. | | DigitalOceanResources |
| digitalOceanClient (advanced) | To use a existing configured DigitalOceanClient as client | | DigitalOceanClient |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| httpProxyHost (proxy) | Set a proxy host if needed | | String |
| httpProxyPassword (proxy) | Set a proxy password if needed | | String |
| httpProxyPort (proxy) | Set a proxy port if needed | | Integer |
| httpProxyUser (proxy) | Set a proxy host if needed | | String |
| oAuthToken (security) | DigitalOcean OAuth Token | | String |

82.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.digitalocean.enabled | Enable digitalocean component | true | Boolean |
| camel.component.digitalocean.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

You have to provide an **operation** value for each endpoint, with the **operation** URI option or the **CamelDigitalOceanOperation** message header.

All **operation** values are defined in **DigitalOceanOperations** enumeration.

All **header** names used by the component are defined in **DigitalOceanHeaders** enumeration.

82.5. MESSAGE BODY RESULT

All message bodies returned are using objects provided by the **digitalocean-api-java** library.

82.6. API RATE LIMITS

DigitalOcean REST API encapsulated by camel-digitalocean component is subjected to API Rate Limiting. You can find the per method limits in the [API Rate Limits documentation] (<https://developers.digitalocean.com/documentation/v2/#rate-limit>).

82.7. ACCOUNT ENDPOINT

| operation | Description | Headers | Result |
|-----------|------------------|---------|----------------------------------------------|
| get | get account info | | com.myjeeva.digitalocean.pojo.Account |

82.8. BLOCKSTORAGES ENDPOINT

| operation | Description | Headers | Result |
|---------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| list | list all of the Block Storage volumes available on your account | | List<com.myjeeva.digitalocean.pojo.Volume> |
| get | show information about a Block Storage volume | CamelDigitalOceanId Integer | com.myjeeva.digitalocean.pojo.Volume |
| get | show information about a Block Storage volume by name | CamelDigitalOceanName String CamelDigitalOceanRegion String | com.myjeeva.digitalocean.pojo.Volume |
| listSnapshots | retrieve the snapshots that have been created from a volume | CamelDigitalOceanId Integer | List<com.myjeeva.digitalocean.pojo.Snapshot> |
| create | create a new volume | CamelDigitalOceanVolumeSizeGigabytes Integer CamelDigitalOceanName String CamelDigitalOceanDescription * String CamelDigitalOceanRegion * String | com.myjeeva.digitalocean.pojo.Volume |
| delete | delete a Block Storage volume, destroying all data and removing it from your account | CamelDigitalOceanId Integer | com.myjeeva.digitalocean.pojo.Delete |
| delete | delete a Block Storage volume by name | CamelDigitalOceanName String CamelDigitalOceanRegion String | com.myjeeva.digitalocean.pojo.Delete |
| attach | attach a Block Storage volume to a Droplet | CamelDigitalOceanId Integer CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String | com.myjeeva.digitalocean.pojo.Action |
| attach | attach a Block Storage volume to a Droplet by name | CamelDigitalOceanName String CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String | com.myjeeva.digitalocean.pojo.Action |
| detach | detach a Block Storage volume from a Droplet | CamelDigitalOceanId Integer CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String | com.myjeeva.digitalocean.pojo.Action |
| detach | detach a Block Storage volume from a Droplet by name | CamelDigitalOceanName String CamelDigitalOceanDropletId Integer CamelDigitalOceanDropletRegion String | com.myjeeva.digitalocean.pojo.Action |
| resize | resize a Block Storage volume | CamelDigitalOceanVolumeSizeGigabytes Integer CamelDigitalOceanRegion String | com.myjeeva.digitalocean.pojo.Action |
| listActions | retrieve all actions that have been executed on a volume | CamelDigitalOceanId Integer | List<com.myjeeva.digitalocean.pojo.Action> |

82.9. DROPLETS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all Droplets in your account | | **List**<**com.myjeeva.digitalocean.pojo.Droplet**> | | **get** | show an individual droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Droplet** | | **create** | create a new Droplet | **CamelDigitalOceanName** *String*
`CamelDigitalOceanDropletImage` *String*
`CamelDigitalOceanRegion` *String*
`CamelDigitalOceanDropletSize` *String*
`CamelDigitalOceanDropletSSHKeys` * *List*<*String*>
`CamelDigitalOceanDropletEnableBackups` * *Boolean*
`CamelDigitalOceanDropletEnableIpv6` * *Boolean*
`CamelDigitalOceanDropletEnablePrivateNetworking` * *Boolean*
`CamelDigitalOceanDropletUserData` * *String*
`CamelDigitalOceanDropletVolumes` * *List*<*String*>
`CamelDigitalOceanDropletTags` *List*<*String*> | **com.myjeeva.digitalocean.pojo.Droplet** | | **create** | create multiple Droplets | **CamelDigitalOceanNames** *List*<*String*>
`CamelDigitalOceanDropletImage` *String*
`CamelDigitalOceanRegion` *String*
`CamelDigitalOceanDropletSize` *String*
`CamelDigitalOceanDropletSSHKeys` * *List*<*String*>
`CamelDigitalOceanDropletEnableBackups` * *Boolean*
`CamelDigitalOceanDropletEnableIpv6` * *Boolean*
`CamelDigitalOceanDropletEnablePrivateNetworking` * *Boolean*
`CamelDigitalOceanDropletUserData` * *String*
`CamelDigitalOceanDropletVolumes` * *List*<*String*>
`CamelDigitalOceanDropletTags` *List*<*String*> | **com.myjeeva.digitalocean.pojo.Droplet** | | **delete** | delete a Droplet, | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Delete** | | **enableBackups** | enable backups on an existing Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **disableBackups** | disable backups on an existing Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **enableIpv6** | enable IPv6 networking on an existing Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **enablePrivateNetworking** | enable private networking on an existing Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **reboot** | reboot a Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **powerCycle** | power cycle a Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **shutdown** | shutdown a Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **powerOff** | power off a Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **powerOn** | power on a Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **restore** | shutdown a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanImageId` *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **passwordReset** | reset the password for a Droplet | **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **resize** | resize a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanDropletSize` *String* | **com.myjeeva.digitalocean.pojo.Action** | | **rebuild** | rebuild a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanImageId` *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **rename** | rename a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanName` *String* | **com.myjeeva.digitalocean.pojo.Action** | | **changeKernel** | change the kernel of a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanKernelId` *Integer* | **com.myjeeva.digitalocean.pojo.Action** | | **takeSnapshot** | snapshot a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanName` * *String* | **com.myjeeva.digitalocean.pojo.Action** | | **tag** | tag a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanName` *String* | **com.myjeeva.digitalocean.pojo.Response** | | **untag** | untag a Droplet | **CamelDigitalOceanId** *Integer*
`CamelDigitalOceanName` *String* | **com.myjeeva.digitalocean.pojo.Response** | | **listKernels** | retrieve a list of all kernels available to a Droplet | **CamelDigitalOceanId** *Integer* | **List**<**com.myjeeva.digitalocean.pojo.Kernel**> | | **listSnapshots** | retrieve the snapshots that have been created from a Droplet | **CamelDigitalOceanId** *Integer* | **List**<**com.myjeeva.digitalocean.pojo.Snapshot**> | | **listBackups** | retrieve any backups associated with a Droplet | **CamelDigitalOceanId** *Integer* | **List**<**com.myjeeva.digitalocean.pojo.Backup**> | | **listActions** | retrieve all actions that have been executed on a Droplet | **CamelDigitalOceanId** *Integer* | **List**<**com.myjeeva.digitalocean.pojo.Action**> | | **listNeighbors** | retrieve a list of droplets that are

running on the same physical server | **CamelDigitalOceanId** *Integer* |

List<com.myjeeva.digitalocean.pojo.Droplet> | **listAllNeighbors** | retrieve a list of any droplets that are running on the same physical hardware | **List<com.myjeeva.digitalocean.pojo.Droplet>** |

82.10. IMAGES ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list images available on your account | **CamelDigitalOceanType*** *DigitalOceanImageTypes* |

List<com.myjeeva.digitalocean.pojo.Image> | **ownList** | retrieve only the private images of a user | |

List<com.myjeeva.digitalocean.pojo.Image> | **listActions** | retrieve all actions that have been executed on a Image | **CamelDigitalOceanId** *Integer* | **List<com.myjeeva.digitalocean.pojo.Action>** |

| **get** | retrieve information about an image (public or private) by id| **CamelDigitalOceanId** *Integer*|

com.myjeeva.digitalocean.pojo.Image | **get** | retrieve information about a public image by slug|

CamelDigitalOceanDropletImage *String*| **com.myjeeva.digitalocean.pojo.Image** | | **update** | update an image| **CamelDigitalOceanId** *Integer*
 CamelDigitalOceanName *String*|

com.myjeeva.digitalocean.pojo.Image | **delete** | delete an image| **CamelDigitalOceanId** *Integer* |

com.myjeeva.digitalocean.pojo.Delete | **transfer** | transfer an image to another region|

CamelDigitalOceanId *Integer*
 CamelDigitalOceanRegion *String*|

com.myjeeva.digitalocean.pojo.Action | | **convert** | convert an image, for example, a backup to a snapshot| **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Action** |

82.11. SNAPSHOTS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all of the snapshots available on your account | **CamelDigitalOceanType*** *DigitalOceanSnapshotTypes* |

List<com.myjeeva.digitalocean.pojo.Snapshot> | | **get** | retrieve information about a snapshot|

CamelDigitalOceanId *Integer*| **com.myjeeva.digitalocean.pojo.Snapshot** | | **delete** | delete an snapshot| **CamelDigitalOceanId** *Integer* | **com.myjeeva.digitalocean.pojo.Delete** |

82.12. KEYS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all of the keys in your account | | **List<com.myjeeva.digitalocean.pojo.Key>** | | **get** | retrieve information about a key by id| **CamelDigitalOceanId** *Integer*| **com.myjeeva.digitalocean.pojo.Key** | | **get** | retrieve information about a key by fingerprint| **CamelDigitalOceanKeyFingerprint** *String*|

com.myjeeva.digitalocean.pojo.Key | | **update** | update a key by id| **CamelDigitalOceanId** *Integer*
 CamelDigitalOceanName *String*| **com.myjeeva.digitalocean.pojo.Key** | | **update** | update a key by fingerprint|

CamelDigitalOceanKeyFingerprint *String*
 CamelDigitalOceanName *String*|

com.myjeeva.digitalocean.pojo.Key | | **delete** | delete a key by id| **CamelDigitalOceanId** *Integer* |

com.myjeeva.digitalocean.pojo.Delete | | **delete** | delete a key by fingerprint|

CamelDigitalOceanKeyFingerprint *String* | **com.myjeeva.digitalocean.pojo.Delete** |

82.13. REGIONS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all of the regions that are available | | **List<com.myjeeva.digitalocean.pojo.Region>** |

82.14. SIZES ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all of the sizes that are available | | **List<com.myjeeva.digitalocean.pojo.Size>** |

82.15. FLOATING IPS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all of the Floating IPs available on your account | | **List<com.myjeeva.digitalocean.pojo.FloatingIP>** | | **create** | create a new Floating IP assigned to a Droplet | **CamelDigitalOceanId** *Integer* | **List<com.myjeeva.digitalocean.pojo.FloatingIP>** | | **create** | create a new Floating IP assigned to a Region | **CamelDigitalOceanRegion** *String* | **List<com.myjeeva.digitalocean.pojo.FloatingIP>** | | **get** | retrieve information about a Floating IP | **CamelDigitalOceanFloatingIPAddress** *String* | **com.myjeeva.digitalocean.pojo.Key** | | **delete** | delete a Floating IP and remove it from your account | **CamelDigitalOceanFloatingIPAddress** *String* | **com.myjeeva.digitalocean.pojo.Delete** | | **assign** | assign a Floating IP to a Droplet | **CamelDigitalOceanFloatingIPAddress** *String* | **com.myjeeva.digitalocean.pojo.Action** | | **unassign** | unassign a Floating IP | **CamelDigitalOceanFloatingIPAddress** *String* | **com.myjeeva.digitalocean.pojo.Action** | | **listActions** | retrieve all actions that have been executed on a Floating IP | **CamelDigitalOceanFloatingIPAddress** *String* | **List<com.myjeeva.digitalocean.pojo.Action>** |

82.16. TAGS ENDPOINT

| operation | Description | Headers | Result | | ----- | ---- | ----- | ----- | | **list** | list all of your tags | | **List<com.myjeeva.digitalocean.pojo.Tag>** | | **create** | create a Tag | **CamelDigitalOceanName** *String* | **com.myjeeva.digitalocean.pojo.Tag** | | **get** | retrieve an individual tag | **CamelDigitalOceanName** *String* | **com.myjeeva.digitalocean.pojo.Tag** | | **delete** | delete a tag | **CamelDigitalOceanName** *String* | **com.myjeeva.digitalocean.pojo.Delete** | | **update** | update a tag | **CamelDigitalOceanName** *String* | **CamelDigitalOceanNewName** *String* | **com.myjeeva.digitalocean.pojo.Tag** |

82.17. EXAMPLES

Get your account info

```
from("direct:getAccountInfo")
    .setHeader(DigitalOceanConstants.OPERATION, constant(DigitalOceanOperations.get))
    .to("digitalocean:account?oAuthToken=XXXXXX")
```

Create a droplet

```
from("direct:createDroplet")
    .setHeader(DigitalOceanConstants.OPERATION, constant("create"))
    .setHeader(DigitalOceanHeaders.NAME, constant("myDroplet"))
    .setHeader(DigitalOceanHeaders.REGION, constant("fra1"))
    .setHeader(DigitalOceanHeaders.DROPLET_IMAGE, constant("ubuntu-14-04-x64"))
    .setHeader(DigitalOceanHeaders.DROPLET_SIZE, constant("512mb"))
    .to("digitalocean:droplet?oAuthToken=XXXXXX")
```

List all your droplets

```
from("direct:getDroplets")
    .setHeader(DigitalOceanConstants.OPERATION, constant("list"))
    .to("digitalocean:droplets?oAuthToken=XXXXXX")
```

Retrieve information for the Droplet (dropletId = 34772987)

```
from("direct:getDroplet")  
  .setHeader(DigitalOceanConstants.OPERATION, constant("get"))  
  .setHeader(DigitalOceanConstants.ID, 34772987)  
  .to("digitalocean:droplet?oAuthToken=XXXXXX")
```

Shutdown information for the Droplet (dropletId = 34772987)

```
from("direct:shutdown")  
  .setHeader(DigitalOceanConstants.ID, 34772987)  
  .to("digitalocean:droplet?operation=shutdown&oAuthToken=XXXXXX")
```

CHAPTER 83. DIRECT COMPONENT

Available as of Camel version 1.0

The **direct:** component provides direct, synchronous invocation of any consumers when a producer sends a message exchange.

This endpoint can be used to connect existing routes in the **same** camel context.

TIP

Asynchronous The [SEDA](#) component provides asynchronous invocation of any consumers when a producer sends a message exchange.

TIP

Connection to other camel contextsThe [VM](#) component provides connections between Camel contexts as long they run in the same **JVM**.

83.1. URI FORMAT

```
direct:someName[?options]
```

Where **someName** can be any string to uniquely identify the endpoint

83.2. OPTIONS

The Direct component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| block (producer) | If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active. | true | boolean |
| timeout (producer) | The timeout value to use if block is enabled. | 30000 | long |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Direct endpoint is configured using URI syntax:

```
direct:name
```

with the following path and query parameters:

83.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------|-----------------------------------------|---------|--------|
| name | Required Name of direct endpoint | | String |

83.2.2. Query Parameters (7 parameters):

| Name | Description | Default | Type |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the default exchange pattern when creating an exchange. | | <code>ExchangePattern</code> |
| block (producer) | If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active. | true | boolean |
| failIfNoConsumers (producer) | Whether the producer should fail by throwing an exception, when sending to a DIRECT endpoint with no active consumers. | false | boolean |
| timeout (producer) | The timeout value to use if block is enabled. | 30000 | long |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

83.3. SAMPLES

In the route below we use the direct component to link the two routes together:

```
from("activemq:queue:order.in")
```

```
.to("bean:orderServer?method=validate")
.to("direct:processOrder");

from("direct:processOrder")
.to("bean:orderService?method=process")
.to("activemq:queue:order.out");
```

And the sample using spring DSL:

```
<route>
  <from uri="activemq:queue:order.in"/>
  <to uri="bean:orderService?method=validate"/>
  <to uri="direct:processOrder"/>
</route>

<route>
  <from uri="direct:processOrder"/>
  <to uri="bean:orderService?method=process"/>
  <to uri="activemq:queue:order.out"/>
</route>
```

See also samples from the [SEDA](#) component, how they can be used together.

- [SEDA](#)
- [VM](#)

CHAPTER 84. DIRECT VM COMPONENT

Available as of Camel version 2.10

The **direct-vm**: component provides direct, synchronous invocation of any consumers in the JVM when a producer sends a message exchange.

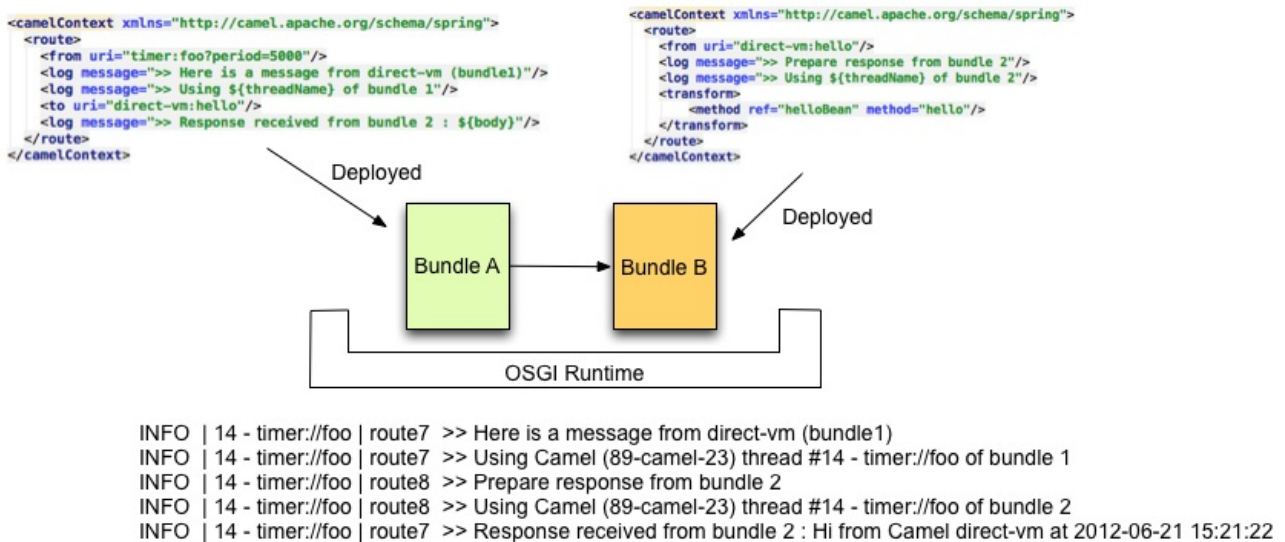

This endpoint can be used to connect existing routes in the same camel context, as well from other camel contexts in the **same** JVM.

This component differs from the [Direct](#) component in that [Direct-VM](#) supports communication across CamelContext instances - so you can use this mechanism to communicate across web applications (provided that camel-core.jar is on the system/boot classpath).

At runtime you can swap in new consumers, by stopping the existing consumer(s) and start new consumers.

But at any given time there can be at most only one active consumer for a given endpoint.

This component allows also to connect routes deployed in different OSGI Bundles as you can see here after. Even if they are running in different bundles, the camel routes will use the same thread. That autorises to develop applications using Transactions - Tx.

84.1. URI FORMAT

`direct-vm:someName`

Where **someName** can be any string to uniquely identify the endpoint

84.2. OPTIONS

The Direct VM component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|------|-------------|---------|------|
| | | t | |

| Name | Description | Default | Type |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| block (producer) | If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active. | true | boolean |
| timeout (producer) | The timeout value to use if block is enabled. | 30000 | long |
| headerFilterStrategy (advanced) | Sets a HeaderFilterStrategy that will only be applied on producer endpoints (on both directions: request and response). Default value: none. | | HeaderFilterStrategy |
| propagateProperties (advanced) | Whether to propagate or not properties from the producer side to the consumer side, and vice versa. Default value: true. | true | boolean |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Direct VM endpoint is configured using URI syntax:

```
direct-vm:name
```

with the following path and query parameters:

84.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------|--------------------------------------------|---------|--------|
| name | Required Name of direct-vm endpoint | | String |

84.2.2. Query Parameters (9 parameters):

| Name | Description | Default | Type |
|------|-------------|---------|------|
|------|-------------|---------|------|

| Name | Description | Default | Type |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN/ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the default exchange pattern when creating an exchange. | | ExchangePattern |
| block (producer) | If sending a message to a direct endpoint which has no active consumer, then we can tell the producer to block and wait for the consumer to become active. | true | boolean |
| failIfNoConsumers (producer) | Whether the producer should fail by throwing an exception, when sending to a Direct-VM endpoint with no active consumers. | false | boolean |
| timeout (producer) | The timeout value to use if block is enabled. | 30000 | long |
| headerFilterStrategy (producer) | Sets a HeaderFilterStrategy that will only be applied on producer endpoints (on both directions: request and response). Default value: none. | | HeaderFilterStrategy |
| propagateProperties (advanced) | Whether to propagate or not properties from the producer side to the consumer side, and vice versa. Default value: true. | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

84.3. SAMPLES

In the route below we use the direct component to link the two routes together:

-

```
from("activemq:queue:order.in")
  .to("bean:orderServer?method=validate")
  .to("direct-vm:processOrder");
```

And now in another CamelContext, such as another OSGi bundle

```
from("direct-vm:processOrder")
  .to("bean:orderService?method=process")
  .to("activemq:queue:order.out");
```

And the sample using spring DSL:

```
<route>
  <from uri="activemq:queue:order.in"/>
  <to uri="bean:orderService?method=validate"/>
  <to uri="direct-vm:processOrder"/>
</route>

<route>
  <from uri="direct-vm:processOrder"/>
  <to uri="bean:orderService?method=process"/>
  <to uri="activemq:queue:order.out"/>
</route>
```

- [VM](#)

CHAPTER 85. DISRUPTOR COMPONENT

Available as of Camel version 2.12

The **disruptor**: component provides asynchronous [SEDA](#) behavior much as the standard SEDA Component, but utilizes a [Disruptor](#) instead of a [BlockingQueue](#) utilized by the standard [SEDA](#). Alternatively, a

disruptor-vm: endpoint is supported by this component, providing an alternative to the standard [VM](#). As with the SEDA component, buffers of the **disruptor**: endpoints are only visible within a **single** CamelContext and no support is provided for persistence or recovery. The buffers of the **disruptor-vm**: endpoints also provides support for communication across CamelContexts instances so you can use this mechanism to communicate across web applications (provided that **camel-disruptor.jar** is on the **system/boot** classpath).

The main advantage of choosing to use the Disruptor Component over the SEDA or the VM Component is performance in use cases where there is high contention between producer(s) and/or multicasted or concurrent Consumers. In those cases, significant increases of throughput and reduction of latency has been observed. Performance in scenarios without contention is comparable to the SEDA and VM Components.

The Disruptor is implemented with the intention of mimicing the behaviour and options of the SEDA and VM Components as much as possible. The main differences with the them are the following:

- The buffer used is always bounded in size (default 1024 exchanges).
- As a the buffer is always bouded, the default behaviour for the Disruptor is to block while the buffer is full instead of throwing an exception. This default behaviour may be configured on the component (see options).
- The Disruptor enpoints don't implement the `BrowsableEndpoint` interface. As such, the exchanges currently in the Disruptor can't be retrieved, only the amount of exchanges.
- The Disruptor requires its consumers (multicasted or otherwise) to be statically configured. Adding or removing consumers on the fly requires complete flushing of all pending exchanges in the Disruptor.
- As a result of the reconfiguration: Data sent over a Disruptor is directly processed and 'gone' if there is at least one consumer, late joiners only get new exchanges published after they've joined.
- The **pollTimeout** option is not supported by the Disruptor Component.
- When a producer blocks on a full Disruptor, it does not respond to thread interrupts.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-disruptor</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

85.1. URI FORMAT

`disruptor:someName[?options]`

or

`disruptor-vm:someName[?options]`

Where **someName** can be any string that uniquely identifies the endpoint within the current CamelContext (or across contexts in case of **disruptor-vm**).

You can append query options to the URI in the following format:

`?option=value&option=value&...`

85.2. OPTIONS

All the following options are valid for both the **disruptor**: and **disruptor-vm**: components.

The Disruptor component supports 8 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----------------------|
| defaultConcurrentConsumers (consumer) | To configure the default number of concurrent consumers | 1 | int |
| defaultMultipleConsumers (consumer) | To configure the default value for multiple consumers | false | boolean |
| defaultProducerType (producer) | To configure the default value for DisruptorProducerType The default value is Multi. | Multi | DisruptorProducerType |
| defaultWaitStrategy (consumer) | To configure the default value for DisruptorWaitStrategy The default value is Blocking. | Blocking | DisruptorWaitStrategy |
| defaultBlockWhenFull (producer) | To configure the default value for block when full The default value is true. | true | boolean |
| queueSize (common) | Deprecated To configure the ring buffer size | | int |
| bufferSize (common) | To configure the ring buffer size | 1024 | int |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Disruptor endpoint is configured using URI syntax:

```
disruptor:name
```

with the following path and query parameters:

85.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|------------------------|---------|--------|
| name | Required Name of queue | | String |

85.2.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----------------------|
| size (common) | The maximum capacity of the Disruptors ringbuffer Will be effectively increased to the nearest power of two. Notice: Mind if you use this option, then its the first endpoint being created with the queue name, that determines the size. To make sure all endpoints use same size, then configure the size option on all of them, or the first endpoint being created. | 1024 | int |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| concurrentConsumers (consumer) | Number of concurrent threads processing exchanges. | 1 | int |
| multipleConsumers (consumer) | Specifies whether multiple consumers are allowed. If enabled, you can use Disruptor for Publish-Subscribe messaging. That is, you can send a message to the queue and have each consumer receive a copy of the message. When enabled, this option should be specified on every consumer endpoint. | false | boolean |
| waitStrategy (consumer) | Defines the strategy used by consumer threads to wait on new exchanges to be published. The options allowed are:Blocking, Sleeping, BusySpin and Yielding. | Blocking | DisruptorWaitStrategy |

| Name | Description | Default | Type |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| blockWhenFull (producer) | Whether a thread that sends messages to a full Disruptor will block until the ringbuffer's capacity is no longer exhausted. By default, the calling thread will block and wait until the message can be accepted. By disabling this option, an exception will be thrown stating that the queue is full. | false | boolean |
| producerType (producer) | Defines the producers allowed on the Disruptor. The options allowed are: Multi to allow multiple producers and Single to enable certain optimizations only allowed when one concurrent producer (on one thread or otherwise synchronized) is active. | Multi | DisruptorProducerType |
| timeout (producer) | Timeout (in milliseconds) before a producer will stop waiting for an asynchronous task to complete. You can disable timeout by using 0 or a negative value. | 30000 | long |
| waitForTaskToComplete (producer) | Option to specify whether the caller should wait for the async task to complete or not before continuing. The following three options are supported: Always, Never or IfReplyExpected. The first two values are self-explanatory. The last value, IfReplyExpected, will only wait if the message is Request Reply based. | IfReplyExpected | WaitForTaskToComplete |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

85.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 18 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|-----------------------------------|---------|---------|
| camel.component. .disruptor- vm.buffer-size | To configure the ring buffer size | 1024 | Integer |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| <code>camel.component.disruptor-vm.default-block-when-full</code> | To configure the default value for block when full The default value is true. | true | Boolean |
| <code>camel.component.disruptor-vm.default-concurrent-consumers</code> | To configure the default number of concurrent consumers | 1 | Integer |
| <code>camel.component.disruptor-vm.default-multiple-consumers</code> | To configure the default value for multiple consumers | false | Boolean |
| <code>camel.component.disruptor-vm.default-producer-type</code> | To configure the default value for DisruptorProducerType The default value is Multi. | | DisruptorProducerType |
| <code>camel.component.disruptor-vm.default-wait-strategy</code> | To configure the default value for DisruptorWaitStrategy The default value is Blocking. | | DisruptorWaitStrategy |
| <code>camel.component.disruptor-vm.enabled</code> | Enable disruptor-vm component | true | Boolean |
| <code>camel.component.disruptor-vm.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.disruptor.buffer-size</code> | To configure the ring buffer size | 1024 | Integer |
| <code>camel.component.disruptor.default-block-when-full</code> | To configure the default value for block when full The default value is true. | true | Boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| <code>camel.component.disruptor.default-concurrent-consumers</code> | To configure the default number of concurrent consumers | 1 | Integer |
| <code>camel.component.disruptor.default-multiple-consumers</code> | To configure the default value for multiple consumers | false | Boolean |
| <code>camel.component.disruptor.default-producer-type</code> | To configure the default value for DisruptorProducerType The default value is Multi. | | DisruptorProducerType |
| <code>camel.component.disruptor.default-wait-strategy</code> | To configure the default value for DisruptorWaitStrategy The default value is Blocking. | | DisruptorWaitStrategy |
| <code>camel.component.disruptor.enabled</code> | Enable disruptor component | true | Boolean |
| <code>camel.component.disruptor.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.disruptor-vm.queue-size</code> | To configure the ring buffer size | | Integer |
| <code>camel.component.disruptor.queue-size</code> | To configure the ring buffer size | | Integer |

85.4. WAIT STRATEGIES

The wait strategy effects the type of waiting performed by the consumer threads that are currently waiting for the next exchange to be published. The following strategies can be chosen:

| Name | Description | Advice |
|----------|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Blocking | Blocking strategy that uses a lock and condition variable for Consumers waiting on a barrier. | This strategy can be used when throughput and low-latency are not as important as CPU resource. |

| Name | Description | Advice |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sleeping | Sleeping strategy that initially spins, then uses a <code>Thread.yield()</code> , and eventually for the minimum number of nanos the OS and JVM will allow while the Consumers are waiting on a barrier. | This strategy is a good compromise between performance and CPU resource. Latency spikes can occur after quiet periods. |
| BusySpin | Busy Spin strategy that uses a busy spin loop for Consumers waiting on a barrier. | This strategy will use CPU resource to avoid syscalls which can introduce latency jitter. It is best used when threads can be bound to specific CPU cores. |
| Yielding | Yielding strategy that uses a <code>Thread.yield()</code> for Consumers waiting on a barrier after an initially spinning. | This strategy is a good compromise between performance and CPU resource without incurring significant latency spikes. |

85.5. USE OF REQUEST REPLY

The Disruptor component supports using [Request Reply](#), where the caller will wait for the Async route to complete. For instance:

```
from("mina:tcp://0.0.0.0:9876?textline=true&sync=true").to("disruptor:input");
from("disruptor:input").to("bean:processInput").to("bean:createResponse");
```

In the route above, we have a TCP listener on port 9876 that accepts incoming requests. The request is routed to the `disruptor:input` buffer. As it is a Request Reply message, we wait for the response. When the consumer on the `disruptor:input` buffer is complete, it copies the response to the original message response.

85.6. CONCURRENT CONSUMERS

By default, the Disruptor endpoint uses a single consumer thread, but you can configure it to use concurrent consumer threads. So instead of thread pools you can use:

```
from("disruptor:stageName?concurrentConsumers=5").process(...)
```

As for the difference between the two, note a thread pool can increase/shrink dynamically at runtime depending on load, whereas the number of concurrent consumers is always fixed and supported by the Disruptor internally so performance will be higher.

85.7. THREAD POOLS

Be aware that adding a thread pool to a Disruptor endpoint by doing something like:

```
from("disruptor:stageName").thread(5).process(...)
```

Can wind up with adding a normal [BlockingQueue](#) to be used in conjunction with the Disruptor, effectively negating part of the performance gains achieved by using the Disruptor. Instead, it is advised to directly configure number of threads that process messages on a Disruptor endpoint using the

concurrentConsumers option.

85.8. SAMPLE

In the route below we use the Disruptor to send the request to this async queue to be able to send a fire-and-forget message for further processing in another thread, and return a constant reply in this thread to the original caller.

```
public void configure() throws Exception {
    from("direct:start")
        // send it to the disruptor that is async
        .to("disruptor:next")
        // return a constant response
        .transform(constant("OK"));

    from("disruptor:next").to("mock:result");
}
```

Here we send a Hello World message and expects the reply to be OK.

```
Object out = template.requestBody("direct:start", "Hello World");
assertEquals("OK", out);
```

The "Hello World" message will be consumed from the Disruptor from another thread for further processing. Since this is from a unit test, it will be sent to a mock endpoint where we can do assertions in the unit test.

85.9. USING MULTIPLECONSUMERS

In this example we have defined two consumers and registered them as spring beans.

```
<!-- define the consumers as spring beans -->
<bean id="consumer1" class="org.apache.camel.spring.example.FooEventConsumer"/>

<bean id="consumer2" class="org.apache.camel.spring.example.AnotherFooEventConsumer"/>

<camelContext xmlns="http://camel.apache.org/schema/spring">
    <!-- define a shared endpoint which the consumers can refer to instead of using url -->
    <endpoint id="foo" uri="disruptor:foo?multipleConsumers=true"/>
</camelContext>
```

Since we have specified multipleConsumers=true on the Disruptor foo endpoint we can have those two or more consumers receive their own copy of the message as a kind of pub-sub style messaging. As the beans are part of an unit test they simply send the message to a mock endpoint, but notice how we can use @Consume to consume from the Disruptor.

```
public class FooEventConsumer {

    @EndpointInject(uri = "mock:result")
    private ProducerTemplate destination;

    @Consume(ref = "foo")
    public void doSomething(String body) {
```

```
destination.sendBody("foo" + body);  
}  
}
```

85.10. EXTRACTING DISRUPTOR INFORMATION

If needed, information such as buffer size, etc. can be obtained without using JMX in this fashion:

```
DisruptorEndpoint disruptor = context.getEndpoint("disruptor:xxxx");  
int size = disruptor.getBufferSize();
```

CHAPTER 86. DNS COMPONENT

Available as of Camel version 2.7

This is an additional component for Camel to run DNS queries, using DNSJava. The component is a thin layer on top of [DNSJava](#).

The component offers the following operations:

- `ip`, to resolve a domain by its ip
- `lookup`, to lookup information about the domain
- `dig`, to run DNS queries

INFO:*Requires SUN JVM* The DNSJava library requires running on the SUN JVM.

If you use Apache ServiceMix or Apache Karaf, you'll need to adjust the `etc/jre.properties` file, to add `sun.net.spi.nameservice` to the list of Java platform packages exported. The server will need restarting before this change takes effect.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dns</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

86.1. URI FORMAT

The URI scheme for a DNS component is as follows

```
dns://operation[?options]
```

This component only supports producers.

86.2. OPTIONS

The DNS component has no options.

The DNS endpoint is configured using URI syntax:

```
dns:dnsType
```

with the following path and query parameters:

86.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------------|-----------------------------------------|---------|---------|
| <code>dnsType</code> | Required The type of the lookup. | | DnsType |

86.2.2. Query Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

86.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.dns.enabled | Enable dns component | true | Boolean |
| camel.component.dns.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

86.4. HEADERS

| Header | Type | Operations | Description |
|------------|--------|-------------|-----------------------------------------------------------------------------------------------------------------------|
| dns.domain | String | ip | The domain name. Mandatory. |
| dns.name | String | lookup | The name to lookup. Mandatory. |
| dns.type | | lookup, dig | The type of the lookup. Should match the values of org.xbill.dns.Type . Optional. |
| dns.class | | lookup, dig | The DNS class of the lookup. Should match the values of org.xbill.dns.DClass . Optional. |
| dns.query | String | dig | The query itself. Mandatory. |
| dns.server | String | dig | The server in particular for the query. If none is given, the default one specified by the OS will be used. Optional. |

86.5. EXAMPLES

86.5.1. IP lookup

```
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:ip"/>
</route>
```

This looks up a domain's IP. For example, `www.example.com` resolves to `192.0.32.10`. The IP address to lookup must be provided in the header with key **"dns.domain"**.

86.5.2. DNS lookup

```
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:lookup"/>
</route>
```

This returns a set of DNS records associated with a domain. The name to lookup must be provided in the header with key **"dns.name"**.

86.5.3. DNS Dig

Dig is a Unix command-line utility to run DNS queries.

```
<route id="IPCheck">
  <from uri="direct:start"/>
  <to uri="dns:dig"/>
</route>
```

The query must be provided in the header with key **"dns.query"**.

86.6. DNS ACTIVATION POLICY

`DnsActivationPolicy` can be used to dynamically start and stop routes based on dns state.

If you have instances of the same component running in different regions you can configure a route in each region to activate only if dns is pointing to its region.

i.e. You may have an instance in NYC and an instance in SFO. You would configure a service CNAME `service.example.com` to point to `nyc-service.example.com` to bring NYC instance up and SFO instance down. When you change the CNAME `service.example.com` to point to `sfo-service.example.com` – nyc instance would stop its routes and sfo will bring its routes up. This allows you to switch regions without restarting actual components.

```
<bean id="dnsActivationPolicy"
class="org.apache.camel.component.dns.policy.DnsActivationPolicy">
  <property name="hostname" value="service.example.com" />
  <property name="resolvesTo" value="nyc-service.example.com" />
  <property name="ttl" value="60000" />
  <property name="stopRoutesOnException" value="false" />
</bean>
```

```
<route id="routeId" autoStartup="false" routePolicyRef="dnsActivationPolicy">  
</route>
```

CHAPTER 87. DOCKER COMPONENT

Available as of Camel version 2.15

Camel component for communicating with Docker.

The Docker Camel component leverages the [docker-java](#) via the [Docker Remote API](#).

87.1. URI FORMAT

```
docker://[operation]?[options]
```

Where **operation** is the specific action to perform on Docker.

87.2. GENERAL OPTIONS

The Docker component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| configuration (advanced) | To use the shared docker configuration | | DockerConfigurati on |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Docker endpoint is configured using URI syntax:

```
docker:operation
```

with the following path and query parameters:

87.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|----------------------------------------|---------|-----------------|
| operation | Required Which operation to use | | DockerOperation |

87.2.2. Query Parameters (20 parameters):

| Name | Description | Default | Type |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|------------------|
| email (common) | Email address associated with the user | | String |
| host (common) | Required Docker host | localhost | String |
| port (common) | Required Docker port | 2375 | Integer |
| requestTimeout (common) | Request timeout for response (in seconds) | | Integer |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| cmdExecFactory (advanced) | The fully qualified class name of the DockerCmdExecFactory implementation to use | com.github.dockerjava.netty.NettyDockerCmdExecFactory | String |
| followRedirectFilter (advanced) | Whether to follow redirect filter | false | boolean |
| loggingFilter (advanced) | Whether to use logging filter | false | boolean |
| maxPerRouteConnections (advanced) | Maximum route connections | 100 | Integer |

| Name | Description | Default | Type |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|---------|
| maxTotalConnections (advanced) | Maximum total connections | 100 | Integer |
| serverAddress (advanced) | Server address for docker registry. | https://index.docker.io/v1/ | String |
| socket (advanced) | Socket connection mode | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| certPath (security) | Location containing the SSL certificate chain | | String |
| password (security) | Password to authenticate with | | String |
| secure (security) | Use HTTPS communication | false | boolean |
| tlsVerify (security) | Check TLS | false | boolean |
| username (security) | User name to authenticate with | | String |

87.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 20 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-----------------------------------------------|---------|--------|
| camel.component.docker.configuration.cert-path | Location containing the SSL certificate chain | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------|------------------------------|
| <code>camel.component.docker.configuration.cmd-exec-factory</code> | The fully qualified class name of the <code>DockerCmdExecFactory</code> implementation to use | <code>com.github.dockerjava.netty.NettyDockerCmdExecFactory</code> | String |
| <code>camel.component.docker.configuration.email</code> | Email address associated with the user | | String |
| <code>camel.component.docker.configuration.follow-redirect-filter</code> | Whether to follow redirect filter | <code>false</code> | Boolean |
| <code>camel.component.docker.configuration.host</code> | Docker host | <code>localhost</code> | String |
| <code>camel.component.docker.configuration.logging-filter</code> | Whether to use logging filter | <code>false</code> | Boolean |
| <code>camel.component.docker.configuration.max-per-route-connections</code> | Maximum route connections | <code>100</code> | Integer |
| <code>camel.component.docker.configuration.max-total-connections</code> | Maximum total connections | <code>100</code> | Integer |
| <code>camel.component.docker.configuration.operation</code> | Which operation to use | | <code>DockerOperation</code> |
| <code>camel.component.docker.configuration.parameters</code> | Additional configuration parameters as key/value pairs | | Map |

| Name | Description | Default | Type |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|---------|
| <code>camel.component.docker.configuration.password</code> | Password to authenticate with | | String |
| <code>camel.component.docker.configuration.port</code> | Docker port | 2375 | Integer |
| <code>camel.component.docker.configuration.request-timeout</code> | Request timeout for response (in seconds) | | Integer |
| <code>camel.component.docker.configuration.secure</code> | Use HTTPS communication | false | Boolean |
| <code>camel.component.docker.configuration.server-address</code> | Server address for docker registry. | https://index.docker.io/v1/ | String |
| <code>camel.component.docker.configuration.socket</code> | Socket connection mode | true | Boolean |
| <code>camel.component.docker.configuration.tls-verify</code> | Check TLS | false | Boolean |
| <code>camel.component.docker.configuration.username</code> | User name to authenticate with | | String |
| <code>camel.component.docker.enabled</code> | Enable docker component | true | Boolean |
| <code>camel.component.docker.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

87.4. HEADER STRATEGY

All URI option can be passed as Header properties. Values found in a message header take precedence over URI parameters. A header property takes the form of a URI option prefixed with **CamelDocker** as shown below

| URI Option | Header Property |
|-------------|------------------------|
| containerId | CamelDockerContainerId |

87.5. EXAMPLES

The following example consumes events from Docker:

```
from("docker://events?host=192.168.59.103&port=2375").to("log:event");
```

The following example queries Docker for system wide information

```
from("docker://info?host=192.168.59.103&port=2375").to("log:info");
```

87.6. DEPENDENCIES

To use Docker in your Camel routes you need to add a dependency on **camel-docker**, which implements the component.

If you use Maven you can just add the following to your pom.xml, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-docker</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 88. DOZER COMPONENT

Available as of Camel version 2.15

The **dozer**: component provides the ability to map between Java beans using the [Dozer](#) mapping framework since **Camel 2.15.0**. Camel also supports the ability to trigger Dozer mappings [as a type converter](#). The primary differences between using a Dozer endpoint and a Dozer converter are:

- The ability to manage Dozer mapping configuration on a per-endpoint basis vs. global configuration via the converter registry.
- A Dozer endpoint can be configured to marshal/unmarshal input and output data using Camel data formats to support a single, any-to-any transformation endpoint
- The Dozer component allows for fine-grained integration and extension of Dozer to support additional functionality (e.g. mapping literal values, using expressions for mappings, etc.).

In order to use the Dozer component, Maven users will need to add the following dependency to their **pom.xml**:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dozer</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

88.1. URI FORMAT

The Dozer component only supports producer endpoints.

```
dozer:endpointId[?options]
```

Where **endpointId** is a name used to uniquely identify the Dozer endpoint configuration.

An example Dozer endpoint URI:

```
from("direct:orderInput").
  to("dozer:transformOrder?mappingFile=orderMapping.xml&targetModel=example.XYZOrder").
  to("direct:orderOutput");
```

88.2. OPTIONS

The Dozer component has no options.

The Dozer endpoint is configured using URI syntax:

```
dozer:name
```

with the following path and query parameters:

88.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|-------------------------------------------------------|---------|--------|
| <code>name</code> | Required A human readable name of the mapping. | | String |

88.2.2. Query Parameters (7 parameters):

| Name | Description | Default | Type |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|-------------------------------------------|
| <code>mappingConfiguration</code> (producer) | The name of a <code>DozerBeanMapperConfiguration</code> bean in the Camel registry which should be used for configuring the Dozer mapping. This is an alternative to the <code>mappingFile</code> option that can be used for fine-grained control over how Dozer is configured. Remember to use a <code>#</code> prefix in the value to indicate that the bean is in the Camel registry (e.g. <code>#myDozerConfig</code>). | | <code>DozerBeanMapperConfiguration</code> |
| <code>mappingFile</code> (producer) | The location of a Dozer configuration file. The file is loaded from the classpath by default, but you can use <code>file;</code> , <code>classpath;</code> , or <code>http:</code> to load the configuration from a specific location. | <code>dozerBeanMapping.xml</code> | String |
| <code>marshallId</code> (producer) | The id of a <code>dataFormat</code> defined within the Camel Context to use for marshalling the mapping output to a non-Java type. | | String |
| <code>sourceModel</code> (producer) | Fully-qualified class name for the source type used in the mapping. If specified, the input to the mapping is converted to the specified type before being mapped with Dozer. | | String |
| <code>targetModel</code> (producer) | Required Fully-qualified class name for the target type used in the mapping. | | String |
| <code>unmarshallId</code> (producer) | The id of a <code>dataFormat</code> defined within the Camel Context to use for unmarshalling the mapping input from a non-Java type. | | String |
| <code>synchronous</code> (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | <code>false</code> | boolean |

88.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.dozer.enabled</code> | Enable dozer component | true | Boolean |
| <code>camel.component.dozer.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

88.4. USING DATA FORMATS WITH DOZER

Dozer does not support non-Java sources and targets for mappings, so it cannot, for example, map an XML document to a Java object on its own. Luckily, Camel has extensive support for marshalling between Java and a wide variety of formats using [data formats](#). The Dozer component takes advantage of this support by allowing you to specify that input and output data should be passed through a data format prior to processing via Dozer. You can always do this on your own outside the call to Dozer, but supporting it directly in the Dozer component allows you to use a single endpoints to configure any-to-any transformation within Camel.

As an example, let's say you wanted to map between an XML data structure and a JSON data structure using the Dozer component. If you had the following data formats defined in a Camel Context:

```
<dataFormats>
  <json library="Jackson" id="myjson"/>
  <jaxb contextPath="org.example" id="myjxb"/>
</dataFormats>
```

You could then configure a Dozer endpoint to unmarshal the input XML using a JAXB data format and marshal the mapping output using Jackson.

```
<endpoint uri="dozer:xml2json?
  marshallId=myjson&unmarshalId=myjxb&targetModel=org.example.Order"/>
```

88.5. CONFIGURING DOZER

All Dozer endpoints require a Dozer mapping configuration file which defines mappings between source and target objects. The component will default to a location of META-INF/dozerBeanMapping.xml if the `mappingFile` or `mappingConfiguration` options are not specified on an endpoint. If you need to supply multiple mapping configuration files for a single endpoint or specify additional configuration options (e.g. event listeners, custom converters, etc.), then you can use an instance of **`org.apache.camel.converter.dozer.DozerBeanMapperConfiguration`**.

```
<bean id="mapper" class="org.apache.camel.converter.dozer.DozerBeanMapperConfiguration">
  <property name="mappingFiles">
    <list>
      <value>mapping1.xml</value>
      <value>mapping2.xml</value>
    </list>
  </property>
</bean>
```

88.6. MAPPING EXTENSIONS

The Dozer component implements a number of extensions to the Dozer mapping framework as custom converters. These converters implement mapping functions that are not supported directly by Dozer itself.

88.6.1. Variable Mappings

Variable mappings allow you to map the value of a variable definition within a Dozer configuration into a target field instead of using the value of a source field. This is equivalent to constant mapping in other mapping frameworks, where can you assign a literal value to a target field. To use a variable mapping, simply define a variable within your mapping configuration and then map from the VariableMapper class into your target field of choice:

```
<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
http://dozermapper.github.io/schema/bean-mapping.xsd">
  <configuration>
    <variables>
      <variable name="CUST_ID">ACME-SALES</variable>
    </variables>
  </configuration>
  <mapping>
    <class-a>org.apache.camel.component.dozer.VariableMapper</class-a>
    <class-b>org.example.Order</class-b>
    <field custom-converter-id="_variableMapping" custom-converter-param="{CUST_ID}">
      <a>literal</a>
      <b>custId</b>
    </field>
  </mapping>
</mappings>
```

88.6.2. Custom Mappings

Custom mappings allow you to define your own logic for how a source field is mapped to a target field. They are similar in function to Dozer customer converters, with two notable differences:

- You can have multiple converter methods in a single class with custom mappings.
- There is no requirement to implement a Dozer-specific interface with custom mappings.

A custom mapping is declared by using the built-in '_customMapping' converter in your mapping configuration. The parameter to this converter has the following syntax:

```
[class-name][,method-name]
```

Method name is optional - the Dozer component will search for a method that matches the input and output types required for a mapping. An example custom mapping and configuration are provided below.

```
public class CustomMapper {
  // All customer ids must be wrapped in "[ ]"
```

```

public Object mapCustomer(String customerId) {
    return "[" + customerId + "];"
}
}

```

```

<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
http://dozermapper.github.io/schema/bean-mapping.xsd">
  <mapping>
    <class-a>org.example.A</class-a>
    <class-b>org.example.B</class-b>
    <field custom-converter-id="_customMapping"
      custom-converter-param="org.example.CustomMapper,mapCustomer">
      <a>header.customerNum</a>
      <b>custId</b>
    </field>
  </mapping>
</mappings>

```

88.6.3. Expression Mappings

Expression mappings allow you to use the powerful [language](#) capabilities of Camel to evaluate an expression and assign the result to a target field in a mapping. Any language that Camel supports can be used in an expression mapping. Basic examples of expressions include the ability to map a Camel message header or exchange property to a target field or to concatenate multiple source fields into a target field. The syntax of a mapping expression is:

```
[language]:[expression]
```

An example of mapping a message header into a target field:

```

<mappings xmlns="http://dozermapper.github.io/schema/bean-mapping"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://dozermapper.github.io/schema/bean-mapping
http://dozermapper.github.io/schema/bean-mapping.xsd">
  <mapping>
    <class-a>org.apache.camel.component.dozer.ExpressionMapper</class-a>
    <class-b>org.example.B</class-b>
    <field custom-converter-id="_expressionMapping" custom-converter-
param="simple:\${header.customerNumber}">
      <a>expression</a>
      <b>custId</b>
    </field>
  </mapping>
</mappings>

```

Note that any properties within your expression must be escaped with "\" to prevent an error when Dozer attempts to resolve variable values defined using the EL.

CHAPTER 89. DRILL COMPONENT

Available as of Camel version 2.19

The **drill:** component gives you the ability to querying to [Apache Drill Cluster](#)

Drill is an Apache open-source SQL query engine for Big Data exploration. Drill is designed from the ground up to support high-performance analysis on the semi-structured and rapidly evolving data coming from modern Big Data applications, while still providing the familiarity and ecosystem of ANSI SQL, the industry-standard query language

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-drill</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

89.1. URI FORMAT

```
drill://host[?options]
```

You can append query options to the URI in the following format, **?option=value&option=value&...**

89.2. DRILL PRODUCER

The producer execute query using **CamelDrillQuery** header and put results into body.

89.3. OPTIONS

The Drill component has no options.

The Drill endpoint is configured using URI syntax:

```
drill:host
```

with the following path and query parameters:

89.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------|------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| host | Required ZooKeeper host name or IP address. Use local instead of a host name or IP address to connect to the local Drillbit | | String |

89.3.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| clusterId (producer) | Cluster ID https://drill.apache.org/docs/using-the-jdbc-driver/#determining-the-cluster-id | | String |
| directory (producer) | Drill directory in ZooKeeper | | String |
| mode (producer) | Connection mode: zk: Zookeeper drillbit: Drillbit direct connection https://drill.apache.org/docs/using-the-jdbc-driver/ | ZK | DrillConnectionMode |
| port (producer) | ZooKeeper port number | | Integer |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

89.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.drill.enabled | Enable drill component | true | Boolean |
| camel.component.drill.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

89.5. SEE ALSO

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 90. DROPBOX COMPONENT

Available as of Camel version 2.14

The **dropbox**: component allows you to treat [Dropbox](#) remote folders as a producer or consumer of messages. Using the [Dropbox Java Core API](#) (reference version for this component is 1.7.x), this camel component has the following features:

- As a consumer, download files and search files by queries
- As a producer, download files, move files between remote directories, delete files/dir, upload files and search files by queries

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-dropbox</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

90.1. URI FORMAT

```
dropbox://[operation]?[options]
```

Where **operation** is the specific action (typically is a CRUD action) to perform on Dropbox remote folder.

90.2. OPERATIONS

| Operation | Description |
|---------------|-------------------------------------------------|
| del | deletes files or directories on Dropbox |
| get | download files from Dropbox |
| move | move files from folders on Dropbox |
| put | upload files on Dropbox |
| search | search files on Dropbox based on string queries |

Operations require additional options to work, some are mandatory for the specific operation.

90.3. OPTIONS

In order to work with Dropbox API you need to obtain an **accessToken** and a **clientId**. You can refer to the [Dropbox documentation](#) that explains how to get them.

The Dropbox component has no options.

The Dropbox endpoint is configured using URI syntax:

```
dropbox:operation
```

with the following path and query parameters:

90.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|-------------------------------------------------------------------------------------------------------|---------|------------------|
| operation | Required The specific action (typically is a CRUD action) to perform on Dropbox remote folder. | | DropboxOperation |

90.3.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|
| accessToken (common) | Required The access token to make API requests for a specific Dropbox user | | String |
| client (common) | To use an existing DbxClient instance as DropBox client. | | DbxClientV2 |
| clientId (common) | Name of the app registered to make API requests | | String |
| localPath (common) | Optional folder or file to upload on Dropbox from the local filesystem. If this option has not been configured then the message body is used as the content to upload. | | String |
| newRemotePath (common) | Destination file or folder | | String |
| query (common) | A space-separated list of sub-strings to search for. A file matches only if it contains all the sub-strings. If this option is not set, all files will be matched. | | String |
| remotePath (common) | Original file or folder to move | | String |

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| uploadMode (common) | Which mode to upload. in case of add the new file will be renamed if a file with the same name already exists on dropbox. in case of force if a file with the same name already exists on dropbox, this will be overwritten. | | DropboxUploadMode |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

90.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.dropbox.enabled | Enable dropbox component | true | Boolean |
| camel.component.dropbox.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

90.5. DEL OPERATION

Delete files on Dropbox.

Works only as Camel producer.

Below are listed the options for this operation:

| Property | Mandatory | Description |
|-------------------|-------------|-------------------------------------|
| remotePath | true | Folder or file to delete on Dropbox |

90.5.1. Samples

```
from("direct:start")
.to("dropbox://del?accessToken=XXX&clientId=XXX&remotePath=/root/folder1")
.to("mock:result");
```

```
from("direct:start")
.to("dropbox://del?accessToken=XXX&clientId=XXX&remotePath=/root/folder1/file1.tar.gz")
.to("mock:result");
```

90.5.2. Result Message Headers

The following headers are set on message result:

| Property | Value |
|---------------------|-------------------------------------|
| DELETED_PATH | name of the path deleted on dropbox |

90.5.3. Result Message Body

The following objects are set on message body result:

| Object type | Description |
|---------------|-------------------------------------|
| String | name of the path deleted on dropbox |

90.6. GET (DOWNLOAD) OPERATION

Download files from Dropbox.

Works as Camel producer or Camel consumer.

Below are listed the options for this operation:

| Property | Mandatory | Description |
|-------------------|-------------|-----------------------------------------|
| remotePath | true | Folder or file to download from Dropbox |

90.6.1. Samples

```

from("direct:start")
.to("dropbox://get?accessToken=XXX&clientId=XXX&remotePath=/root/folder1/file1.tar.gz")
.to("file:///home/kermit/?fileName=file1.tar.gz");

from("direct:start")
.to("dropbox://get?accessToken=XXX&clientId=XXX&remotePath=/root/folder1")
.to("mock:result");

from("dropbox://get?accessToken=XXX&clientId=XXX&remotePath=/root/folder1")
.to("file:///home/kermit");

```

90.6.2. Result Message Headers

The following headers are set on message result:

| Property | Value |
|-------------------------|-------------------------------------------------------------------------|
| DOWNLOADED_FILE | in case of single file download, path of the remote file downloaded |
| DOWNLOADED_FILES | in case of multiple files download, path of the remote files downloaded |

90.6.3. Result Message Body

The following objects are set on message body result:

| Object type | Description |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| ByteArrayOutputStream | in case of single file download, stream representing the file downloaded |
| Map<String, ByteArrayOutputStream> | in case of multiple files download, a map with as key the path of the remote file downloaded and as value the stream representing the file downloaded |

90.7. MOVE OPERATION

Move files on Dropbox between one folder to another.

Works only as Camel producer.

Below are listed the options for this operation:

| Property | Mandatory | Description |
|-------------------|-------------|---------------------------------|
| remotePath | true | Original file or folder to move |

| Property | Mandatory | Description |
|----------------------|-------------|----------------------------|
| newRemotePath | true | Destination file or folder |

90.7.1. Samples

```
from("direct:start")
  .to("dropbox://move?
accessToken=XXX&clientId=XXX&remotePath=/root/folder1&newRemotePath=/root/folder2")
  .to("mock:result");
```

90.7.2. Result Message Headers

The following headers are set on message result:

| Property | Value |
|-------------------|-----------------------------------|
| MOVED_PATH | name of the path moved on dropbox |

90.7.3. Result Message Body

The following objects are set on message body result:

| Object type | Description |
|---------------|-----------------------------------|
| String | name of the path moved on dropbox |

90.8. PUT (UPLOAD) OPERATION

Upload files on Dropbox.

Works as Camel producer.

Below are listed the options for this operation:

| Property | Mandatory | Description |
|-------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uploadMode | true | add or force this option specifies how a file should be saved on dropbox: in case of "add" the new file will be renamed if a file with the same name already exists on dropbox. In case of "force" if a file with the same name already exists on dropbox, this will be overwritten. |
| localPath | false | Folder or file to upload on Dropbox from the local filesystem. If this option has been configured then it takes precedence over uploading as a single file with content from the Camel message body (message body is converted into a byte array). |

| Property | Mandatory | Description |
|-------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remotePath | false | Folder destination on Dropbox. If the property is not set, the component will upload the file on a remote path equal to the local path. With Windows or without an absolute localPath you may run into an exception like the following: Caused by: java.lang.IllegalArgumentException: 'path': bad path: must start with "/": "C:/My/File" OR Caused by: java.lang.IllegalArgumentException: 'path': bad path: must start with "/": "MyFile" |

90.8.1. Samples

```
from("direct:start").to("dropbox://put?
accessToken=XXX&clientId=XXX&uploadMode=add&localPath=/root/folder1")
.to("mock:result");
```

```
from("direct:start").to("dropbox://put?
accessToken=XXX&clientId=XXX&uploadMode=add&localPath=/root/folder1&remotePath=/root/f
older2")
.to("mock:result");
```

And to upload a single file with content from the message body

```
from("direct:start")
.setHeader(DropboxConstants.HEADER_PUT_FILE_NAME, constant("myfile.txt"))
.to("dropbox://put?
accessToken=XXX&clientId=XXX&uploadMode=add&remotePath=/root/folder2")
.to("mock:result");
```

The name of the file can be provided in the header **DropboxConstants.HEADER_PUT_FILE_NAME** or **Exchange.FILE_NAME** in that order of precedence. If no header has been provided then the message id (uuid) is used as the file name.

90.8.2. Result Message Headers

The following headers are set on message result:

| Property | Value |
|-----------------------|-------------------------------------------------------------------------|
| UPLOADED_FILE | in case of single file upload, path of the remote path uploaded |
| UPLOADED_FILES | in case of multiple files upload, string with the remote paths uploaded |

90.8.3. Result Message Body

The following objects are set on message body result:

| Object type | Description |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| String | in case of single file upload, result of the upload operation, OK or KO |
| Map<String, DropboxResultCode> | in case of multiple files upload, a map with as key the path of the remote file uploaded and as value the result of the upload operation, OK or KO |

90.9. SEARCH OPERATION

Search inside a remote Dropbox folder including its sub directories.

Works as Camel producer and as Camel consumer.

Below are listed the options for this operation:

| Property | Mandatory | Description |
|-------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| remotePath | true | Folder on Dropbox where to search in. |
| query | true | A space-separated list of sub-strings to search for. A file matches only if it contains all the sub-strings. If this option is not set, all files will be matched. The query is required to be provided in either the endpoint configuration or as a header CamelDropboxQuery on the Camel message. |

90.9.1. Samples

```
from("dropbox://search?accessToken=XXX&clientId=XXX&remotePath=/XXX&query=XXX")
  .to("mock:result");

from("direct:start")
  .setHeader("CamelDropboxQuery", constant("XXX"))
  .to("dropbox://search?accessToken=XXX&clientId=XXX&remotePath=/XXX")
  .to("mock:result");
```

90.9.2. Result Message Headers

The following headers are set on message result:

| Property | Value |
|----------------------|---------------------------|
| FOUNDED_FILES | list of file path founded |

90.9.3. Result Message Body

The following objects are set on message body result:

| Object type | Description |
|-----------------------------|------------------------------------------------------------------------------------------------|
| List<DbxEntry> | list of file path founded. For more information on this object refer to Dropbox documentation, |

CHAPTER 91. EHCACHE COMPONENT

Available as of Camel version 2.18

The **ehcache** component enables you to perform caching operations using Ehcache 3 as the Cache Implementation.

This component supports producer and event based consumer endpoints.

The Cache consumer is an event based consumer and can be used to listen and respond to specific cache activities.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ehcache</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

91.1. URI FORMAT

```
ehcache://cacheName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=#beanRef&...**

91.2. OPTIONS

The Ehcache component supports 7 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------|--------------------------------------------------------------|---------|----------------------|
| configuration (advanced) | Sets the global component configuration | | EhcacheConfiguration |
| cacheManager (common) | The cache manager | | CacheManager |
| cacheManager Configuration (common) | The cache manager configuration | | Configuration |
| cacheConfiguration (common) | The default cache configuration to be used to create caches. | | CacheConfiguration |
| cachesConfigurations (common) | A map of caches configurations to be used to create caches. | | Map |

| Name | Description | Default | Type |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| cacheConfigurationUri (common) | URI pointing to the Ehcache XML configuration file's location | | String |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Ehcache endpoint is configured using URI syntax:

```
ehcache:cacheName
```

with the following path and query parameters:

91.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|--------------------------------|---------|--------|
| cacheName | Required the cache name | | String |

91.2.2. Query Parameters (17 parameters):

| Name | Description | Default | Type |
|-------------------------------------------|--------------------------------------------------------------------------------------|---------|---------------|
| cacheManager (common) | The cache manager | | CacheManager |
| cacheManagerConfiguration (common) | The cache manager configuration | | Configuration |
| configurationUri (common) | URI pointing to the Ehcache XML configuration file's location | | String |
| createCacheIfNotExist (common) | Configure if a cache need to be created if it does exist or can't be pre-configured. | true | boolean |

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|--------------------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| eventFiring (consumer) | Set the delivery mode (synchronous, asynchronous) | ASYNCHRONOUS | EventFiring |
| eventOrdering (consumer) | Set the delivery mode (ordered, unordered) | ORDERED | EventOrdering |
| eventTypes (consumer) | Set the type of events to listen for | EVICTED, EXPIRED, REMOVED, CREATED, UPDATED | Set |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| action (producer) | To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence. | | String |
| key (producer) | To configure the default action key. If a key is set in the message header, then the key from the header takes precedence. | | Object |
| configuration (advanced) | The default cache configuration to be used to create caches. | | CacheConfiguration |

| Name | Description | Default | Type |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|------------------|---------|
| configurations (advanced) | A map of cache configuration to be used to create caches. | | Map |
| keyType (advanced) | The cache key type, default java.lang.Object | java.lang.Object | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| valueType (advanced) | The cache value type, default java.lang.Object | java.lang.Object | String |

91.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 25 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| camel.component.ehcache.cache-configuration | The default cache configuration to be used to create caches. The option is a <code>org.ehcache.config.CacheConfiguration<?,?></code> type. | | String |
| camel.component.ehcache.cache-configuration-uri | URI pointing to the Ehcache XML configuration file's location | | String |
| camel.component.ehcache.cache-manager | The cache manager. The option is a <code>org.ehcache.CacheManager</code> type. | | String |
| camel.component.ehcache.cache-manager-configuration | The cache manager configuration. The option is a <code>org.ehcache.config.Configuration</code> type. | | String |
| camel.component.ehcache.caches-configurations | A map of caches configurations to be used to create caches. | | Map |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| <code>camel.component.ehcache.configuration.action</code> | To configure the default cache action. If an action is set in the message header, then the operation from the header takes precedence. | | String |
| <code>camel.component.ehcache.configuration.cache-manager</code> | The cache manager | | CacheManager |
| <code>camel.component.ehcache.configuration.cache-manager-configuration</code> | The cache manager configuration | | Configuration |
| <code>camel.component.ehcache.configuration.configuration</code> | The default cache configuration to be used to create caches. | | CacheConfiguration |
| <code>camel.component.ehcache.configuration.configuration-uri</code> | URI pointing to the Ehcache XML configuration file's location | | String |
| <code>camel.component.ehcache.configuration.configurations</code> | A map of cache configuration to be used to create caches. | | Map |
| <code>camel.component.ehcache.configuration.create-cache-if-not-exist</code> | Configure if a cache need to be created if it does exist or can't be pre-configured. | true | Boolean |
| <code>camel.component.ehcache.configuration.event-firing</code> | Set the delivery mode (synchronous, asynchronous) | | EventFiring |
| <code>camel.component.ehcache.configuration.event-ordering</code> | Set the delivery mode (ordered, unordered) | | EventOrdering |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-------------------------------------------------|
| <code>camel.component.ehcache.configuration.event-types</code> | Set the type of events to listen for | | Set |
| <code>camel.component.ehcache.configuration.key</code> | To configure the default action key. If a key is set in the message header, then the key from the header takes precedence. | | Object |
| <code>camel.component.ehcache.configuration.key-type</code> | The cache key type, default <code>java.lang.Object</code> | <code>java.lang.Object</code> | String |
| <code>camel.component.ehcache.configuration.value-type</code> | The cache value type, default <code>java.lang.Object</code> | <code>java.lang.Object</code> | String |
| <code>camel.component.ehcache.customizer.cache-configuration.enabled</code> | Enable or disable the cache-configuration customizer. | <code>true</code> | Boolean |
| <code>camel.component.ehcache.customizer.cache-configuration.mode</code> | Configure if the cache configurations have be added or they have to replace those already configured on the component. | | CacheConfigurationCustomizerConfiguration\$Mode |
| <code>camel.component.ehcache.customizer.cache-manager.enabled</code> | Enable or disable the cache-manager customizer. | <code>true</code> | Boolean |
| <code>camel.component.ehcache.customizer.cache-manager.override</code> | Configure if the cache manager eventually set on the component should be overridden by the customizer. | <code>false</code> | Boolean |
| <code>camel.component.ehcache.enabled</code> | Enable ehcache component | <code>true</code> | Boolean |
| <code>camel.component.ehcache.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | <code>true</code> | Boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|---------|--------|
| camel.component.ehcache.configuration.config-uri (DEPRECATED - Use set configurationUri (String) instead.) | URI pointing to the Ehcache XML configuration file's location | | String |

91.3.1. Message Headers Camel

| Header | Type | Description |
|-----------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CamelEhcacheAction | String | The operation to be performed on the cache, valid options are: * CLEAR * PUT * PUT_ALL * PUT_IF_ABSENT * GET * GET_ALL * REMOVE * REMOVE_ALL * REPLACE |
| CamelEhcacheActionHasResult | Boolean | Set to true if the action has a result |
| CamelEhcacheActionSucceeded | Boolean | Set to true if the actionsucceeded |
| CamelEhcacheKey | Object | The cache key used for an action |
| CamelEhcacheKeys | Set<Object> | A list of keys, used in * PUT_ALL * GET_ALL * REMOVE_ALL |
| CamelEhcacheValue | Object | The value to put in the cache or the result of an operation |
| CamelEhcacheOldValue | Object | The old value associated to a key for actions like PUT_IF_ABSENT or the Object used for comparison for actions like REPLACE |

| Header | Type | Description |
|-----------------------|-----------|----------------------------|
| CamelEhcacheEventType | EventType | The type of event received |

91.4. EHCACHE BASED IDEMPOTENT REPOSITORY EXAMPLE:

```
CacheManager manager = CacheManagerBuilder.newCacheManager(new
XmlConfiguration("ehcache.xml"));
EhcacheIdempotentRepository repo = new EhcacheIdempotentRepository(manager, "idempotent-
cache");

from("direct:in")
    .idempotentConsumer(header("messageId"), idempotentRepo)
    .to("mock:out");
```

91.5. EHCACHE BASED AGGREGATION REPOSITORY EXAMPLE:

```
public class EhcacheAggregationRepositoryRoutesTest extends CamelTestSupport {
    private static final String ENDPOINT_MOCK = "mock:result";
    private static final String ENDPOINT_DIRECT = "direct:one";
    private static final int[] VALUES = generateRandomArrayOfInt(10, 0, 30);
    private static final int SUM = IntStream.of(VALUES).reduce(0, (a, b) -> a + b);
    private static final String CORRELATOR = "CORRELATOR";

    @EndpointInject(uri = ENDPOINT_MOCK)
    private MockEndpoint mock;

    @Produce(uri = ENDPOINT_DIRECT)
    private ProducerTemplate producer;

    @Test
    public void checkAggregationFromOneRoute() throws Exception {
        mock.expectedMessageCount(VALUES.length);
        mock.expectedBodiesReceived(SUM);

        IntStream.of(VALUES).forEach(
            i -> producer.sendBodyAndHeader(i, CORRELATOR, CORRELATOR)
        );

        mock.assertIsSatisfied();
    }

    private Exchange aggregate(Exchange oldExchange, Exchange newExchange) {
        if (oldExchange == null) {
            return newExchange;
        } else {
            Integer n = newExchange.getIn().getBody(Integer.class);
```

```

Integer o = oldExchange.getIn().getBody(Integer.class);
Integer v = (o == null ? 0 : o) + (n == null ? 0 : n);

oldExchange.getIn().setBody(v, Integer.class);

return oldExchange;
}
}

@Override
protected RoutesBuilder createRouteBuilder() throws Exception {
return new RouteBuilder() {
@Override
public void configure() throws Exception {
from(ENDPOINT_DIRECT)
.routeId("AggregatingRouteOne")
.aggregate(header(CORRELATOR))
.aggregationRepository(createAggregateRepository())
.aggregationStrategy(EhcacheAggregationRepositoryRoutesTest.this::aggregate)
.completionSize(VALUE_LENGTH);

.to("log:org.apache.camel.component.ehcache.processor.aggregate.level=INFO&showAll=true&multiline=true")
.to(ENDPOINT_MOCK);
}
};
}

protected EhcacheAggregationRepository createAggregateRepository() throws Exception {
CacheManager cacheManager = CacheManagerBuilder.newCacheManager(new
XmlConfiguration("ehcache.xml"));
cacheManager.init();

EhcacheAggregationRepository repository = new EhcacheAggregationRepository();
repository.setCacheManager(cacheManager);
repository.setCacheName("aggregate");

return repository;
}
}

```

CHAPTER 92. EJB COMPONENT

Available as of Camel version 2.4

The **ejb:** component binds EJBs to Camel message exchanges.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ejb</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

92.1. URI FORMAT

```
ejb:ejbName[?options]
```

Where **ejbName** can be any string which is used to look up the EJB in the Application Server JNDI Registry

92.2. OPTIONS

The EJB component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------|
| context (producer) | The Context to use for looking up the EJBs | | Context |
| properties (producer) | Properties for creating javax.naming.Context if a context has not been configured. | | Properties |
| cache (advanced) | If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope. | | Boolean |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The EJB endpoint is configured using URI syntax:

```
ejb:beanName
```

with the following path and query parameters:

92.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-----------------------|-----------------------------------------------------|---------|--------|
| <code>beanName</code> | Required Sets the name of the bean to invoke | | String |

92.2.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>method</code> (producer) | Sets the name of the method to invoke on the bean | | String |
| <code>cache</code> (advanced) | If enabled, Camel will cache the result of the first Registry look-up. Cache can be enabled if the bean in the Registry is defined as a singleton scope. | | Boolean |
| <code>multiParameterArray</code> (advanced) | Deprecated How to treat the parameters which are passed from the message body.true means the message body should be an array of parameters.. Deprecation note: This option is used internally by Camel, and is not intended for end users to use. Deprecation note: This option is used internally by Camel, and is not intended for end users to use. | false | boolean |
| <code>parameters</code> (advanced) | Used for configuring additional properties on the bean | | Map |
| <code>synchronous</code> (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

92.3. BEAN BINDING

How bean methods to be invoked are chosen (if they are not specified explicitly through the **method** parameter) and how parameter values are constructed from the Message are all defined by the Bean Binding mechanism which is used throughout all of the various Bean Integration mechanisms in Camel.

92.4. EXAMPLES

In the following examples we use the Greater EJB which is defined as follows:

GreaterLocal.java

```
public interface GreaterLocal {
    String hello(String name);
}
```

```
String bye(String name);
}
```

And the implementation

GreaterImpl.java

```
@Stateless
public class GreaterImpl implements GreaterLocal {

    public String hello(String name) {
        return "Hello " + name;
    }

    public String bye(String name) {
        return "Bye " + name;
    }
}
```

92.4.1. Using Java DSL

In this example we want to invoke the **hello** method on the EJB. Since this example is based on an unit test using Apache OpenEJB we have to set a **JndiContext** on the **EJB** component with the OpenEJB settings.

```
@Override
protected CamelContext createCamelContext() throws Exception {
    CamelContext answer = new DefaultCamelContext();

    // enlist EJB component using the JndiContext
    EjbComponent ejb = answer.getComponent("ejb", EjbComponent.class);
    ejb.setContext(createEjbContext());

    return answer;
}

private static Context createEjbContext() throws NamingException {
    // here we need to define our context factory to use OpenEJB for our testing
    Properties properties = new Properties();
    properties.setProperty(Context.INITIAL_CONTEXT_FACTORY,
        "org.apache.openejb.client.LocalInitialContextFactory");

    return new InitialContext(properties);
}
```

Then we are ready to use the EJB in the Camel route:

```
from("direct:start")
    // invoke the greeter EJB using the local interface and invoke the hello method
    .to("ejb:GreaterImplLocal?method=hello")
    .to("mock:result");
```

In a real application server

In a real application server you most likely do not have to setup a **JndiContext** on the [EJB](#) component as it will create a default **JndiContext** on the same JVM as the application server, which usually allows it to access the JNDI registry and lookup the [EJBs](#). However if you need to access a application server on a remote JVM or the likes, you have to prepare the properties beforehand.

92.4.2. Using Spring XML

And this is the same example using Spring XML instead:

Again since this is based on an unit test we need to setup the [EJB](#) component:

```
<!-- setup Camel EJB component -->
<bean id="ejb" class="org.apache.camel.component.ejb.EjbComponent">
  <property name="properties" ref="jndiProperties"/>
</bean>

<!-- use OpenEJB context factory -->
<p:properties id="jndiProperties">
  <prop
key="java.naming.factory.initial">org.apache.openejb.client.LocalInitialContextFactory</prop>
</p:properties>
```

Before we are ready to use [EJB](#) in the Camel routes:

```
<camelContext xmlns="http://camel.apache.org/schema/spring">
  <route>
    <from uri="direct:start"/>
    <to uri="ejb:GreaterImplLocal?method=hello"/>
    <to uri="mock:result"/>
  </route>
</camelContext>
```

CHAPTER 93. ELASTICSEARCH COMPONENT (DEPRECATED)

Available as of Camel version 2.11

The ElasticSearch component allows you to interface with an [ElasticSearch](#) server.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

93.1. URI FORMAT

```
elasticsearch://clusterName[?options]
```

93.2. ENDPOINT OPTIONS

The Elasticsearch component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| client (advanced) | To use an existing configured Elasticsearch client, instead of creating a client per endpoint. | | Client |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Elasticsearch endpoint is configured using URI syntax:

```
elasticsearch:clusterName
```

with the following path and query parameters:

93.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|-------------------------------------------------------------|---------|--------|
| clusterName | Required Name of cluster or use local for local mode | | String |

93.2.2. Query Parameters (11 parameters):

| Name | Description | Default | Type |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------------|
| clientTransportSniff (producer) | Is the client allowed to sniff the rest of the cluster or not (default true). This setting map to the client.transport.sniff setting. | true | Boolean |
| consistencyLevel (producer) | The write consistency level to use with INDEX and BULK operations (can be any of ONE, QUORUM, ALL or DEFAULT) | DEFAULT | WriteConsistencyLevel |
| data (producer) | Is the node going to be allowed to allocate data (shards) to it or not. This setting map to the node.data setting. | | Boolean |
| indexName (producer) | The name of the index to act against | | String |
| indexType (producer) | The type of the index to act against | | String |
| ip (producer) | The TransportClient remote host ip to use | | String |
| operation (producer) | What operation to perform | | String |
| pathHome (producer) | The path.home property of Elasticsearch configuration. You need to provide a valid path, otherwise the default, \$user.home/.elasticsearch, will be used. | `\${user.home}/.elasticsearch | String |
| port (producer) | The TransportClient remote port to use (defaults to 9300) | 9300 | int |
| transportAddresses (producer) | Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for transportAddresses to be considered instead. | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

93.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.elasticsearch.client</code> | To use an existing configured Elasticsearch client, instead of creating a client per endpoint. The option is a <code>org.elasticsearch.client.Client</code> type. | | String |
| <code>camel.component.elasticsearch.enabled</code> | Enable elasticsearch component | true | Boolean |
| <code>camel.component.elasticsearch.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

93.4. LOCAL TESTING

If you want to run against a local (in JVM/classloader) Elasticsearch server, just set the `clusterName` value in the URI to "local". See the [client guide](#) for more details.

93.5. MESSAGE OPERATIONS

The following Elasticsearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

| operation | message body | description |
|-------------|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INDEX | Map, String, byte[] or XContentBuilder content to index | adds content to an index and returns the content's indexId in the body. Camel 2.15 , you can set the indexId by setting the message header with the key "indexId". |
| GET_BODY_ID | index id of content to retrieve | retrieves the specified index and returns a GetResult object in the body |

| operation | message body | description |
|------------|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| DELETE | index id of content to delete | deletes the specified indexId and returns a DeleteResult object in the body |
| BULK_INDEX | a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String) | *Camel 2.14,*adds content to an index and return a List of the id of the successfully indexed documents in the body |
| BULK | a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String) | Camel 2.15: Adds content to an index and returns the BulkResponse object in the body |
| SEARCH | Map or Search Request Object | Camel 2.15: search the content with the map of query string |

| operation | message body | description |
|--------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| MULTI GET | List of MultigetRequestItem object | Camel 2.17: retrieves the specified indexes, types etc. in MultigetRequest and returns a MultigetResponse object in the body |
| MULTI SEARCH | List of SearchRequest object | Camel 2.17: search for parameters specified in MultiSearchRequest and returns a MultiSearchResponse object in the body |
| EXISTS | Index name as header | Camel 2.17: Returns a Boolean object in the body |
| UPDATE | Map, String, byte[] or XContentBuilder content to update | Camel 2.17: Updates content to an index and returns the content's indexId in the body. |

93.6. INDEX EXAMPLE

Below is a simple INDEX example

```
from("direct:index")
.to("elasticsearch://local?operation=INDEX&indexName=twitter&indexType=tweet");
```

```
<route>
  <from uri="direct:index" />
  <to uri="elasticsearch://local?operation=INDEX&indexName=twitter&indexType=tweet"/>
</route>
```

A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

CHAPTER 94. ELASTICSEARCH5 COMPONENT (DEPRECATED)

Available as of Camel version 2.19

The ElasticSearch component allows you to interface with an [ElasticSearch 5.x API](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch5</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

94.1. URI FORMAT

```
elasticsearch5://clusterName[?options]
```

94.2. ENDPOINT OPTIONS

The Elasticsearch5 component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| client (advanced) | To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings. | | TransportClient |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Elasticsearch5 endpoint is configured using URI syntax:

```
elasticsearch5:clusterName
```

with the following path and query parameters:

94.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|-------------------------------------|---------|--------|
| clusterName | Required Name of the cluster | | String |

94.2.2. Query Parameters (16 parameters):

| Name | Description | Default | Type |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| clientTransportSniff (producer) | Is the client allowed to sniff the rest of the cluster or not. This setting map to the client.transport.sniff setting. | false | boolean |
| indexName (producer) | The name of the index to act against | | String |
| indexType (producer) | The type of the index to act against | | String |
| ip (producer) | The TransportClient remote host ip to use | | String |
| operation (producer) | What operation to perform | | ElasticsearchOperation |
| pingSchedule (producer) | The time(in unit) the client ping the cluster. | 5s | String |
| pingTimeout (producer) | The time(in unit) to wait for a ping response from a node too return. | 5s | String |
| port (producer) | The TransportClient remote port to use (defaults to 9300) | 9300 | int |
| tcpCompress (producer) | true if compression (LZF) enable between all nodes. | false | boolean |
| tcpConnectTimeout (producer) | The time(in unit) to wait for connection timeout. | 30s | String |
| transportAddresses (producer) | Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for transportAddresses to be considered instead. | | String |
| waitForActiveShards (producer) | Index creation waits for the write consistency number of shards to be available | 1 | int |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| enableSSL (security) | Enable SSL. Require XPack client jar on the classpath | false | boolean |

| Name | Description | Default | Type |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| password (authentication) | Password for authenticate against the cluster. Require XPack client jar on the classpath | | String |
| user (authentication) | User for authenticate against the cluster. Requires transport_client role for accessing the cluster. Require XPack client jar on the classpath | | String |

94.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component .elasticsearch5.client | To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings. The option is a org.elasticsearch.client.transport.TransportClient type. | | String |
| camel.component .elasticsearch5.enabled | Enable elasticsearch5 component | true | Boolean |
| camel.component .elasticsearch5.resolve-property- placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

94.4. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

| operation | message body | description |
|-----------|--------------|-------------|
|-----------|--------------|-------------|

| operation | message body | description |
|--------------|----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| INDEX | Map, String, byte[] or XContentBuilder content to index | Adds content to an index and returns the content's indexId in the body. You can set the indexId by setting the message header with the key "indexId". |
| GET_BODY_ID | index id of content to retrieve | Retrieves the specified index and returns a GetResult object in the body |
| DELETE | index name and type of content to delete | Deletes the specified indexName and indexType and returns a DeleteResponse object in the body |
| DELETE_INDEX | index name of content to delete | Deletes the specified indexName and returns a DeleteIndexResponse object in the body |
| BULK_INDEX | a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String) | Adds content to an index and return a List of the id of the successfully indexed documents in the body |

| operation | message body | description |
|-----------|--------------|-------------|
|-----------|--------------|-------------|

| | | |
|-----------|----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| BULK | a List or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String) | Adds content to an index and returns the BulkResponse object in the body |
| SEARCH | Map, String or SearchRequest Object | Search the content with the map of query string |
| MULTI GET | List of MultigetRequest.Item object | Retrieves the specified indexes, types etc. in MultigetRequest and returns a MultigetResponse object in the body |

| operation | message body | description |
|--------------|----------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| MULTI SEARCH | List of Search Request object | Search for parameters specified in MultiSearchRequest and returns a MultiSearchResponse object in the body |
| EXISTS | Index name as header | Checks the index exists or not and returns a Boolean flag in the body |
| UPDATE | Map, String, byte[] or XContentBuilder content to update | Updates content to an index and returns the content's indexId in the body. |

94.5. INDEX EXAMPLE

Below is a simple INDEX example

```
from("direct:index")
.to("elasticsearch5://elasticsearch?operation=INDEX&indexName=twitter&indexType=tweet");
```

```
<route>
  <from uri="direct:index" />
  <to uri="elasticsearch5://elasticsearch?operation=INDEX&indexName=twitter&indexType=tweet"/>
</route>
```

A client would simply need to pass a body message containing a Map to the route. The result body contains the indexId created.

```
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

CHAPTER 95. ELASTICSEARCH REST COMPONENT

Available as of Camel version 2.21

The ElasticSearch component allows you to interface with an [ElasticSearch](#) 6.x API using the REST Client library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elasticsearch-rest</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

95.1. URI FORMAT

```
elasticsearch-rest://clusterName[?options]
```

95.2. ENDPOINT OPTIONS

The Elastichsearch Rest component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------|
| client (advanced) | To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings. | | RestClient |
| hostAddresses (advanced) | Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for hostAddresses to be considered instead. | | String |
| socketTimeout (advanced) | The timeout in ms to wait before the socket will timeout. | 30000 | int |
| connectionTimeout (advanced) | The time in ms to wait before connection will timeout. | 30000 | int |
| user (security) | Basic authenticate user | | String |
| password (security) | Password for authenticate | | String |
| enableSSL (security) | Enable SSL | false | Boolean |

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------|
| maxRetryTimeout (advanced) | The time in ms before retry | 30000 | int |
| enableSniffer (advanced) | Enable automatically discover nodes from a running Elasticsearch cluster | false | Boolean |
| snifferInterval (advanced) | The interval between consecutive ordinary sniff executions in milliseconds. Will be honoured when sniffOnFailure is disabled or when there are no failures between consecutive sniff executions | 30000 0 | int |
| sniffAfterFailure Delay (advanced) | The delay of a sniff execution scheduled after a failure (in milliseconds) | 60000 | int |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Elasticsearch Rest endpoint is configured using URI syntax:

```
elasticsearch-rest:clusterName
```

with the following path and query parameters:

95.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|-------------------------------------|---------|--------|
| clusterName | Required Name of the cluster | | String |

95.2.2. Query Parameters (11 parameters):

| Name | Description | Default | Type |
|-------------------------------------|--------------------------------------------------------|---------|---------|
| connectionTimeout (producer) | The time in ms to wait before connection will timeout. | 30000 | int |
| disconnect (producer) | Disconnect after it finish calling the producer | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|------------------------|
| enableSSL (producer) | Enable SSL | false | boolean |
| hostAddresses (producer) | Required Comma separated list with ip:port formatted remote transport addresses to use. | | String |
| indexName (producer) | The name of the index to act against | | String |
| indexType (producer) | The type of the index to act against | | String |
| maxRetryTimeout (producer) | The time in ms before retry | 30000 | int |
| operation (producer) | What operation to perform | | ElasticsearchOperation |
| socketTimeout (producer) | The timeout in ms to wait before the socket will timeout. | 30000 | int |
| waitForActiveShards (producer) | Index creation waits for the write consistency number of shards to be available | 1 | int |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

95.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 13 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.elasticsearch-rest.client | To use an existing configured Elasticsearch client, instead of creating a client per endpoint. This allow to customize the client with specific settings. The option is a org.elasticsearch.client.RestClient type. | | String |
| camel.component.elasticsearch-rest.connection-timeout | The time in ms to wait before connection will timeout. | 30000 | Integer |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|---------|
| <code>camel.component.elasticsearch-rest.enable-ssl</code> | Enable SSL | false | Boolean |
| <code>camel.component.elasticsearch-rest.enable-sniffer</code> | Enable automatically discover nodes from a running Elasticsearch cluster | false | Boolean |
| <code>camel.component.elasticsearch-rest.enabled</code> | Whether to enable auto configuration of the elasticsearch-rest component. This is enabled by default. | | Boolean |
| <code>camel.component.elasticsearch-rest.host-addresses</code> | Comma separated list with ip:port formatted remote transport addresses to use. The ip and port options must be left blank for hostAddresses to be considered instead. | | String |
| <code>camel.component.elasticsearch-rest.max-retry-timeout</code> | The time in ms before retry | 30000 | Integer |
| <code>camel.component.elasticsearch-rest.password</code> | Password for authenticate | | String |
| <code>camel.component.elasticsearch-rest.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.elasticsearch-rest.sniff-after-failure-delay</code> | The delay of a sniff execution scheduled after a failure (in milliseconds) | 60000 | Integer |
| <code>camel.component.elasticsearch-rest.sniffer-interval</code> | The interval between consecutive ordinary sniff executions in milliseconds. Will be honoured when sniffOnFailure is disabled or when there are no failures between consecutive sniff executions | 30000 0 | Integer |
| <code>camel.component.elasticsearch-rest.socket-timeout</code> | The timeout in ms to wait before the socket will timeout. | 30000 | Integer |

| Name | Description | Default | Type |
|------------------------------------------------------|-------------------------|---------|--------|
| <code>camel.component.elasticsearch-rest.user</code> | Basic authenticate user | | String |

95.4. MESSAGE OPERATIONS

The following ElasticSearch operations are currently supported. Simply set an endpoint URI option or exchange header with a key of "operation" and a value set to one of the following. Some operations also require other parameters or the message body to be set.

| operation | message body | description |
|-----------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Index | Map , String , byte[] , XContentBuilder or IndexRequest content to index | Adds content to an index and returns the content's indexId in the body. You can set the indexId by setting the message header with the key "indexId". |
| GetById | String or GetRequest index id of content to retrieve | Retrieves the specified index and returns a <code>GetResult</code> object in the body |
| Delete | String or DeleteRequest index name and type of content to delete | Deletes the specified <code>indexName</code> and <code>indexType</code> and returns a <code>DeleteResponse</code> object in the body |

| operation | message body | description |
|-----------|--------------|-------------|
|-----------|--------------|-------------|

| | | |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| DeleteIndex | String or DeleteRequest index name of the index to delete | Deletes the specified indexName and returns a status code the body |
| BulkIndex | a List , BulkRequest , or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String) | Adds content to an index and return a List of the id of the successfully indexed documents in the body |

| operation | message body | description |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| Bulk | a List , BulkRequest , or Collection of any type that is already accepted (XContentBuilder, Map, byte[], String) | Adds content to an index and returns the BulkItemResponse[] object in the body |
| Search | Map , String or SearchRequest | Search the content with the map of query string |
| MultiSearch | MultiSearchRequest | Multiple search in one |
| Exists | Index name(indexName) as header | Checks the index exists or not and returns a Boolean flag in the body |

| operation | message body | description |
|-----------|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Update | Map, UpdateRequest, String, byte[] or XContentBuilder content to update | Updates content to an index and returns the content's indexId in the body. |
| Ping | None | Pings the remote Elasticsearch cluster and returns true if the ping succeeded, false otherwise |
| Info | None | Get the info of the Elasticsearch cluster and returns them as MainResponse class instance |

95.5. CONFIGURE THE COMPONENT AND ENABLE BASIC AUTHENTICATION

To use the Elasticsearch component it has to be configured with a minimum configuration.

```
ElasticsearchComponent elasticsearchComponent = new ElasticsearchComponent();
elasticsearchComponent.setHostAddresses("myelkhost:9200");
camelContext.addComponent("elasticsearch-rest", elasticsearchComponent);
```

For basic authentication with elasticsearch or using reverse http proxy in front of the elasticsearch cluster, simply setup basic authentication and SSL on the component like the example below

```
ElasticsearchComponent elasticsearchComponent = new ElasticsearchComponent();
elasticsearchComponent.setHostAddresses("myelkhost:9200");
elasticsearchComponent.setUser("elkuser");
elasticsearchComponent.setPassword("secure!!!");
elasticsearchComponent.setEnableSSL(true);

camelContext.addComponent("elasticsearch-rest", elasticsearchComponent);
```

95.6. INDEX EXAMPLE

Below is a simple INDEX example

```
from("direct:index")
.to("elasticsearch-rest://elasticsearch?operation=Index&indexName=twitter&indexType=tweet");
```

```
<route>
  <from uri="direct:index" />
  <to uri="elasticsearch-rest://elasticsearch?
operation=Index&indexName=twitter&indexType=tweet"/>
</route>
```

For this operation you'll need to specify a `indexId` header.

A client would simply need to pass a body message containing a `Map` to the route. The result body contains the `indexId` created.

```
Map<String, String> map = new HashMap<String, String>();
map.put("content", "test");
String indexId = template.requestBody("direct:index", map, String.class);
```

95.7. SEARCH EXAMPLE

Searching on specific field(s) and value use the Operation `Search`. Pass in the query JSON String or the `Map`

```
from("direct:search")
  .to("elasticsearch-rest://elasticsearch?operation=Search&indexName=twitter&indexType=tweet");
```

```
<route>
  <from uri="direct:search" />
  <to uri="elasticsearch-rest://elasticsearch?
operation=Search&indexName=twitter&indexType=tweet"/>
</route>
```

```
String query = "{\"query\":{\"match\":{\"content\":\"new release of ApacheCamel\"}}}\";
SearchHits response = template.requestBody("direct:search", query, SearchHits.class);
```

Search on specific field(s) using `Map`.

```
Map<String, Object> actualQuery = new HashMap<>();
actualQuery.put("content", "new release of ApacheCamel");

Map<String, Object> match = new HashMap<>();
match.put("match", actualQuery);

Map<String, Object> query = new HashMap<>();
query.put("query", match);
SearchHits response = template.requestBody("direct:search", query, SearchHits.class);
```

95.8. MULTISEARCH EXAMPLE

MultiSearching on specific field(s) and value use the Operation `MultiSearch`. Pass in the `MultiSearchRequest` instance

```
from("direct:multiSearch")
  .to("elasticsearch-rest://elasticsearch?operation=MultiSearch");
```

```
<route>
  <from uri="direct:multiSearch" />
  <to uri="elasticsearch-rest://elasticsearch?operation=MultiSearch"/>
</route>
```

MultiSearch on specific field(s)

```
SearchRequest req = new SearchRequest();
req.indices("twitter");
req.types("tweet");
SearchRequest req1 = new SearchRequest();
req1.indices("twitter");
req1.types("tweets");
MultiSearchRequest request = new MultiSearchRequest().add(req1).add(req);
Item[] response = template.requestBody("direct:search", request, Item[].class);
```

CHAPTER 96. ELSQL COMPONENT

Available as of Camel version 2.16

The `elsql` component is an extension to the existing [SQL Component](#) that uses [EISql](#) to define the SQL queries.

This component uses `spring-jdbc` behind the scenes for the actual SQL handling.

This component can be used as a [Transactional Client](#).

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-elsql</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

The SQL component uses the following endpoint URI notation:

```
sql:elSqlName:resourceUri[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`

The parameters to the SQL queries are named parameters in the `elsql` mapping files, and maps to corresponding keys from the Camel message, in the given precedence:

1. **Camel 2.16.1:** from message body if [Simple](#) expression.
2. from message body if its a `java.util.Map``
3. from message headers

If a named parameter cannot be resolved, then an exception is thrown.

96.1. OPTIONS

The EISQL component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------------|
| <code>databaseVendor</code> (common) | To use a vendor specific <code>com.opengamma.elsql.EISqlConfig</code> | | <code>EISqlDatabaseVendor</code> |
| <code>dataSource</code> (common) | Sets the <code>DataSource</code> to use to communicate with the database. | | <code>DataSource</code> |
| <code>elSqlConfig</code> (advanced) | To use a specific configured <code>EISqlConfig</code> . It may be better to use the <code>databaseVendor</code> option instead. | | <code>EISqlConfig</code> |

| Name | Description | Default | Type |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| resourceUri (common) | The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint. | | String |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The EISQL endpoint is configured using URI syntax:

```
elsql:elsqlName:resourceUri
```

with the following path and query parameters:

96.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| elsqlName | Required The name of the elsql to use (is NAMED in the elsql file) | | String |
| resourceUri | The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with file: to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint. | | String |

96.1.2. Query Parameters (47 parameters):

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------|---------|---------|
| allowNamedParameters (common) | Whether to allow using named parameters in the queries. | true | boolean |

| Name | Description | Default | Type |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|---------------------|
| databaseVendor (common) | To use a vendor specific com.opengamma.elsql.EISqlConfig | | EISqlDatabaseVendor |
| dataSource (common) | Sets the DataSource to use to communicate with the database. | | DataSource |
| dataSourceRef (common) | Deprecated Sets the reference to a DataSource to lookup from the registry, to use for communicating with the database. | | String |
| outputClass (common) | Specify the full package and class name to use as conversion when outputType=SelectOne. | | String |
| outputHeader (common) | Store the query result in a header instead of the message body. By default, outputHeader == null and the query result is stored in the message body, any existing content in the message body is discarded. If outputHeader is set, the value is used as the name of the header to store the query result and the original message body is preserved. | | String |
| outputType (common) | Make the output of consumer or producer to SelectList as List of Map, or SelectOne as single Java object in the following way:a) If the query has only single column, then that JDBC Column object is returned. (such as SELECT COUNT() FROM PROJECT will return a Long object.b) If the query has more than one column, then it will return a Map of that result.c) If the outputClass is set, then it will convert the query result into an Java bean object by calling all the setters that match the column names.It will assume your class has a default constructor to create instance with.d) If the query resulted in more than one rows, it throws an non-unique result exception.StreamList streams the result of the query using an Iterator. This can be used with the Splitter EIP in streaming mode to process the ResultSet in streaming fashion. | Select List | SqlOutputType |
| separator (common) | The separator to use when parameter values is taken from message body (if the body is a String type), to be inserted at # placeholders.Notice if you use named parameters, then a Map type is used instead. The default value is comma | , | char |
| breakBatchOnConsumeFail (consumer) | Sets whether to break batch if onConsume failed. | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| expectedUpdateCount (consumer) | Sets an expected update count to validate when using <code>onConsume</code> . | -1 | int |
| maxMessagesPerPoll (consumer) | Sets the maximum number of messages to poll | | int |
| onConsume (consumer) | After processing each row then this query can be executed, if the Exchange was processed successfully, for example to mark the row as processed. The query can have parameter. | | String |
| onConsumeBatchComplete (consumer) | After processing the entire batch, this query can be executed to bulk update rows etc. The query cannot have parameters. | | String |
| onConsumeFailed (consumer) | After processing each row then this query can be executed, if the Exchange failed, for example to mark the row as failed. The query can have parameter. | | String |
| routeEmptyResultSet (consumer) | Sets whether empty resultset should be allowed to be sent to the next hop. Defaults to false. So the empty resultset will be filtered out. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| transacted (consumer) | Enables or disables transaction. If enabled then if processing an exchange failed then the consumer break out processing any further exchanges to cause a rollback eager. | false | boolean |
| useliterator (consumer) | Sets how resultset should be delivered to route. Indicates delivery as either a list or individual object. defaults to true. | true | boolean |

| Name | Description | Default | Type |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| processingStrategy (consumer) | Allows to plugin to use a custom org.apache.camel.component.sql.SqlProcessingStrategy to execute queries when the consumer has processed the rows/batch. | | SqlProcessingStrategy |
| batch (producer) | Enables or disables batch mode | false | boolean |
| noop (producer) | If set, will ignore the results of the SQL query and use the existing IN message as the OUT message for the continuation of processing | false | boolean |
| useMessageBodyForSql (producer) | Whether to use the message body as the SQL and then headers for parameters. If this option is enabled then the SQL in the uri is not used. | false | boolean |
| alwaysPopulateStatement (advanced) | If enabled then the populateStatement method from org.apache.camel.component.sql.SqlPrepareStatementStrategy is always invoked, also if there is no expected parameters to be prepared. When this is false then the populateStatement is only invoked if there is 1 or more expected parameters to be set; for example this avoids reading the message body/headers for SQL queries with no parameters. | false | boolean |
| elSqlConfig (advanced) | To use a specific configured EISqlConfig. It may be better to use the databaseVendor option instead. | | EISqlConfig |
| parametersCount (advanced) | If set greater than zero, then Camel will use this count value of parameters to replace instead of querying via JDBC metadata API. This is useful if the JDBC vendor could not return correct parameters count, then user may override instead. | | int |

| Name | Description | Default | Type |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------|
| placeholder (advanced) | Specifies a character that will be replaced to in SQL query. Notice, that it is simple <code>String.replaceAll()</code> operation and no SQL parsing is involved (quoted strings will also change). | # | String |
| prepareStatementStrategy (advanced) | Allows to plugin to use a custom <code>org.apache.camel.component.sql.SqlPreparedStatementStrategy</code> to control preparation of the query and prepared statement. | | SqlPreparedStatementStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| templateOptions (advanced) | Configures the Spring <code>JdbcTemplate</code> with the key/values from the Map | | Map |
| usePlaceholder (advanced) | Sets whether to use placeholder and replace all placeholder characters with sign in the SQL queries. | true | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------------------------|
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumerScheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

96.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| camel.component.elsql.data-source | Sets the DataSource to use to communicate with the database. The option is a javax.sql.DataSource type. | | String |
| camel.component.elsql.database-vendor | To use a vendor specific com.opengamma.elsql.EISqlConfig | | EISqlDatabaseVendor |
| camel.component.elsql.el-sql-config | To use a specific configured EISqlConfig. It may be better to use the databaseVendor option instead. The option is a com.opengamma.elsql.EISqlConfig type. | | String |

| Name | Description | Default | Type |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.elsql.enabled</code> | Enable elsql component | true | Boolean |
| <code>camel.component.elsql.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.elsql.resource-uri</code> | The resource file which contains the elsql SQL statements to use. You can specify multiple resources separated by comma. The resources are loaded on the classpath by default, you can prefix with <code>file:</code> to load from file system. Notice you can set this option on the component and then you do not have to configure this on the endpoint. | | String |

96.3. RESULT OF THE QUERY

For **select** operations, the result is an instance of `List<Map<String, Object>>` type, as returned by the `JdbcTemplate.queryForList()` method. For **update** operations, the result is the number of updated rows, returned as an **Integer**.

By default, the result is placed in the message body. If the `outputHeader` parameter is set, the result is placed in the header. This is an alternative to using a full message enrichment pattern to add headers, it provides a concise syntax for querying a sequence or some other small value into a header. It is convenient to use `outputHeader` and `outputType` together:

96.4. HEADER VALUES

When performing **update** operations, the SQL Component stores the update count in the following message headers:

| Header | Description |
|----------------------------|-------------------------------------------------------------------------------------------------|
| CamelSqlUpdateCount | The number of rows updated for update operations, returned as an Integer object. |
| CamelSqlRowCount | The number of rows returned for select operations, returned as an Integer object. |

96.4.1. Sample

In the given route below, we want to get all the projects from the projects table. Notice the SQL query has 2 named parameters, `:#lic` and `:#min`.

Camel will then lookup for these parameters from the message body or message headers. Notice in the example above we set two headers with constant value for the named parameters:

```
from("direct:projects")
  .setHeader("lic", constant("ASF"))
  .setHeader("min", constant(123))
  .to("elsql:projects:com/foo/orders.elsql")
```

And the `elsql` mapping file

```
@NAME(projects)
SELECT *
FROM projects
WHERE license = :lic AND id > :min
ORDER BY id
```

Though if the message body is a `java.util.Map` then the named parameters will be taken from the body.

```
from("direct:projects")
  .to("elsql:projects:com/foo/orders.elsql")
```

96.5. USING EXPRESSION PARAMETERS IN PRODUCERS

In from Camel 2.16.1 onwards you can use Simple expressions as well, which allows to use an OGNL like notation on the message body, where it assumes to have `getLicense` and `getMinimum` methods:

```
@NAME(projects)
SELECT *
FROM projects
WHERE license = :${body.license} AND id > :${body.minimum}
ORDER BY id
```

96.5.1. Using expression parameters in consumers

Available as of Camel 2.23

When using the `EISql` component as consumer, you can now also use expression parameters (simple language) to build dynamic query parameters, such as calling a method on a bean to retrieve an id, date or something.

For example in the sample below we call the `nextId` method on the bean `myIdGenerator`:

```
@NAME(projectsByIdBean)
SELECT *
FROM projects
WHERE id = :${bean#myIdGenerator.nextId}
```

IMPORTANT

Notice in the bean syntax above, we must use **#** instead of **:** in the simple expression. This is because Spring query parameter parser is in-use which will separate parameters on colon. Also pay attention that Spring query parser will invoke the bean twice for each query.

And the bean has the following method:

```
public static class MyIdGenerator {  
    private int id = 1;  
  
    public int nextId() {  
        // spring will call this twice, one for initializing query and 2nd for actual value  
        id++;  
        return id / 2;  
    }  
}
```

Notice that there is no existing **Exchange** with message body and headers, so the simple expression you can use in the consumer are most useable for calling bean methods as in this example.

CHAPTER 97. ETCD COMPONENT

Available as of Camel version 2.18

The camel etcd component allows you to work with Etcd, a distributed reliable key-value store.

97.1. URI FORMAT

```
etcd:namespace/path[?options]
```

97.2. URI OPTIONS

The etcd component supports 7 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| uris (common) | To set the URIs the client connects. | | String |
| sslContextParameters (common) | To configure security using SSLContextParameters. | | SSLContextParameters |
| userName (common) | The user name to use for basic authentication. | | String |
| password (common) | The password to use for basic authentication. | | String |
| configuration (advanced) | Sets the common configuration shared among endpoints | | EtcdConfiguration |
| useGlobalSslContextParameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The etcd endpoint is configured using URI syntax:

```
etcd:namespace/path
```

with the following path and query parameters:

97.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------|------------------------------------------|---------|--------------|
| namespace | Required The API namespace to use | | EtcNamespace |
| path | The path the endpoint refers to | | String |

97.2.2. Query Parameters (29 parameters):

| Name | Description | Default | Type |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|---------|
| recursive (common) | To apply an action recursively. | false | boolean |
| servicePath (common) | The path to look for for service discovery | /services/ | String |
| timeout (common) | To set the maximum time an action could take to complete. | | Long |
| uris (common) | To set the URIs the client connects. | http://localhost:2379 , http://localhost:4001 | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| sendEmptyExchangeOnTimeout (consumer) | To send an empty message in case of timeout watching for a key. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| fromIndex (consumer) | The index to watch from | 0 | Long |
| pollStrategy (consumer) | A pluggable org.apache.camel.PollingConsumerPollingStrategy allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| timeToLive (producer) | To set the lifespan of a key in milliseconds. | | Integer |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |
| password (security) | The password to use for basic authentication. | | String |
| sslContextParameters (security) | To configure security using SSLContextParameters. | | SSLContextParameters |
| userName (security) | The user name to use for basic authentication. | | String |

97.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 17 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------|
| <code>camel.component.etcd.configuration.from-index</code> | The index to watch from | 0 | Long |
| <code>camel.component.etcd.configuration.password</code> | The password to use for basic authentication. | | String |
| <code>camel.component.etcd.configuration.recursive</code> | To apply an action recursively. | false | Boolean |
| <code>camel.component.etcd.configuration.send-empty-exchange-on-timeout</code> | To send an empty message in case of timeout watching for a key. | false | Boolean |
| <code>camel.component.etcd.configuration.service-path</code> | The path to look for for service discovery | /services/ | String |
| <code>camel.component.etcd.configuration.ssl-context-parameters</code> | To configure security using SSLContextParameters. | | SSLContextParameters |
| <code>camel.component.etcd.configuration.time-to-live</code> | To set the lifespan of a key in milliseconds. | | Integer |
| <code>camel.component.etcd.configuration.timeout</code> | To set the maximum time an action could take to complete. | | Long |
| <code>camel.component.etcd.configuration.uris</code> | To set the URIs the client connects. | http://localhost:2379 , http://localhost:4001 | String |
| <code>camel.component.etcd.configuration.user-name</code> | The user name to use for basic authentication. | | String |

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.etcd.enabled</code> | Enable etcd component | true | Boolean |
| <code>camel.component.etcd.password</code> | The password to use for basic authentication. | | String |
| <code>camel.component.etcd.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.component.etcd.ssl-context-parameters</code> | To configure security using <code>SSLContextParameters</code> . The option is a <code>org.apache.camel.util.jsse.SSLContextParameters</code> type. | | String |
| <code>camel.component.etcd.uris</code> | To set the URIs the client connects. | | String |
| <code>camel.component.etcd.use-global-ssl-context-parameters</code> | Enable usage of global SSL context parameters. | false | Boolean |
| <code>camel.component.etcd.user-name</code> | The user name to use for basic authentication. | | String |

CHAPTER 98. OSGI EVENTADMIN COMPONENT

Available as of Camel version 2.6

The **eventadmin** component can be used in an OSGi environment to receive OSGi EventAdmin events and process them.

98.1. DEPENDENCIES

Maven users need to add the following dependency to their **pom.xml**

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-eventadmin</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.6.0 or higher).

98.2. URI FORMAT

```
eventadmin:topic[?options]
```

where **topic** is the name of the topic to listen too.

98.3. URI OPTIONS

The OSGi EventAdmin component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| bundleContext (common) | The OSGi BundleContext is automatic injected by Camel | | BundleContext |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The OSGi EventAdmin endpoint is configured using URI syntax:

```
eventadmin:topic
```

with the following path and query parameters:

98.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------|------------------------------------|---------|--------|
| topic | Name of topic to listen or send to | | String |

98.3.2. Query Parameters (5 parameters):

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| send (common) | Whether to use 'send' or 'synchronous' deliver. Default false (async delivery) | false | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

98.4. MESSAGE HEADERS

| Name | Type | Message |
|-------------|------|---------|
| Description | | |

98.5. MESSAGE BODY

The **in** message body will be set to the received Event.

98.6. EXAMPLE USAGE

```
<route>  
  <from uri="eventadmin:*/>  
  <to uri="stream:out"/>  
</route>
```

CHAPTER 99. EXEC COMPONENT

Available as of Camel version 2.3

The **exec** component can be used to execute system commands.

99.1. DEPENDENCIES

Maven users need to add the following dependency to their **pom.xml**

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-exec</artifactId>
  <version>${camel-version}</version>
</dependency>
```

where **\${camel-version}** must be replaced by the actual version of Camel (2.3.0 or higher).

99.2. URI FORMAT

```
exec://executable[?options]
```

where **executable** is the name, or file path, of the system command that will be executed. If executable name is used (e.g. **exec:java**), the executable must in the system path.

99.3. URI OPTIONS

The Exec component has no options.

The Exec endpoint is configured using URI syntax:

```
exec:executable
```

with the following path and query parameters:

99.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|-----------------------------------------------------------------------------------------------|---------|--------|
| executable | Required Sets the executable to be executed. The executable must not be empty or null. | | String |

99.3.2. Query Parameters (8 parameters):

| Name | Description | Default | Type |
|------|-------------|---------|------|
|------|-------------|---------|------|

| Name | Description | Default | Type |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------|
| args (producer) | The arguments may be one or many whitespace-separated tokens. | | String |
| binding (producer) | A reference to a <code>org.apache.commons.exec.ExecBinding</code> in the Registry. | | ExecBinding |
| commandExecutor (producer) | A reference to a <code>org.apache.commons.exec.ExecCommandExecutor</code> in the Registry that customizes the command execution. The default command executor utilizes the <code>commons-exec</code> library, which adds a shutdown hook for every executed command. | | ExecCommandExecutor |
| outFile (producer) | The name of a file, created by the executable, that should be considered as its output. If no <code>outFile</code> is set, the standard output (<code>stdout</code>) of the executable will be used instead. | | String |
| timeout (producer) | The timeout, in milliseconds, after which the executable should be terminated. If execution has not completed within the timeout, the component will send a termination request. | | long |
| useStderrOnEmptyStdout (producer) | A boolean indicating that when <code>stdout</code> is empty, this component will populate the Camel Message Body with <code>stderr</code> . This behavior is disabled (<code>false</code>) by default. | false | boolean |
| workingDir (producer) | The directory in which the command should be executed. If null, the working directory of the current process will be used. | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

99.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------|-----------------------|---------|---------|
| camel.component.exec.enabled | Enable exec component | true | Boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.exec.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

99.5. MESSAGE HEADERS

The supported headers are defined in `org.apache.camel.component.exec.ExecBinding`.

| Name | Type | Message | Description |
|--------------------------------------------------|------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ExecBinding.EXEC_COMMAND_EXECUTABLE</code> | String | in | The name of the system command that will be executed. Overrides executable in the URI. |
| <code>ExecBinding.EXEC_COMMAND_ARGS</code> | java.util.List<String> | in | Command-line arguments to pass to the executed process. The arguments are used literally - no quoting is applied. Overrides any existing args in the URI. |
| <code>ExecBinding.EXEC_COMMAND_ARGS</code> | String | in | Camel 2.5: The arguments of the executable as a Single string where each argument is whitespace separated (see args in URI option). The arguments are used literally, no quoting is applied. Overrides any existing args in the URI. |
| <code>ExecBinding.EXEC_COMMAND_OUT_FILE</code> | String | in | The name of a file, created by the executable, that should be considered as its output. Overrides any existing outFile in the URI. |

| Name | Type | Message | Description |
|-----------------------------------------------------|----------------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecBinding .EXEC_COMMAND_TIMEOUT | long | in | The timeout, in milliseconds, after which the executable should be terminated. Overrides any existing timeout in the URI. |
| ExecBinding .EXEC_COMMAND_WORKING_DIR | String | in | The directory in which the command should be executed. Overrides any existing workingDir in the URI. |
| ExecBinding .EXEC_EXIT_VALUE | int | out | The value of this header is the <i>exit value</i> of the executable. Non-zero exit values typically indicate abnormal termination. Note that the exit value is OS-dependent. |
| ExecBinding .EXEC_STDERR | java.io.InputStream | out | The value of this header points to the standard error stream (stderr) of the executable. If no stderr is written, the value is null . |
| ExecBinding .EXEC_USE_STDERR_ON_EMPTY_STDOUT | boolean | in | Indicates that when stdout is empty, this component will populate the Camel Message Body with stderr . This behavior is disabled (false) by default. |

99.6. MESSAGE BODY

If the **Exec** component receives an **in** message body that is convertible to **java.io.InputStream**, it is used to feed input to the executable via its stdin. After execution, [the message body](#) is the result of the execution, - that is, an **org.apache.camel.components.exec.ExecResult** instance containing the stdout, stderr, exit value, and out file. This component supports the following **ExecResult** [type converters](#) for convenience:

| From | To |
|------------|----------------------|
| ExecResult | java.io.InputStream |
| ExecResult | String |
| ExecResult | byte [] |
| ExecResult | org.w3c.dom.Document |

If an out file is specified (in the endpoint via **outFile** or the message headers via **ExecBinding.EXEC_COMMAND_OUT_FILE**), converters will return the content of the out file. If no out file is used, then this component will convert the stdout of the process to the target type. For more details, please refer to the [usage examples](#) below.

99.7. USAGE EXAMPLES

99.7.1. Executing word count (Linux)

The example below executes **wc** (word count, Linux) to count the words in file **/usr/share/dict/words**. The word count (output) is written to the standard output stream of **wc**.

```
from("direct:exec")
.to("exec:wc?args=--words /usr/share/dict/words")
.process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        // By default, the body is ExecResult instance
        assertInstanceOf(ExecResult.class, exchange.getIn().getBody());
        // Use the Camel Exec String type converter to convert the ExecResult to String
        // In this case, the stdout is considered as output
        String wordCountOutput = exchange.getIn().getBody(String.class);
        // do something with the word count
    }
});
```

99.7.2. Executing java

The example below executes **java** with 2 arguments: **-server** and **-version**, provided that **java** is in the system path.

```
from("direct:exec")
.to("exec:java?args=-server -version")
```

The example below executes **java** in **c:\temp** with 3 arguments: **-server**, **-version** and the system property **user.name**.

```
from("direct:exec")
.to("exec:c:/program files/jdk/bin/java?args=-server -version -
Duser.name=Camel&workingDir=c:/temp")
```

99.7.3. Executing Ant scripts

The following example executes [Apache Ant](#) (Windows only) with the build file **CamelExecBuildFile.xml**, provided that **ant.bat** is in the system path, and that **CamelExecBuildFile.xml** is in the current directory.

```
from("direct:exec")
.to("exec:ant.bat?args=-f CamelExecBuildFile.xml")
```

In the next example, the **ant.bat** command redirects its output to **CamelExecOutFile.txt** with **-l**. The file **CamelExecOutFile.txt** is used as the out file with **outFile=CamelExecOutFile.txt**. The example assumes that **ant.bat** is in the system path, and that **CamelExecBuildFile.xml** is in the current directory.

```
from("direct:exec")
.to("exec:ant.bat?args=-f CamelExecBuildFile.xml -l
CamelExecOutFile.txt&outFile=CamelExecOutFile.txt")
.process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        InputStream outFile = exchange.getIn().getBody(InputStream.class);
        assertInstanceOf(InputStream.class, outFile);
        // do something with the out file here
    }
});
```

99.7.4. Executing echo (Windows)

Commands such as **echo** and **dir** can be executed only with the command interpreter of the operating system. This example shows how to execute such a command - **echo** - in Windows.

```
from("direct:exec").to("exec:cmd?args=/C echo echoString")
```

CHAPTER 100. FACEBOOK COMPONENT

Available as of Camel version 2.14

The Facebook component provides access to all of the Facebook APIs accessible using [Facebook4J](#). It allows producing messages to retrieve, add, and delete posts, likes, comments, photos, albums, videos, photos, checkins, locations, links, etc. It also supports APIs that allow polling for posts, users, checkins, groups, locations, etc.

Facebook requires the use of OAuth for all client application authentication. In order to use camel-facebook with your account, you'll need to create a new application within Facebook at <https://developers.facebook.com/apps> and grant the application access to your account. The Facebook application's id and secret will allow access to Facebook APIs which do not require a current user. A user access token is required for APIs that require a logged in user. More information on obtaining a user access token can be found at <https://developers.facebook.com/docs/facebook-login/access-tokens/>.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-facebook</artifactId>
  <version>${camel-version}</version>
</dependency>
```

100.1. URI FORMAT

```
facebook://[endpoint]?[options]
```

100.2. FACEBOOKCOMPONENT

The facebook component can be configured with the Facebook account settings below, which are mandatory. The values can be provided to the component using the bean property **configuration** of type **org.apache.camel.component.facebook.config.FacebookConfiguration**. The **oAuthAccessToken** option may be omitted but that will only allow access to application APIs.

The Facebook component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| configuration (advanced) | To use the shared configuration | | FacebookConfiguration |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Facebook endpoint is configured using URI syntax:

facebook:methodName

with the following path and query parameters:

100.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------|-------------------------------------------|---------|--------|
| methodName | Required What operation to perform | | String |

100.2.2. Query Parameters (102 parameters):

| Name | Description | Default | Type |
|-----------------------------------|----------------------------------------------------------------------------------------------------------|---------|---------------|
| achievementURL (common) | The unique URL of the achievement | | URL |
| albumId (common) | The album ID | | String |
| albumUpdate (common) | The facebook Album to be created or updated | | AlbumUpdate |
| appId (common) | The ID of the Facebook Application | | String |
| center (common) | Location latitude and longitude | | GeoLocation |
| checkinId (common) | The checkin ID | | String |
| checkinUpdate (common) | Deprecated The checkin to be created. Deprecated, instead create a Post with an attached location | | CheckinUpdate |
| clientURL (common) | Facebook4J API client URL | | String |
| clientVersion (common) | Facebook4J client API version | | String |
| commentId (common) | The comment ID | | String |
| commentUpdate (common) | The facebook Comment to be created or updated | | CommentUpdate |

| Name | Description | Default | Type |
|---------------------------------------|---------------------------------------------------------------|---------|-------------|
| debugEnabled (common) | Enables debug output. Effective only with the embedded logger | false | Boolean |
| description (common) | The description text | | String |
| distance (common) | Distance in meters | | Integer |
| domainId (common) | The domain ID | | String |
| domainName (common) | The domain name | | String |
| domainNames (common) | The domain names | | List |
| eventId (common) | The event ID | | String |
| eventUpdate (common) | The event to be created or updated | | EventUpdate |
| friendId (common) | The friend ID | | String |
| friendlistId (common) | The friend list ID | | String |
| friendlistName (common) | The friend list Name | | String |
| friendUserId (common) | The friend user ID | | String |
| groupId (common) | The group ID | | String |
| gzipEnabled (common) | Use Facebook GZIP encoding | true | Boolean |
| httpConnectionTimeout (common) | Http connection timeout in milliseconds | 20000 | Integer |

| Name | Description | Default | Type |
|--------------------------------------------------|---------------------------------------------------------------------------------|------------|---------|
| httpDefaultMaxP erRoute (common) | HTTP maximum connections per route | 2 | Integer |
| httpMaxTotalCon nections (common) | HTTP maximum total connections | 20 | Integer |
| httpReadTimeout (common) | Http read timeout in milliseconds | 12000 0 | Integer |
| httpRetryCount (common) | Number of HTTP retries | 0 | Integer |
| httpRetryInterval Seconds (common) | HTTP retry interval in seconds | 5 | Integer |
| httpStreamingRe adTimeout (common) | HTTP streaming read timeout in milliseconds | 40000 | Integer |
| ids (common) | The ids of users | | List |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| includeRead (common) | Enables notifications that the user has already read in addition to unread ones | | Boolean |
| isHidden (common) | Whether hidden | | Boolean |
| jsonStoreEnabled (common) | If set to true, raw JSON forms will be stored in DataObjectFactory | false | Boolean |
| link (common) | Link URL | | URL |
| linkId (common) | Link ID | | String |
| locale (common) | Desired FQL locale | | Locale |
| mbeanEnabled (common) | If set to true, Facebook4J mbean will be registerd | false | Boolean |

| Name | Description | Default | Type |
|--------------------------------------|-----------------------------------------------------|---------|-------------|
| message (common) | The message text | | String |
| messageId (common) | The message ID | | String |
| metric (common) | The metric name | | String |
| milestoneId (common) | The milestone id | | String |
| name (common) | Test user name, must be of the form 'first last' | | String |
| noteId (common) | The note ID | | String |
| notificationId (common) | The notification ID | | String |
| objectId (common) | The insight object ID | | String |
| offerId (common) | The offer id | | String |
| optionDescription (common) | The question's answer option description | | String |
| pageId (common) | The page id | | String |
| permissionName (common) | The permission name | | String |
| permissions (common) | Test user permissions in the format perm1,perm2,... | | String |
| photoId (common) | The photo ID | | String |
| pictureId (common) | The picture id | | Integer |
| pictureId2 (common) | The picture2 id | | Integer |
| pictureSize (common) | The picture size | | PictureSize |

| Name | Description | Default | Type |
|------------------------------------|---------------------------------------------------------------------|-----------------------------------------------------------------------|-------------|
| placeId (common) | The place ID | | String |
| postId (common) | The post ID | | String |
| postUpdate (common) | The post to create or update | | PostUpdate |
| prettyDebugEnabled (common) | Prettify JSON debug output if set to true | false | Boolean |
| queries (common) | FQL queries | | Map |
| query (common) | FQL query or search terms for search endpoints | | String |
| questionId (common) | The question id | | String |
| reading (common) | Optional reading parameters. See Reading Options(#reading) | | Reading |
| readingOptions (common) | To configure Reading using key/value pairs from the Map. | | Map |
| restBaseURL (common) | API base URL | https://graph.facebook.com/ | String |
| scoreValue (common) | The numeric score with value | | Integer |
| size (common) | The picture size, one of large, normal, small or square | | PictureSize |
| source (common) | The media content from either a java.io.File or java.io.InputStream | | Media |
| subject (common) | The note of the subject | | String |
| tabId (common) | The tab id | | String |
| tagUpdate (common) | Photo tag information | | TagUpdate |
| testUser1 (common) | Test user 1 | | TestUser |

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------|
| testUser2 (common) | Test user 2 | | TestUser |
| testUserId (common) | The ID of the test user | | String |
| title (common) | The title text | | String |
| toUserId (common) | The ID of the user to tag | | String |
| toUserIds (common) | The IDs of the users to tag | | List |
| userId (common) | The Facebook user ID | | String |
| userId1 (common) | The ID of a user 1 | | String |
| userId2 (common) | The ID of a user 2 | | String |
| userIds (common) | The IDs of users to invite to event | | List |
| userLocale (common) | The test user locale | | String |
| useSSL (common) | Use SSL | true | Boolean |
| videoBaseURL (common) | Video API base URL | https://graph-video.facebook.com/ | String |
| videoid (common) | The video ID | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| httpProxyHost (proxy) | HTTP proxy server host name | | String |
| httpProxyPassword (proxy) | HTTP proxy server password | | String |
| httpProxyPort (proxy) | HTTP proxy server port | | Integer |
| httpProxyUser (proxy) | HTTP proxy server user name | | String |
| oAuthAccessToken (security) | The user access token | | String |
| oAuthAccessTokenURL (security) | OAuth access token URL | https://graph.facebook.com/oauth/access_token | String |
| oAuthAppId (security) | The application Id | | String |
| oAuthAppSecret (security) | The application Secret | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|--------|
| <code>oAuthAuthorizationURL</code> (security) | OAuth authorization URL | https://www.facebook.com/dialog/oauth | String |
| <code>oAuthPermissions</code> (security) | Default OAuth permissions. Comma separated permission names. See https://developers.facebook.com/docs/reference/login/#permissions for the detail | | String |

100.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 29 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|---------------------------------------------------------------|---------|---------|
| <code>camel.component.facebook.configuration.client-url</code> | Facebook4J API client URL | | String |
| <code>camel.component.facebook.configuration.client-version</code> | Facebook4J client API version | | String |
| <code>camel.component.facebook.configuration.debug-enabled</code> | Enables debug output. Effective only with the embedded logger | false | Boolean |
| <code>camel.component.facebook.configuration.gzip-enabled</code> | Use Facebook GZIP encoding | true | Boolean |
| <code>camel.component.facebook.configuration.http-connection-timeout</code> | Http connection timeout in milliseconds | 20000 | Integer |

| Name | Description | Default | Type |
|---------------------------------------------------------------------------------|------------------------------------|------------|---------|
| <code>camel.component.facebook.configuration.http-default-max-per-route</code> | HTTP maximum connections per route | 2 | Integer |
| <code>camel.component.facebook.configuration.http-max-total-connections</code> | HTTP maximum total connections | 20 | Integer |
| <code>camel.component.facebook.configuration.http-proxy-host</code> | HTTP proxy server host name | | String |
| <code>camel.component.facebook.configuration.http-proxy-password</code> | HTTP proxy server password | | String |
| <code>camel.component.facebook.configuration.http-proxy-port</code> | HTTP proxy server port | | Integer |
| <code>camel.component.facebook.configuration.http-proxy-user</code> | HTTP proxy server user name | | String |
| <code>camel.component.facebook.configuration.http-read-timeout</code> | Http read timeout in milliseconds | 12000 0 | Integer |
| <code>camel.component.facebook.configuration.http-retry-count</code> | Number of HTTP retries | 0 | Integer |
| <code>camel.component.facebook.configuration.http-retry-interval-seconds</code> | HTTP retry interval in seconds | 5 | Integer |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|---------|
| camel.component.facebook.configuration.http-streaming-read-timeout | HTTP streaming read timeout in milliseconds | 40000 | Integer |
| camel.component.facebook.configuration.json-store-enabled | If set to true, raw JSON forms will be stored in DataObjectFactory | false | Boolean |
| camel.component.facebook.configuration.mbean-enabled | If set to true, Facebook4J mbean will be registered | false | Boolean |
| camel.component.facebook.configuration.o-auth-access-token | The user access token | | String |
| camel.component.facebook.configuration.o-auth-access-token-url | OAuth access token URL | https://graph.facebook.com/oauth/access_token | String |
| camel.component.facebook.configuration.o-auth-app-id | The application Id | | String |
| camel.component.facebook.configuration.o-auth-app-secret | The application Secret | | String |
| camel.component.facebook.configuration.o-auth-authorization-url | OAuth authorization URL | https://www.facebook.com/dialog/oauth | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|---------|
| <code>camel.component.facebook.configuration.o-auth-permissions</code> | Default OAuth permissions. Comma separated permission names. See https://developers.facebook.com/docs/reference/login/#permissions for the detail | | String |
| <code>camel.component.facebook.configuration.pretty-debug-enabled</code> | Prettify JSON debug output if set to true | false | Boolean |
| <code>camel.component.facebook.configuration.rest-base-url</code> | API base URL | https://graph.facebook.com/ | String |
| <code>camel.component.facebook.configuration.use-ssl</code> | Use SSL | true | Boolean |
| <code>camel.component.facebook.configuration.video-base-url</code> | Video API base URL | https://graph-video.facebook.com/ | String |
| <code>camel.component.facebook.enabled</code> | Enable facebook component | true | Boolean |
| <code>camel.component.facebook.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

100.4. PRODUCER ENDPOINTS:

Producer endpoints can use endpoint names and options from the table below. Endpoints can also use the short name without the **get** or **search** prefix, except **checkin** due to ambiguity between **getCheckin** and **searchCheckin**. Endpoint options that are not mandatory are denoted by [].

Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message. For example, the facebook endpoint in the following route retrieves activities for the user id value in the incoming message body.

```
from("direct:test").to("facebook://activities?inBody=userId")...
```

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format

CamelFacebook.https://cwiki.apache.org/confluence/pages/createpage.action?

spaceKey=CAMEL&title=option&linkCreation=true&fromPageId=34020899[option]. For example, the **userId** option value in the previous route could alternately be provided in the message header

CamelFacebook.userId. Note that the **inBody** option overrides message header, e.g. the endpoint

option **inBody=user** would override a **CamelFacebook.userId** header.

Endpoints that return a String return an Id for the created or modified entity, e.g. **addAlbumPhoto** returns the new album Id. Endpoints that return a boolean, return true for success and false otherwise. In case of Facebook API errors the endpoint will throw a **RuntimeCamelException** with a **facebook4j.FacebookException** cause.

100.5. CONSUMER ENDPOINTS:

Any of the producer endpoints that take a [reading#reading](#) parameter can be used as a consumer endpoint. The polling consumer uses the **since** and **until** fields to get responses within the polling interval. In addition to other reading fields, an initial **since** value can be provided in the endpoint for the first poll.

Rather than the endpoints returning a List (or **facebook4j.ResponseList**) through a single route exchange, camel-facebook creates one route exchange per returned object. As an example, if **"facebook://home"** results in five posts, the route will be executed five times (once for each Post).

100.6. READING OPTIONS

The **reading** option of type **facebook4j.Reading** adds support for reading parameters, which allow selecting specific fields, limits the number of results, etc. For more information see [Graph API#reading - Facebook Developers](#).

It is also used by consumer endpoints to poll Facebook data to avoid sending duplicate messages across polls.

The reading option can be a reference or value of type **facebook4j.Reading**, or can be specified using the following reading options in either the endpoint URI or exchange header with **CamelFacebook.** prefix.

100.7. MESSAGE HEADER

Any of the [URI options#urioptions](#) can be provided in a message header for producer endpoints with **CamelFacebook.** prefix.

100.8. MESSAGE BODY

All result message bodies utilize objects provided by the Facebook4J API. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint parameter.

For endpoints that return an array, or **facebook4j.ResponseList**, or **java.util.List**, a consumer endpoint will map every elements in the list to distinct messages.

100.9. USE CASES

To create a post within your Facebook profile, send this producer a `facebook4j.PostUpdate` body.

```
from("direct:foo")
  .to("facebook://postFeed/inBody=postUpdate);
```

To poll, every 5 sec (You can set the [polling consumer](#) options by adding a prefix of "consumer"), all statuses on your home feed:

```
from("facebook://home?consumer.delay=5000")
  .to("bean:blah");
```

Searching using a producer with dynamic options from header.

In the bar header we have the Facebook search string we want to execute in public posts, so we need to assign this value to the `CamelFacebook.query` header.

```
from("direct:foo")
  .setHeader("CamelFacebook.query", header("bar"))
  .to("facebook://posts");
```

CHAPTER 101. FHIR COMPONENT

Available as of Camel version 2.23

The FHIR component integrates with the [HAPI-FHIR](#) library which is an open-source implementation of the [FHIR](#) (Fast Healthcare Interoperability Resources) specification in Java.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-fhir</artifactId>
  <version>${camel-version}</version>
</dependency>
```

101.1. URI FORMAT

The FHIR Component uses the following URI format:

```
fhir://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- capabilities
- create
- delete
- history
- load-page
- meta
- operation
- patch
- read
- search
- transaction
- update
- validate

The FHIR component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| configuration (common) | To use the shared configuration | | FhirConfiguration |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The FHIR endpoint is configured using URI syntax:

```
fhir:apiName/methodName
```

with the following path and query parameters:

101.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------|----------------------------------------------------------------------|---------|-------------|
| apiName | Required What kind of operation to perform | | FhirApiName |
| methodName | Required What sub operation to use for the selected operation | | String |

101.1.2. Query Parameters (26 parameters):

| Name | Description | Default | Type |
|--------------------------------|-------------------------------------------------------------------|---------|---------|
| encoding (common) | Encoding to use for all request | | String |
| fhirVersion (common) | The FHIR Version to use | DSTU3 | String |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| log (common) | Will log every requests and responses | false | boolean |
| prettyPrint (common) | Pretty print all request | false | boolean |

| Name | Description | Default | Type |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| serverUrl (common) | The FHIR server base URL | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| compress (advanced) | Compresses outgoing (POST/PUT) contents to the GZIP format | false | boolean |
| connectionTimeout (advanced) | How long to try and establish the initial TCP connection (in ms) | 10000 | Integer |
| deferModelScanning (advanced) | When this option is set, model classes will not be scanned for children until the child list for the given type is actually accessed. | false | boolean |
| fhirContext (advanced) | FhirContext is an expensive object to create. To avoid creating multiple instances, it can be set directly. | | FhirContext |
| forceConformanceCheck (advanced) | Force conformance check | false | boolean |
| sessionCookie (advanced) | HTTP session cookie to add to every request | | String |
| socketTimeout (advanced) | How long to block for individual read/write operations (in ms) | 10000 | Integer |
| summary (advanced) | Request that the server modify the response using the <code>_summary</code> param | | String |

| Name | Description | Default | Type |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| validationMode (advanced) | When should Camel validate the FHIR Server's conformance statement | ONCE | String |
| proxyHost (proxy) | The proxy host | | String |
| proxyPassword (proxy) | The proxy password | | String |
| proxyPort (proxy) | The proxy port | | Integer |
| proxyUser (proxy) | The proxy username | | String |
| accessToken (security) | OAuth access token | | String |
| password (security) | Username to use for basic authentication | | String |
| username (security) | Username to use for basic authentication | | String |

101.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 23 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------|-----------------------------------|---------|----------------|
| camel.component.fhir.configuration.access-token | OAuth access token | | String |
| camel.component.fhir.configuration.api-name | What kind of operation to perform | | FhirApiName |
| camel.component.fhir.configuration.client | To use the custom client | | IGenericClient |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------------|
| <code>camel.component.fhir.configuration.client-factory</code> | To use the custom client factory | | <code>IRestfulClientFactory</code> |
| <code>camel.component.fhir.configuration.compress</code> | Compresses outgoing (POST/PUT) contents to the GZIP format | false | Boolean |
| <code>camel.component.fhir.configuration.connection-timeout</code> | How long to try and establish the initial TCP connection (in ms) | 10000 | Integer |
| <code>camel.component.fhir.configuration.defer-model-scanning</code> | When this option is set, model classes will not be scanned for children until the child list for the given type is actually accessed. | false | Boolean |
| <code>camel.component.fhir.configuration.fhir-context</code> | <code>FhirContext</code> is an expensive object to create. To avoid creating multiple instances, it can be set directly. | | <code>FhirContext</code> |
| <code>camel.component.fhir.configuration.force-conformance-check</code> | Force conformance check | false | Boolean |
| <code>camel.component.fhir.configuration.log</code> | Will log every requests and responses | false | Boolean |
| <code>camel.component.fhir.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.fhir.configuration.password</code> | Username to use for basic authentication | | String |
| <code>camel.component.fhir.configuration.pretty-print</code> | Pretty print all request | false | Boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.fhir.configuration.proxy-host</code> | The proxy host | | String |
| <code>camel.component.fhir.configuration.proxy-password</code> | The proxy password | | String |
| <code>camel.component.fhir.configuration.proxy-port</code> | The proxy port | | Integer |
| <code>camel.component.fhir.configuration.proxy-user</code> | The proxy username | | String |
| <code>camel.component.fhir.configuration.server-url</code> | The FHIR server base URL | | String |
| <code>camel.component.fhir.configuration.session-cookie</code> | HTTP session cookie to add to every request | | String |
| <code>camel.component.fhir.configuration.socket-timeout</code> | How long to block for individual read/write operations (in ms) | 10000 | Integer |
| <code>camel.component.fhir.configuration.username</code> | Username to use for basic authentication | | String |
| <code>camel.component.fhir.enabled</code> | Whether to enable auto configuration of the fhir component. This is enabled by default. | | Boolean |
| <code>camel.component.fhir.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

CHAPTER 102. FHIR JSON DATAFORMAT

Available as of Camel version 2.21 Available as of Camel version 2.21

The FHIR-JSON Data Format leverages [HAPI-FHIR's](#) JSON parser to parse to/from JSON format to/from a HAPI-FHIR's **IBaseResource**.

102.1. FHIR JSON FORMAT OPTIONS

The FHIR JSon dataformat supports 14 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------------------------|--------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fhirVersion | DSTU3 | String | The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4 |
| prettyPrint | false | Boolean | Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible. |
| serverBaseUrl | | String | Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base. |
| omitResourceId | false | Boolean | If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID. |
| encodeElementsAppliesToResourceTypes | | Set | If provided, tells the parse which resource types to apply link <code>#setEncodeElements(Set)</code> encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded. |
| encodeElementsAppliesToChildResourcesOnly | false | Boolean | If set to true (default is false), the values supplied to <code>setEncodeElements(Set)</code> will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle) |
| encodeElements | | Set | If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) (mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded |

| Name | Default | Java Type | Description |
|-------------------------------------------------------|--------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dontEncodeElements</code> | | Set | If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as Patient.meta will work for DSTU2 parsers, but values with subelements on meta such as Patient.meta.lastUpdated will only work in DSTU3 mode. |
| <code>stripVersionsFromReferences</code> | false | Boolean | If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code> |
| <code>overrideResourceIdWithBundleEntryFullUrl</code> | false | Boolean | If set to true (which is the default), the <code>Bundle.entry.fullUrl</code> will override the <code>Bundle.entry.resource</code> 's resource id if the <code>fullUrl</code> is defined. This behavior happens when parsing the source data into a <code>Bundle</code> object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the <code>fullUrl</code> and the resource id). |
| <code>summaryMode</code> | false | Boolean | If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included. |
| <code>suppressNarratives</code> | false | Boolean | If set to true (default is false), narratives will not be included in the encoded values. |
| <code>dontStripVersionsFromReferencesAtPath</code> | | List | If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default) |

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. |

102.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.fhirjson.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.fhirjson.dont-encode-elements</code> | If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as <code>Patient.meta</code> will work for DSTU2 parsers, but values with subelements on meta such as <code>Patient.meta.lastUpdated</code> will only work in DSTU3 mode. | | Set |
| <code>camel.dataformat.fhirjson.dont-strip-versions-from-references-at-paths</code> | If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default) | | List |
| <code>camel.dataformat.fhirjson.enabled</code> | Whether to enable auto configuration of the <code>fhirJson</code> data format. This is enabled by default. | | Boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.fhirjson.encode-elements</code> | If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) .(mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded | | Set |
| <code>camel.dataformat.fhirjson.encode-elements-applies-to-child-resources-only</code> | If set to true (default is false), the values supplied to <code>setEncodeElements(Set)</code> will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle) | false | Boolean |
| <code>camel.dataformat.fhirjson.encode-elements-applies-to-resource-types</code> | If provided, tells the parse which resource types to apply link <code>#setEncodeElements(Set)</code> encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded. | | Set |
| <code>camel.dataformat.fhirjson.fhir-version</code> | The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4 | DSTU3 | String |
| <code>camel.dataformat.fhirjson.omit-resource-id</code> | If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID. | false | Boolean |
| <code>camel.dataformat.fhirjson.override-resource-id-with-bundle-entry-full-url</code> | If set to true (which is the default), the <code>Bundle.entry.fullUrl</code> will override the <code>Bundle.entry.resource's</code> resource id if the fullUrl is defined. This behavior happens when parsing the source data into a Bundle object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the fullUrl and the resource id). | false | Boolean |
| <code>camel.dataformat.fhirjson.pretty-print</code> | Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible. | false | Boolean |

| Name | Description | Default | Type |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.dataformat.fhirjson.server-base-url | Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base. | | String |
| camel.dataformat.fhirjson.strip-versions-from-references | If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code> | false | Boolean |
| camel.dataformat.fhirjson.summary-mode | If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included. | false | Boolean |
| camel.dataformat.fhirjson.suppress-narratives | If set to true (default is false), narratives will not be included in the encoded values. | false | Boolean |

CHAPTER 103. FHIR XML DATAFORMAT

Available as of Camel version 2.21 Available as of Camel version 2.21

The FHIR-XML Data Format leverages [HAPI-FHIR's](#) XML parser to parse to/from XML format to/from a HAPI-FHIR's **IBaseResource**.

103.1. FHIR XML FORMAT OPTIONS

The FHIR XML dataformat supports 14 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------------------------|--------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fhirVersion | DSTU3 | String | The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4 |
| prettyPrint | false | Boolean | Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible. |
| serverBaseUrl | | String | Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base. |
| omitResourceId | false | Boolean | If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID. |
| encodeElementsAppliesToResourceTypes | | Set | If provided, tells the parse which resource types to apply link <code>#setEncodeElements(Set)</code> encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded. |
| encodeElementsAppliesToChildResourcesOnly | false | Boolean | If set to true (default is false), the values supplied to <code>setEncodeElements(Set)</code> will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle) |
| encodeElements | | Set | If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) (mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded |

| Name | Default | Java Type | Description |
|-------------------------------------------------------|--------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>dontEncodeElements</code> | | Set | If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as Patient.meta will work for DSTU2 parsers, but values with subelements on meta such as Patient.meta.lastUpdated will only work in DSTU3 mode. |
| <code>stripVersionsFromReferences</code> | false | Boolean | If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code> |
| <code>overrideResourceIdWithBundleEntryFullUrl</code> | false | Boolean | If set to true (which is the default), the <code>Bundle.entry.fullUrl</code> will override the <code>Bundle.entry.resource</code> 's resource id if the <code>fullUrl</code> is defined. This behavior happens when parsing the source data into a <code>Bundle</code> object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the <code>fullUrl</code> and the resource id). |
| <code>summaryMode</code> | false | Boolean | If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included. |
| <code>suppressNarratives</code> | false | Boolean | If set to true (default is false), narratives will not be included in the encoded values. |
| <code>dontStripVersionsFromReferencesAtPath</code> | | List | If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default) |

| Name | Default | Java Type | Description |
|--------------------------------|--------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>contentTypeHeader</code> | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. |

103.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

| Name | Description | Default | Type |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.fhirxml.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.fhirxml.dont-encode-elements</code> | If provided, specifies the elements which should NOT be encoded. Valid values for this field would include: Patient - Don't encode patient and all its children Patient.name - Don't encode the patient's name Patient.name.family - Don't encode the patient's family name .text - Don't encode the text element on any resource (only the very first position may contain a wildcard) DSTU2 note: Note that values including meta, such as <code>Patient.meta</code> will work for DSTU2 parsers, but values with subelements on meta such as <code>Patient.meta.lastUpdated</code> will only work in DSTU3 mode. | | Set |
| <code>camel.dataformat.fhirxml.dont-strip-versions-from-references-at-paths</code> | If supplied value(s), any resource references at the specified paths will have their resource versions encoded instead of being automatically stripped during the encoding process. This setting has no effect on the parsing process. This method provides a finer-grained level of control than <code>setStripVersionsFromReferences(Boolean)</code> and any paths specified by this method will be encoded even if <code>setStripVersionsFromReferences(Boolean)</code> has been set to true (which is the default) | | List |
| <code>camel.dataformat.fhirxml.enabled</code> | Whether to enable auto configuration of the <code>fhirXml</code> data format. This is enabled by default. | | Boolean |

| Name | Description | Default | Type |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.dataformat.fhirxml.encode-elements | If provided, specifies the elements which should be encoded, to the exclusion of all others. Valid values for this field would include: Patient - Encode patient and all its children Patient.name - Encode only the patient's name Patient.name.family - Encode only the patient's family name .text - Encode the text element on any resource (only the very first position may contain a wildcard) .(mandatory) - This is a special case which causes any mandatory fields (min 0) to be encoded | | Set |
| camel.dataformat.fhirxml.encode-elements-applies-to-child-resources-only | If set to true (default is false), the values supplied to setEncodeElements(Set) will not be applied to the root resource (typically a Bundle), but will be applied to any sub-resources contained within it (i.e. search result resources in that bundle) | false | Boolean |
| camel.dataformat.fhirxml.encode-elements-applies-to-resource-types | If provided, tells the parse which resource types to apply link #setEncodeElements(Set) encode elements to. Any resource types not specified here will be encoded completely, with no elements excluded. | | Set |
| camel.dataformat.fhirxml.fhir-version | The version of FHIR to use. Possible values are: DSTU2,DSTU2_HL7ORG,DSTU2_1,DSTU3,R4 | DSTU3 | String |
| camel.dataformat.fhirxml.omit-resource-id | If set to true (default is false) the ID of any resources being encoded will not be included in the output. Note that this does not apply to contained resources, only to root resources. In other words, if this is set to true, contained resources will still have local IDs but the outer/containing ID will not have an ID. | false | Boolean |
| camel.dataformat.fhirxml.override-resource-id-with-bundle-entry-full-url | If set to true (which is the default), the Bundle.entry.fullUrl will override the Bundle.entry.resource's resource id if the fullUrl is defined. This behavior happens when parsing the source data into a Bundle object. Set this to false if this is not the desired behavior (e.g. the client code wishes to perform additional validation checks between the fullUrl and the resource id). | false | Boolean |
| camel.dataformat.fhirxml.pretty-print | Sets the pretty print flag, meaning that the parser will encode resources with human-readable spacing and newlines between elements instead of condensing output as much as possible. | false | Boolean |

| Name | Description | Default | Type |
|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.dataformat.fhirxml.server-base-url | Sets the server's base URL used by this parser. If a value is set, resource references will be turned into relative references if they are provided as absolute URLs but have a base matching the given base. | | String |
| camel.dataformat.fhirxml.strip-versions-from-references | If set to true (which is the default), resource references containing a version will have the version removed when the resource is encoded. This is generally good behaviour because in most situations, references from one resource to another should be to the resource by ID, not by ID and version. In some cases though, it may be desirable to preserve the version in resource links. In that case, this value should be set to false. This method provides the ability to globally disable reference encoding. If finer-grained control is needed, use <code>setDontStripVersionsFromReferencesAtPath(List)</code> | false | Boolean |
| camel.dataformat.fhirxml.summary-mode | If set to true (default is false) only elements marked by the FHIR specification as being summary elements will be included. | false | Boolean |
| camel.dataformat.fhirxml.suppress-narratives | If set to true (default is false), narratives will not be included in the encoded values. | false | Boolean |

CHAPTER 104. FILE COMPONENT

Available as of Camel version 1.0

The File component provides access to file systems, allowing files to be processed by any other Camel Components or messages from other components to be saved to disk.

104.1. URI FORMAT

```
file:directoryName[?options]
```

or

```
file://directoryName[?options]
```

Where **directoryName** represents the underlying file directory.

You can append query options to the URI in the following format, **?option=value&option=value&...**

Only directories

Camel supports only endpoints configured with a starting directory. So the **directoryName** must be a directory.

If you want to consume a single file only, you can use the **fileName** option, e.g. by setting **fileName=thefilename**.

Also, the starting directory must not contain dynamic expressions with `${ }` placeholders. Again use the **fileName** option to specify the dynamic part of the filename.

WARNING

Avoid reading files currently being written by another application Beware the JDK File IO API is a bit limited in detecting whether another application is currently writing/copying a file. And the implementation can be different depending on OS platform as well. This could lead to that Camel thinks the file is not locked by another process and start consuming it. Therefore you have to do your own investigation what suits your environment. To help with this Camel provides different **readLock** options and **doneFileName** option that you can use. See also the section *Consuming files from folders where others drop files directly* .

104.2. URI OPTIONS

The File component has no options.

The File endpoint is configured using URI syntax:

```
file:directoryName
```

with the following path and query parameters:

104.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------------|----------------------------------------|---------|------|
| directoryName | Required The starting directory | | File |

104.2.2. Query Parameters (87 parameters):

| Name | Description | Default | Type |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| charset (common) | This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages. | | String |
| doneFileName (common) | Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only \$file.name and \$file.name.noext is supported as dynamic placeholders. | | String |

| Name | Description | Default | Type |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| fileName (common) | Use Expression such as File Language to dynamically set the filename. For consumers, it's used as a filename filter. For producers, it's used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today's file using the File Language syntax: mydata-\$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards. | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN/ERROR level and ignored. | false | boolean |
| delete (consumer) | If true, the file will be deleted after it is processed successfully. | false | boolean |
| moveFailed (consumer) | Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again. | | String |
| noop (consumer) | If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again. | false | boolean |

| Name | Description | Default | Type |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| preMove (consumer) | Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order. | | String |
| preSort (consumer) | When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled. | false | boolean |
| recursive (consumer) | If a directory, will look for files in all the sub-directories as well. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| directoryMustExist (consumer) | Similar to startingDirectoryMustExist but this applies during polling recursive sub directories. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this options is not in use. By default the consumer will deal with exceptions, that will be logged at WARN/ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the default exchange pattern when creating an exchange. | | ExchangePattern |
| extendedAttributes (consumer) | To define which file attributes of interest. Like posix:permissions,posix:owner,basic:lastAccessTime, it supports basic wildcard like posix:;, basic:lastAccessTime | | String |
| inProgressRepository (consumer) | A pluggable in-progress repository org.apache.camel.spi.IdempotentRepository. The in-progress repository is used to account the current in progress files being consumed. By default a memory based repository is used. | | IdempotentRepository |

| Name | Description | Default | Type |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| localWorkDirectory (consumer) | When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory. | | String |
| onCompletionExceptionHandler (consumer) | To use a custom <code>org.apache.camel.spi.ExceptionHandler</code> to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore. | | ExceptionHandler |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. In other words the error occurred while the polling was gathering information, for instance access to a file network failed so Camel cannot access it to scan for files. The default implementation will log the caused exception at WARN level and ignore it. | | PollingConsumerPollStrategy |
| probeContentType (consumer) | Whether to enable probing of the content type. If enable then the consumer uses <code>Files#probeContentType(java.nio.file.Path)</code> to determine the content-type of the file, and store that as a header with key <code>Exchange#FILE_CONTENT_TYPE</code> on the Message. | false | boolean |
| processStrategy (consumer) | A pluggable <code>org.apache.camel.component.file.GenericFileProcessStrategy</code> allowing you to implement your own <code>readLock</code> option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the <code>readLock</code> option does not apply. | | GenericFileProcessStrategy |

| Name | Description | Default | Type |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------------------|
| startingDirectoryMustExist (consumer) | Whether the starting directory must exist. Mind that the autoCreate option is default enabled, which means the starting directory is normally auto created if it doesn't exist. You can disable autoCreate and enable this to ensure the starting directory must exist. Will thrown an exception if the directory doesn't exist. | false | boolean |
| fileExist (producer) | What to do if a file already exists with the same name. Override, which is the default, replaces the existing file. Append - adds content to the existing file. Fail - throws a GenericFileOperationException, indicating that there is already an existing file. Ignore - silently ignores the problem and does not override the existing file, but assumes everything is okay. Move - option requires to use the moveExisting option to be configured as well. The option eagerDeleteTargetFile can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The Move option will move any existing files, before writing the target file. TryRename is only applicable if tempFileName option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers. | Override | GenericFileExist |
| flatten (producer) | Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths. | false | boolean |
| jailStartingDirectory (producer) | Used for jailing (restricting) writing files to the starting directory (and sub) only. This is enabled by default to not allow Camel to write files to outside directories (to be more secured out of the box). You can turn this off to allow writing files to directories outside the starting directory, such as parent or root folders. | true | boolean |

| Name | Description | Default | Type |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| moveExisting (producer) | Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base. | | String |
| tempFileName (producer) | The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language. | | String |
| tempPrefix (producer) | This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files. | | String |
| allowNullBody (producer) | Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged. | false | boolean |
| chmod (producer) | Specify the file permissions which is sent by the producer, the chmod value must be between 000 and 777; If there is a leading digit like in 0755 we will ignore it. | | String |
| chmodDirectory (producer) | Specify the directory permissions used when the producer creates missing directories, the chmod value must be between 000 and 777; If there is a leading digit like in 0755 we will ignore it. | | String |

| Name | Description | Default | Type |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| eagerDeleteTargetFile (producer) | Whether or not to eagerly delete any existing target file. This option only applies when you use <code>fileExists=Override</code> and the <code>tempFileName</code> option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exist during the temp file is being written. This ensures the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when <code>fileExist=Move</code> is enabled, and an existing file exists. If this option <code>copyAndDeleteOnRenameFails</code> is false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation. | true | boolean |
| forceWrites (producer) | Whether to force syncing writes to the file system. You can turn this off if you do not want this level of guarantee, for example if writing to logs / audit logs etc; this would yield better performance. | true | boolean |
| keepLastModified (producer) | Will keep the last modified timestamp from the source file (if any). Will use the <code>Exchange.FILE_LAST_MODIFIED</code> header to locate the timestamp. This header can contain either a <code>java.util.Date</code> or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers. | false | boolean |
| moveExistingFileStrategy (producer) | Strategy (Custom Strategy) used to move file with special naming token to use when <code>fileExist=Move</code> is configured. By default, there is an implementation used if no custom strategy is provided | | FileMoveExistingStrategy |
| autoCreate (advanced) | Automatically create missing directories in the file's pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to. | true | boolean |
| bufferSize (advanced) | Write buffer sized in bytes. | 131072 | int |
| copyAndDeleteOnRenameFail (advanced) | Whether to fallback and do a copy and delete file, in case the file could not be renamed directly. This option is not available for the FTP component. | true | boolean |

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| renameUsingCopy (advanced) | Perform rename operations using a copy and delete strategy. This is primarily used in environments where the regular rename operation is unreliable (e.g. across different file systems or networks). This option takes precedence over the <code>copyAndDeleteOnRenameFail</code> parameter that will automatically fall back to the copy and delete strategy, but only after additional delays. | false | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| antExclude (filter) | Ant style filter exclusion. If both <code>antInclude</code> and <code>antExclude</code> are used, <code>antExclude</code> takes precedence over <code>antInclude</code> . Multiple exclusions may be specified in comma-delimited format. | | String |
| antFilterCaseSensitive (filter) | Sets case sensitive flag on ant filter | true | boolean |
| antInclude (filter) | Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format. | | String |
| eagerMaxMessagesPerPoll (filter) | Allows for controlling whether the limit from <code>maxMessagesPerPoll</code> is eager or not. If eager then the limit is during the scanning of files. Where as false would scan all files, and then perform sorting. Setting this option to false allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting. | true | boolean |
| exclude (filter) | Is used to exclude files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris | | String |
| filter (filter) | Pluggable filter as a <code>org.apache.camel.component.file.GenericFileFilter</code> class. Will skip files if filter returns false in its <code>accept()</code> method. | | GenericFileFilter |
| filterDirectory (filter) | Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as <code>\$date:now:yyMMdd</code> | | String |

| Name | Description | Default | Type |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------|
| filterFile (filter) | Filters the file based on Simple language. For example to filter on file size, you can use <code>\$file:size 5000</code> | | String |
| idempotent (filter) | Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRU Cache that holds 1000 entries. If <code>noop=true</code> then idempotent will be enabled as well to avoid consuming the same files over and over again. | false | Boolean |
| idempotentKey (filter) | To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: <code>idempotentKey=\$file:name-\$file:size</code> | | String |
| idempotentRepository (filter) | A pluggable repository <code>org.apache.camel.spi.IdempotentRepository</code> which by default use <code>MemoryMessageIdRepository</code> if none is specified and idempotent is true. | | IdempotentRepository |
| include (filter) | Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris | | String |
| maxDepth (filter) | The maximum depth to traverse when recursively processing a directory. | 2147483647 | int |
| maxMessagesPerPoll (filter) | To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use <code>maxMessagesPerPoll=500</code> , then only the first 500 files will be picked up, and then sorted. You can use the <code>eagerMaxMessagesPerPoll</code> option and set this to false to allow to scan all files first and then sort afterwards. | | int |
| minDepth (filter) | The minimum depth to start processing when recursively processing a directory. Using <code>minDepth=1</code> means the base directory. Using <code>minDepth=2</code> means the first sub directory. | | int |

| Name | Description | Default | Type |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------------|
| move (filter) | Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a .done subdirectory just enter .done. | | String |
| exclusiveReadLockStrategy (lock) | Pluggable read-lock as a <code>org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy</code> implementation. | | GenericFileExclusiveReadLockStrategy |

| Name | Description | Default | Type |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| readLock (lock) | <p>Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail for the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.</p> | none | String |

| Name | Description | Default | Type |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| readLockCheckInterval (lock) | Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit. | 1000 | long |
| readLockDeleteOrphanLockFiles (lock) | Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory. | true | boolean |
| readLockIdempotentRelease Async (lock) | Whether the delayed release task should be synchronous or asynchronous. See more details at the readLockIdempotentReleaseDelay option. | false | boolean |
| readLockIdempotentRelease AsyncPoolSize (lock) | The number of threads in the scheduled thread pool when using asynchronous release tasks. Using a default of 1 core threads should be sufficient in almost all use-cases, only set this to a higher value if either updating the idempotent repository is slow, or there are a lot of files to process. This option is not in-use if you use a shared thread pool by configuring the readLockIdempotentReleaseExecutorService option. See more details at the readLockIdempotentReleaseDelay option. | | int |
| readLockIdempotentRelease Delay (lock) | Whether to delay the release task for a period of millis. This can be used to delay the release tasks to expand the window when a file is regarded as read-locked, in an active/active cluster scenario with a shared idempotent repository, to ensure other nodes cannot potentially scan and acquire the same file, due to race-conditions. By expanding the time-window of the release tasks helps prevents these situations. Note delaying is only needed if you have configured readLockRemoveOnCommit to true. | | int |

| Name | Description | Default | Type |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| readLockIdempotentReleaseExecutorService (lock) | To use a custom and shared thread pool for asynchronous release tasks. See more details at the <code>readLockIdempotentReleaseDelay</code> option. | | ScheduledExecutorService |
| readLockLoggingLevel (lock) | Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename. | DEBUG | LogLevel |
| readLockMarkerFile (lock) | Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application. | true | boolean |
| readLockMinAge (lock) | This option is applied only for readLock=changed. It allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use <code>readLockMinAge=300s</code> to require the file is at least 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age. | 0 | long |
| readLockMinLength (lock) | This option is applied only for readLock=changed. It allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files. | 1 | long |
| readLockRemoveOnCommit (lock) | This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions. See more details at the <code>readLockIdempotentReleaseDelay</code> option. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| readLockRemoveOnRollback (lock) | This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit). | true | boolean |
| readLockTimeout (lock) | Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit. | 10000 | long |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. The default value is 500. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------------------------|
| initialDelay (scheduler) | Milliseconds before the first poll starts. The default value is 1000. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. This option allows you to share a thread pool among multiple consumers. | | ScheduledExecutorService |
| scheduler (scheduler) | Allow to plugin a custom <code>org.apache.camel.spi.ScheduledPollConsumerScheduler</code> to use as the scheduler for firing when the polling consumer runs. The default implementation uses the <code>ScheduledExecutorService</code> and there is a Quartz2, and Spring based which supports CRON expressions. Notice: If using a custom scheduler then the options for <code>initialDelay</code> , <code>useFixedDelay</code> , <code>timeUnit</code> , and <code>scheduledExecutorService</code> may not be in use. Use the text <code>quartz2</code> to refer to use the Quartz2 scheduler; and use the text <code>spring</code> to use the Spring based; and use the text <code>#myScheduler</code> to refer to a custom scheduler by its id in the Registry. See Quartz2 page for an example. | none | ScheduledPollConsumerScheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for <code>initialDelay</code> and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details. | true | boolean |
| shuffle (sort) | To shuffle the list of files (sort in random order) | false | boolean |

| Name | Description | Default | Type |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------|
| <code>sortBy</code> (sort) | Built-in sort by using the File Language. Supports nested sorts, so you can have a sort by file name and as a 2nd group sort by modified date. | | String |
| <code>sorter</code> (sort) | Pluggable sorter as a <code>java.util.Comparator</code> class. | | Comparator |

TIP

Default behavior for file producer By default it will override any existing file, if one exist with the same name.

104.3. MOVE AND DELETE OPERATIONS

Any move or delete operations is executed after (post command) the routing has completed; so during processing of the **Exchange** the file is still located in the inbox folder.

Lets illustrate this with an example:

```
from("file://inbox?move=.done").to("bean:handleOrder");
```

When a file is dropped in the **inbox** folder, the file consumer notices this and creates a new **FileExchange** that is routed to the **handleOrder** bean. The bean then processes the **File** object. At this point in time the file is still located in the **inbox** folder. After the bean completes, and thus the route is completed, the file consumer will perform the move operation and move the file to the **.done** sub-folder.

The **move** and the **preMove** options are considered as a directory name (though if you use an expression such as [File Language](#), or [Simple](#) then the result of the expression evaluation is the file name to be used - eg if you set

```
move=../backup/copy-of-${file:name}
```

then that's using the [File Language](#) which we use return the file name to be used), which can be either relative or absolute. If relative, the directory is created as a sub-folder from within the folder where the file was consumed.

By default, Camel will move consumed files to the **.camel** sub-folder relative to the directory where the file was consumed.

If you want to delete the file after processing, the route should be:

```
from("file://inbox?delete=true").to("bean:handleOrder");
```

We have introduced a **pre** move operation to move files **before** they are processed. This allows you to mark which files have been scanned as they are moved to this sub folder before being processed.

```
from("file://inbox?preMove=inprogress").to("bean:handleOrder");
```

You can combine the **pre** move and the regular move:

```
from("file://inbox?preMove=inprogress&move=.done").to("bean:handleOrder");
```

So in this situation, the file is in the **inprogress** folder when being processed and after it's processed, it's moved to the **.done** folder.

104.4. FINE GRAINED CONTROL OVER MOVE AND PREMOVE OPTION

The **move** and **preMove** options are Expression-based, so we have the full power of the [File Language](#) to do advanced configuration of the directory and name pattern.

Camel will, in fact, internally convert the directory name you enter into a [File Language](#) expression. So when we enter **move=.done** Camel will convert this into: `${file:parent}/.done/${file:onlyname}`. This is only done if Camel detects that you have not provided a `/${}` in the option value yourself. So when you enter a `/${}` Camel will **not** convert it and thus you have the full power.

So if we want to move the file into a backup folder with today's date as the pattern, we can do:

```
move=backup/${date:now:yyyyMMdd}/${file:name}
```

104.5. ABOUT MOVEFAILED

The **moveFailed** option allows you to move files that **could not** be processed successfully to another location such as an error folder of your choice. For example to move the files in an error folder with a timestamp you can use **moveFailed=/error/\${file:name.noext}-\${date:now:yyyyMMddHHmmssSSS}.\${file:ext}**.

See more examples at [File Language](#)

104.6. MESSAGE HEADERS

The following headers are supported by this component:

104.6.1. File producer only

| Header | Description |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel FileName | Specifies the name of the file to write (relative to the endpoint directory). This name can be a String ; a String with a File Language or Simple expression; or an Expression object. If it's null then Camel will auto-generate a filename based on the message unique ID. |
| Camel FileNameProduced | The actual absolute filepath (path + name) for the output file that was written. This header is set by Camel and its purpose is providing end-users with the name of the file that was written. |
| Camel OverrideFileName | Camel 2.11: Is used for overruling CamelFileName header and use the value instead (but only once, as the producer will remove this header after writing the file). The value can be only be a String. Notice that if the option fileName has been configured, then this is still being evaluated. |

104.6.2. File consumer only

| Header | Description |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Camel FileName | Name of the consumed file as a relative file path with offset from the starting directory configured on the endpoint. |
| Camel FileNameOnly | Only the file name (the name with no leading paths). |
| Camel FileAbsolute | A boolean option specifying whether the consumed file denotes an absolute path or not. Should normally be false for relative paths. Absolute paths should normally not be used but we added to the move option to allow moving files to absolute paths. But can be used elsewhere as well. |
| Camel FileAbsolutePath | The absolute path to the file. For relative files this path holds the relative path instead. |
| Camel FilePath | The file path. For relative files this is the starting directory + the relative filename. For absolute files this is the absolute path. |
| Camel FileRelativePath | The relative path. |
| Camel FileParent | The parent path. |
| Camel FileLength | A long value containing the file size. |
| Camel FileLastModified | A Long value containing the last modified timestamp of the file. In Camel 2.10.3 and older the type is Date . |

104.7. BATCH CONSUMER

This component implements the Batch Consumer.

104.8. EXCHANGE PROPERTIES, FILE CONSUMER ONLY

As the file consumer implements the **BatchConsumer** it supports batching the files it polls. By batching we mean that Camel will add the following additional properties to the Exchange, so you know the number of files polled, the current index, and whether the batch is already completed.

| Property | Description |
|-----------------------------|-----------------------------------------------------------------------------------------------------------|
| Camel Batch Size | The total number of files that was polled in this batch. |
| Camel Batch Index | The current index of the batch. Starts from 0. |
| Camel Batch Complete | A boolean value indicating the last Exchange in the batch. Is only true for the last entry. |

This allows you for instance to know how many files exist in this batch and for instance let the `Aggregator2` aggregate this number of files.

104.9. USING CHARSET

Available as of Camel 2.9.3

The `charset` option allows for configuring an encoding of the files on both the consumer and producer endpoints. For example if you read utf-8 files, and want to convert the files to iso-8859-1, you can do:

```
from("file:inbox?charset=utf-8")
  .to("file:outbox?charset=iso-8859-1")
```

You can also use the **convertBodyTo** in the route. In the example below we have still input files in utf-8 format, but we want to convert the file content to a byte array in iso-8859-1 format. And then let a bean process the data. Before writing the content to the outbox folder using the current charset.

```
from("file:inbox?charset=utf-8")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .to("file:outbox");
```

If you omit the `charset` on the consumer endpoint, then Camel does not know the charset of the file, and would by default use "UTF-8". However you can configure a JVM system property to override and use a different default encoding with the key **org.apache.camel.default.charset**.

In the example below this could be a problem if the files is not in UTF-8 encoding, which would be the default encoding for read the files.

In this example when writing the files, the content has already been converted to a byte array, and thus would write the content directly as is (without any further encodings).

```
from("file:inbox")
  .convertBodyTo(byte[].class, "iso-8859-1")
```

```
.to("bean:myBean")
.to("file:outbox");
```

You can also override and control the encoding dynamic when writing files, by setting a property on the exchange with the key **Exchange.CHARSET_NAME**. For example in the route below we set the property with a value from a message header.

```
from("file:inbox")
  .convertBodyTo(byte[].class, "iso-8859-1")
  .to("bean:myBean")
  .setProperty(Exchange.CHARSET_NAME, header("someCharsetHeader"))
  .to("file:outbox");
```

We suggest to keep things simpler, so if you pickup files with the same encoding, and want to write the files in a specific encoding, then favor to use the **charset** option on the endpoints.

Notice that if you have explicit configured a **charset** option on the endpoint, then that configuration is used, regardless of the **Exchange.CHARSET_NAME** property.

If you have some issues then you can enable DEBUG logging on **org.apache.camel.component.file**, and Camel logs when it reads/write a file using a specific charset.

For example the route below will log the following:

```
from("file:inbox?charset=utf-8")
  .to("file:outbox?charset=iso-8859-1")
```

And the logs:

```
DEBUG GenericFileConverter      - Read file /Users/davsclaus/workspace/camel/camel-
core/target/charset/input/input.txt with charset utf-8
DEBUG FileOperations            - Using Reader to write file: target/charset/output.txt with charset:
iso-8859-1
```

104.10. COMMON GOTCHAS WITH FOLDER AND FILENAMES

When Camel is producing files (writing files) there are a few gotchas affecting how to set a filename of your choice. By default, Camel will use the message ID as the filename, and since the message ID is normally a unique generated ID, you will end up with filenames such as: **ID-MACHINENAME-2443-1211718892437-1-0**. If such a filename is not desired, then you must provide a filename in the **CamelFileName** message header. The constant, **Exchange.FILE_NAME**, can also be used.

The sample code below produces files using the message ID as the filename:

```
from("direct:report").to("file:target/reports");
```

To use **report.txt** as the filename you have to do:

```
from("direct:report").setHeader(Exchange.FILE_NAME, constant("report.txt")).to("file:target/reports");
```

- i. the same as above, but with **CamelFileName**:

```
from("direct:report").setHeader("CamelFileName", constant("report.txt")).to("file:target/reports");
```

And a syntax where we set the filename on the endpoint with the **fileName** URI option.

```
from("direct:report").to("file:target/reports/?fileName=report.txt");
```

104.11. FILENAME EXPRESSION

Filename can be set either using the **expression** option or as a string-based [File Language](#) expression in the **CamelFileName** header. See the [File Language](#) for syntax and samples.

104.12. CONSUMING FILES FROM FOLDERS WHERE OTHERS DROP FILES DIRECTLY

Beware if you consume files from a folder where other applications write files to directly. Take a look at the different readLock options to see what suits your use cases. The best approach is however to write to another folder and after the write move the file in the drop folder. However if you write files directly to the drop folder then the option changed could better detect whether a file is currently being written/copied as it uses a file changed algorithm to see whether the file size / modification changes over a period of time. The other readLock options rely on Java File API that sadly is not always very good at detecting this. You may also want to look at the doneFileName option, which uses a marker file (done file) to signal when a file is done and ready to be consumed.

104.13. USING DONE FILES

Available as of Camel 2.6

See also section *writing done files* below.

If you want only to consume files when a done file exists, then you can use the **doneFileName** option on the endpoint.

```
from("file:bar?doneFileName=done");
```

Will only consume files from the bar folder, if a done *file* exists in the same directory as the target files. Camel will automatically delete the *done file* when it's done consuming the files. From Camel **2.9.3** onwards Camel will not automatically delete the *done file* if **noop=true** is configured.

However it is more common to have one *done file* per target file. This means there is a 1:1 correlation. To do this you must use dynamic placeholders in the **doneFileName** option. Currently Camel supports the following two dynamic tokens: **file:name** and **file:name.noext** which must be enclosed in $\${}$. The consumer only supports the static part of the *done file* name as either prefix or suffix (not both).

```
from("file:bar?doneFileName=${file:name}.done");
```

In this example only files will be polled if there exists a done file with the name *file name.done*. For example

- **hello.txt** - is the file to be consumed
- **hello.txt.done** - is the associated done file

You can also use a prefix for the done file, such as:

```
from("file:bar?doneFileName=ready-${file:name}");
```

-
- **hello.txt** - is the file to be consumed
- **ready-hello.txt** - is the associated done file

104.14. WRITING DONE FILES

Available as of Camel 2.6

After you have written a file you may want to write an additional *donefile* as a kind of marker, to indicate to others that the file is finished and has been written. To do that you can use the **doneFileName** option on the file producer endpoint.

```
.to("file:bar?doneFileName=done");
```

Will simply create a file named **done** in the same directory as the target file.

However it is more common to have one done file per target file. This means there is a 1:1 correlation. To do this you must use dynamic placeholders in the **doneFileName** option. Currently Camel supports the following two dynamic tokens: **file:name** and **file:name.noext** which must be enclosed in `${ }`.

```
.to("file:bar?doneFileName=done-${file:name}");
```

Will for example create a file named **done-foo.txt** if the target file was **foo.txt** in the same directory as the target file.

```
.to("file:bar?doneFileName=${file:name}.done");
```

Will for example create a file named **foo.txt.done** if the target file was **foo.txt** in the same directory as the target file.

```
.to("file:bar?doneFileName=${file:name.noext}.done");
```

Will for example create a file named **foo.done** if the target file was **foo.txt** in the same directory as the target file.

104.15. SAMPLES

#=== Read from a directory and write to another directory

```
from("file://inputdir/?delete=true").to("file://outputdir")
```

104.15.1. Read from a directory and write to another directory using a overrule dynamic name

```
from("file://inputdir/?delete=true").to("file://outputdir?overruleFile=copy-of-${file:name}")
```

Listen on a directory and create a message for each file dropped there. Copy the contents to the **outputdir** and delete the file in the **inputdir**.

104.15.2. Reading recursively from a directory and writing to another

-

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir")
```

Listen on a directory and create a message for each file dropped there. Copy the contents to the **outputdir** and delete the file in the **inputdir**. Will scan recursively into sub-directories. Will lay out the files in the same directory structure in the **outputdir** as the **inputdir**, including any sub-directories.

```
inputdir/foo.txt
inputdir/sub/bar.txt
```

Will result in the following output layout:

```
outputdir/foo.txt
outputdir/sub/bar.txt
```

104.16. USING FLATTEN

If you want to store the files in the outputdir directory in the same directory, disregarding the source directory layout (e.g. to flatten out the path), you just add the **flatten=true** option on the file producer side:

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir?flatten=true")
```

Will result in the following output layout:

```
outputdir/foo.txt
outputdir/bar.txt
```

104.17. READING FROM A DIRECTORY AND THE DEFAULT MOVE OPERATION

Camel will by default move any processed file into a **.camel** subdirectory in the directory the file was consumed from.

```
from("file://inputdir/?recursive=true&delete=true").to("file://outputdir")
```

Affects the layout as follows:

before

```
inputdir/foo.txt
inputdir/sub/bar.txt
```

after

```
inputdir/.camel/foo.txt
inputdir/sub/.camel/bar.txt
outputdir/foo.txt
outputdir/sub/bar.txt
```

104.18. READ FROM A DIRECTORY AND PROCESS THE MESSAGE IN JAVA

```

from("file://inputdir/").process(new Processor() {
    public void process(Exchange exchange) throws Exception {
        Object body = exchange.getIn().getBody();
        // do some business logic with the input body
    }
});

```

The body will be a **File** object that points to the file that was just dropped into the **inputdir** directory.

104.19. WRITING TO FILES

Camel is of course also able to write files, i.e. produce files. In the sample below we receive some reports on the SEDA queue that we process before they are being written to a directory.

104.19.1. Write to subdirectory using `Exchange.FILE_NAME`

Using a single route, it is possible to write a file to any number of subdirectories. If you have a route setup as such:

```

<route>
  <from uri="bean:myBean"/>
  <to uri="file:/rootDirectory"/>
</route>

```

You can have **myBean** set the header **Exchange.FILE_NAME** to values such as:

```

Exchange.FILE_NAME = hello.txt => /rootDirectory/hello.txt
Exchange.FILE_NAME = foo/bye.txt => /rootDirectory/foo/bye.txt

```

This allows you to have a single route to write files to multiple destinations.

104.19.2. Writing file through the temporary directory relative to the final destination

Sometime you need to temporarily write the files to some directory relative to the destination directory. Such situation usually happens when some external process with limited filtering capabilities is reading from the directory you are writing to. In the example below files will be written to the **/var/myapp/filesInProgress** directory and after data transfer is done, they will be atomically moved to the `/var/myapp/finalDirectory`` directory.

```

from("direct:start").
  to("file:///var/myapp/finalDirectory?tempPrefix=./filesInProgress");

```

104.20. USING EXPRESSION FOR FILENAMES

In this sample we want to move consumed files to a backup folder using today's date as a sub-folder name:

```

from("file://inbox?move=backup/${date:now:yyyyMMdd}/${file:name}").to("...");

```

See [File Language](#) for more samples.

104.21. AVOIDING READING THE SAME FILE MORE THAN ONCE (IDEMPOTENT CONSUMER)

Camel supports Idempotent Consumer directly within the component so it will skip already processed files. This feature can be enabled by setting the **idempotent=true** option.

```
from("file://inbox?idempotent=true").to("...");
```

Camel uses the absolute file name as the idempotent key, to detect duplicate files. From **Camel 2.11** onwards you can customize this key by using an expression in the `idempotentKey` option. For example to use both the name and the file size as the key

```
<route>
  <from uri="file://inbox?idempotent=true&idempotentKey=${file:name}-${file:size}"/>
  <to uri="bean:processInbox"/>
</route>
```

By default Camel uses a in memory based store for keeping track of consumed files, it uses a least recently used cache holding up to 1000 entries. You can plugin your own implementation of this store by using the **idempotentRepository** option using the **#** sign in the value to indicate it's a referring to a bean in the Registry with the specified **id**.

```
<!-- define our store as a plain spring bean -->
<bean id="myStore" class="com.mycompany.MyIdempotentStore"/>

<route>
  <from uri="file://inbox?idempotent=true&idempotentRepository=#myStore"/>
  <to uri="bean:processInbox"/>
</route>
```

Camel will log at **DEBUG** level if it skips a file because it has been consumed before:

```
DEBUG FileConsumer is idempotent and the file has been consumed before. Will skip this file:
target\idempotent\report.txt
```

104.22. USING A FILE BASED IDEMPOTENT REPOSITORY

In this section we will use the file based idempotent repository **org.apache.camel.processor.idempotent.FileIdempotentRepository** instead of the in-memory based that is used as default.

This repository uses a 1st level cache to avoid reading the file repository. It will only use the file repository to store the content of the 1st level cache. Thereby the repository can survive server restarts. It will load the content of the file into the 1st level cache upon startup. The file structure is very simple as it stores the key in separate lines in the file. By default, the file store has a size limit of 1mb. When the file grows larger Camel will truncate the file store, rebuilding the content by flushing the 1st level cache into a fresh empty file.

We configure our repository using Spring XML creating our file idempotent repository and define our file consumer to use our repository with the **idempotentRepository** using **#** sign to indicate Registry lookup:

104.23. USING A JPA BASED IDEMPOTENT REPOSITORY

In this section we will use the JPA based idempotent repository instead of the in-memory based that is used as default.

First we need a persistence-unit in **META-INF/persistence.xml** where we need to use the class **org.apache.camel.processor.idempotent.jpa.MessageProcessed** as model.

```
<persistence-unit name="idempotentDb" transaction-type="RESOURCE_LOCAL">
  <class>org.apache.camel.processor.idempotent.jpa.MessageProcessed</class>

  <properties>
    <property name="openjpa.ConnectionURL" value="jdbc:derby:target/idempotentTest;create=true"/>
    <property name="openjpa.ConnectionDriverName"
value="org.apache.derby.jdbc.EmbeddedDriver"/>
    <property name="openjpa.jdbc.SynchronizeMappings" value="buildSchema"/>
    <property name="openjpa.Log" value="DefaultLevel=WARN, Tool=INFO"/>
    <property name="openjpa.Multithreaded" value="true"/>
  </properties>
</persistence-unit>
```

Next, we can create our JPA idempotent repository in the spring XML file as well:

```
<!-- we define our jpa based idempotent repository we want to use in the file consumer -->
<bean id="jpaStore" class="org.apache.camel.processor.idempotent.jpa.JpaMessageIdRepository">
  <!-- Here we refer to the entityManagerFactory -->
  <constructor-arg index="0" ref="entityManagerFactory"/>
  <!-- This 2nd parameter is the name (= a category name).
  You can have different repositories with different names -->
  <constructor-arg index="1" value="FileConsumer"/>
</bean>
```

And yes then we just need to refer to the **jpaStore** bean in the file consumer endpoint using the **idempotentRepository** using the **#** syntax option:

```
<route>
  <from uri="file://inbox?idempotent=true&idempotentRepository=#jpaStore"/>
  <to uri="bean:processInbox"/>
</route>
```

104.24. FILTER USING ORG.APACHE.CAMEL.COMPONENT.FILE.GENERICFILEFILTER

Camel supports pluggable filtering strategies. You can then configure the endpoint with such a filter to skip certain files being processed.

In the sample we have built our own filter that skips files starting with **skip** in the filename:

And then we can configure our route using the **filter** attribute to reference our filter (using **#** notation) that we have defined in the spring XML file:

```
<!-- define our filter as a plain spring bean -->
<bean id="myFilter" class="com.mycompany.MyFileFilter"/>

<route>
```

```

<from uri="file://inbox?filter=#myFilter"/>
<to uri="bean:processInbox"/>
</route>

```

104.25. FILTERING USING ANT PATH MATCHER

The ANT path matcher is shipped out-of-the-box in the **camel-spring** jar. So you need to depend on **camel-spring** if you are using Maven.

The reason is that we leverage Spring's [AntPathMatcher](#) to do the actual matching.

The file paths is matched with the following rules:

- **?** matches one character
- ***** matches zero or more characters
- ****** matches zero or more directories in a path

TIP

New options from Camel 2.10 onwards There are now **antInclude** and **antExclude** options to make it easy to specify ANT style include/exclude without having to define the filter. See the URI options above for more information.

The sample below demonstrates how to use it:

104.25.1. Sorting using Comparator

Camel supports pluggable sorting strategies. This strategy it to use the build in **java.util.Comparator** in Java. You can then configure the endpoint with such a comparator and have Camel sort the files before being processed.

In the sample we have built our own comparator that just sorts by file name:

And then we can configure our route using the **sorter** option to reference to our sorter (**mySorter**) we have defined in the spring XML file:

```

<!-- define our sorter as a plain spring bean -->
<bean id="mySorter" class="com.mycompany.MyFileSorter"/>

<route>
  <from uri="file://inbox?sorter=#mySorter"/>
  <to uri="bean:processInbox"/>
</route>

```

TIP

URI options can reference beans using the # syntax In the Spring DSL route above notice that we can refer to beans in the Registry by prefixing the id with **#**. So writing **sorter=#mySorter**, will instruct Camel to go look in the Registry for a bean with the ID, **mySorter**.

104.25.2. Sorting using sortBy

Camel supports pluggable sorting strategies. This strategy it to use the [File Language](#) to configure the sorting. The **sortBy** option is configured as follows:

```
sortBy=group 1;group 2;group 3;...
```

Where each group is separated with semi colon. In the simple situations you just use one group, so a simple example could be:

```
sortBy=file:name
```

This will sort by file name, you can reverse the order by prefixing **reverse:** to the group, so the sorting is now Z..A:

```
sortBy=reverse:file:name
```

As we have the full power of [File Language](#) we can use some of the other parameters, so if we want to sort by file size we do:

```
sortBy=file:length
```

You can configure to ignore the case, using **ignoreCase:** for string comparison, so if you want to use file name sorting but to ignore the case then we do:

```
sortBy=ignoreCase:file:name
```

You can combine ignore case and reverse, however reverse must be specified first:

```
sortBy=reverse:ignoreCase:file:name
```

In the sample below we want to sort by last modified file, so we do:

```
sortBy=file:modified
```

And then we want to group by name as a 2nd option so files with same modification is sorted by name:

```
sortBy=file:modified;file:name
```

Now there is an issue here, can you spot it? Well the modified timestamp of the file is too fine as it will be in milliseconds, but what if we want to sort by date only and then subgroup by name?

Well as we have the true power of [File Language](#) we can use its date command that supports patterns. So this can be solved as:

```
sortBy=date:file:yyyyMMdd;file:name
```

Yeah, that is pretty powerful, oh by the way you can also use reverse per group, so we could reverse the file names:

```
sortBy=date:file:yyyyMMdd;reverse:file:name
```

104.26. USING GENERICFILEPROCESSSTRATEGY

The option **processStrategy** can be used to use a custom **GenericFileProcessStrategy** that allows you to implement your own *begin*, *commit* and *rollback* logic.

For instance lets assume a system writes a file in a folder you should consume. But you should not start consuming the file before another *ready* file has been written as well.

So by implementing our own **GenericFileProcessStrategy** we can implement this as:

- In the **begin()** method we can test whether the special *ready* file exists. The begin method returns a **boolean** to indicate if we can consume the file or not.
- In the **abort()** method (Camel 2.10) special logic can be executed in case the **begin** operation returned **false**, for example to cleanup resources etc.
- in the **commit()** method we can move the actual file and also delete the *ready* file.

104.27. USING FILTER

The **filter** option allows you to implement a custom filter in Java code by implementing the **org.apache.camel.component.file.GenericFileFilter** interface. This interface has an **accept** method that returns a boolean. Return **true** to include the file, and **false** to skip the file. From Camel 2.10 onwards, there is a **isDirectory** method on **GenericFile** whether the file is a directory. This allows you to filter unwanted directories, to avoid traversing down unwanted directories.

For example to skip any directories which starts with **"skip"** in the name, can be implemented as follows:

104.28. USING CONSUMER.BRIDGEERRORHANDLER

Available as of Camel 2.10

If you want to use the Camel Error Handler to deal with any exception occurring in the file consumer, then you can enable the **consumer.bridgeErrorHandler** option as shown below:

```
// to handle any IOException being thrown
onException(IOException.class)
    .handled(true)
    .log("IOException occurred due: ${exception.message}")
    .transform().simple("Error ${exception.message}")
    .to("mock:error");

// this is the file route that pickup files, notice how we bridge the consumer to use the Camel routing
// error handler
// the exclusiveReadLockStrategy is only configured because this is from an unit test, so we use that
// to simulate exceptions
from("file:target/nospace?consumer.bridgeErrorHandler=true")
    .convertBodyTo(String.class)
    .to("mock:result");
```

So all you have to do is to enable this option, and the error handler in the route will take it from there.

IMPORTANT

Important when using consumer.bridgeErrorHandler When using **consumer.bridgeErrorHandler**, then interceptors, **OnCompletions** does **not** apply. The Exchange is processed directly by the Camel Error Handler, and does not allow prior actions such as interceptors, **onCompletion** to take action.

104.29. DEBUG LOGGING

This component has log level **TRACE** that can be helpful if you have problems.

CHAPTER 105. FILE LANGUAGE

Available as of Camel version 1.1

INFO:*File language is now merged with Simple language* From Camel 2.2 onwards, the file language is now merged with [Simple](#) language which means you can use all the file syntax directly within the simple language.

The File Expression Language is an extension to the [Simple](#) language, adding file related capabilities. These capabilities are related to common use cases working with file path and names. The goal is to allow expressions to be used with the File and FTP components for setting dynamic file patterns for both consumer and producer.

105.1. FILE LANGUAGE OPTIONS

The File language supports 2 options, which are listed below.

| Name | Default | Java Type | Description |
|------------|-------------|----------------|--------------------------------------------------------------------------------------|
| resultType | | String | Sets the class name of the result type (type from output) |
| trim | true | Boolean | Whether to trim the value to remove leading and trailing whitespaces and line breaks |

105.2. SYNTAX

This language is an **extension** to the [Simple](#) language so the [Simple](#) syntax applies also. So the table below only lists the additional.

As opposed to [Simple](#) language [File Language](#) also supports [Constant](#) expressions so you can enter a fixed filename.

All the file tokens use the same expression name as the method on the **java.io.File** object, for instance **file:absolute** refers to the **java.io.File.getAbsolute()** method. Notice that not all expressions are supported by the current Exchange. For instance the [FTP](#) component supports some of the options, where as the File component supports all of them.

| Expression | Type | File Consumer | File Producer | FTP Consumer | FTP Producer | Description |
|---------------|--------|---------------|---------------|--------------|--------------|---------------------------------------------------------------------------------|
| file:name | String | yes | no | yes | no | refers to the file name (is relative to the starting directory, see note below) |
| file:name.ext | String | yes | no | yes | no | Camel 2.3: refers to the file extension only |

| Expression | Type | File Consumer | File Producer | FTP Consumer | FTP Producer | Description |
|----------------------------|--------|---------------|---------------|--------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file:name.ext.single | String | yes | no | yes | no | Camel 2.14.4/2.15.3: refers to the file extension. If the file extension has multiple dots, then this expression strips and only returns the last part. |
| file:name.noext | String | yes | no | yes | no | refers to the file name with no extension (is relative to the starting directory, see note below) |
| file:name.noext.single | String | yes | no | yes | no | Camel 2.14.4/2.15.3: refers to the file name with no extension (is relative to the starting directory, see note below). If the file extension has multiple dots, then this expression strips only the last part, and keep the others. |
| file:onlyname | String | yes | no | yes | no | refers to the file name only with no leading paths. |
| file:onlyname.noext | String | yes | no | yes | no | refers to the file name only with no extension and with no leading paths. |
| file:onlyname.noext.single | String | yes | no | yes | no | *Camel 2.14.4/2.15.3:*refers to the file name only with no extension and with no leading paths. If the file extension has multiple dots, then this expression strips only the last part, and keep the others. |

| Expression | Type | File Consumer | File Producer | FTP Consumer | FTP Producer | Description |
|------------------------|---------|---------------|---------------|--------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file:ext | String | yes | no | yes | no | refers to the file extension only |
| file:parent | String | yes | no | yes | no | refers to the file parent |
| file:path | String | yes | no | yes | no | refers to the file path |
| file:absolute | Boolean | yes | no | no | no | refers to whether the file is regarded as absolute or relative |
| file:absolute.path | String | yes | no | no | no | refers to the absolute file path |
| file:length | Long | yes | no | yes | no | refers to the file length returned as a Long type |
| file:size | Long | yes | no | yes | no | Camel 2.5: refers to the file length returned as a Long type |
| file:modified | Date | yes | no | yes | no | Refers to the file last modified returned as a Date type |
| date:_command:pattern_ | String | yes | yes | yes | yes | for date formatting using the java.text.SimpleDateFormat patterns. Is an extension to the Simple language. Additional command is: file (consumers only) for the last modified timestamp of the file. Notice: all the commands from the Simple language can also be used. |

105.3. FILE TOKEN EXAMPLE

105.3.1. Relative paths

We have a **java.io.File** handle for the file **hello.txt** in the following **relative** directory: **filelanguage\test**. And we configure our endpoint to use this starting directory **filelanguage**. The file tokens will return as:

| Expression | Returns |
|---------------------|----------------------------------------------------------------|
| file:name | test\hello.txt |
| file:name.ext | txt |
| file:name.noext | test\hello |
| file:onlyname | hello.txt |
| file:onlyname.noext | hello |
| file:ext | txt |
| file:parent | filelanguage\test |
| file:path | filelanguage\test\hello.txt |
| file:absolute | false |
| file:absolute.path | \workspace\camel\camel-core\target\filelanguage\test\hello.txt |

105.3.2. Absolute paths

We have a **java.io.File** handle for the file **hello.txt** in the following **absolute** directory: **\workspace\camel\camel-core\target\filelanguage\test**. And we configure our endpoint to use the absolute starting directory **\workspace\camel\camel-core\target\filelanguage**. The file tokens will return as:

| Expression | Returns |
|---------------------|----------------|
| file:name | test\hello.txt |
| file:name.ext | txt |
| file:name.noext | test\hello |
| file:onlyname | hello.txt |
| file:onlyname.noext | hello |
| file:ext | txt |

| Expression | Returns |
|--------------------|----------------------------------------------------------------|
| file:parent | \workspace\camel\camel-core\target\filelanguage\test |
| file:path | \workspace\camel\camel-core\target\filelanguage\test\hello.txt |
| file:absolute | true |
| file:absolute.path | \workspace\camel\camel-core\target\filelanguage\test\hello.txt |

105.4. SAMPLES

You can enter a fixed [Constant](#) expression such as **myfile.txt**:

```
fileName="myfile.txt"
```

Lets assume we use the file consumer to read files and want to move the read files to backup folder with the current date as a sub folder. This can be achieved using an expression like:

```
fileName="backup/${date:now:yyyyMMdd}/${file:name.noext}.bak"
```

relative folder names are also supported so suppose the backup folder should be a sibling folder then you can append .. as:

```
fileName="../backup/${date:now:yyyyMMdd}/${file:name.noext}.bak"
```

As this is an extension to the [Simple](#) language we have access to all the goodies from this language also, so in this use case we want to use the in.header.type as a parameter in the dynamic expression:

```
fileName="../backup/${date:now:yyyyMMdd}/type-${in.header.type}/backup-of-${file:name.noext}.bak"
```

If you have a custom Date you want to use in the expression then Camel supports retrieving dates from the message header.

```
fileName="orders/order-${in.header.customerId}-${date:in.header.orderDate:yyyyMMdd}.xml"
```

And finally we can also use a bean expression to invoke a POJO class that generates some String output (or convertible to String) to be used:

```
fileName="uniquefile-${bean:myguidgenerator.generateid}.txt"
```

And of course all this can be combined in one expression where you can use the [File Language](#), [Simple](#) and the [Bean](#) language in one combined expression. This is pretty powerful for those common file path patterns.

105.5. USING SPRING PROPERTYPLACEHOLDERCONFIGURER TOGETHER WITH THE FILE COMPONENT

In Camel you can use the [File Language](#) directly from the [Simple](#) language which makes a Content Based Router easier to do in Spring XML, where we can route based on file extensions as shown below:

```
<from uri="file://input/orders"/>
  <choice>
    <when>
      <simple>${file:ext} == 'txt'</simple>
      <to uri="bean:orderService?method=handleTextFiles"/>
    </when>
    <when>
      <simple>${file:ext} == 'xml'</simple>
      <to uri="bean:orderService?method=handleXmlFiles"/>
    </when>
    <otherwise>
      <to uri="bean:orderService?method=handleOtherFiles"/>
    </otherwise>
  </choice>
```

If you use the **fileName** option on the File endpoint to set a dynamic filename using the [File Language](#) then make sure you use the alternative syntax (available from Camel 2.5 onwards) to avoid clashing with Springs **PropertyPlaceholderConfigurer**.

bundle-context.xml

```
<bean id="propertyPlaceholder"
class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
  <property name="location" value="classpath:bundle-context.cfg" />
</bean>

<bean id="sampleRoute" class="SampleRoute">
  <property name="fromEndpoint" value="${fromEndpoint}" />
  <property name="toEndpoint" value="${toEndpoint}" />
</bean>
```

bundle-context.cfg

```
fromEndpoint=activemq:queue:test
toEndpoint=file://fileRoute/out?fileName=test-${simple{date:now:yyyyMMdd}.txt
```

Notice how we use the `simple{ }` syntax in the **toEndpoint** above. If you don't do this, there is a clash and Spring will throw an exception like

```
org.springframework.beans.factory.BeanDefinitionStoreException:
Invalid bean definition with name 'sampleRoute' defined in class path resource [bundle-context.xml]:
Could not resolve placeholder 'date:now:yyyyMMdd'
```

105.6. DEPENDENCIES

The File language is part of **camel-core**.

CHAPTER 106. FLATPACK COMPONENT

Available as of Camel version 1.4

The Flatpack component supports fixed width and delimited file parsing via the [FlatPack library](#).

Notice: This component only supports consuming from flatpack files to Object model. You can not (yet) write from Object model to flatpack format.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

106.1. URI FORMAT

```
flatpack:[delim|fixed]:flatPackConfig.pzmap.xml[?options]
```

Or for a delimited file handler with no configuration file just use

```
flatpack:someName[?options]
```

You can append query options to the URI in the following format, **?option=value&option=value&...**

106.2. URI OPTIONS

The Flatpack component has no options.

The Flatpack endpoint is configured using URI syntax:

```
flatpack:type:resourceUri
```

with the following path and query parameters:

106.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|--------------------|-----------------------------------------------------------------------------------------|---------|--------------|
| type | Whether to use fixed or delimiter | delim | FlatpackType |
| resourceUri | Required URL for loading the flatpack mapping file from classpath or file system | | String |

106.2.2. Query Parameters (25 parameters):

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------------------|
| allowShortLines (common) | Allows for lines to be shorter than expected and ignores the extra characters | false | boolean |
| delimiter (common) | The default character delimiter for delimited files. | , | char |
| ignoreExtraColumns (common) | Allows for lines to be longer than expected and ignores the extra characters | false | boolean |
| ignoreFirstRecord (common) | Whether the first line is ignored for delimited files (for the column headers). | true | boolean |
| splitRows (common) | Sets the Component to send each row as a separate exchange once parsed | true | boolean |
| textQualifier (common) | The text qualifier for delimited files. | | char |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | <code>PollingConsumerPollStrategy</code> |

| Name | Description | Default | Type |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |

| Name | Description | Default | Type |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------|----------------------|----------|
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

106.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.flatpack.enabled | Enable flatpack component | true | Boolean |
| camel.component.flatpack.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| camel.dataformat.flatpack.allow-short-lines | Allows for lines to be shorter than expected and ignores the extra characters | false | Boolean |
| camel.dataformat.flatpack.content-type-header | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSon etc. | false | Boolean |
| camel.dataformat.flatpack.definition | The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap. | | String |
| camel.dataformat.flatpack.delimiter | The delimiter char (could be ; , or similar) | , | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.dataformat.flatpack.enabled</code> | Enable flatpack dataformat | true | Boolean |
| <code>camel.dataformat.flatpack.fixed</code> | Delimited or fixed. Is by default false = delimited | false | Boolean |
| <code>camel.dataformat.flatpack.ignore-extra-columns</code> | Allows for lines to be longer than expected and ignores the extra characters. | false | Boolean |
| <code>camel.dataformat.flatpack.ignore-first-record</code> | Whether the first line is ignored for delimited files (for the column headers). Is by default true. | true | Boolean |
| <code>camel.dataformat.flatpack.parser-factory-ref</code> | References to a custom parser factory to lookup in the registry | | String |
| <code>camel.dataformat.flatpack.text-qualifier</code> | If the text is qualified with a character. Uses quote character by default. | | String |

106.4. EXAMPLES

- `flatpack:fixed:foo.pzmap.xml` creates a fixed-width endpoint using the `foo.pzmap.xml` file configuration.
- `flatpack:delim:bar.pzmap.xml` creates a delimited endpoint using the `bar.pzmap.xml` file configuration.
- `flatpack:foo` creates a delimited endpoint called `foo` with no file configuration.

106.5. MESSAGE HEADERS

Camel will store the following headers on the IN message:

| Header | Description |
|-----------------------------------|--------------------------------------------------------------------------------------------------|
| <code>camelFlatpackCounter</code> | The current row index. For <code>splitRows=false</code> the counter is the total number of rows. |

106.6. MESSAGE BODY

The component delivers the data in the IN message as a `org.apache.camel.component.flatpack.DataSetList` object that has converters for `java.util.Map` or `java.util.List`.

Usually you want the **Map** if you process one row at a time (**splitRows=true**). Use **List** for the entire content (**splitRows=false**), where each element in the list is a **Map**. Each **Map** contains the key for the column name and its corresponding value.

For example to get the firstname from the sample below:

```
Map row = exchange.getIn().getBody(Map.class);
String firstName = row.get("FIRSTNAME");
```

However, you can also always get it as a **List** (even for **splitRows=true**). The same example:

```
List data = exchange.getIn().getBody(List.class);
Map row = (Map)data.get(0);
String firstName = row.get("FIRSTNAME");
```

106.7. HEADER AND TRAILER RECORDS

The header and trailer notions in Flatpack are supported. However, you **must** use fixed record IDs:

- **header** for the header record (must be lowercase)
- **trailer** for the trailer record (must be lowercase)

The example below illustrates this fact that we have a header and a trailer. You can omit one or both of them if not needed.

```
<RECORD id="header" startPosition="1" endPosition="3" indicator="HBT">
  <COLUMN name="INDICATOR" length="3"/>
  <COLUMN name="DATE" length="8"/>
</RECORD>

<COLUMN name="FIRSTNAME" length="35" />
<COLUMN name="LASTNAME" length="35" />
<COLUMN name="ADDRESS" length="100" />
<COLUMN name="CITY" length="100" />
<COLUMN name="STATE" length="2" />
<COLUMN name="ZIP" length="5" />

<RECORD id="trailer" startPosition="1" endPosition="3" indicator="FBT">
  <COLUMN name="INDICATOR" length="3"/>
  <COLUMN name="STATUS" length="7"/>
</RECORD>
```

106.8. USING THE ENDPOINT

A common use case is sending a file to this endpoint for further processing in a separate route. For example:

```
<camelContext xmlns="http://activemq.apache.org/camel/schema/spring">
  <route>
    <from uri="file://someDirectory"/>
    <to uri="flatpack:foo"/>
  </route>
```

```

<route>
  <from uri="flatpack:foo"/>
  ...
</route>
</camelContext>

```

You can also convert the payload of each message created to a **Map** for easy Bean Integration

106.9. FLATPACK DATAFORMAT

The [Flatpack](#) component ships with the Flatpack data format that can be used to format between fixed width or delimited text messages to a **List** of rows as **Map**.

- marshal = from **List<Map<String, Object>>** to **OutputStream** (can be converted to **String**)
- unmarshal = from **java.io.InputStream** (such as a **File** or **String**) to a **java.util.List** as an **org.apache.camel.component.flatpack.DataSetList** instance.
The result of the operation will contain all the data. If you need to process each row one by one you can split the exchange, using Splitter.

Notice: The Flatpack library does currently not support header and trailers for the marshal operation.

106.10. OPTIONS

The data format has the following options:

| Option | Default | Description |
|--------------------------|--------------|------------------------------------------------------------------------------------------------------------------|
| definition | null | The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap. |
| fixed | false | Delimited or fixed. |
| ignoreFirstRecord | true | Whether the first line is ignored for delimited files (for the column headers). |
| textQualifier | " | If the text is qualified with a char such as " . |
| delimiter | , | The delimiter char (could be ; , or similar) |
| parserFactory | null | Uses the default Flatpack parser factory. |

| Option | Default | Description |
|-----------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------|
| allow Short Lines | false | Camel 2.9.7 and 2.10.5 onwards: Allows for lines to be shorter than expected and ignores the extra characters. |
| ignore Extra Columns | false | Camel 2.9.7 and 2.10.5 onwards: Allows for lines to be longer than expected and ignores the extra characters. |

106.11. USAGE

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```
FlatpackDataFormat fp = new FlatpackDataFormat();
fp.setDefinition(new ClassPathResource("INVENTORY-Delimited.pzmap.xml"));
...
from("file:order/in").unmarshal(df).to("seda:queue:neworder");
```

The sample above will read files from the **order/in** folder and unmarshal the input using the Flatpack configuration file **INVENTORY-Delimited.pzmap.xml** that configures the structure of the files. The result is a **DataSetList** object we store on the SEDA queue.

```
FlatpackDataFormat df = new FlatpackDataFormat();
df.setDefinition(new ClassPathResource("PEOPLE-FixedLength.pzmap.xml"));
df.setFixed(true);
df.setIgnoreFirstRecord(false);

from("seda:people").marshal(df).convertBodyTo(String.class).to("jms:queue:people");
```

In the code above we marshal the data from a Object representation as a **List** of rows as **Maps**. The rows as **Map** contains the column name as the key, and the corresponding value. This structure can be created in Java code from e.g. a processor. We marshal the data according to the Flatpack format and convert the result as a **String** object and store it on a JMS queue.

106.12. DEPENDENCIES

To use Flatpack in your camel routes you need to add the a dependency on **camel-flatpack** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
</dependency>
```

- [Getting Started](#)

CHAPTER 107. FLATPACK DATAFORMAT

Available as of Camel version 2.1

The [Flatpack](#) component ships with the Flatpack data format that can be used to format between fixed width or delimited text messages to a **List** of rows as **Map**.

- marshal = from **List<Map<String, Object>>** to **OutputStream** (can be converted to **String**)
- unmarshal = from **java.io.InputStream** (such as a **File** or **String**) to a **java.util.List** as an **org.apache.camel.component.flatpack.DataSetList** instance.
The result of the operation will contain all the data. If you need to process each row one by one you can split the exchange, using **Splitter**.

Notice: The Flatpack library does currently not support header and trailers for the marshal operation.

107.1. OPTIONS

The Flatpack dataformat supports 9 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| definition | | String | The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap. |
| fixed | false | Boolean | Delimited or fixed. Is by default false = delimited |
| ignoreFirstRecord | true | Boolean | Whether the first line is ignored for delimited files (for the column headers). Is by default true. |
| textQualifier | | String | If the text is qualified with a character. Uses quote character by default. |
| delimiter | , | String | The delimiter char (could be ; , or similar) |
| allowShortLines | false | Boolean | Allows for lines to be shorter than expected and ignores the extra characters |
| ignoreExtraColumns | false | Boolean | Allows for lines to be longer than expected and ignores the extra characters. |
| parserFactoryRef | | String | References to a custom parser factory to lookup in the registry |
| contentTypeHeader | false | Boolean | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example application/xml for data formats marshalling to XML, or application/json for data formats marshalling to JSON etc. |

107.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 12 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.flatpack.enabled</code> | Enable flatpack component | true | Boolean |
| <code>camel.component.flatpack.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |
| <code>camel.dataformat.flatpack.allow-short-lines</code> | Allows for lines to be shorter than expected and ignores the extra characters | false | Boolean |
| <code>camel.dataformat.flatpack.content-type-header</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSON etc. | false | Boolean |
| <code>camel.dataformat.flatpack.definition</code> | The flatpack pzmap configuration file. Can be omitted in simpler situations, but its preferred to use the pzmap. | | String |
| <code>camel.dataformat.flatpack.delimiter</code> | The delimiter char (could be <code>;</code> , or similar) | , | String |
| <code>camel.dataformat.flatpack.enabled</code> | Enable flatpack dataformat | true | Boolean |
| <code>camel.dataformat.flatpack.fixed</code> | Delimited or fixed. Is by default false = delimited | false | Boolean |
| <code>camel.dataformat.flatpack.ignore-extra-columns</code> | Allows for lines to be longer than expected and ignores the extra characters. | false | Boolean |
| <code>camel.dataformat.flatpack.ignore-first-record</code> | Whether the first line is ignored for delimited files (for the column headers). Is by default true. | true | Boolean |
| <code>camel.dataformat.flatpack.parser-factory-ref</code> | References to a custom parser factory to lookup in the registry | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------|-----------------------------------------------------------------------------|---------|--------|
| <code>camel.dataformat.flatpack.text-qualifier</code> | If the text is qualified with a character. Uses quote character by default. | | String |

ND

107.3. USAGE

To use the data format, simply instantiate an instance and invoke the marshal or unmarshal operation in the route builder:

```
FlatpackDataFormat fp = new FlatpackDataFormat();
fp.setDefinition(new ClassPathResource("INVENTORY-Delimited.pzmap.xml"));
...
from("file:order/in").unmarshal(df).to("seda:queue:neworder");
```

The sample above will read files from the **order/in** folder and unmarshal the input using the Flatpack configuration file **INVENTORY-Delimited.pzmap.xml** that configures the structure of the files. The result is a **DataSetList** object we store on the SEDA queue.

```
FlatpackDataFormat df = new FlatpackDataFormat();
df.setDefinition(new ClassPathResource("PEOPLE-FixedLength.pzmap.xml"));
df.setFixed(true);
df.setIgnoreFirstRecord(false);

from("seda:people").marshal(df).convertBodyTo(String.class).to("jms:queue:people");
```

In the code above we marshal the data from a Object representation as a **List** of rows as **Maps**. The rows as **Map** contains the column name as the key, and the corresponding value. This structure can be created in Java code from e.g. a processor. We marshal the data according to the Flatpack format and convert the result as a **String** object and store it on a JMS queue.

107.4. DEPENDENCIES

To use Flatpack in your camel routes you need to add the a dependency on **camel-flatpack** which implements this data format.

If you use maven you could just add the following to your pom.xml, substituting the version number for the latest & greatest release (see the download page for the latest versions).

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flatpack</artifactId>
  <version>x.x.x</version>
</dependency>
```

CHAPTER 108. APACHE FLINK COMPONENT

Available as of Camel version 2.18

This documentation page covers the [Apache Flink](#) component for the Apache Camel. The **camel-flink** component provides a bridge between Camel connectors and Flink tasks.

This Camel Flink connector provides a way to route message from various transports, dynamically choosing a flink task to execute, use incoming message as input data for the task and finally deliver the results back to the Camel pipeline.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-flink</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

108.1. URI FORMAT

Currently, the Flink Component supports only Producers. One can create DataSet, DataStream jobs.

```
flink:dataset?dataset=#myDataSet&dataSetCallback=#dataSetCallback
flink:datastream?datastream=#myDataStream&dataStreamCallback=#dataStreamCallback
```

FlinkEndpoint Options

The Apache Flink endpoint is configured using URI syntax:

```
flink:endpointType
```

with the following path and query parameters:

108.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|---------------------|-------------------------------------------------------------|---------|--------------|
| endpointType | Required Type of the endpoint (dataset, datastream). | | EndpointType |

108.1.2. Query Parameters (6 parameters):

| Name | Description | Default | Type |
|---------------------------|------------------------------------------------------|---------|---------|
| collect (producer) | Indicates if results should be collected or counted. | true | boolean |

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| dataSet (producer) | DataSet to compute against. | | DataSet |
| dataSetCallback (producer) | Function performing action against a DataSet. | | DataSetCallback |
| dataStream (producer) | DataStream to compute against. | | DataStream |
| dataStreamCallback (producer) | Function performing action against a DataStream. | | DataStreamCallback |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

108.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 6 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.flink.data-set | DataSet to compute against. The option is a <code>org.apache.flink.api.java.DataSet</code> type. | | String |
| camel.component.flink.data-set-callback | Function performing action against a DataSet. The option is a <code>org.apache.camel.component.flink.DataSetCallback</code> type. | | String |
| camel.component.flink.data-stream | DataStream to compute against. The option is a <code>org.apache.flink.streaming.api.datastream.DataStream</code> type. | | String |
| camel.component.flink.data-stream-callback | Function performing action against a DataStream. The option is a <code>org.apache.camel.component.flink.DataStreamCallback</code> type. | | String |
| camel.component.flink.enabled | Enable flink component | true | Boolean |

| Name | Description | Default | Type |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.flink.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

108.3. FLINKCOMPONENT OPTIONS

The Apache Flink component supports 5 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| <code>dataSet</code> (producer) | DataSet to compute against. | | DataSet |
| <code>dataStream</code> (producer) | DataStream to compute against. | | DataStream |
| <code>dataSetCallback</code> (producer) | Function performing action against a DataSet. | | DataSetCallback |
| <code>dataStreamCallback</code> (producer) | Function performing action against a DataStream. | | DataStreamCallback |
| <code>resolvePropertyPlaceholders</code> (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

108.4. FLINK DATASET CALLBACK

```
@Bean
public DataSetCallback<Long> dataSetCallback() {
    return new DataSetCallback<Long>() {
        public Long onDataSet(DataSet dataSet, Object... objects) {
            try {
                dataSet.print();
                return new Long(0);
            } catch (Exception e) {
                return new Long(-1);
            }
        }
    };
}
```

108.5. FLINK DATASTREAM CALLBACK

```

@Bean
public VoidDataStreamCallback dataStreamCallback() {
    return new VoidDataStreamCallback() {
        @Override
        public void doOnDataStream(DataStream dataStream, Object... objects) throws Exception {
            dataStream.flatMap(new Splitter()).print();

            environment.execute("data stream test");
        }
    };
}

```

108.6. CAMEL-FLINK PRODUCER CALL

```

CamelContext camelContext = new SpringCamelContext(context);

String pattern = "foo";

try {
    ProducerTemplate template = camelContext.createProducerTemplate();
    camelContext.start();
    Long count = template.requestBody("flink:dataSet?
dataSet=#myDataSet&dataSetCallback=#countLinesContaining", pattern, Long.class);
} finally {
    camelContext.stop();
}

```

108.7. SEE ALSO

- [Configuring Camel](#)

- [Endpoint](#)
- [Getting Started](#)

CHAPTER 109. FOP COMPONENT

Available as of Camel version 2.10

The FOP component allows you to render a message into different output formats using [Apache FOP](#).

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-fop</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

109.1. URI FORMAT

```
fop://outputFormat?[options]
```

109.2. OUTPUT FORMATS

The primary output format is PDF but other output [formats](#) are also supported:

| name | output Format | description |
|------|------------------------|--------------------------|
| PDF | application/pdf | Portable Document Format |
| PS | application/postscript | Adobe Postscript |
| PCL | application/x-pcl | Printer Control Language |
| PNG | image/png | PNG images |
| JPEG | image/jpeg | JPEG images |
| SVG | image/svg+xml | Scalable Vector Graphics |

| name | output Format | description |
|------|----------------------------|--------------------------|
| XML | application/X-fop-areatree | Area tree representation |
| MIF | application/mif | FrameMaker's MIF |
| RTF | application/rtf | Rich Text Format |
| TXT | text/plain | Text |

The complete list of valid output formats can be found [here](#)

109.3. ENDPOINT OPTIONS

The FOP component has no options.

The FOP endpoint is configured using URI syntax:

```
fop:outputType
```

with the following path and query parameters:

109.3.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|-------------------|-----------------------------------------------------------------------------------------------|---------|---------------|
| outputType | Required The primary output format is PDF but other output formats are also supported. | | FopOutputType |

109.3.2. Query Parameters (3 parameters):

| Name | Description | Default | Type |
|---------------------------------|----------------------------------------------------------------------------------------|---------|------------|
| fopFactory (producer) | Allows to use a custom configured or implementation of org.apache.fop.apps.FopFactory. | | FopFactory |

| Name | Description | Default | Type |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| userConfigURL (producer) | The location of a configuration file which can be loaded from classpath or file system. | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

109.4. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.fop.enabled | Enable fop component | true | Boolean |
| camel.component.fop.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

The location of a configuration file with the following [structure](#). From **Camel 2.12** onwards the file is loaded from the classpath by default. You can use **file:**, or **classpath:** as prefix to load the resource from file or classpath. In previous releases the file is always loaded from file system.

fopFactory

Allows to use a custom configured or implementation of **org.apache.fop.apps.FopFactory**.

109.5. MESSAGE OPERATIONS

| name | default value | description |
|-------------------------------|---------------|----------------------------------------------|
| CamelFop.Output.Format | | Overrides the output format for that message |
| CamelFop.Encrypt.userPassword | | PDF user password |

| name | default value | description |
|---------------------------------------|---------------|---------------------------------------------------------------------|
| CamelFop.Encrypt.ownerPassword | | PDF owner password |
| CamelFop.Encrypt.allowPrint | true | Allows printing the PDF |
| CamelFop.Encrypt.allowCopyContent | true | Allows copying content of the PDF |
| CamelFop.Encrypt.allowEditContent | true | Allows editing content of the PDF |
| CamelFop.Encrypt.allowEditAnnotations | true | Allows editing annotation of the PDF |
| CamelFop.Renderer.producer | Apache FOP | Metadata element for the system/software that produces the document |
| CamelFop.Renderer.creator | | Metadata element for the user that created the document |
| CamelFop.Renderer.creationDate | | Creation Date |

| name | default value | description |
|--------------------------|---------------|---------------------------------------------|
| CamelFop.Render.author | | Author of the content of the document |
| CamelFop.Render.title | | Title of the document |
| CamelFop.Render.subject | | Subject of the document |
| CamelFop.Render.keywords | | Set of keywords applicable to this document |

109.6. EXAMPLE

Below is an example route that renders PDFs from xml data and xslt template and saves the PDF files in target folder:

```
from("file:source/data/xml")
  .to("xslt:xslt/template.xsl")
  .to("fop:application/pdf")
  .to("file:target/data");
```

For more information, see these resources...

- [Getting Started](#)

CHAPTER 110. FREEMARKER COMPONENT

Available as of Camel version 2.10

The **freemarker**: component allows for processing a message using a [FreeMarker](#) template. This can be ideal when using Templating to generate responses for requests.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-freemarker</artifactId>
  <version>x.x.x</version> <!-- use the same version as your Camel core version -->
</dependency>
```

110.1. URI FORMAT

```
freemarker:templateName[?options]
```

Where **templateName** is the classpath-local URI of the template to invoke; or the complete URL of the remote template (eg: [file://folder/myfile.ftl](#)).

You can append query options to the URI in the following format, **?option=value&option=value&...**

110.2. OPTIONS

The Freemarker component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| allowContextMapAll (producer) | Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API. | false | boolean |
| allowTemplateFromHeader (producer) | Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution. | false | boolean |
| configuration (advanced) | To use an existing freemarker.template.Configuration instance as the configuration. | | Configuration |

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Freemarker endpoint is configured using URI syntax:

```
freemarker:resourceUri
```

with the following path and query parameters:

110.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| resourceUri | Required Path to the resource. You can prefix with: classpath, file, http, ref, or bean. classpath, file and http loads the resource using these protocols (classpath is default). ref will lookup the resource in the registry. bean will call a method on a bean to be used as the resource. For bean you can specify the method name after dot, eg bean:myBean.myMethod. | | String |

110.2.2. Query Parameters (7 parameters):

| Name | Description | Default | Type |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| allowContextMapAll (producer) | Sets whether the context map should allow access to all details. By default only the message body and headers can be accessed. This option can be enabled for full access to the current Exchange and CamelContext. Doing so imposes a potential security risk as this opens access to the full power of CamelContext API. | false | boolean |
| allowTemplateFromHeader (producer) | Whether to allow to use resource template from header or not (default false). Enabling this option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| configuration (producer) | Sets the Freemarker configuration to use | | Configuration |
| contentCache (producer) | Sets whether to use resource content cache or not | false | boolean |
| encoding (producer) | Sets the encoding to be used for loading the template file. | | String |
| templateUpdateDelay (producer) | Number of seconds the loaded template resource will remain in the cache. | | int |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

110.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.freemarker.configuration | To use an existing freemarker.template.Configuration instance as the configuration. The option is a freemarker.template.Configuration type. | | String |
| camel.component.freemarker.enabled | Enable freemarker component | true | Boolean |
| camel.component.freemarker.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

110.4. HEADERS

Headers set during the FreeMarker evaluation are returned to the message and added as headers. This provides a mechanism for the FreeMarker component to return values to the Message.

An example: Set the header value of **fruit** in the FreeMarker template:

```
${request.setHeader('fruit', 'Apple')}
```

The header, **fruit**, is now accessible from the **message.out.headers**.

110.5. FREEMARKER CONTEXT

Camel will provide exchange information in the FreeMarker context (just a **Map**). The **Exchange** is transferred as:

| key | value |
|----------------------------|------------------------------------------------------------|
| exchange | The Exchange itself. |
| exchange.properties | The Exchange properties. |
| headers | The headers of the In message. |
| camelContext | The Camel Context. |
| request | The In message. |
| body | The In message body. |
| response | The Out message (only for InOut message exchange pattern). |

From Camel 2.14, you can setup your custom FreeMarker context in the message header with the key "**CamelFreemarkerDataModel**" just like this

```
Map<String, Object> variableMap = new HashMap<String, Object>();
variableMap.put("headers", headersMap);
variableMap.put("body", "Monday");
variableMap.put("exchange", exchange);
exchange.getIn().setHeader("CamelFreemarkerDataModel", variableMap);
```

110.6. HOT RELOADING

The FreeMarker template resource is by default **not** hot reloadable for both file and classpath resources (expanded jar). If you set **contentCache=false**, then Camel will not cache the resource and hot reloading is thus enabled. This scenario can be used in development.

110.7. DYNAMIC TEMPLATES

Camel provides two headers by which you can define a different resource location for a template or the template content itself. If any of these headers is set then Camel uses this over the endpoint configured resource. This allows you to provide a dynamic template at runtime.

| Header | Type | Description | Support Version |
|---------------------------------------------|---------------------------------|----------------------------------------------------------------------------|-----------------|
| FreemarkerConstants.FREEMARKER_RESOURCE | org.springframework.io.Resource | The template resource | ≤ 2.1 |
| FreemarkerConstants.FREEMARKER_RESOURCE_URI | String | A URI for the template resource to use instead of the endpoint configured. | ≥ 2.1 |
| FreemarkerConstants.FREEMARKER_TEMPLATE | String | The template to use instead of the endpoint configured. | ≥ 2.1 |

110.8. SAMPLES

For example you could use something like:

```
from("activemq:My.Queue").
to("freemarker:com/acme/MyResponse.ftl");
```

To use a FreeMarker template to formulate a response for a message for InOut message exchanges (where there is a **JMSReplyTo** header).

If you want to use InOnly and consume the message and send it to another destination you could use:

```
from("activemq:My.Queue").
to("freemarker:com/acme/MyResponse.ftl").
to("activemq:Another.Queue");
```

And to disable the content cache, e.g. for development usage where the **.ftl** template should be hot reloaded:

```
from("activemq:My.Queue").
  to("freemarker:com/acme/MyResponse.ftl?contentCache=false").
  to("activemq:Another.Queue");
```

And a file-based resource:

```
from("activemq:My.Queue").
  to("freemarker:file://myfolder/MyResponse.ftl?contentCache=false").
  to("activemq:Another.Queue");
```

In **Camel 2.1** it's possible to specify what template the component should use dynamically via a header, so for example:

```
from("direct:in").

setHeader(FreemarkerConstants.FREEMARKER_RESOURCE_URI).constant("path/to/my/template.ftl").
  to("freemarker:dummy?allowTemplateFromHeader=true");
```

WARNING

Enabling the **allowTemplateFromHeader** option has security ramifications. For example, if the header contains untrusted or user derived content, this can ultimately impact on the confidentiality and integrity of your end application, so use this option with caution.

110.9. THE EMAIL SAMPLE

In this sample we want to use FreeMarker templating for an order confirmation email. The email template is laid out in FreeMarker as:

```
Dear ${headers.lastName}, ${headers.firstName}

Thanks for the order of ${headers.item}.

Regards Camel Riders Bookstore
${body}
```

And the java code:

110.10. SEE ALSO

- [Configuring Camel](#)
- [Component](#)

- Endpoint
- Getting Started

CHAPTER 111. FTP COMPONENT

Available as of Camel version 1.1

This component provides access to remote file systems over the FTP and SFTP protocols.

When consuming from remote FTP server make sure you read the section titled *Default when consuming files* further below for details related to consuming files.

Absolute path is **not** supported. **Camel 2.16** will translate absolute path to relative by trimming all leading slashes from **directoryname**. There'll be WARN message printed in the logs.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ftp</artifactId>
  <version>x.x.x</version>See the documentation of the Apache Commons
  <!-- use the same version as your Camel core version -->
</dependency>
```

111.1. URI FORMAT

```
ftp://[username@]hostname[:port]/directoryname[?options]
sftp://[username@]hostname[:port]/directoryname[?options]
ftps://[username@]hostname[:port]/directoryname[?options]
```

Where **directoryname** represents the underlying directory. The directory name is a relative path. Absolute path's is **not** supported. The relative path can contain nested folders, such as /inbox/us.

For Camel versions before **Camel 2.16**, the `directoryName` **must** exist already as this component does not support the **autoCreate** option (which the file component does). The reason is that its the FTP administrator (FTP server) task to properly setup user accounts, and home directories with the right file permissions etc.

For **Camel 2.16**, **autoCreate** option is supported. When consumer starts, before polling is scheduled, there's additional FTP operation performed to create the directory configured for endpoint. The default value for **autoCreate** is **true**.

If no **username** is provided, then **anonymous** login is attempted using no password.

If no **port** number is provided, Camel will provide default values according to the protocol (ftp = 21, sftp = 22, ftps = 2222).

You can append query options to the URI in the following format, **?option=value&option=value&...**

This component uses two different libraries for the actual FTP work. FTP and FTPS uses [Apache Commons Net](#) while SFTP uses [JCraft JSCH](#).

The FTPS component is only available in Camel 2.2 or newer.

FTPS (also known as FTP Secure) is an extension to FTP that adds support for the Transport Layer Security (TLS) and the Secure Sockets Layer (SSL) cryptographic protocols.

111.2. URI OPTIONS

The options below are exclusive for the FTP component.

The FTP component has no options.

The FTP endpoint is configured using URI syntax:

```
ftp:host:port/directoryName
```

with the following path and query parameters:

111.2.1. Path Parameters (3 parameters):

| Name | Description | Default | Type |
|----------------------|--------------------------------------------|---------|--------|
| host | Required Hostname of the FTP server | | String |
| port | Port of the FTP server | | int |
| directoryName | The starting directory | | String |

111.2.2. Query Parameters (110 parameters):

| Name | Description | Default | Type |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| binary (common) | Specifies the file transfer mode, BINARY or ASCII. Default is ASCII (false). | false | boolean |
| charset (common) | This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages. | | String |
| disconnect (common) | Whether or not to disconnect from remote FTP server right after use. Disconnect will only disconnect the current connection to the FTP server. If you have a consumer which you want to stop, then you need to stop the consumer/route instead. | false | boolean |

| Name | Description | Default | Type |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| doneFileName (common) | Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only \$file.name and \$file.name.noext is supported as dynamic placeholders. | | String |
| fileName (common) | Use Expression such as File Language to dynamically set the filename. For consumers, it's used as a filename filter. For producers, it's used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today's file using the File Language syntax: mydata-\$date:now:yyyyMMdd.txt. The producers support the CamelOverrideFileName header which takes precedence over any existing CamelFileName header; the CamelOverrideFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards. | | String |
| passiveMode (common) | Sets passive mode connections. Default is active mode connections. | false | boolean |
| separator (common) | Sets the path separator to be used. UNIX = Uses unix style path separator Windows = Uses windows style path separator Auto = (is default) Use existing path separator in file name | UNIX | PathSeparator |
| transferLoggingInterval Seconds (common) | Configures the interval in seconds to use when logging the progress of upload and download operations that are in-flight. This is used for logging progress when operations takes longer time. | 5 | int |

| Name | Description | Default | Type |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| transferLoggingLevel (common) | Configure the logging level to use when logging the progress of upload and download operations. | DEBUG | LogLevel |
| transferLoggingVerbose (common) | Configures whether the perform verbose (fine grained) logging of the progress of upload and download operations. | false | boolean |
| fastExistsCheck (common) | If set this option to be true, camel-ftp will use the list file directly to check if the file exists. Since some FTP server may not support to list the file directly, if the option is false, camel-ftp will use the old way to list the directory and check if the file exists. This option also influences readLock=changed to control whether it performs a fast check to update file information or not. This can be used to speed up the process if the FTP server has a lot of files. | false | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| delete (consumer) | If true, the file will be deleted after it is processed successfully. | false | boolean |
| moveFailed (consumer) | Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again. | | String |
| noop (consumer) | If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again. | false | boolean |
| preMove (consumer) | Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| preSort (consumer) | When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled. | false | boolean |
| recursive (consumer) | If a directory, will look for files in all the sub-directories as well. | false | boolean |
| resumeDownload (consumer) | Configures whether resume download is enabled. This must be supported by the FTP server (almost all FTP servers support it). In addition the options localWorkDirectory must be configured so downloaded files are stored in a local directory, and the option binary must be enabled, which is required to support resuming of downloads. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| streamDownload (consumer) | Sets the download method to use when not using a local working directory. If set to true, the remote files are streamed to the route as they are read. When set to false, the remote files are loaded into memory before being sent into the route. | false | boolean |
| directoryMustExist (consumer) | Similar to startingDirectoryMustExist but this applies during polling recursive sub directories. | false | boolean |
| download (consumer) | Whether the FTP consumer should download the file. If this option is set to false, then the message body will be null, but the consumer will still trigger a Camel Exchange that has details about the file such as file name, file size, etc. It's just that the file will not be downloaded. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| handleDirectoryParserAbsoluteResult (consumer) | Allows you to set how the consumer will handle subfolders and files in the path if the directory parser results in with absolute paths. The reason for this is that some FTP servers may return file names with absolute paths, and if so then the FTP component needs to handle this by converting the returned path into a relative path. | false | boolean |
| ignoreFileNotFoundOrPermissionError (consumer) | Whether to ignore when (trying to list files in directories or when downloading a file), which does not exist or due to permission error. By default when a directory or file does not exist or insufficient permission, then an exception is thrown. Setting this option to true allows to ignore that instead. | false | boolean |
| inProgressRepository (consumer) | A pluggable in-progress repository <code>org.apache.camel.spi.IdempotentRepository</code> . The in-progress repository is used to account the current in-progress files being consumed. By default a memory based repository is used. | | IdempotentRepository |
| localWorkDirectory (consumer) | When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory. | | String |
| onCompletionExceptionHandler (consumer) | To use a custom <code>org.apache.camel.spi.ExceptionHandler</code> to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore. | | ExceptionHandler |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |

| Name | Description | Default | Type |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----------------------------------------|
| processStrategy (consumer) | A pluggable <code>org.apache.camel.component.file.GenericFileProcessStrategy</code> allowing you to implement your own <code>readLock</code> option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the <code>readLock</code> option does not apply. | | <code>GenericFileProcessStrategy</code> |
| receiveBufferSize (consumer) | The receive (download) buffer size Used only by <code>FTPClient</code> | 32768 | int |
| startingDirectoryMustExist (consumer) | Whether the starting directory must exist. Mind that the <code>autoCreate</code> option is default enabled, which means the starting directory is normally auto created if it doesn't exist. You can disable <code>autoCreate</code> and enable this to ensure the starting directory must exist. Will throw an exception if the directory doesn't exist. | false | boolean |
| useList (consumer) | Whether to allow using <code>LIST</code> command when downloading a file. Default is true. In some use cases you may want to download a specific file and are not allowed to use the <code>LIST</code> command, and therefore you can set this option to false. Notice when using this option, then the specific file to download does not include meta-data information such as file size, timestamp, permissions etc, because those information is only possible to retrieve when <code>LIST</code> command is in use. | true | boolean |
| fileExist (producer) | What to do if a file already exists with the same name. <code>Override</code> , which is the default, replaces the existing file. <code>Append</code> - adds content to the existing file. <code>Fail</code> - throws a <code>GenericFileOperationException</code> , indicating that there is already an existing file. <code>Ignore</code> - silently ignores the problem and does not override the existing file, but assumes everything is okay. <code>Move</code> - option requires to use the <code>moveExisting</code> option to be configured as well. The option <code>eagerDeleteTargetFile</code> can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The <code>Move</code> option will move any existing files, before writing the target file. <code>TryRename</code> is only applicable if <code>tempFileName</code> option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers. | Override | <code>GenericFileExist</code> |

| Name | Description | Default | Type |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| flatten (producer) | Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths. | false | boolean |
| jailStartingDirectory (producer) | Used for jailing (restricting) writing files to the starting directory (and sub) only. This is enabled by default to not allow Camel to write files to outside directories (to be more secured out of the box). You can turn this off to allow writing files to directories outside the starting directory, such as parent or root folders. | true | boolean |
| moveExisting (producer) | Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base. | | String |
| tempFileName (producer) | The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language. | | String |
| tempPrefix (producer) | This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files. | | String |
| allowNullBody (producer) | Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| chmod (producer) | Allows you to set chmod on the stored file. For example chmod=640. | | String |
| disconnectOnBatchComplete (producer) | Whether or not to disconnect from remote FTP server right after a Batch upload is complete. disconnectOnBatchComplete will only disconnect the current connection to the FTP server. | false | boolean |
| eagerDeleteTargetFile (producer) | Whether or not to eagerly delete any existing target file. This option only applies when you use fileExists=Override and the tempFileName option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exist during the temp file is being written. This ensures the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when fileExist=Move is enabled, and an existing file exists. If this option copyAndDeleteOnRenameFails false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation. | true | boolean |
| keepLastModified (producer) | Will keep the last modified timestamp from the source file (if any). Will use the Exchange.FILE_LAST_MODIFIED header to locate the timestamp. This header can contain either a java.util.Date or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers. | false | boolean |
| moveExistingFileStrategy (producer) | Strategy (Custom Strategy) used to move file with special naming token to use when fileExist=Move is configured. By default, there is an implementation used if no custom strategy is provided | | FileMoveExistingStrategy |
| sendNoop (producer) | Whether to send a noop command as a pre-write check before uploading files to the FTP server. This is enabled by default as a validation of the connection is still valid, which allows to silently re-connect to be able to upload the file. However if this causes problems, you can turn this option off. | true | boolean |

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------------|
| activePortRange (advanced) | Set the client side port range in active mode. The syntax is: minPort-maxPort Both port numbers are inclusive, eg 10000-19999 to include all lxxx ports. | | String |
| autoCreate (advanced) | Automatically create missing directories in the file's pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to. | true | boolean |
| bufferSize (advanced) | Write buffer sized in bytes. | 131072 | int |
| connectTimeout (advanced) | Sets the connect timeout for waiting for a connection to be established Used by both FTPClient and JSCH | 10000 | int |
| ftpClient (advanced) | To use a custom instance of FTPClient | | FTPClient |
| ftpClientConfig (advanced) | To use a custom instance of FTPClientConfig to configure the FTP client the endpoint should use. | | FTPClientConfig |
| ftpClientConfigParameters (advanced) | Used by FtpComponent to provide additional parameters for the FTPClientConfig | | Map |
| ftpClientParameters (advanced) | Used by FtpComponent to provide additional parameters for the FTPClient | | Map |
| maximumReconnectAttempts (advanced) | Specifies the maximum reconnect attempts Camel performs when it tries to connect to the remote FTP server. Use 0 to disable this behavior. | | int |
| reconnectDelay (advanced) | Delay in millis Camel will wait before performing a reconnect attempt. | | long |
| siteCommand (advanced) | Sets optional site command(s) to be executed after successful login. Multiple site commands can be separated using a new line character. | | String |
| soTimeout (advanced) | Sets the so timeout Used only by FTPClient | 30000 0 | int |

| Name | Description | Default | Type |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| stepwise (advanced) | Sets whether we should stepwise change directories while traversing file structures when downloading files, or as well when uploading a file to a directory. You can disable this if you for example are in a situation where you cannot change directory on the FTP server due security reasons. | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| throwExceptionOnConnectFailed (advanced) | Should an exception be thrown if connection failed (exhausted) By default exception is not thrown and a WARN is logged. You can use this to enable exception being thrown and handle the thrown exception from the <code>org.apache.camel.spi.PollingConsumerPollStrategy</code> rollback method. | false | boolean |
| timeout (advanced) | Sets the data timeout for waiting for reply Used only by FTPClient | 30000 | int |
| antExclude (filter) | Ant style filter exclusion. If both <code>antInclude</code> and <code>antExclude</code> are used, <code>antExclude</code> takes precedence over <code>antInclude</code> . Multiple exclusions may be specified in comma-delimited format. | | String |
| antFilterCaseSensitive (filter) | Sets case sensitive flag on ant filter | true | boolean |
| antInclude (filter) | Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format. | | String |
| eagerMaxMessagesPerPoll (filter) | Allows for controlling whether the limit from <code>maxMessagesPerPoll</code> is eager or not. If eager then the limit is during the scanning of files. Where as false would scan all files, and then perform sorting. Setting this option to false allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting. | true | boolean |
| exclude (filter) | Is used to exclude files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris | | String |

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------|
| filter (filter) | Pluggable filter as a <code>org.apache.camel.component.file.GenericFileFilter</code> class. Will skip files if filter returns false in its <code>accept()</code> method. | | GenericFileFilter |
| filterDirectory (filter) | Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as <code>\$date:now:yyyMMdd</code> | | String |
| filterFile (filter) | Filters the file based on Simple language. For example to filter on file size, you can use <code>\$file:size 5000</code> | | String |
| idempotent (filter) | Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRU Cache that holds 1000 entries. If <code>noop=true</code> then idempotent will be enabled as well to avoid consuming the same files over and over again. | false | Boolean |
| idempotentKey (filter) | To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: <code>idempotentKey=\$file:name-\$file:size</code> | | String |
| idempotentRepository (filter) | A pluggable repository <code>org.apache.camel.spi.IdempotentRepository</code> which by default use <code>MemoryMessageIdRepository</code> if none is specified and idempotent is true. | | IdempotentRepository |
| include (filter) | Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the <code>RAW()</code> syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris | | String |
| maxDepth (filter) | The maximum depth to traverse when recursively processing a directory. | 2147483647 | int |

| Name | Description | Default | Type |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------------|
| maxMessagesPerPoll (filter) | To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use <code>maxMessagesPerPoll=500</code> , then only the first 500 files will be picked up, and then sorted. You can use the <code>eagerMaxMessagesPerPoll</code> option and set this to false to allow to scan all files first and then sort afterwards. | | int |
| minDepth (filter) | The minimum depth to start processing when recursively processing a directory. Using <code>minDepth=1</code> means the base directory. Using <code>minDepth=2</code> means the first sub directory. | | int |
| move (filter) | Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a <code>.done</code> subdirectory just enter <code>.done</code> . | | String |
| exclusiveReadLockStrategy (lock) | Pluggable read-lock as a <code>org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy</code> implementation. | | GenericFileExclusiveReadLockStrategy |

| Name | Description | Default | Type |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| readLock (lock) | <p>Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail on Windows or the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.</p> | none | String |

| Name | Description | Default | Type |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| readLockCheckInterval (lock) | Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit. | 1000 | long |
| readLockDeleteOrphanLock Files (lock) | Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory. | true | boolean |
| readLockLogging Level (lock) | Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename. | DEBUG | LogLevel |
| readLockMarkerFile (lock) | Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application. | true | boolean |
| readLockMinAge (lock) | This option is applied only for readLock=changed. It allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use readLockMinAge=300s to require the file is at least 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age. | 0 | long |

| Name | Description | Default | Type |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| readLockMinLength (lock) | This option is applied only for readLock=changed. It allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files. | 1 | long |
| readLockRemoveOnCommit (lock) | This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions. See more details at the readLockIdempotentReleaseDelay option. | false | boolean |
| readLockRemoveOnRollback (lock) | This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit). | true | boolean |
| readLockTimeout (lock) | Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit. | 10000 | long |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for <code>initialDelay</code> and <code>delay</code> options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See <code>ScheduledExecutorService</code> in JDK for details. | true | boolean |
| shuffle (sort) | To shuffle the list of files (sort in random order) | false | boolean |

| Name | Description | Default | Type |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------|
| sortBy (sort) | Built-in sort by using the File Language. Supports nested sorts, so you can have a sort by file name and as a 2nd group sort by modified date. | | String |
| sorter (sort) | Pluggable sorter as a java.util.Comparator class. | | Comparator |
| account (security) | Account to use for login | | String |
| password (security) | Password to use for login | | String |
| username (security) | Username to use for login | | String |

111.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.ftp.enabled | Enable ftp component | true | Boolean |
| camel.component.ftp.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

111.4. FTPS COMPONENT DEFAULT TRUST STORE

When using the **ftpClient** properties related to SSL with the FTPS component, the trust store accept all certificates. If you only want trust selective certificates, you have to configure the trust store with the **ftpClient.trustStore.xxx** options or by configuring a custom **ftpClient**.

When using **sslContextParameters**, the trust store is managed by the configuration of the provided `SSLContextParameters` instance.

You can configure additional options on the **ftpClient** and **ftpClientConfig** from the URI directly by using the **ftpClient.** or **ftpClientConfig.** prefix.

For example to set the **setDataTimeout** on the **FTPClient** to 30 seconds you can do:

```
from("ftp://foo@myserver?password=secret&ftpClient.dataTimeout=30000").to("bean:foo");
```

You can mix and match and have use both prefixes, for example to configure date format or timezones.

```
from("ftp://foo@myserver?
password=secret&ftpClient.dataTimeout=30000&ftpClientConfig.serverLanguageCode=fr").to("bean:foo");
```

You can have as many of these options as you like.

See the documentation of the Apache Commons FTP `FTPClientConfig` for possible options and more details. And as well for Apache Commons FTP `FTPClient`.

If you do not like having many and long configuration in the url you can refer to the `ftpClient` or `ftpClientConfig` to use by letting Camel lookup in the Registry for it.

For example:

```
<bean id="myConfig" class="org.apache.commons.net.ftp.FTPClientConfig">
  <property name="lenientFutureDates" value="true"/>
  <property name="serverLanguageCode" value="fr"/>
</bean>
```

And then let Camel lookup this bean when you use the `#` notation in the url.

```
from("ftp://foo@myserver?password=secret&ftpClientConfig=#myConfig").to("bean:foo");
```

111.5. EXAMPLES

<ftp://someone@someftpsrv.com/public/upload/images/holiday2008?password=secret&binary=true>

<ftp://someoneelse@someotherftpsrv.co.uk:12049/reports/2008/password=secret&binary=false>
<ftp://publicftpsrv.com/download>

111.6. CONCURRENCY

FTP Consumer does not support concurrency

The FTP consumer (with the same endpoint) does not support concurrency (the backing FTP client is not thread safe).

You can use multiple FTP consumers to poll from different endpoints. It is only a single endpoint that does not support concurrent consumers.

The FTP producer does **not** have this issue, it supports concurrency.

111.7. MORE INFORMATION

This component is an extension of the File component. So there are more samples and details on the File component page.

111.8. DEFAULT WHEN CONSUMING FILES

The FTP consumer will by default leave the consumed files untouched on the remote FTP server. You have to configure it explicitly if you want it to delete the files or move them to another location. For example you can use `delete=true` to delete the files, or use `move=.done` to move the files into a hidden done sub directory.

The regular File consumer is different as it will by default move files to a **.camel** sub directory. The reason Camel does **not** do this by default for the FTP consumer is that it may lack permissions by default to be able to move or delete files.

111.8.1. limitations

The option **readLock** can be used to force Camel **not** to consume files that is currently in the progress of being written. However, this option is turned off by default, as it requires that the user has write access. See the options table at File2 for more details about read locks.

There are other solutions to avoid consuming files that are currently being written over FTP; for instance, you can write to a temporary destination and move the file after it has been written.

When moving files using **move** or **preMove** option the files are restricted to the FTP_ROOT folder. That prevents you from moving files outside the FTP area. If you want to move files to another area you can use soft links and move files into a soft linked folder.

111.9. MESSAGE HEADERS

The following message headers can be used to affect the behavior of the component

| Header | Description |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CamelFileName | Specifies the output file name (relative to the endpoint directory) to be used for the output message when sending to the endpoint. If this is not present and no expression either, then a generated message ID is used as the filename instead. |
| CamelFileNameProduced | The actual filepath (path + name) for the output file that was written. This header is set by Camel and its purpose is providing end-users the name of the file that was written. |
| CamelFileIndex | Current index out of total number of files being consumed in this batch. |
| CamelFileSize | Total number of files being consumed in this batch. |
| CamelFileHost | The remote hostname. |
| CamelFileLocalWorkPath | Path to the local work file, if local work directory is used. |

In addition the FTP/FTPS consumer and producer will enrich the Camel **Message** with the following headers

| Header | Description |
|--------------------------|------------------------------------------------------------------------|
| CamelFtpReplyCode | Camel 2.11.1: The FTP client reply code (the type is a integer) |

| Header | Description |
|----------------------------|-------------------------------------------|
| CamelFtpReplyString | Camel 2.11.1: The FTP client reply string |

111.10. ABOUT TIMEOUTS

The two set of libraries (see top) has different API for setting timeout. You can use the **connectTimeout** option for both of them to set a timeout in millis to establish a network connection. An individual **soTimeout** can also be set on the FTP/FTPS, which corresponds to using **ftpClient.soTimeout**. Notice SFTP will automatically use **connectTimeout** as its **soTimeout**. The **timeout** option only applies for FTP/FTSP as the data timeout, which corresponds to the **ftpClient.dataTimeout** value. All timeout values are in millis.

111.11. USING LOCAL WORK DIRECTORY

Camel supports consuming from remote FTP servers and downloading the files directly into a local work directory. This avoids reading the entire remote file content into memory as it is streamed directly into the local file using **FileOutputStream**.

Camel will store to a local file with the same name as the remote file, though with **.inprogress** as extension while the file is being downloaded. Afterwards, the file is renamed to remove the **.inprogress** suffix. And finally, when the Exchange is complete the local file is deleted.

So if you want to download files from a remote FTP server and store it as files then you need to route to a file endpoint such as:

```
from("ftp://someone@someserver.com?password=secret&localWorkDirectory=/tmp").to("file://inbox");
```

TIP

The route above is ultra efficient as it avoids reading the entire file content into memory. It will download the remote file directly to a local file stream. The **java.io.File** handle is then used as the Exchange body. The file producer leverages this fact and can work directly on the work file **java.io.File** handle and perform a **java.io.File.rename** to the target filename. As Camel knows it's a local work file, it can optimize and use a rename instead of a file copy, as the work file is meant to be deleted anyway.

111.12. STEPWISE CHANGING DIRECTORIES

Camel FTP can operate in two modes in terms of traversing directories when consuming files (eg downloading) or producing files (eg uploading)

- stepwise
- not stepwise

You may want to pick either one depending on your situation and security issues. Some Camel end users can only download files if they use stepwise, while others can only download if they do not. At least you have the choice to pick (from Camel 2.6 onwards).

In Camel 2.0 - 2.5 there is only one mode and it is:

- before 2.5 not stepwise

- 2.5 stepwise

From Camel 2.6 onwards there is now an option **stepwise** you can use to control the behavior.

Note that stepwise changing of directory will in most cases only work when the user is confined to it's home directory and when the home directory is reported as `"/"`.

The difference between the two of them is best illustrated with an example. Suppose we have the following directory structure on the remote FTP server we need to traverse and download files:

```

/
/one
/one/two
/one/two/sub-a
/one/two/sub-b

```

And that we have a file in each of sub-a (a.txt) and sub-b (b.txt) folder.

111.12.1. Using `stepwise=true` (default mode)

```

TYPE A
200 Type set to A
PWD
257 "/" is current directory.
CWD one
250 CWD successful. "/one" is current directory.

As you can see when not using stepwise, there are no CD operation invoked at all.

111.13. SAMPLES

In the sample below we set up Camel to download all the reports from the FTP server once every hour (60 min) as BINARY content and store it as files on the local file system.

And the route using Spring DSL:

```

<route>
  <from uri="ftp://scott@localhost/public/reports?
password=tiger&binary=true&delay=60000"/>
  <to uri="file://target/test-reports"/>
</route>

```

111.13.1. Consuming a remote FTPS server (implicit SSL) and client authentication

```

from("ftps://admin@localhost:2222/public/camel?
password=admin&securityProtocol=SSL&isImplicit=true

```

```
&ftpClient.keyStore.file=./src/test/resources/server.jks
&ftpClient.keyStore.password=password&ftpClient.keyStore.keyPassword=password")
.to("bean:foo");
```

11.13.2. Consuming a remote FTPS server (explicit TLS) and a custom trust store configuration

```
from("ftps://admin@localhost:2222/public/camel?
password=admin&ftpClient.trustStore.file=./src/test/resources/server.jks&ftpClient.trustStore.password=
password")
.to("bean:foo");
```

11.14. FILTER USING `ORG.APACHE.CAMEL.COMPONENT.FILE.GENERICFILEFILTER`

Camel supports pluggable filtering strategies. This strategy it to use the build in **`org.apache.camel.component.file.GenericFileFilter`** in Java. You can then configure the endpoint with such a filter to skip certain filters before being processed.

In the sample we have built our own filter that only accepts files starting with report in the filename.

And then we can configure our route using the **`filter`** attribute to reference our filter (using **`#`** notation) that we have defined in the spring XML file:

```
<!-- define our sorter as a plain spring bean -->
<bean id="myFilter" class="com.mycompany.MyFileFilter"/>

<route>
  <from uri="ftp://someuser@someftpserver.com?password=secret&filter=#myFilter"/>
  <to uri="bean:processInbox"/>
</route>
```

11.15. FILTERING USING ANT PATH MATCHER

The ANT path matcher is a filter that is shipped out-of-the-box in the **`camel-spring`** jar. So you need to depend on **`camel-spring`** if you are using Maven.

The reason is that we leverage Spring's **`AntPathMatcher`** to do the actual matching.

The file paths are matched with the following rules:

- **`?`** matches one character
- **`*`** matches zero or more characters
- **`**`** matches zero or more directories in a path

The sample below demonstrates how to use it:

11.16. USING A PROXY WITH SFTP

To use an HTTP proxy to connect to your remote host, you can configure your route in the following way:

```

<!-- define our sorter as a plain spring bean -->
<bean id="proxy" class="com.jcraft.jsch.ProxyHTTP">
  <constructor-arg value="localhost"/>
  <constructor-arg value="7777"/>
</bean>

<route>
  <from uri="sftp://localhost:9999/root?username=admin&password=admin&proxy=#proxy"/>
  <to uri="bean:processFile"/>
</route>

```

You can also assign a user name and password to the proxy, if necessary. Please consult the documentation for **com.jcraft.jsch.Proxy** to discover all options.

111.17. SETTING PREFERRED SFTP AUTHENTICATION METHOD

If you want to explicitly specify the list of authentication methods that should be used by **sftp** component, use **preferredAuthentications** option. If for example you would like Camel to attempt to authenticate with private/public SSH key and fallback to user/password authentication in the case when no public key is available, use the following route configuration:

```

from("sftp://localhost:9999/root?
username=admin&password=admin&preferredAuthentications=publickey,password").
to("bean:processFile");

```

111.18. CONSUMING A SINGLE FILE USING A FIXED NAME

When you want to download a single file and knows the file name, you can use **fileName=myFileName.txt** to tell Camel the name of the file to download. By default the consumer will still do a FTP LIST command to do a directory listing and then filter these files based on the **fileName** option. Though in this use-case it may be desirable to turn off the directory listing by setting **useList=false**. For example the user account used to login to the FTP server may not have permission to do a FTP LIST command. So you can turn off this with **useList=false**, and then provide the fixed name of the file to download with **fileName=myFileName.txt**, then the FTP consumer can still download the file. If the file for some reason does not exist, then Camel will by default throw an exception, you can turn this off and ignore this by setting **ignoreFileNotFoundOrPermissionError=true**.

For example to have a Camel route that pickup a single file, and delete it after use you can do

```

from("ftp://admin@localhost:21/nolist/?
password=admin&stepwise=false&useList=false&ignoreFileNotFoundOrPermissionError=true&fileName
=report.txt&delete=true")
.to("activemq:queue:report");

```

Notice that we have use all the options we talked above above.

You can also use this with **ConsumerTemplate**. For example to download a single file (if it exists) and grab the file content as a String type:

```

String data = template.retrieveBodyNoWait("ftp://admin@localhost:21/nolist/?
password=admin&stepwise=false&useList=false&ignoreFileNotFoundOrPermissionError=true&fileName
=report.txt&delete=true", String.class);

```

111.19. DEBUG LOGGING

This component has log level **TRACE** that can be helpful if you have problems.

CHAPTER 112. FTPS COMPONENT

Available as of Camel version 2.2

This component provides access to remote file systems over the FTP and SFTP protocols.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ftp</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

For more information you can look at [FTP component](#)

112.1. URI OPTIONS

The options below are exclusive for the FTPS component.

The FTPS component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| useGlobalSslContext Parameters (security) | Enable usage of global SSL context parameters. | false | boolean |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The FTPS endpoint is configured using URI syntax:

```
ftps:host:port/directoryName
```

with the following path and query parameters:

112.1.1. Path Parameters (3 parameters):

| Name | Description | Default | Type |
|-------------|--------------------------------------------|---------|--------|
| host | Required Hostname of the FTP server | | String |
| port | Port of the FTP server | | int |

| Name | Description | Default | Type |
|----------------------|------------------------|---------|--------|
| directoryName | The starting directory | | String |

112.1.2. Query Parameters (122 parameters):

| Name | Description | Default | Type |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| binary (common) | Specifies the file transfer mode, BINARY or ASCII. Default is ASCII (false). | false | boolean |
| charset (common) | This option is used to specify the encoding of the file. You can use this on the consumer, to specify the encodings of the files, which allow Camel to know the charset it should load the file content in case the file content is being accessed. Likewise when writing a file, you can use this option to specify which charset to write the file as well. Do mind that when writing the file Camel may have to read the message content into memory to be able to convert the data into the configured charset, so do not use this if you have big messages. | | String |
| disconnect (common) | Whether or not to disconnect from remote FTP server right after use. Disconnect will only disconnect the current connection to the FTP server. If you have a consumer which you want to stop, then you need to stop the consumer/route instead. | false | boolean |
| doneFileName (common) | Producer: If provided, then Camel will write a 2nd done file when the original file has been written. The done file will be empty. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file will always be written in the same folder as the original file. Consumer: If provided, Camel will only consume files if a done file exists. This option configures what file name to use. Either you can specify a fixed name. Or you can use dynamic placeholders. The done file is always expected in the same folder as the original file. Only \$file.name and \$file.name.noext is supported as dynamic placeholders. | | String |

| Name | Description | Default | Type |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------|
| fileName (common) | Use Expression such as File Language to dynamically set the filename. For consumers, it's used as a filename filter. For producers, it's used to evaluate the filename to write. If an expression is set, it take precedence over the CamelFileName header. (Note: The header itself can also be an Expression). The expression options support both String and Expression types. If the expression is a String type, it is always evaluated using the File Language. If the expression is an Expression type, the specified Expression type is used - this allows you, for instance, to use OGNL expressions. For the consumer, you can use it to filter filenames, so you can for instance consume today's file using the File Language syntax: mydata-\$date:now:yyyyMMdd.txt. The producers support the CamelOverruleFileName header which takes precedence over any existing CamelFileName header; the CamelOverruleFileName is a header that is used only once, and makes it easier as this avoids to temporary store CamelFileName and have to restore it afterwards. | | String |
| passiveMode (common) | Sets passive mode connections. Default is active mode connections. | false | boolean |
| separator (common) | Sets the path separator to be used. UNIX = Uses unix style path separator Windows = Uses windows style path separator Auto = (is default) Use existing path separator in file name | UNIX | PathSeparator |
| transferLoggingInterval Seconds (common) | Configures the interval in seconds to use when logging the progress of upload and download operations that are in-flight. This is used for logging progress when operations takes longer time. | 5 | int |
| transferLoggingLevel (common) | Configure the logging level to use when logging the progress of upload and download operations. | DEBUG | LoggingLevel |
| transferLoggingVerbose (common) | Configures whether the perform verbose (fine grained) logging of the progress of upload and download operations. | false | boolean |

| Name | Description | Default | Type |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| fastExistsCheck (common) | If set this option to be true, camel-ftp will use the list file directly to check if the file exists. Since some FTP server may not support to list the file directly, if the option is false, camel-ftp will use the old way to list the directory and check if the file exists. This option also influences readLock=changed to control whether it performs a fast check to update file information or not. This can be used to speed up the process if the FTP server has a lot of files. | false | boolean |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| delete (consumer) | If true, the file will be deleted after it is processed successfully. | false | boolean |
| moveFailed (consumer) | Sets the move failure expression based on Simple language. For example, to move files into a .error subdirectory use: .error. Note: When moving the files to the fail location Camel will handle the error and will not pick up the file again. | | String |
| noop (consumer) | If true, the file is not moved or deleted in any way. This option is good for readonly data, or for ETL type requirements. If noop=true, Camel will set idempotent=true as well, to avoid consuming the same files over and over again. | false | boolean |
| preMove (consumer) | Expression (such as File Language) used to dynamically set the filename when moving it before processing. For example to move in-progress files into the order directory set this value to order. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| preSort (consumer) | When pre-sort is enabled then the consumer will sort the file and directory names during polling, that was retrieved from the file system. You may want to do this in case you need to operate on the files in a sorted order. The pre-sort is executed before the consumer starts to filter, and accept files to process by Camel. This option is default=false meaning disabled. | false | boolean |
| recursive (consumer) | If a directory, will look for files in all the sub-directories as well. | false | boolean |
| resumeDownload (consumer) | Configures whether resume download is enabled. This must be supported by the FTP server (almost all FTP servers support it). In addition the options localWorkDirectory must be configured so downloaded files are stored in a local directory, and the option binary must be enabled, which is required to support resuming of downloads. | false | boolean |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| streamDownload (consumer) | Sets the download method to use when not using a local working directory. If set to true, the remote files are streamed to the route as they are read. When set to false, the remote files are loaded into memory before being sent into the route. | false | boolean |
| directoryMustExist (consumer) | Similar to startingDirectoryMustExist but this applies during polling recursive sub directories. | false | boolean |
| download (consumer) | Whether the FTP consumer should download the file. If this option is set to false, then the message body will be null, but the consumer will still trigger a Camel Exchange that has details about the file such as file name, file size, etc. It's just that the file will not be downloaded. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option errorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| handleDirectoryParserAbsoluteResult (consumer) | Allows you to set how the consumer will handle subfolders and files in the path if the directory parser results in with absolute paths. The reason for this is that some FTP servers may return file names with absolute paths, and if so then the FTP component needs to handle this by converting the returned path into a relative path. | false | boolean |
| ignoreFileNotFoundOrPermissionError (consumer) | Whether to ignore when (trying to list files in directories or when downloading a file), which does not exist or due to permission error. By default when a directory or file does not exist or insufficient permission, then an exception is thrown. Setting this option to true allows to ignore that instead. | false | boolean |
| inProgressRepository (consumer) | A pluggable in-progress repository <code>org.apache.camel.spi.IdempotentRepository</code> . The in-progress repository is used to account the current in progress files being consumed. By default a memory based repository is used. | | IdempotentRepository |
| localWorkDirectory (consumer) | When consuming, a local work directory can be used to store the remote file content directly in local files, to avoid loading the content into memory. This is beneficial, if you consume a very big remote file and thus can conserve memory. | | String |
| onCompletionExceptionHandler (consumer) | To use a custom <code>org.apache.camel.spi.ExceptionHandler</code> to handle any thrown exceptions that happens during the file on completion process where the consumer does either a commit or rollback. The default implementation will log any exception at WARN level and ignore. | | ExceptionHandler |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |

| Name | Description | Default | Type |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----------------------------------------|
| processStrategy (consumer) | A pluggable <code>org.apache.camel.component.file.GenericFileProcessStrategy</code> allowing you to implement your own <code>readLock</code> option or similar. Can also be used when special conditions must be met before a file can be consumed, such as a special ready file exists. If this option is set then the <code>readLock</code> option does not apply. | | <code>GenericFileProcessStrategy</code> |
| receiveBufferSize (consumer) | The receive (download) buffer size Used only by <code>FTPClient</code> | 32768 | int |
| startingDirectoryMustExist (consumer) | Whether the starting directory must exist. Mind that the <code>autoCreate</code> option is default enabled, which means the starting directory is normally auto created if it doesn't exist. You can disable <code>autoCreate</code> and enable this to ensure the starting directory must exist. Will throw an exception if the directory doesn't exist. | false | boolean |
| useList (consumer) | Whether to allow using <code>LIST</code> command when downloading a file. Default is true. In some use cases you may want to download a specific file and are not allowed to use the <code>LIST</code> command, and therefore you can set this option to false. Notice when using this option, then the specific file to download does not include meta-data information such as file size, timestamp, permissions etc, because those information is only possible to retrieve when <code>LIST</code> command is in use. | true | boolean |
| fileExist (producer) | What to do if a file already exists with the same name. <code>Override</code> , which is the default, replaces the existing file. <code>Append</code> - adds content to the existing file. <code>Fail</code> - throws a <code>GenericFileOperationException</code> , indicating that there is already an existing file. <code>Ignore</code> - silently ignores the problem and does not override the existing file, but assumes everything is okay. <code>Move</code> - option requires to use the <code>moveExisting</code> option to be configured as well. The option <code>eagerDeleteTargetFile</code> can be used to control what to do if an moving the file, and there exists already an existing file, otherwise causing the move operation to fail. The <code>Move</code> option will move any existing files, before writing the target file. <code>TryRename</code> is only applicable if <code>tempFileName</code> option is in use. This allows to try renaming the file from the temporary name to the actual name, without doing any exists check. This check may be faster on some file systems and especially FTP servers. | Override | <code>GenericFileExist</code> |

| Name | Description | Default | Type |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| flatten (producer) | Flatten is used to flatten the file name path to strip any leading paths, so it's just the file name. This allows you to consume recursively into sub-directories, but when you eg write the files to another directory they will be written in a single directory. Setting this to true on the producer enforces that any file name in CamelFileName header will be stripped for any leading paths. | false | boolean |
| jailStartingDirectory (producer) | Used for jailing (restricting) writing files to the starting directory (and sub) only. This is enabled by default to not allow Camel to write files to outside directories (to be more secured out of the box). You can turn this off to allow writing files to directories outside the starting directory, such as parent or root folders. | true | boolean |
| moveExisting (producer) | Expression (such as File Language) used to compute file name to use when fileExist=Move is configured. To move files into a backup subdirectory just enter backup. This option only supports the following File Language tokens: file:name, file:name.ext, file:name.noext, file:onlyname, file:onlyname.noext, file:ext, and file:parent. Notice the file:parent is not supported by the FTP component, as the FTP component can only move any existing files to a relative directory based on current dir as base. | | String |
| tempFileName (producer) | The same as tempPrefix option but offering a more fine grained control on the naming of the temporary filename as it uses the File Language. | | String |
| tempPrefix (producer) | This option is used to write the file using a temporary name and then, after the write is complete, rename it to the real name. Can be used to identify files being written and also avoid consumers (not using exclusive read locks) reading in progress files. Is often used by FTP when uploading big files. | | String |
| allowNullBody (producer) | Used to specify if a null body is allowed during file writing. If set to true then an empty file will be created, when set to false, and attempting to send a null body to the file component, a GenericFileWriteException of 'Cannot write null body to file.' will be thrown. If the fileExist option is set to 'Override', then the file will be truncated, and if set to append the file will remain unchanged. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| chmod (producer) | Allows you to set chmod on the stored file. For example chmod=640. | | String |
| disconnectOnBatchComplete (producer) | Whether or not to disconnect from remote FTP server right after a Batch upload is complete. disconnectOnBatchComplete will only disconnect the current connection to the FTP server. | false | boolean |
| eagerDeleteTargetFile (producer) | Whether or not to eagerly delete any existing target file. This option only applies when you use fileExists=Override and the tempFileName option as well. You can use this to disable (set it to false) deleting the target file before the temp file is written. For example you may write big files and want the target file to exist during the temp file is being written. This ensure the target file is only deleted until the very last moment, just before the temp file is being renamed to the target filename. This option is also used to control whether to delete any existing files when fileExist=Move is enabled, and an existing file exists. If this option copyAndDeleteOnRenameFails false, then an exception will be thrown if an existing file existed, if its true, then the existing file is deleted before the move operation. | true | boolean |
| keepLastModified (producer) | Will keep the last modified timestamp from the source file (if any). Will use the Exchange.FILE_LAST_MODIFIED header to located the timestamp. This header can contain either a java.util.Date or long with the timestamp. If the timestamp exists and the option is enabled it will set this timestamp on the written file. Note: This option only applies to the file producer. You cannot use this option with any of the ftp producers. | false | boolean |
| moveExistingFileStrategy (producer) | Strategy (Custom Strategy) used to move file with special naming token to use when fileExist=Move is configured. By default, there is an implementation used if no custom strategy is provided | | FileMoveExistingStrategy |
| sendNoop (producer) | Whether to send a noop command as a pre-write check before uploading files to the FTP server. This is enabled by default as a validation of the connection is still valid, which allows to silently re-connect to be able to upload the file. However if this causes problems, you can turn this option off. | true | boolean |

| Name | Description | Default | Type |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------------|
| activePortRange (advanced) | Set the client side port range in active mode. The syntax is: minPort-maxPort Both port numbers are inclusive, eg 10000-19999 to include all lxxx ports. | | String |
| autoCreate (advanced) | Automatically create missing directories in the file's pathname. For the file consumer, that means creating the starting directory. For the file producer, it means the directory the files should be written to. | true | boolean |
| bufferSize (advanced) | Write buffer sized in bytes. | 131072 | int |
| connectTimeout (advanced) | Sets the connect timeout for waiting for a connection to be established Used by both FTPClient and JSCH | 10000 | int |
| ftpClient (advanced) | To use a custom instance of FTPClient | | FTPClient |
| ftpClientConfig (advanced) | To use a custom instance of FTPClientConfig to configure the FTP client the endpoint should use. | | FTPClientConfig |
| ftpClientConfigParameters (advanced) | Used by FtpComponent to provide additional parameters for the FTPClientConfig | | Map |
| ftpClientParameters (advanced) | Used by FtpComponent to provide additional parameters for the FTPClient | | Map |
| maximumReconnectAttempts (advanced) | Specifies the maximum reconnect attempts Camel performs when it tries to connect to the remote FTP server. Use 0 to disable this behavior. | | int |
| reconnectDelay (advanced) | Delay in millis Camel will wait before performing a reconnect attempt. | | long |
| siteCommand (advanced) | Sets optional site command(s) to be executed after successful login. Multiple site commands can be separated using a new line character. | | String |
| soTimeout (advanced) | Sets the so timeout Used only by FTPClient | 30000 0 | int |

| Name | Description | Default | Type |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| stepwise (advanced) | Sets whether we should stepwise change directories while traversing file structures when downloading files, or as well when uploading a file to a directory. You can disable this if you for example are in a situation where you cannot change directory on the FTP server due security reasons. | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| throwExceptionOnConnectFailed (advanced) | Should an exception be thrown if connection failed (exhausted) By default exception is not thrown and a WARN is logged. You can use this to enable exception being thrown and handle the thrown exception from the <code>org.apache.camel.spi.PollingConsumerPollStrategy</code> rollback method. | false | boolean |
| timeout (advanced) | Sets the data timeout for waiting for reply Used only by FTPClient | 30000 | int |
| antExclude (filter) | Ant style filter exclusion. If both antInclude and antExclude are used, antExclude takes precedence over antInclude. Multiple exclusions may be specified in comma-delimited format. | | String |
| antFilterCaseSensitive (filter) | Sets case sensitive flag on ant filter | true | boolean |
| antInclude (filter) | Ant style filter inclusion. Multiple inclusions may be specified in comma-delimited format. | | String |
| eagerMaxMessagesPerPoll (filter) | Allows for controlling whether the limit from <code>maxMessagesPerPoll</code> is eager or not. If eager then the limit is during the scanning of files. Where as false would scan all files, and then perform sorting. Setting this option to false allows for sorting all files first, and then limit the poll. Mind that this requires a higher memory usage as all file details are in memory to perform the sorting. | true | boolean |
| exclude (filter) | Is used to exclude files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the RAW() syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris | | String |

| Name | Description | Default | Type |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------------------|
| filter (filter) | Pluggable filter as a <code>org.apache.camel.component.file.GenericFileFilter</code> class. Will skip files if filter returns false in its <code>accept()</code> method. | | GenericFileFilter |
| filterDirectory (filter) | Filters the directory based on Simple language. For example to filter on current date, you can use a simple date pattern such as <code>\$date:now:yyMMdd</code> | | String |
| filterFile (filter) | Filters the file based on Simple language. For example to filter on file size, you can use <code>\$file:size 5000</code> | | String |
| idempotent (filter) | Option to use the Idempotent Consumer EIP pattern to let Camel skip already processed files. Will by default use a memory based LRU Cache that holds 1000 entries. If <code>noop=true</code> then idempotent will be enabled as well to avoid consuming the same files over and over again. | false | Boolean |
| idempotentKey (filter) | To use a custom idempotent key. By default the absolute path of the file is used. You can use the File Language, for example to use the file name and file size, you can do: <code>idempotentKey=\$file:name-\$file:size</code> | | String |
| idempotentRepository (filter) | A pluggable repository <code>org.apache.camel.spi.IdempotentRepository</code> which by default use <code>MemoryMessageIdRepository</code> if none is specified and idempotent is true. | | IdempotentRepository |
| include (filter) | Is used to include files, if filename matches the regex pattern (matching is case in-sensitive). Notice if you use symbols such as plus sign and others you would need to configure this using the RAW() syntax if configuring this as an endpoint uri. See more details at configuring endpoint uris | | String |
| maxDepth (filter) | The maximum depth to traverse when recursively processing a directory. | 2147483647 | int |

| Name | Description | Default | Type |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------------|
| maxMessagesPerPoll (filter) | To define a maximum messages to gather per poll. By default no maximum is set. Can be used to set a limit of e.g. 1000 to avoid when starting up the server that there are thousands of files. Set a value of 0 or negative to disabled it. Notice: If this option is in use then the File and FTP components will limit before any sorting. For example if you have 100000 files and use <code>maxMessagesPerPoll=500</code> , then only the first 500 files will be picked up, and then sorted. You can use the <code>eagerMaxMessagesPerPoll</code> option and set this to false to allow to scan all files first and then sort afterwards. | | int |
| minDepth (filter) | The minimum depth to start processing when recursively processing a directory. Using <code>minDepth=1</code> means the base directory. Using <code>minDepth=2</code> means the first sub directory. | | int |
| move (filter) | Expression (such as Simple Language) used to dynamically set the filename when moving it after processing. To move files into a <code>.done</code> subdirectory just enter <code>.done</code> . | | String |
| exclusiveReadLockStrategy (lock) | Pluggable read-lock as a <code>org.apache.camel.component.file.GenericFileExclusiveReadLockStrategy</code> implementation. | | GenericFileExclusiveReadLockStrategy |

| Name | Description | Default | Type |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| readLock (lock) | <p>Used by consumer, to only poll the files if it has exclusive read-lock on the file (i.e. the file is not in-progress or being written). Camel will wait until the file lock is granted. This option provides the build in strategies: none - No read lock is in use markerFile - Camel creates a marker file (fileName.camelLock) and then holds a lock on it. This option is not available for the FTP component changed - Changed is using file length/modification timestamp to detect whether the file is currently being copied or not. Will at least use 1 sec to determine this, so this option cannot consume files as fast as the others, but can be more reliable as the JDK IO API cannot always determine whether a file is currently being used by another process. The option readLockCheckInterval can be used to set the check frequency. fileLock - is for using java.nio.channels.FileLock. This option is not avail on Windows or the FTP component. This approach should be avoided when accessing a remote file system via a mount/share unless that file system supports distributed file locks. rename - rename is for using a try to rename the file as a test if we can get exclusive read-lock. idempotent - (only for file component) idempotent is for using a idempotentRepository as the read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-changed - (only for file component) idempotent-changed is for using a idempotentRepository and changed as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. idempotent-rename - (only for file component) idempotent-rename is for using a idempotentRepository and rename as the combined read-lock. This allows to use read locks that supports clustering if the idempotent repository implementation supports that. Notice: The various read locks is not all suited to work in clustered mode, where concurrent consumers on different nodes is competing for the same files on a shared file system. The markerFile using a close to atomic operation to create the empty marker file, but its not guaranteed to work in a cluster. The fileLock may work better but then the file system need to support distributed file locks, and so on. Using the idempotent read lock can support clustering if the idempotent repository supports clustering, such as Hazelcast Component or Infinispan.</p> | none | String |

| Name | Description | Default | Type |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| readLockCheckInterval (lock) | Interval in millis for the read-lock, if supported by the read lock. This interval is used for sleeping between attempts to acquire the read lock. For example when using the changed read lock, you can set a higher interval period to cater for slow writes. The default of 1 sec. may be too fast if the producer is very slow writing the file. Notice: For FTP the default readLockCheckInterval is 5000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit. | 1000 | long |
| readLockDeleteOrphanLockFiles (lock) | Whether or not read lock with marker files should upon startup delete any orphan read lock files, which may have been left on the file system, if Camel was not properly shutdown (such as a JVM crash). If turning this option to false then any orphaned lock file will cause Camel to not attempt to pickup that file, this could also be due another node is concurrently reading files from the same shared directory. | true | boolean |
| readLockIdempotentRelease Async (lock) | Whether the delayed release task should be synchronous or asynchronous. See more details at the readLockIdempotentReleaseDelay option. | false | boolean |
| readLockIdempotentRelease AsyncPoolSize (lock) | The number of threads in the scheduled thread pool when using asynchronous release tasks. Using a default of 1 core threads should be sufficient in almost all use-cases, only set this to a higher value if either updating the idempotent repository is slow, or there are a lot of files to process. This option is not in-use if you use a shared thread pool by configuring the readLockIdempotentReleaseExecutorService option. See more details at the readLockIdempotentReleaseDelay option. | | int |
| readLockIdempotentRelease Delay (lock) | Whether to delay the release task for a period of millis. This can be used to delay the release tasks to expand the window when a file is regarded as read-locked, in an active/active cluster scenario with a shared idempotent repository, to ensure other nodes cannot potentially scan and acquire the same file, due to race-conditions. By expanding the time-window of the release tasks helps prevents these situations. Note delaying is only needed if you have configured readLockRemoveOnCommit to true. | | int |

| Name | Description | Default | Type |
|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| readLockIdempotentReleaseExecutorService (lock) | To use a custom and shared thread pool for asynchronous release tasks. See more details at the <code>readLockIdempotentReleaseDelay</code> option. | | ScheduledExecutorService |
| readLockLoggingLevel (lock) | Logging level used when a read lock could not be acquired. By default a WARN is logged. You can change this level, for example to OFF to not have any logging. This option is only applicable for readLock of types: changed, fileLock, idempotent, idempotent-changed, idempotent-rename, rename. | DEBUG | LoggingLevel |
| readLockMarkerFile (lock) | Whether to use marker file with the changed, rename, or exclusive read lock types. By default a marker file is used as well to guard against other processes picking up the same files. This behavior can be turned off by setting this option to false. For example if you do not want to write marker files to the file systems by the Camel application. | true | boolean |
| readLockMinAge (lock) | This option is applied only for readLock=changed. It allows to specify a minimum age the file must be before attempting to acquire the read lock. For example use <code>readLockMinAge=300s</code> to require the file is at least 5 minutes old. This can speedup the changed read lock as it will only attempt to acquire files which are at least that given age. | 0 | long |
| readLockMinLength (lock) | This option is applied only for readLock=changed. It allows you to configure a minimum file length. By default Camel expects the file to contain data, and thus the default value is 1. You can set this option to zero, to allow consuming zero-length files. | 1 | long |
| readLockRemoveOnCommit (lock) | This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file is succeeded and a commit happens. By default the file is not removed which ensures that any race-condition do not occur so another active node may attempt to grab the file. Instead the idempotent repository may support eviction strategies that you can configure to evict the file name entry after X minutes - this ensures no problems with race conditions. See more details at the <code>readLockIdempotentReleaseDelay</code> option. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| readLockRemoveOnRollback (lock) | This option is applied only for readLock=idempotent. It allows to specify whether to remove the file name entry from the idempotent repository when processing the file failed and a rollback happens. If this option is false, then the file name entry is confirmed (as if the file did a commit). | true | boolean |
| readLockTimeout (lock) | Optional timeout in millis for the read-lock, if supported by the read-lock. If the read-lock could not be granted and the timeout triggered, then Camel will skip the file. At next poll Camel, will try the file again, and this time maybe the read-lock could be granted. Use a value of 0 or lower to indicate forever. Currently fileLock, changed and rename support the timeout. Notice: For FTP the default readLockTimeout value is 20000 instead of 10000. The readLockTimeout value must be higher than readLockCheckInterval, but a rule of thumb is to have a timeout that is at least 2 or more times higher than the readLockCheckInterval. This is needed to ensure that ample time is allowed for the read lock process to try to grab the lock before the timeout was hit. | 10000 | long |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |

| Name | Description | Default | Type |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |
| shuffle (sort) | To shuffle the list of files (sort in random order) | false | boolean |
| sortBy (sort) | Built-in sort by using the File Language. Supports nested sorts, so you can have a sort by file name and as a 2nd group sort by modified date. | | String |
| sorter (sort) | Pluggable sorter as a java.util.Comparator class. | | Comparator |
| account (security) | Account to use for login | | String |
| disableSecureDataChannelDefaults (security) | Use this option to disable default options when using secure data channel. This allows you to be in full control what the execPbsz and execProt setting should be used. Default is false | false | boolean |
| execPbsz (security) | When using secure data channel you can set the exec protection buffer size | | Long |

| Name | Description | Default | Type |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| execProt (security) | The exec protection level PROT command. C - Clear S - Safe(SSL protocol only) E - Confidential(SSL protocol only) P - Private | | String |
| ftpClientKeyStoreParameters (security) | Set the key store parameters | | Map |
| ftpClientTrustStoreParameters (security) | Set the trust store parameters | | Map |
| isImplicit (security) | Set the security mode(Implicit/Explicit). true - Implicit Mode / False - Explicit Mode | false | boolean |
| password (security) | Password to use for login | | String |
| securityProtocol (security) | Set the underlying security protocol. | TLS | String |
| sslContextParameters (security) | Gets the JSSE configuration that overrides any settings in FtpsEndpoint#ftpClientKeyStoreParameters, ftpClientTrustStoreParameters, and FtpsConfiguration#getSecurityProtocol(). | | SSLContextParameters |
| username (security) | Username to use for login | | String |

112.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.ftps.enabled | Enable ftps component | true | Boolean |
| camel.component.ftps.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|------------------------------------------------|---------|---------|
| <code>camel.component.ftp.use-global-ssl-context-parameters</code> | Enable usage of global SSL context parameters. | false | Boolean |

CHAPTER 113. GANGLIA COMPONENT

Available as of Camel version 2.15

Provides a mechanism to send a value (the message body) as a metric to the [Ganglia](#) monitoring system. Uses the `gmetric4j` library. Can be used in conjunction with standard [Ganglia](#) and [JMXetric](#) for monitoring metrics from the OS, JVM and business processes through a single platform.

You should have a Ganglia `gmond` agent running on the machine where your JVM runs. The `gmond` sends a heartbeat to the Ganglia infrastructure, `camel-ganglia` can't send the heartbeat itself currently.

On most Linux systems (Debian, Ubuntu, Fedora and RHEL/CentOS with EPEL) you can just install the Ganglia agent package and it runs automatically using multicast configuration. You can configure it to use regular UDP unicast if you prefer.

Maven users will need to add the following dependency to their `pom.xml` for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-ganglia</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

113.1. URI FORMAT

```
ganglia:address:port[?options]
```

You can append query options to the URI in the following format, `?option=value&option=value&...`

113.2. GANGLIA COMPONENT AND ENDPOINT URI OPTIONS

The Ganglia component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| configuration (advanced) | To use the shared configuration | | GangliaConfigurat ion |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Ganglia endpoint is configured using URI syntax:

```
ganglia:host:port
```

with the following path and query parameters:

113.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------|------------------------------|-------------|--------|
| host | Host name for Ganglia server | 239.2.11.71 | String |
| port | Port for Ganglia server | 8649 | int |

113.2.2. Query Parameters (13 parameters):

| Name | Description | Default | Type |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|--------------------|
| dmax (producer) | Minimum time in seconds before Ganglia will purge the metric value if it expires. Set to 0 and the value will remain in Ganglia indefinitely until a gmond agent restart. | 0 | int |
| groupName (producer) | The group that the metric belongs to. | java | String |
| metricName (producer) | The name to use for the metric. | metric | String |
| mode (producer) | Send the UDP metric packets using MULTICAST or UNICAST | MULTICAST | UDPAAddressingMode |
| prefix (producer) | Prefix the metric name with this string and an underscore. | | String |
| slope (producer) | The slope | BOTH | GMetricSlope |
| spoofHostname (producer) | Spoofing information IP:hostname | | String |
| tmax (producer) | Maximum time in seconds that the value can be considered current. After this, Ganglia considers the value to have expired. | 60 | int |
| ttl (producer) | If using multicast, set the TTL of the packets | 5 | int |
| type (producer) | The type of value | STRING | GMetricType |

| Name | Description | Default | Type |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| units (producer) | Any unit of measurement that qualifies the metric, e.g. widgets, litres, bytes. Do not include a prefix such as k (kilo) or m (milli), other tools may scale the units later. The value should be unscaled. | | String |
| wireFormat31x (producer) | Use the wire format of Ganglia 3.1.0 and later versions. Set this to false to use Ganglia 3.0.x or earlier. | true | boolean |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

113.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----------------------------|
| camel.component.ganglia.configuration.dmax | Minimum time in seconds before Ganglia will purge the metric value if it expires. Set to 0 and the value will remain in Ganglia indefinitely until a gmond agent restart. | 0 | Integer |
| camel.component.ganglia.configuration.group-name | The group that the metric belongs to. | java | String |
| camel.component.ganglia.configuration.host | Host name for Ganglia server | 239.2.11.71 | String |
| camel.component.ganglia.configuration.metric-name | The name to use for the metric. | metric | String |
| camel.component.ganglia.configuration.mode | Send the UDP metric packets using MULTICAST or UNICAST | | GMetric\$UDP AddressingMode |
| camel.component.ganglia.configuration.port | Port for Ganglia server | 8649 | Integer |

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------|
| <code>camel.component.ganglia.configuration.prefix</code> | Prefix the metric name with this string and an underscore. | | String |
| <code>camel.component.ganglia.configuration.slope</code> | The slope | | GMetricSlope |
| <code>camel.component.ganglia.configuration.spoof-hostname</code> | Spoofing information IP:hostname | | String |
| <code>camel.component.ganglia.configuration.tmax</code> | Maximum time in seconds that the value can be considered current. After this, Ganglia considers the value to have expired. | 60 | Integer |
| <code>camel.component.ganglia.configuration.ttl</code> | If using multicast, set the TTL of the packets | 5 | Integer |
| <code>camel.component.ganglia.configuration.type</code> | The type of value | | GMetricType |
| <code>camel.component.ganglia.configuration.units</code> | Any unit of measurement that qualifies the metric, e.g. widgets, litres, bytes. Do not include a prefix such as k (kilo) or m (milli), other tools may scale the units later. The value should be unscaled. | | String |
| <code>camel.component.ganglia.configuration.wire-format31x</code> | Use the wire format of Ganglia 3.1.0 and later versions. Set this to false to use Ganglia 3.0.x or earlier. | true | Boolean |
| <code>camel.component.ganglia.enabled</code> | Enable ganglia component | true | Boolean |
| <code>camel.component.ganglia.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

113.4. MESSAGE BODY

Any value (such as a string or numeric type) in the body is sent to the Ganglia system.

113.5. RETURN VALUE / RESPONSE

Ganglia sends metrics using unidirectional UDP or multicast. There is no response or change to the message body.

113.6. EXAMPLES

113.6.1. Sending a String metric

The message body will be converted to a String and sent as a metric value. Unlike numeric metrics, String values can't be charted but Ganglia makes them available for reporting. The `os_version` string at the top of every Ganglia host page is an example of a String metric.

```
from("direct:string.for.ganglia")
  .setHeader(GangliaConstants.METRIC_NAME, simple("my_string_metric"))
  .setHeader(GangliaConstants.METRIC_TYPE, GMetricType.STRING)
  .to("direct:ganglia.tx");

from("direct:ganglia.tx")
  .to("ganglia:239.2.11.71:8649?mode=MULTICAST&prefix=test");
```

113.6.2. Sending a numeric metric

```
from("direct:value.for.ganglia")
  .setHeader(GangliaConstants.METRIC_NAME, simple("widgets_in_stock"))
  .setHeader(GangliaConstants.METRIC_TYPE, GMetricType.UINT32)
  .setHeader(GangliaConstants.METRIC_UNITS, simple("widgets"))
  .to("direct:ganglia.tx");

from("direct:ganglia.tx")
  .to("ganglia:239.2.11.71:8649?mode=MULTICAST&prefix=test");
```

CHAPTER 114. GEOCODER COMPONENT

Available as of Camel version 2.12

The **geocoder**: component is used for looking up geocodes (latitude and longitude) for a given address, or reverse lookup. The component uses the [Java API for Google Geocoder](#) library.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-geocoder</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

114.1. URI FORMAT

```
geocoder:address:name[?options]
geocoder:latlng:latitude,longitude[?options]
```

114.2. OPTIONS

The Geocoder component has no options.

The Geocoder endpoint is configured using URI syntax:

```
geocoder:address:latlng
```

with the following path and query parameters:

114.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|----------------|----------------------------------------------------------------------|---------|--------|
| address | The geo address which should be prefixed with address: | | String |
| latlng | The geo latitude and longitude which should be prefixed with latlng: | | String |

114.2.2. Query Parameters (13 parameters):

| Name | Description | Default | Type |
|----------------------------------|-----------------------------------------------------------------------------|---------|---------|
| headersOnly (producer) | Whether to only enrich the Exchange with headers, and leave the body as-is. | false | boolean |

| Name | Description | Default | Type |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| language (producer) | The language to use. | en | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| proxyAuthDomain (proxy) | Domain for proxy NTML authentication | | String |
| proxyAuthHost (proxy) | Optional host for proxy NTML authentication | | String |
| proxyAuthMethod (proxy) | Authentication method for proxy, either as Basic, Digest or NTLM. | | String |
| proxyAuthPassword (proxy) | Password for proxy authentication | | String |
| proxyAuthUsername (proxy) | Username for proxy authentication | | String |
| proxyHost (proxy) | The proxy host name | | String |
| proxyPort (proxy) | The proxy port number | | Integer |
| apiKey (security) | To use google apiKey | | String |
| clientId (security) | To use google premium with this client id | | String |
| clientKey (security) | To use google premium with this client key | | String |

114.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.geocoder.enabled</code> | Enable geocoder component | true | Boolean |
| <code>camel.component.geocoder.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

114.4. EXCHANGE DATA FORMAT

Camel will deliver the body as a `com.google.code.geocoder.model.GeocodeResponse` type. And if the address is "**current**" then the response is a String type with a JSON representation of the current location.

If the option **headersOnly** is set to **true** then the message body is left as-is, and only headers will be added to the Exchange.

114.5. MESSAGE HEADERS

| Header | Description |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| CamelGeoCoderStatus | Mandatory. Status code from the geocoder library. If status is GeocoderStatus.OK then additional headers is enriched |
| CamelGeoCoderAddress | The formatted address |
| CamelGeoCoderLat | The latitude of the location. |
| CamelGeoCoderLng | The longitude of the location. |
| CamelGeoCoderLatlng | The latitude and longitude of the location. Separated by comma. |
| CamelGeoCoderCity | The city long name. |
| CamelGeoCoderRegionCode | The region code. |
| CamelGeoCoderRegionName | The region name. |
| CamelGeoCoderCountryLong | The country long name. |
| CamelGeoCoderCountryShort | The country short name. |

| Header | Description |
|--------------------------------|------------------|
| CamelGeoCoderPostalCode | The postal code. |

Notice not all headers may be provided depending on available data and mode in use (address vs latlng).

114.6. SAMPLES

In the example below we get the latitude and longitude for Paris, France

```
from("direct:start")
  .to("geocoder:address:Paris, France")
```

If you provide a header with the **CamelGeoCoderAddress** then that overrides the endpoint configuration, so to get the location of Copenhagen, Denmark we can send a message with a headers as shown:

```
template.sendBodyAndHeader("direct:start", "Hello", GeoCoderConstants.ADDRESS, "Copenhagen, Denmark");
```

To get the address for a latitude and longitude we can do:

```
from("direct:start")
  .to("geocoder:latlng:40.714224,-73.961452")
  .log("Location ${header.CamelGeoCoderAddress} is at lat/lng: ${header.CamelGeoCoderLatlng} and in country ${header.CamelGeoCoderCountryShort}")
```

Which will log

```
Location 285 Bedford Avenue, Brooklyn, NY 11211, USA is at lat/lng: 40.71412890,-73.96140740 and in country US
```

To get the current location you can use "current" as the address as shown:

```
from("direct:start")
  .to("geocoder:address:current")
```

CHAPTER 115. GIT COMPONENT

Available as of Camel version 2.16

The **git**: component allows you to work with a generic Git repository.

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-git</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

URI Format

```
git://localRepositoryPath[?options]
```

115.1. URI OPTIONS

The producer allows to do operations on a specific repository.

The consumer allows consuming commits, tags and branches on a specific repository.

The Git component has no options.

The Git endpoint is configured using URI syntax:

```
git:localPath
```

with the following path and query parameters:

115.1.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|------------------|---------------------------------------|---------|--------|
| localPath | Required Local repository path | | String |

115.1.2. Query Parameters (13 parameters):

| Name | Description | Default | Type |
|-------------------------------|----------------------------|---------|--------|
| branchName (common) | The branch name to work on | | String |
| password (common) | Remote repository password | | String |

| Name | Description | Default | Type |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| remoteName (common) | The remote repository name to use in particular operation like pull | | String |
| remotePath (common) | The remote repository path | | String |
| tagName (common) | The tag name to work on | | String |
| username (common) | Remote repository username | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| type (consumer) | The consumer type | | GitType |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| allowEmpty (producer) | The flag to manage empty git commits | true | boolean |
| operation (producer) | The operation to do on the repository | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

115.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.git.enabled</code> | Enable git component | true | Boolean |
| <code>camel.component.git.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

115.3. MESSAGE HEADERS

| Name | Default Value | Type | Context | Description |
|-------------------------|---------------|---------|----------|--------------------------------------------------------------------------|
| Camel GitOperation | null | String | Producer | The operation to do on a repository, if not specified as endpoint option |
| Camel GitFilename | null | String | Producer | The file name in an add operation |
| Camel GitCommitMessage | null | String | Producer | The commit message related in a commit operation |
| Camel GitCommitUsername | null | String | Producer | The commit username in a commit operation |
| Camel GitCommitEmail | null | String | Producer | The commit email in a commit operation |
| Camel GitCommitId | null | String | Producer | The commit id |
| Camel GitAllowEmpty | null | Boolean | Producer | The flag to manage empty git commits |

115.4. PRODUCER EXAMPLE

Below is an example route of a producer that add a file test.java to a local repository, commit it with a specific message on master branch and then push it to remote repository.

```
from("direct:start")
    .setHeader(GitConstants.GIT_FILE_NAME, constant("test.java"))
    .to("git:///tmp/testRepo?operation=add")
    .setHeader(GitConstants.GIT_COMMIT_MESSAGE, constant("first commit"))
    .to("git:///tmp/testRepo?operation=commit")
    .to("git:///tmp/testRepo?
operation=push&remotePath=https://foo.com/test/test.git&username=xxx&password=xxx")
    .to("git:///tmp/testRepo?operation=createTag&tagName=myTag")
    .to("git:///tmp/testRepo?operation=pushTag&tagName=myTag&remoteName=origin")
```

115.5. CONSUMER EXAMPLE

Below is an example route of a consumer that consumes commit:

```
from("git:///tmp/testRepo?type=commit")
    .to(...)
```

CHAPTER 116. GITHUB COMPONENT

Available as of Camel version 2.15

The GitHub component interacts with the GitHub API by encapsulating [egit-github](#). It currently provides polling for new pull requests, pull request comments, tags, and commits. It is also able to produce comments on pull requests, as well as close the pull request entirely.

Rather than webhooks, this endpoint relies on simple polling. Reasons include:

- Concern for reliability/stability
- The types of payloads we're polling aren't typically large (plus, paging is available in the API)
- The need to support apps running somewhere not publicly accessible where a webhook would fail

Note that the GitHub API is fairly expansive. Therefore, this component could be easily expanded to provide additional interactions.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-github</artifactId>
  <version>${camel-version}</version>
</dependency>
```

116.1. URI FORMAT

```
github://endpoint[?options]
```

116.2. MANDATORY OPTIONS:

Note that these can be configured directly through the endpoint.

The GitHub component has no options.

The GitHub endpoint is configured using URI syntax:

```
github:type/branchName
```

with the following path and query parameters:

116.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------|----------------------------------------|---------|------------|
| type | Required What git operation to execute | t | GitHubType |

| Name | Description | Default | Type |
|-------------------|----------------|---------|--------|
| branchName | Name of branch | | String |

116.2.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| oauthToken (common) | GitHub OAuth token, required unless username & password are provided | | String |
| password (common) | GitHub password, required unless oauthToken is provided | | String |
| repoName (common) | Required GitHub repository name | | String |
| repoOwner (common) | Required GitHub repository owner (organization) | | String |
| username (common) | GitHub username, required unless oauthToken is provided | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| encoding (producer) | To use the given encoding when getting a git commit file | | String |
| state (producer) | To set git commit status state | | String |

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| targetUrl (producer) | To set git commit status target url | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

116.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.github.enabled | Enable github component | true | Boolean |
| camel.component.github.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

116.4. CONSUMER ENDPOINTS:

| Endpoint | Context | Body Type |
|--------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pullRequest | polling | org.eclipse.egit.github.core.PullRequest |
| pullRequestComment | polling | org.eclipse.egit.github.core.Comment (comment on the general pull request discussion) or org.eclipse.egit.github.core.CommitComment (inline comment on a pull request diff) |
| tag | polling | org.eclipse.egit.github.core.RepositoryTag |
| commit | polling | org.eclipse.egit.github.core.RepositoryCommit |

116.5. PRODUCER ENDPOINTS:

| Endpoint | Body | Message Headers |
|----------|------|-----------------|
|----------|------|-----------------|

| Endpoint | Body | Message Headers |
|-------------------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pullRequestComment | String (comment text) | <ul style="list-style-type: none">- GitHubPullRequest (integer) (REQUIRED): Pull request number.- GitHubInResponseTo (integer): Required if responding to another inline comment on the pull request diff. If left off, a general comment on the pull request discussion is assumed. |
| closePullRequest | none | <ul style="list-style-type: none">- GitHubPullRequest (integer) (REQUIRED): Pull request number. |
| createIssue (From Camel 2.18) | String (issue body text) | <ul style="list-style-type: none">- GitHubIssueTitle (String) (REQUIRED): Issue Title. |

CHAPTER 117. GZIP DATAFORMAT

Available as of Camel version 2.0

The GZip Data Format is a message compression and de-compression format. It uses the same deflate algorithm that is used in [Zip DataFormat](#), although some additional headers are provided. This format is produced by popular **gzip/gunzip** tool. Messages marshalled using GZip compression can be unmarshalled using GZip decompression just prior to being consumed at the endpoint. The compression capability is quite useful when you deal with large XML and Text based payloads or when you read messages previously compressed using **gzip** tool.

117.1. OPTIONS

The GZip dataformat supports 1 options, which are listed below.

| Name | Default | Java Type | Description |
|--------------------------------|--------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>contentTypeHeader</code> | <code>false</code> | <code>Boolean</code> | Whether the data format should set the Content-Type header with the type from the data format if the data format is capable of doing so. For example <code>application/xml</code> for data formats marshalling to XML, or <code>application/json</code> for data formats marshalling to JSon etc. |

117.2. MARSHAL

In this example we marshal a regular text/XML payload to a compressed payload employing gzip compression format and send it an ActiveMQ queue called MY_QUEUE.

```
from("direct:start").marshal().gzip().to("activemq:queue:MY_QUEUE");
```

117.3. UNMARSHAL

In this example we unmarshal a gzipped payload from an ActiveMQ queue called MY_QUEUE to its original format, and forward it for processing to the **UnGzippedMessageProcessor**.

```
from("activemq:queue:MY_QUEUE").unmarshal().gzip().process(new UnGzippedMessageProcessor());
```

117.4. DEPENDENCIES

This data format is provided in **camel-core** so no additional dependencies is needed.

CHAPTER 118. GOOGLE BIGQUERY COMPONENT

Available as of Camel version 2.20

118.1. COMPONENT DESCRIPTION

The Google Bigquery component provides access to [Cloud BigQuery Infrastructure](#) via the [Google Client Services API](#).

The current implementation does not use gRPC.

The current implementation does not support querying BigQuery i.e. is a producer only.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-bigquery</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

118.2. AUTHENTICATION CONFIGURATION

Google BigQuery component authentication is targeted for use with the GCP Service Accounts. For more information please refer to [Google Cloud Platform Auth Guide](#)

Google security credentials can be set explicitly via one of the two options:

- Service Account Email and Service Account Key (PEM format)
- GCP credentials file location

If both are set, the Service Account Email/Key will take precedence.

Or implicitly, where the connection factory falls back on [Application Default Credentials](#).

OBS! The location of the default credentials file is configurable - via `GOOGLE_APPLICATION_CREDENTIALS` environment variable.

Service Account Email and Service Account Key can be found in the GCP JSON credentials file as `client_email` and `private_key` respectively.

118.3. URI FORMAT

```
google-bigquery://project-id:datasetId[:tableId]?[options]
```

118.4. OPTIONS

The Google BigQuery component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------------|
| projectId (producer) | Google Cloud Project Id | | String |
| datasetId (producer) | BigQuery Dataset Id | | String |
| connectionFactory (producer) | ConnectionFactory to obtain connection to Bigquery Service. If non provided the default one will be used | | GoogleBigQuery ConnectionFactory |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google BigQuery endpoint is configured using URI syntax:

```
google-bigquery:projectId:datasetId:tableName
```

with the following path and query parameters:

118.4.1. Path Parameters (3 parameters):

| Name | Description | Default | Type |
|------------------|-----------------------------------------|---------|--------|
| projectId | Required Google Cloud Project Id | | String |
| datasetId | Required BigQuery Dataset Id | | String |
| tableId | BigQuery table id | | String |

118.4.2. Query Parameters (3 parameters):

| Name | Description | Default | Type |
|----------------------------------------|-------------------------------------------------------------------------------------------------------|---------|-------------------------------------|
| connectionFactory (producer) | ConnectionFactory to obtain connection to Bigquery Service. If non provided the default will be used. | | GoogleBigQuery ConnectionFactory |
| useAsInsertId (producer) | Field name to use as insert id | | String |

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

118.5. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.google-bigquery.dataset-id | BigQuery Dataset Id | | String |
| camel.component.google-bigquery.enabled | Whether to enable auto configuration of the google-bigquery component. This is enabled by default. | | Boolean |
| camel.component.google-bigquery.project-id | Google Cloud Project Id | | String |
| camel.component.google-bigquery.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

118.6. MESSAGE HEADERS

| Name | Type | Description |
|---------------------------------------|---------------|-----------------------------------------|
| CamelGoogleBigQueryTableSuffix | String | Table suffix to use when inserting data |

| Name | Type | Description |
|------------------------------------------------|---------------|------------------------------------------------------------------------------------------|
| Camel GoogleBigQuery.InsertId | String | InsertId to use when inserting data |
| Camel GoogleBigQuery.PartitionDecorator | String | Partition decorator to indicate partition to use when inserting data |
| Camel GoogleBigQuery.TableId | String | Table id where data will be submitted. If specified will override endpoint configuration |

118.7. PRODUCER ENDPOINTS

Producer endpoints can accept and deliver to BigQuery individual and grouped exchanges alike. Grouped exchanges have **Exchange.GROUPED_EXCHANGE** property set.

Google BigQuery producer will send a grouped exchange in a single api call unless different table suffix or partition decorators are specified in which case it will break it down to ensure data is written with the correct suffix or partition decorator.

Google BigQuery endpoint expects the payload to be either a map or list of maps. A payload containing a map will insert a single row and a payload containing a list of map's will insert a row for each entry in the list.

118.8. TEMPLATE TABLES

Reference: <https://cloud.google.com/bigquery/streaming-data-into-bigquery#template-tables>

Templated tables can be specified using the **GoogleBigQueryConstants.TABLE_SUFFIX** header.

I.e. the following route will create tables and insert records sharded on a per day basis:

```
from("direct:start")
  .header(GoogleBigQueryConstants.TABLE_SUFFIX, "_${date:now:yyyyMMdd}")
  .to("google-bigquery:sampleDataset:sampleTable")
```

Note it is recommended to use partitioning for this use case.

118.9. PARTITIONING

Reference: <https://cloud.google.com/bigquery/docs/creating-partitioned-tables>

Partitioning is specified when creating a table and if set data will be automatically partitioned into separate tables. When inserting data a specific partition can be specified by setting the **GoogleBigQueryConstants.PARTITION_DECORATOR** header on the exchange.

118.10. ENSURING DATA CONSISTENCY

Reference: <https://cloud.google.com/bigquery/streaming-data-into-bigquery#dataconsistency>

An insert id can be set on the exchange with the header **GoogleBigQueryConstants.INSERT_ID** or by specifying query parameter **useAsInsertId**. As an insert id need to be specified per row inserted the exchange header can't be used when the payload is a list - if the payload is a list the **GoogleBigQueryConstants.INSERT_ID** will be ignored. In that case use the query parameter **useAsInsertId**.

CHAPTER 119. GOOGLE CALENDAR COMPONENT

Available as of Camel version 2.15

The Google Calendar component provides access to [Google Calendar](#) via the [Google Calendar Web APIs](#).

Google Calendar uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-calendar</artifactId>
  <version>2.15.0</version>
</dependency>
```

119.1.1. GOOGLE CALENDAR OPTIONS

The Google Calendar component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| configuration (common) | To use the shared configuration | | GoogleCalendarConfiguration |
| clientFactory (advanced) | To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleCalendarClientFactory | | GoogleCalendarClientFactory |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Calendar endpoint is configured using URI syntax:

```
google-calendar:apiName/methodName
```

with the following path and query parameters:

119.1.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------|----------------------------------------------------------------------|---------|-----------------------|
| apiName | Required What kind of operation to perform | | GoogleCalendarApiName |
| methodName | Required What sub operation to use for the selected operation | | String |

119.1.2. Query Parameters (14 parameters):

| Name | Description | Default | Type |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|--------|
| accessToken (common) | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| applicationName (common) | Google calendar application name. Example would be camel-google-calendar/1.0 | | String |
| clientId (common) | Client ID of the calendar application | | String |
| clientSecret (common) | Client secret of the calendar application | | String |
| emailAddress (common) | The emailAddress of the Google Service Account. | | String |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| p12FileName (common) | The name of the p12 file which has the private key to use with the Google Service Account. | | String |
| refreshToken (common) | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| scopes (common) | Specifies the level of permissions you want a calendar application to have to a user account. You can separate multiple scopes by comma. See https://developers.google.com/google-apps/calendar/auth for more info. | https://www.googleapis.com/auth/calendar | String |

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| user (common) | The email address of the user the application is trying to impersonate in the service account flow | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom <code>ExceptionHandler</code> . Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | <code>ExceptionHandler</code> |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | <code>ExchangePattern</code> |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

119.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 14 options, which are listed below.

| Name | Description | Default | Type |
|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| camel.component.google-calendar.client-factory | To use the <code>GoogleCalendarClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleCalendarClientFactory</code> . The option is a <code>org.apache.camel.component.google.calendar.GoogleCalendarClientFactory</code> type. | | String |
| camel.component.google-calendar.configuration.access-token | OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------|
| <code>camel.component.google-calendar.configuration.api-name</code> | What kind of operation to perform | | GoogleCalendarApiName |
| <code>camel.component.google-calendar.configuration.application-name</code> | Google calendar application name. Example would be camel-google-calendar/1.0 | | String |
| <code>camel.component.google-calendar.configuration.client-id</code> | Client ID of the calendar application | | String |
| <code>camel.component.google-calendar.configuration.client-secret</code> | Client secret of the calendar application | | String |
| <code>camel.component.google-calendar.configuration.email-address</code> | The emailAddress of the Google Service Account. | | String |
| <code>camel.component.google-calendar.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.google-calendar.configuration.p12-file-name</code> | The name of the p12 file which has the private key to use with the Google Service Account. | | String |
| <code>camel.component.google-calendar.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |

| Name | Description | Default | Type |
|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|---------|
| <code>camel.component.google-calendar.configuration.scopes</code> | Specifies the level of permissions you want a calendar application to have to a user account. You can separate multiple scopes by comma. See https://developers.google.com/google-apps/calendar/auth for more info. | https://www.googleapis.com/auth/calendar | String |
| <code>camel.component.google-calendar.configuration.user</code> | The email address of the user the application is trying to impersonate in the service account flow | | String |
| <code>camel.component.google-calendar.enabled</code> | Enable google-calendar component | true | Boolean |
| <code>camel.component.google-calendar.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

119.3. URI FORMAT

The GoogleCalendar Component uses the following URI format:

```
google-calendar://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- acl
- calendars
- channels
- colors
- events
- freebusy
- list
- settings

119.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleCalendar.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleCalendar.option** header.

119.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

119.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleCalendar.** prefix.

119.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleCalendarComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 120. GOOGLE CALENDAR STREAM COMPONENT

Available as of Camel version 2.23

The Google Calendar component provides access to [Calendar](#) via the [Google Calendar Web APIs](#).

Google Calendar uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-calendar</artifactId>
  <version>2.23.0</version>
</dependency>
```

120.1. URI FORMAT

The Google Calendar Component uses the following URI format:

```
google-calendar-stream://index?[options]
```

120.2. GOOGLECALENDARSTREAMCOMPONENT

The Google Calendar Stream component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------------|
| configuration (advanced) | The configuration | | GoogleCalendarStreamConfiguration |
| clientFactory (advanced) | The client Factory | | GoogleCalendarClientFactory |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Calendar Stream endpoint is configured using URI syntax:

```
google-calendar-stream:index
```

with the following path and query parameters:

120.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------|-------------------------------------|---------|--------|
| index | Specifies an index for the endpoint | | String |

120.2.2. Query Parameters (30 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| accessToken (consumer) | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| applicationName (consumer) | Google Calendar application name. Example would be camel-google-calendar/1.0 | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| calendarId (consumer) | The calendarId to be used | primary | String |
| clientId (consumer) | Client ID of the calendar application | | String |
| clientSecret (consumer) | Client secret of the calendar application | | String |
| considerLastUpdate (consumer) | Take into account the lastUpdate of the last event polled as start date for the next poll | false | boolean |
| consumeFromNow (consumer) | Consume events in the selected calendar from now on | true | boolean |
| maxResults (consumer) | Max results to be returned | 10 | int |
| query (consumer) | The query to execute on calendar | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| refreshToken (consumer) | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| scopes (consumer) | Specifies the level of permissions you want a calendar application to have to a user account. See https://developers.google.com/calendar/auth for more info. | | List |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option errorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |

| Name | Description | Default | Type |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

120.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 15 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.google-calendar-stream.client-factory</code> | The client Factory. The option is a <code>org.apache.camel.component.google.calendar.GoogleCalendarClientFactory</code> type. | | String |
| <code>camel.component.google-calendar-stream.configuration.access-token</code> | OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage. | | String |
| <code>camel.component.google-calendar-stream.configuration.application-name</code> | Google Calendar application name. Example would be <code>camel-google-calendar/1.0</code> | | String |
| <code>camel.component.google-calendar-stream.configuration.calendar-id</code> | The <code>calendarId</code> to be used | primary | String |
| <code>camel.component.google-calendar-stream.configuration.client-id</code> | Client ID of the calendar application | | String |
| <code>camel.component.google-calendar-stream.configuration.client-secret</code> | Client secret of the calendar application | | String |
| <code>camel.component.google-calendar-stream.configuration.consider-last-update</code> | Take into account the <code>lastUpdate</code> of the last event polled as start date for the next poll | false | Boolean |
| <code>camel.component.google-calendar-stream.configuration.consume-from-now</code> | Consume events in the selected calendar from now on | true | Boolean |
| <code>camel.component.google-calendar-stream.configuration.index</code> | Specifies an index for the endpoint | | String |

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.google-calendar-stream.configuration.max-results</code> | Max results to be returned | 10 | Integer |
| <code>camel.component.google-calendar-stream.configuration.query</code> | The query to execute on calendar | | String |
| <code>camel.component.google-calendar-stream.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>camel.component.google-calendar-stream.configuration.scopes</code> | Specifies the level of permissions you want a calendar application to have to a user account. See https://developers.google.com/calendar/auth for more info. | | List |
| <code>camel.component.google-calendar-stream.enabled</code> | Whether to enable auto configuration of the google-calendar-stream component. This is enabled by default. | | Boolean |
| <code>camel.component.google-calendar-stream.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

120.4. CONSUMER

The consumer will poll by default with `maxResults` equals to 5.

For example

```
from("google-calendar-stream://test?
markAsRead=true&delay=5000&maxResults=5").to("mock:result");
```

This route will consume the next five events starting from the date of polling.

CHAPTER 121. GOOGLE DRIVE COMPONENT

Available as of Camel version 2.14

The Google Drive component provides access to the [Google Drive file storage service](#) via the [Google Drive Web APIs](#).

Google Drive uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-drive</artifactId>
  <version>2.14-SNAPSHOT</version>
</dependency>
```

121.1. URI FORMAT

The GoogleDrive Component uses the following URI format:

```
google-drive://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- drive-about
- drive-apps
- drive-changes
- drive-channels
- drive-children
- drive-comments
- drive-files
- drive-parents
- drive-permissions
- drive-properties
- drive-realtime
- drive-replies
- drive-revisions

121.2. GOOGLEDRIVECOMPONENT

The Google Drive component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------------------------|
| configuration (common) | To use the shared configuration | | GoogleDrive Configuration |
| clientFactory (advanced) | To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleDriveClientFactory | | GoogleDriveClient Factory |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Drive endpoint is configured using URI syntax:

```
google-drive:apiName/methodName
```

with the following path and query parameters:

121.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------|----------------------------------------------------------------------|---------|--------------------|
| apiName | Required What kind of operation to perform | | GoogleDriveApiName |
| methodName | Required What sub operation to use for the selected operation | | String |

121.2.2. Query Parameters (12 parameters):

| Name | Description | Default | Type |
|------------------------------------|----------------------------------------------------------------------------------------------------------------|---------|--------|
| accessToken (common) | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| applicationName (common) | Google drive application name. Example would be camel-google-drive/1.0 | | String |

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------|
| clientFactory (common) | To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleDriveClientFactory | | GoogleDriveClientFactory |
| clientId (common) | Client ID of the drive application | | String |
| clientSecret (common) | Client secret of the drive application | | String |
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| refreshToken (common) | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| scopes (common) | Specifies the level of permissions you want a drive application to have to a user account. See https://developers.google.com/drive/web/scopes for more info. | | List |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

121.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 11 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------|
| <code>camel.component.google-drive.client-factory</code> | To use the <code>GoogleCalendarClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleDriveClientFactory</code> . The option is a <code>org.apache.camel.component.google.drive.GoogleDriveClientFactory</code> type. | | String |
| <code>camel.component.google-drive.configuration.access-token</code> | OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage. | | String |
| <code>camel.component.google-drive.configuration.api-name</code> | What kind of operation to perform | | GoogleDriveApiName |
| <code>camel.component.google-drive.configuration.application-name</code> | Google drive application name. Example would be <code>camel-google-drive/1.0</code> | | String |
| <code>camel.component.google-drive.configuration.client-id</code> | Client ID of the drive application | | String |
| <code>camel.component.google-drive.configuration.client-secret</code> | Client secret of the drive application | | String |
| <code>camel.component.google-drive.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.google-drive.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new <code>accessToken</code> whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>camel.component.google-drive.configuration.scopes</code> | Specifies the level of permissions you want a drive application to have to a user account. See https://developers.google.com/drive/web/scopes for more info. | | List |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.google-drive.enabled</code> | Enable google-drive component | true | Boolean |
| <code>camel.component.google-drive.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

121.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleDrive.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleDrive.option** header.

For more information on the endpoints and options see API documentation at: <https://developers.google.com/drive/v2/reference/>

121.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

121.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleDrive.** prefix.

121.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleDriveComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 122. GOOGLE MAIL COMPONENT

Available as of Camel version 2.15

The Google Mail component provides access to [Gmail](#) via the [Google Mail Web APIs](#).

Google Mail uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-mail</artifactId>
  <version>2.15-SNAPSHOT</version>
</dependency>
```

122.1. URI FORMAT

The GoogleMail Component uses the following URI format:

```
google-mail://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- attachments
- drafts
- history
- labels
- messages
- threads
- users

122.2. GOOGLEMAILCOMPONENT

The Google Mail component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------|---------------------------------|---------|-------------------------|
| configuration (common) | To use the shared configuration | | GoogleMailConfiguration |

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------|
| clientFactory (advanced) | To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleMailClientFactory | | GoogleMailClientFactory |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Mail endpoint is configured using URI syntax:

```
google-mail:apiName/methodName
```

with the following path and query parameters:

122.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------|----------------------------------------------------------------------|---------|-------------------|
| apiName | Required What kind of operation to perform | | GoogleMailApiName |
| methodName | Required What sub operation to use for the selected operation | | String |

122.2.2. Query Parameters (10 parameters):

| Name | Description | Default | Type |
|------------------------------------|----------------------------------------------------------------------------------------------------------------|---------|--------|
| accessToken (common) | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| applicationName (common) | Google mail application name. Example would be camel-google-mail/1.0 | | String |
| clientId (common) | Client ID of the mail application | | String |
| clientSecret (common) | Client secret of the mail application | | String |

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| inBody (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| refreshToken (common) | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

122.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| camel.component.google-mail.client-factory | To use the GoogleCalendarClientFactory as factory for creating the client. Will by default use BatchGoogleMailClientFactory. The option is a org.apache.camel.component.google.mail.GoogleMailClientFactory type. | | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------|
| <code>camel.component.google-mail.configuration.access-token</code> | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| <code>camel.component.google-mail.configuration.api-name</code> | What kind of operation to perform | | GoogleMailApiName |
| <code>camel.component.google-mail.configuration.application-name</code> | Google mail application name. Example would be camel-google-mail/1.0 | | String |
| <code>camel.component.google-mail.configuration.client-id</code> | Client ID of the mail application | | String |
| <code>camel.component.google-mail.configuration.client-secret</code> | Client secret of the mail application | | String |
| <code>camel.component.google-mail.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.google-mail.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>camel.component.google-mail.enabled</code> | Enable google-mail component | true | Boolean |
| <code>camel.component.google-mail.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

122.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI **MUST** contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options **MUST** be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleMail.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleMail.option** header.

For more information on the endpoints and options see API documentation at:
<https://developers.google.com/gmail/api/v1/reference/>

122.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

122.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleMail.** prefix.

122.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleMailComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 123. GOOGLE MAIL STREAM COMPONENT

Available as of Camel version 2.22

The Google Mail component provides access to [Gmail](#) via the [Google Mail Web APIs](#).

Google Mail uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-mail</artifactId>
  <version>2.22-SNAPSHOT</version>
</dependency>
```

123.1. URI FORMAT

The GoogleMail Component uses the following URI format:

```
google-mail-stream://index?[options]
```

123.2. GOOGLEMAILSTREAMCOMPONENT

The Google Mail Stream component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|--------------------------------|
| configuration (advanced) | The configuration | | GoogleMailStream Configuration |
| clientFactory (advanced) | The client Factory | | GoogleMailClient Factory |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Mail Stream endpoint is configured using URI syntax:

```
google-mail-stream:index
```

with the following path and query parameters:

123.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------|-------------------------------------|---------|--------|
| index | Specifies an index for the endpoint | | String |

123.2.2. Query Parameters (28 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|---------|
| accessToken (consumer) | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| applicationName (consumer) | Google mail application name. Example would be camel-google-mail/1.0 | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| clientId (consumer) | Client ID of the mail application | | String |
| clientSecret (consumer) | Client secret of the mail application | | String |
| labels (consumer) | Comma separated list of labels to take into account | | String |
| markAsRead (consumer) | Mark the message as read once it has been consumed | false | boolean |
| maxResults (consumer) | Max results to be returned | 10 | long |
| query (consumer) | The query to execute on gmail box | is:unread | String |
| refreshToken (consumer) | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |

| Name | Description | Default | Type |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-----------------------------|
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option <code>bridgeErrorHandler</code> is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the <code>backoffMultiplier</code> should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then <code>backoffIdleThreshold</code> and/or <code>backoffErrorThreshold</code> must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the <code>ScheduledPollConsumer</code> will run immediately again, if the previous run polled 1 or more messages. | false | boolean |

| Name | Description | Default | Type |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|---------------------------------|
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumer Scheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

123.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 13 options, which are listed below.

| Name | Description | Default | Type |
|----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|---------|--------|
| camel.component.google-mail-stream.client-factory | The client Factory. The option is a <code>org.apache.camel.component.google.mail.GoogleMailClientFactory</code> type. | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|-----------|---------|
| <code>camel.component.google-mail-stream.configuration.access-token</code> | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| <code>camel.component.google-mail-stream.configuration.application-name</code> | Google mail application name. Example would be camel-google-mail/1.0 | | String |
| <code>camel.component.google-mail-stream.configuration.client-id</code> | Client ID of the mail application | | String |
| <code>camel.component.google-mail-stream.configuration.client-secret</code> | Client secret of the mail application | | String |
| <code>camel.component.google-mail-stream.configuration.index</code> | Specifies an index for the endpoint | | String |
| <code>camel.component.google-mail-stream.configuration.labels</code> | Comma separated list of labels to take into account | | String |
| <code>camel.component.google-mail-stream.configuration.mark-as-read</code> | Mark the message as read once it has been consumed | false | Boolean |
| <code>camel.component.google-mail-stream.configuration.max-results</code> | Max results to be returned | 10 | Long |
| <code>camel.component.google-mail-stream.configuration.query</code> | The query to execute on gmail box | is:unread | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.google-mail-stream.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>camel.component.google-mail-stream.enabled</code> | Whether to enable auto configuration of the google-mail-stream component. This is enabled by default. | | Boolean |
| <code>camel.component.google-mail-stream.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

123.4. CONSUMER

The consumer will poll by default with the query "is:unread" and maxResults equals to 10.

For example

```
from("google-mail-stream://test?
markAsRead=true&delay=5000&maxResults=5&labels=GitHub,Apache").to("mock:result");
```

This route will consume unread messages with labels Github and Apache and it will mark the messages as read.

CHAPTER 124. GOOGLE PUBSUB COMPONENT

Available as of Camel version 2.19

The Google Pubsub component provides access to [Cloud Pub/Sub Infrastructure](#) via the [Google Client Services API](#).

The current implementation does not use gRPC.

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-pubsub</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

124.1. URI FORMAT

The Google Pubsub Component uses the following URI format:

```
google-pubsub://project-id:destinationName?[options]
```

Destination Name can be either a topic or a subscription name.

124.2. OPTIONS

The Google Pubsub component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| connectionFactory (common) | Sets the connection factory to use; provides the ability to explicitly manage connection credentials: - the path to the key file - the Service Account Key / Email pair | | GooglePubsubConnectionFactory |
| resolvePropertyPlaceholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Pubsub endpoint is configured using URI syntax:

```
google-pubsub:projectId:destinationName
```

with the following path and query parameters:

124.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|------------------------|----------------------------------|---------|--------|
| projectId | Required Project Id | | String |
| destinationName | Required Destination Name | | String |

124.2.2. Query Parameters (9 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------------------------|
| ackMode (common) | AUTO = exchange gets ack'ed/nack'ed on completion. NONE = downstream process has to ack/nack explicitly | AUTO | AckMode |
| concurrentConsumers (common) | The number of parallel streams consuming from the subscription | 1 | Integer |
| connectionFactory (common) | ConnectionFactory to obtain connection to PubSub Service. If non provided the default will be used. | | GooglePubsubConnectionFactory |
| loggerId (common) | Logger ID to use when a match to the parent route required | | String |
| maxMessagesPerPoll (common) | The max number of messages to receive from the server in a single API call | 1 | Integer |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |

| Name | Description | Default | Type |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

124.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.google-pubsub.enabled | Enable google-pubsub component | true | Boolean |
| camel.component.google-pubsub.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

124.4. PRODUCER ENDPOINTS

Producer endpoints can accept and deliver to PubSub individual and grouped exchanges alike. Grouped exchanges have **Exchange.GROUPED_EXCHANGE** property set.

Google PubSub expects the payload to be byte[] array, Producer endpoints will send:

- String body as byte[] encoded as UTF-8
- byte[] body as is
- Everything else will be serialised into byte[] array

A Map set as message header **GooglePubsubConstants.ATTRIBUTES** will be sent as PubSub attributes. Once exchange has been delivered to PubSub the PubSub Message ID will be assigned to the header **GooglePubsubConstants.MESSAGE_ID**.

124.5. CONSUMER ENDPOINTS

Google PubSub will redeliver the message if it has not been acknowledged within the time period set as a configuration option on the subscription.

The component will acknowledge the message once exchange processing has been completed.

If the route throws an exception, the exchange is marked as failed and the component will NACK the message - it will be redelivered immediately.

To ack/nack the message the component uses Acknowledgement ID stored as header **GooglePubsubConstants.ACK_ID**. If the header is removed or tampered with, the ack will fail and the message will be redelivered again after the ack deadline.

124.6. MESSAGE HEADERS

Headers set by the consumer endpoints:

- `GooglePubsubConstants.MESSAGE_ID`
- `GooglePubsubConstants.ATTRIBUTES`
- `GooglePubsubConstants.PUBLISH_TIME`
- `GooglePubsubConstants.ACK_ID`

124.7. MESSAGE BODY

The consumer endpoint returns the content of the message as `byte[]` - exactly as the underlying system sends it. It is up for the route to convert/unmarshall the contents.

124.8. AUTHENTICATION CONFIGURATION

Google Pubsub component authentication is targeted for use with the GCP Service Accounts. For more information please refer to [Google Cloud Platform Auth Guide](#)

Google security credentials can be set explicitly via one of the two options:

- Service Account Email and Service Account Key (PEM format)
- GCP credentials file location

If both are set, the Service Account Email/Key will take precedence.

Or implicitly, where the connection factory falls back on [Application Default Credentials](#).

OBS! The location of the default credentials file is configurable - via `GOOGLE_APPLICATION_CREDENTIALS` environment variable.

Service Account Email and Service Account Key can be found in the GCP JSON credentials file as `client_email` and `private_key` respectively.

124.9. ROLLBACK AND REDELIVERY

The rollback for Google PubSub relies on the idea of the Acknowledgement Deadline - the time period where Google PubSub expects to receive the acknowledgement. If the acknowledgement has not been received, the message is redelivered.

Google provides an API to extend the deadline for a message.

More information in [Google PubSub Documentation](#)

So, rollback is effectively a deadline extension API call with zero value - i.e. deadline is reached now and message can be redelivered to the next consumer.

It is possible to delay the message redelivery by setting the acknowledgement deadline explicitly for the rollback by setting the message header **GooglePubsubConstants.ACK_DEADLINE** to the value in seconds.

CHAPTER 125. GOOGLE SHEETS COMPONENT

Available as of Camel version 2.23

The Google Sheets component provides access to [Google Sheets](#) via the [Google Sheets Web APIs](#).

Google Sheets uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-sheets</artifactId>
  <version>2.23.0</version>
</dependency>
```

125.1. URI FORMAT

The GoogleSheets Component uses the following URI format:

```
google-sheets://endpoint-prefix/endpoint?[options]
```

Endpoint prefix can be one of:

- spreadsheets
- data

125.2. GOOGLESHEETSCOMPONENT

The Google Sheets component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|
| configuration (common) | To use the shared configuration | | GoogleSheets Configuration |
| clientFactory (advanced) | To use the GoogleSheetsClientFactory as factory for creating the client. Will by default use BatchGoogleSheetsClientFactory | | GoogleSheetsClient Factory |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Sheets endpoint is configured using URI syntax:

`google-sheets:apiName/methodName`

with the following path and query parameters:

125.2.1. Path Parameters (2 parameters):

| Name | Description | Default | Type |
|-------------------------|----------------------------------------------------------------------|---------|---------------------|
| <code>apiName</code> | Required What kind of operation to perform | | GoogleSheetsApiName |
| <code>methodName</code> | Required What sub operation to use for the selected operation | | String |

125.2.2. Query Parameters (10 parameters):

| Name | Description | Default | Type |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>accessToken</code> (common) | OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage. | | String |
| <code>applicationName</code> (common) | Google Sheets application name. Example would be <code>camel-google-sheets/1.0</code> | | String |
| <code>clientId</code> (common) | Client ID of the sheets application | | String |
| <code>clientSecret</code> (common) | Client secret of the sheets application | | String |
| <code>inBody</code> (common) | Sets the name of a parameter to be passed in the exchange In Body | | String |
| <code>refreshToken</code> (common) | OAuth 2 refresh token. Using this, the Google Sheets component can obtain a new <code>accessToken</code> whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>bridgeErrorHandler</code> (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |

| Name | Description | Default | Type |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

125.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 10 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| camel.component.google-sheets.client-factory | To use the GoogleSheetsClientFactory as factory for creating the client. Will by default use BatchGoogleSheetsClientFactory. The option is a org.apache.camel.component.google.sheets.GoogleSheetsClientFactory type. | | String |
| camel.component.google-sheets.configuration.access-token | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| camel.component.google-sheets.configuration.api-name | What kind of operation to perform | | GoogleSheetsApi Name |
| camel.component.google-sheets.configuration.application-name | Google Sheets application name. Example would be camel-google-sheets/1.0 | | String |
| camel.component.google-sheets.configuration.client-id | Client ID of the sheets application | | String |

| Name | Description | Default | Type |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.google-sheets.configuration.client-secret</code> | Client secret of the sheets application | | String |
| <code>camel.component.google-sheets.configuration.method-name</code> | What sub operation to use for the selected operation | | String |
| <code>camel.component.google-sheets.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Sheets component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>camel.component.google-sheets.enabled</code> | Whether to enable auto configuration of the google-sheets component. This is enabled by default. | | Boolean |
| <code>camel.component.google-sheets.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

125.4. PRODUCER ENDPOINTS

Producer endpoints can use endpoint prefixes followed by endpoint names and associated options described next. A shorthand alias can be used for some endpoints. The endpoint URI MUST contain a prefix.

Endpoint options that are not mandatory are denoted by []. When there are no mandatory options for an endpoint, one of the set of [] options MUST be provided. Producer endpoints can also use a special option **inBody** that in turn should contain the name of the endpoint option whose value will be contained in the Camel Exchange In message.

Any of the endpoint options can be provided in either the endpoint URI, or dynamically in a message header. The message header name must be of the format **CamelGoogleSheets.<option>**. Note that the **inBody** option overrides message header, i.e. the endpoint option **inBody=option** would override a **CamelGoogleSheets.option** header.

For more information on the endpoints and options see API documentation at: <https://developers.google.com/sheets/api/reference/rest/>

125.5. CONSUMER ENDPOINTS

Any of the producer endpoints can be used as a consumer endpoint. Consumer endpoints can use [Scheduled Poll Consumer Options](#) with a **consumer.** prefix to schedule endpoint invocation. Consumer

endpoints that return an array or collection will generate one exchange per element, and their routes will be executed once for each exchange.

125.6. MESSAGE HEADERS

Any URI option can be provided in a message header for producer endpoints with a **CamelGoogleSheets.** prefix.

125.7. MESSAGE BODY

All result message bodies utilize objects provided by the underlying APIs used by the `GoogleSheetsComponent`. Producer endpoints can specify the option name for incoming message body in the **inBody** endpoint URI parameter. For endpoints that return an array or collection, a consumer endpoint will map every element to distinct messages.

CHAPTER 126. GOOGLE SHEETS STREAM COMPONENT

Available as of Camel version 2.23

The Google Sheets component provides access to [Sheets](#) via the [Google Sheets Web APIs](#).

Google Sheets uses the [OAuth 2.0 protocol](#) for authenticating a Google account and authorizing access to user data. Before you can use this component, you will need to [create an account and generate OAuth credentials](#). Credentials comprise of a clientId, clientSecret, and a refreshToken. A handy resource for generating a long-lived refreshToken is the [OAuth playground](#).

Maven users will need to add the following dependency to their pom.xml for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-google-sheets</artifactId>
  <version>2.23.0</version>
</dependency>
```

126.1. URI FORMAT

The Google Sheets Component uses the following URI format:

```
google-sheets-stream://apiName?[options]
```

126.2. GOOGLESHEETSSTREAMCOMPONENT

The Google Sheets Stream component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------------|
| configuration (consumer) | To use the shared configuration | | GoogleSheetsStream Configuration |
| clientFactory (advanced) | To use the GoogleSheetsClientFactory as factory for creating the client. Will by default use BatchGoogleSheetsClientFactory | | GoogleSheetsClient Factory |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Google Sheets Stream endpoint is configured using URI syntax:

```
google-sheets-stream:apiName
```

with the following path and query parameters:

126.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|----------------|-------------------|---------|--------|
| apiName | Sets the apiName. | | String |

126.2.2. Query Parameters (31 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| accessToken (consumer) | OAuth 2 access token. This typically expires after an hour so refreshToken is recommended for long term usage. | | String |
| applicationName (consumer) | Google sheets application name. Example would be camel-google-sheets/1.0 | | String |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| clientId (consumer) | Client ID of the sheets application | | String |
| clientSecret (consumer) | Client secret of the sheets application | | String |
| includeGridData (consumer) | True if grid data should be returned. | false | boolean |
| majorDimension (consumer) | Specifies the major dimension that results should use.. | ROWS | String |
| maxResults (consumer) | Specify the maximum number of returned results. This will limit the number of rows in a returned value range data set or the number of returned value ranges in a batch request. | 10 | int |
| range (consumer) | Specifies the range of rows and columns in a sheet to get data from. | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------------------|
| refreshToken (consumer) | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| scopes (consumer) | Specifies the level of permissions you want a sheets application to have to a user account. See https://developers.google.com/identity/protocols/googlescopes for more info. | | List |
| sendEmptyMessageWhenIdle (consumer) | If the polling consumer did not poll any files, you can enable this option to send an empty message (no body) instead. | false | boolean |
| spreadsheetId (consumer) | Specifies the spreadsheet identifier that is used to identify the target to obtain. | | String |
| valueRenderOption (consumer) | Determines how values should be rendered in the output. | FORMATTED_VALUE | String |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| pollStrategy (consumer) | A pluggable <code>org.apache.camel.PollingConsumerPollingStrategy</code> allowing you to provide your custom implementation to control error handling usually occurred during the poll operation before an Exchange have been created and being routed in Camel. | | PollingConsumerPollStrategy |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| backoffErrorThreshold (scheduler) | The number of subsequent error polls (failed due some error) that should happen before the backoffMultiplier should kick-in. | | int |

| Name | Description | Default | Type |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|--------------------------------|
| backoffIdleThreshold (scheduler) | The number of subsequent idle polls that should happen before the backoffMultiplier should kick-in. | | int |
| backoffMultiplier (scheduler) | To let the scheduled polling consumer backoff if there has been a number of subsequent idles/errors in a row. The multiplier is then the number of polls that will be skipped before the next actual attempt is happening again. When this option is in use then backoffIdleThreshold and/or backoffErrorThreshold must also be configured. | | int |
| delay (scheduler) | Milliseconds before the next poll. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 500 | long |
| greedy (scheduler) | If greedy is enabled, then the ScheduledPollConsumer will run immediately again, if the previous run polled 1 or more messages. | false | boolean |
| initialDelay (scheduler) | Milliseconds before the first poll starts. You can also specify time values using units, such as 60s (60 seconds), 5m30s (5 minutes and 30 seconds), and 1h (1 hour). | 1000 | long |
| runLoggingLevel (scheduler) | The consumer logs a start/complete log line when it polls. This option allows you to configure the logging level for that. | TRACE | LoggingLevel |
| scheduledExecutorService (scheduler) | Allows for configuring a custom/shared thread pool to use for the consumer. By default each consumer has its own single threaded thread pool. | | ScheduledExecutorService |
| scheduler (scheduler) | To use a cron scheduler from either camel-spring or camel-quartz2 component | none | ScheduledPollConsumerScheduler |
| schedulerProperties (scheduler) | To configure additional properties when using a custom scheduler or any of the Quartz2, Spring based scheduler. | | Map |
| startScheduler (scheduler) | Whether the scheduler should be auto started. | true | boolean |
| timeUnit (scheduler) | Time unit for initialDelay and delay options. | MILLIS ECON DS | TimeUnit |
| useFixedDelay (scheduler) | Controls if fixed delay or fixed rate is used. See ScheduledExecutorService in JDK for details. | true | boolean |

126.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 16 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| <code>camel.component.google-sheets-stream.client-factory</code> | To use the <code>GoogleSheetsClientFactory</code> as factory for creating the client. Will by default use <code>BatchGoogleSheetsClientFactory</code> . The option is a <code>org.apache.camel.component.google.sheets.GoogleSheetsClientFactory</code> type. | | String |
| <code>camel.component.google-sheets-stream.configuration.access-token</code> | OAuth 2 access token. This typically expires after an hour so <code>refreshToken</code> is recommended for long term usage. | | String |
| <code>camel.component.google-sheets-stream.configuration.api-name</code> | Sets the <code>apiName</code> . | | String |
| <code>camel.component.google-sheets-stream.configuration.application-name</code> | Google sheets application name. Example would be <code>camel-google-sheets/1.0</code> | | String |
| <code>camel.component.google-sheets-stream.configuration.client-id</code> | Client ID of the sheets application | | String |
| <code>camel.component.google-sheets-stream.configuration.client-secret</code> | Client secret of the sheets application | | String |
| <code>camel.component.google-sheets-stream.configuration.include-grid-data</code> | True if grid data should be returned. | false | Boolean |
| <code>camel.component.google-sheets-stream.configuration.major-dimension</code> | Specifies the major dimension that results should use.. | ROWS | String |

| Name | Description | Default | Type |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------|
| <code>camel.component.google-sheets-stream.configuration.max-results</code> | Specify the maximum number of returned results. This will limit the number of rows in a returned value range data set or the number of returned value ranges in a batch request. | 0 | Integer |
| <code>camel.component.google-sheets-stream.configuration.range</code> | Specifies the range of rows and columns in a sheet to get data from. | | String |
| <code>camel.component.google-sheets-stream.configuration.refresh-token</code> | OAuth 2 refresh token. Using this, the Google Calendar component can obtain a new accessToken whenever the current one expires - a necessity if the application is long-lived. | | String |
| <code>camel.component.google-sheets-stream.configuration.scopes</code> | Specifies the level of permissions you want a sheets application to have to a user account. See https://developers.google.com/identity/protocols/googlescopes for more info. | | List |
| <code>camel.component.google-sheets-stream.configuration.spreadsheet-id</code> | Specifies the spreadsheet identifier that is used to identify the target to obtain. | | String |
| <code>camel.component.google-sheets-stream.configuration.value-render-option</code> | Determines how values should be rendered in the output. | FORMATTED_VALUE | String |
| <code>camel.component.google-sheets-stream.enabled</code> | Whether to enable auto configuration of the google-sheets-stream component. This is enabled by default. | | Boolean |
| <code>camel.component.google-sheets-stream.resolve-property-placeholders</code> | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

126.4. CONSUMER

The consumer will poll by default with `maxResults` equals to 5.

For example

```
from("google-sheets-stream://data?range=A:B&delay=5000&maxResults=5").to("mock:result");
```

This route will consume the next ten events starting from the date of polling.

CHAPTER 127. GROOVY LANGUAGE

Available as of Camel version 1.3

Camel supports [Groovy](#) among other Scripting Languages to allow an Expression or Predicate to be used in the DSL or [Xml Configuration](#).

To use a Groovy expression use the following Java code

```
... groovy("someGroovyExpression") ...
```

For example you could use the **groovy** function to create an Predicate in a [Message Filter](#) or as an Expression for a Recipient List

127.1. GROOVY OPTIONS

The Groovy language supports 1 options, which are listed below.

| Name | Default | Java Type | Description |
|------|-------------|----------------|--------------------------------------------------------------------------------------|
| trim | true | Boolean | Whether to trim the value to remove leading and trailing whitespaces and line breaks |

127.2. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|--------------------------------------|--------------------------------------------------------------------------------------|---------|---------|
| camel.language.groovy.enabled | Enable groovy language | true | Boolean |
| camel.language.groovy.trim | Whether to trim the value to remove leading and trailing whitespaces and line breaks | true | Boolean |

127.3. CUSTOMIZING GROOVY SHELL

Sometimes you may need to use custom **GroovyShell** instance in your Groovy expressions. To provide custom **GroovyShell**, add implementation of the **org.apache.camel.language.groovy.GroovyShellFactory** SPI interface to your Camel registry. For example after adding the following bean to your Spring context...

```
public class CustomGroovyShellFactory implements GroovyShellFactory {
    public GroovyShell createGroovyShell(Exchange exchange) {
        ImportCustomizer importCustomizer = new ImportCustomizer();
        importCustomizer.addStaticStars("com.example.Utils");
        CompilerConfiguration configuration = new CompilerConfiguration();
```

```

configuration.addCompilationCustomizers(importCustomizer);
return new GroovyShell(configuration);
}
}

```

...Camel will use your custom GroovyShell instance (containing your custom static imports), instead of the default one.

127.4. EXAMPLE

```

// lets route if a line item is over $100
from("queue:foo").filter(groovy("request.lineItems.any { i -> i.value > 100 }")).to("queue:bar")

```

And the Spring DSL:

```

<route>
  <from uri="queue:foo"/>
  <filter>
    <groovy>request.lineItems.any { i -> i.value > 100 }</groovy>
    <to uri="queue:bar"/>
  </filter>
</route>

```

127.5. SCRIPTCONTEXT

The JSR-223 scripting languages ScriptContext is pre configured with the following attributes all set at **ENGINE_SCOPE**:

| Attribute | Type | Value |
|--------------|--------------------------------------|--------------------------------------------------|
| context | org.apache.camel.CamelContext | The Camel Context (It cannot be used in groovy) |
| camelContext | org.apache.camel.CamelContext | The Camel Context |
| exchange | org.apache.camel.Exchange | The current Exchange |

| Attribute | Type | Value |
|------------|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| request | org.apache.camel.Message | The message (IN message) |
| response | org.apache.camel.Message | Deprecated: The OUT message. The OUT message if null by default. Use IN message instead. |
| properties | org.apache.camel.builder.PropertiesFunction | Camel 2.9: Function with a resolve method to make it easier to use Camels Properties component from scripts. See further below for example. |

See Scripting Languages for the list of languages with explicit DSL support.

127.6. ADDITIONAL ARGUMENTS TO SCRIPTINGENGINE

Available as of Camel 2.8

You can provide additional arguments to the **ScriptingEngine** using a header on the Camel message with the key **CamelScriptArguments**.

See this example:

127.7. USING PROPERTIES FUNCTION

Available as of Camel 2.9

If you need to use the [Properties](#) component from a script to lookup property placeholders, then its a bit cumbersome to do so. For example to set a header name myHeader with a value from a property placeholder, which key is provided in a header named "foo".

```
.setHeader("myHeader").groovy("""context.resolvePropertyPlaceholders( + '{{' +
request.headers.get(&#39;foo&#39;) + '}' + """)
```

From Camel 2.9 onwards you can now use the properties function and the same example is simpler:

```
.setHeader("myHeader").groovy("properties.resolve(request.headers.get(&#39;foo&#39;))")
```

127.8. LOADING SCRIPT FROM EXTERNAL RESOURCE

Available as of Camel 2.11

You can externalize the script and have Camel load it from a resource such as **"classpath:"**, **"file:"**, or **"http:"**.

This is done using the following syntax: **"resource:scheme:location"**, eg to refer to a file on the classpath you can do:

```
.setHeader("myHeader").groovy("resource:classpath:mygroovy.groovy")
```

127.9. HOW TO GET THE RESULT FROM MULTIPLE STATEMENTS SCRIPT

Available as of Camel 2.14

As the `scriptengine eval` method just return a Null if it runs a multiple statements script. Camel now look up the value of script result by using the key of "result" from the value set. If you have multiple statements script, you need to make sure you set the value of result variable as the script return value.

```
bar = "baz";  
# some other statements ...  
# camel take the result value as the script evaluation result  
result = body * 2 + 1
```

127.10. DEPENDENCIES

To use scripting languages in your camel routes you need to add a dependency on **camel-groovy**.

If you use Maven you could just add the following to your **pom.xml**, substituting the version number for the latest and greatest release (see the download page for the latest versions).

```
<dependency>  
  <groupId>org.apache.camel</groupId>  
  <artifactId>camel-groovy</artifactId>  
  <version>x.x.x</version>  
</dependency>
```

CHAPTER 128. GRPC COMPONENT

Available as of Camel version 2.19

The gRPC component allows you to call or expose Remote Procedure Call (RPC) services using [Protocol Buffers \(protobuf\)](#) exchange format over HTTP/2 transport.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-grpc</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

Starting with Camel 2.22 gRPC requires strong own of the Google Guava version. It's necessary to add following configuration property to the maven file

```
<properties>
  <google-guava-version>${grpc-guava-version}</google-guava-version>
</properties>
```

128.1. URI FORMAT

```
grpc://service[?options]
```

128.2. ENDPOINT OPTIONS

The gRPC component has no options.

The gRPC endpoint is configured using URI syntax:

```
grpc:host:port/service
```

with the following path and query parameters:

128.2.1. Path Parameters (3 parameters):

| Name | Description | Default | Type |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------|--------|
| host | Required The gRPC server host name. This is localhost or 0.0.0.0 when being a consumer or remote server host name when using producer. | | String |
| port | Required The gRPC local or remote server port | | int |

| Name | Description | Default | Type |
|----------------|-----------------------------------------------------------------------------------------------------------------------------|---------|--------|
| service | Required Fully qualified service name from the protocol buffer descriptor file (package dot service definition name) | | String |

128.2.2. Query Parameters (25 parameters):

| Name | Description | Default | Type |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|----------------------|
| flowControlWindow (common) | The HTTP/2 flow control window size (MiB) | 1048576 | int |
| maxMessageSize (common) | The maximum message size allowed to be received/sent (MiB) | 4194304 | int |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the <code>org.apache.camel.spi.ExceptionHandler</code> to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| consumerStrategy (consumer) | This option specifies the top-level strategy for processing service requests and responses in streaming mode. If an aggregation strategy is selected, all requests will be accumulated in the list, then transferred to the flow, and the accumulated responses will be sent to the sender. If a propagation strategy is selected, request is sent to the stream, and the response will be immediately sent back to the sender. | PROPAGATION | GrpcConsumerStrategy |
| forwardOnCompleted (consumer) | Determines if onCompleted events should be pushed to the Camel route. | false | boolean |
| forwardOnError (consumer) | Determines if onError events should be pushed to the Camel route. Exceptions will be set as message body. | false | boolean |
| maxConcurrentCallsPerConnection (consumer) | The maximum number of concurrent calls permitted for each incoming server connection | 2147483647 | int |

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------|
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| method (producer) | gRPC method name | | String |
| producerStrategy (producer) | The mode used to communicate with a remote gRPC server. In SIMPLE mode a single exchange is translated into a remote procedure call. In STREAMING mode all exchanges will be sent within the same request (input and output of the recipient gRPC service must be of type 'stream'). | SIMPLE | GrpcProducerStrategy |
| streamRepliesTo (producer) | When using STREAMING client mode, it indicates the endpoint where responses should be forwarded. | | String |
| userAgent (producer) | The user agent header passed to the server | | String |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |
| authenticationType (security) | Authentication method type in advance to the SSL/TLS negotiation | NONE | GrpcAuthType |
| jwtAlgorithm (security) | JSON Web Token sign algorithm | HMAC256 | JwtAlgorithm |
| jwtIssuer (security) | JSON Web Token issuer | | String |
| jwtSecret (security) | JSON Web Token secret | | String |
| jwtSubject (security) | JSON Web Token subject | | String |

| Name | Description | Default | Type |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------|---------------|-----------------|
| keyCertChainResource (security) | The X.509 certificate chain file resource in PEM format link | | String |
| keyPassword (security) | The PKCS#8 private key file password | | String |
| keyResource (security) | The PKCS#8 private key file resource in PEM format link | | String |
| negotiationType (security) | Identifies the security negotiation type used for HTTP/2 communication | PLAIN TEXT | NegotiationType |
| serviceAccountResource (security) | Service Account key file in JSON format resource link supported by the Google Cloud SDK | | String |
| trustCertCollectionResource (security) | The trusted certificates collection file resource in PEM format for verifying the remote endpoint's certificate | | String |

128.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 2 options, which are listed below.

| Name | Description | Default | Type |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|---------|
| camel.component.grpc.enabled | Enable grpc component | true | Boolean |
| camel.component.grpc.resolve-property-placeholders | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | Boolean |

128.4. TRANSPORT SECURITY AND AUTHENTICATION SUPPORT (AVAILABLE FROM CAMEL 2.20)

The following [authentication](#) mechanisms are built-in to gRPC and available in this component:

- **SSL/TLS:** gRPC has SSL/TLS integration and promotes the use of SSL/TLS to authenticate the server, and to encrypt all the data exchanged between the client and the server. Optional mechanisms are available for clients to provide certificates for mutual authentication.
- **Token-based authentication with Google:** gRPC provides a generic mechanism to attach metadata based credentials to requests and responses. Additional support for acquiring access tokens while accessing Google APIs through gRPC is provided. In general this mechanism must

be used as well as SSL/TLS on the channel.

To enable these features the following component properties combinations must be configured:

| Num. | Option | Parameter | Value | Required/Optional |
|------|------------------------------------------------------------|-----------------------------|----------------------------------------|-----------------------------------------------------------------------------|
| 1 | SSL/TLS | negotiationType | TLS | Required |
| | | keyCertChainResource | | Required |
| | | keyResource | | Required |
| | | keyPassword | | Optional |
| | | trustCertCollectionResource | | Optional |
| 2 | Token-based authentication with Google API | authenticationType | GOOGLE | Required |
| | | negotiationType | TLS | Required |
| | | serviceAccountResource | | Required |
| 3 | Custom JSON Web Token implementation authentication | authenticationType | JWT | Required |
| | | negotiationType | NONE or TLS | Optional. The TLS/SSL not checking for this type, but strongly recommended. |
| | | jwtAlgorithm | HMAC256(default) or (HMAC384, HMAC512) | Optional |
| | | jwtSecret | | Required |
| | | jwtIssuer | | Optional |
| | | jwtSubject | | Optional |

TLS with OpenSSL is currently the recommended approach for using gRPC over TLS component. Using the JDK for ALPN is generally much slower and may not support the necessary ciphers for HTTP2. This function is not implemented in the component.

128.5. GRPC PRODUCER RESOURCE TYPE MAPPING

The table below shows the types of objects in the message body, depending on the types (simple or stream) of incoming and outgoing parameters, as well as the invocation style (synchronous or asynchronous). Please note, that invocation of the procedures with incoming stream parameter in asynchronous style are not allowed.

| Invocation style | Request type | Response type | Request Body Type | Result Body Type |
|---------------------|--------------|---------------|------------------------|------------------|
| synchronous | simple | simple | Object | Object |
| synchronous | simple | stream | Object | List<Object> |
| synchronous | stream | simple | not allowed | not allowed |
| synchronous | stream | stream | not allowed | not allowed |
| asynchronous | simple | simple | Object | List<Object> |
| asynchronous | simple | stream | Object | List<Object> |
| asynchronous | stream | simple | Object or List<Object> | List<Object> |
| asynchronous | stream | stream | Object or List<Object> | List<Object> |

128.6. GRPC CONSUMER HEADERS (WILL BE INSTALLED AFTER THE CONSUMER INVOCATION)

| Header name | Description | Possible values |
|----------------------------|-------------------------------------------------------------------------------------|--------------------------------|
| CamelGrpcMethodName | Method name handled by the consumer service | |
| CamelGrpcEventType | Received event type from the sent request | onNext, onCompleted or onError |
| CamelGrpcUserAgent | If provided, the given agent will prepend the gRPC library's user agent information | |

128.7. EXAMPLES

Below is a simple synchronous method invoke with host and port parameters

```
from("direct:grpc-sync")
.to("grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=sendPing&synchronous=true");
```

```
<route>
  <from uri="direct:grpc-sync" />
  <to uri="grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=sendPing&synchronous=true"/>
</route>
```

An asynchronous method invoke

```
from("direct:grpc-async")
.to("grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=pingAsyncResponse");
```

gRPC service consumer with propagation consumer strategy

```
from("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
consumerStrategy=PROPAGATION")
.to("direct:grpc-service");
```

gRPC service producer with streaming producer strategy (requires a service that uses "stream" mode as input and output)

```
from("direct:grpc-request-stream")
.to("grpc://remotehost:1101/org.apache.camel.component.grpc.PingPong?
method=PingAsyncAsync&producerStrategy=STREAMING&streamRepliesTo=direct:grpc-response-
stream");

from("direct:grpc-response-stream")
.log("Response received: ${body}");
```

gRPC service consumer TLS/SLL security negotiation enable

```
from("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
consumerStrategy=PROPAGATION&negotiationType=TLS&keyCertChainResource=file:src/test/resour
ces/certs/server.pem&keyResource=file:src/test/resources/certs/server.key&trustCertCollectionResource
=file:src/test/resources/certs/ca.pem")
.to("direct:tls-enable")
```

gRPC service producer with custom JSON Web Token implementation authentication

```
from("direct:grpc-jwt")
.to("grpc://localhost:1101/org.apache.camel.component.grpc.PingPong?
method=pingSyncSync&synchronous=true&authenticationType=JWT&jwtSecret=supersecuredsecret"
);
```

128.8. CONFIGURATION

It's it is recommended to use Maven Protocol Buffers Plugin which calls Protocol Buffer Compiler (protoc) tool to generate Java source files from .proto (protocol buffer definition) files for the custom project. This plugin will generate procedures request and response classes, their builders and gRPC procedures stubs classes as well.

Following steps are required:

Insert operating system and CPU architecture detection extension inside `<build>` tag of the project pom.xml or set `${os.detected.classifier}` parameter manually

```
<extensions>
  <extension>
    <groupId>kr.motd.maven</groupId>
    <artifactId>os-maven-plugin</artifactId>
    <version>1.4.1.Final</version>
  </extension>
</extensions>
```

Insert gRPC and protobuf Java code generator plugin `<plugins>` tag of the project pom.xml

```
<plugin>
  <groupId>org.xolstice.maven.plugins</groupId>
  <artifactId>protobuf-maven-plugin</artifactId>
  <version>0.5.0</version>
  <configuration>
    <protocArtifact>com.google.protobuf:protoc:${protobuf-
version}:exe:${os.detected.classifier}</protocArtifact>
    <pluginId>grpc-java</pluginId>
    <pluginArtifact>io.grpc:protoc-gen-grpc-java:${grpc-
version}:exe:${os.detected.classifier}</pluginArtifact>
  </configuration>
  <executions>
    <execution>
      <goals>
        <goal>compile</goal>
        <goal>compile-custom</goal>
        <goal>test-compile</goal>
        <goal>test-compile-custom</goal>
      </goals>
    </execution>
  </executions>
</plugin>
```

CHAPTER 129. GUAVA EVENTBUS COMPONENT

Available as of Camel version 2.10

The [Google Guava EventBus](#) allows publish-subscribe-style communication between components without requiring the components to explicitly register with one another (and thus be aware of each other). The **guava-eventbus** component provides integration bridge between Camel and [Google Guava EventBus](#) infrastructure. With the latter component, messages exchanged with the Guava **EventBus** can be transparently forwarded to the Camel routes. EventBus component allows also to route body of Camel exchanges to the Guava **EventBus**.

Maven users will need to add the following dependency to their **pom.xml** for this component:

```
<dependency>
  <groupId>org.apache.camel</groupId>
  <artifactId>camel-guava-eventbus</artifactId>
  <version>x.x.x</version>
  <!-- use the same version as your Camel core version -->
</dependency>
```

129.1. URI FORMAT

```
guava-eventbus:busName[?options]
```

Where **busName** represents the name of the **com.google.common.eventbus.EventBus** instance located in the Camel registry.

129.2. OPTIONS

The Guava EventBus component supports 3 options, which are listed below.

| Name | Description | Default | Type |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------|
| eventBus (common) | To use the given Guava EventBus instance | | EventBus |
| listenerInterface (common) | The interface with method(s) marked with the Subscribe annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling DeadEvent properly. This option cannot be used together with eventClass option. | | Class |
| resolveProperty Placeholders (advanced) | Whether the component should resolve property placeholders on itself when starting. Only properties which are of String type can use property placeholders. | true | boolean |

The Guava EventBus endpoint is configured using URI syntax:

guava-eventbus:eventBusRef

with the following path and query parameters:

129.2.1. Path Parameters (1 parameters):

| Name | Description | Default | Type |
|--------------------|--------------------------------------------------------------------|---------|--------|
| eventBusRef | To lookup the Guava EventBus from the registry with the given name | | String |

129.2.2. Query Parameters (6 parameters):

| Name | Description | Default | Type |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------|
| eventClass (common) | If used on the consumer side of the route, will filter events received from the EventBus to the instances of the class and superclasses of eventClass. Null value of this option is equal to setting it to the java.lang.Object i.e. the consumer will capture all messages incoming to the event bus. This option cannot be used together with listenerInterface option. | | Class |
| listenerInterface (common) | The interface with method(s) marked with the Subscribe annotation. Dynamic proxy will be created over the interface so it could be registered as the EventBus listener. Particularly useful when creating multi-event listeners and for handling DeadEvent properly. This option cannot be used together with eventClass option. | | Class |
| bridgeErrorHandler (consumer) | Allows for bridging the consumer to the Camel routing Error Handler, which mean any exceptions occurred while the consumer is trying to pickup incoming messages, or the likes, will now be processed as a message and handled by the routing Error Handler. By default the consumer will use the org.apache.camel.spi.ExceptionHandler to deal with exceptions, that will be logged at WARN or ERROR level and ignored. | false | boolean |
| exceptionHandler (consumer) | To let the consumer use a custom ExceptionHandler. Notice if the option bridgeErrorHandler is enabled then this option is not in use. By default the consumer will deal with exceptions, that will be logged at WARN or ERROR level and ignored. | | ExceptionHandler |

| Name | Description | Default | Type |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|---------|-----------------|
| exchangePattern (consumer) | Sets the exchange pattern when the consumer creates an exchange. | | ExchangePattern |
| synchronous (advanced) | Sets whether synchronous processing should be strictly used, or Camel is allowed to use asynchronous processing (if supported). | false | boolean |

129.3. SPRING BOOT AUTO-CONFIGURATION

The component supports 4 options, which are listed below.

| Name | Description | Default | Type |
